UNIVERSAL DICTIONARY

OF

ARTS and SCIENCES.

ART

ARTERY, in *Anatomy*, from *αἴρ*, *air*, and *τηρεῖν*, *to keep*, is the name by which those vessels are distinguished through which the blood flows from the heart to every part of the body. The term was first adopted by the anatomists of the Alexandrian school, in consequence of the erroneous opinion which they entertained, that these vessels were designed for the distribution of air throughout the body.

ARTERIES, Structure of. The larger arteries have thick and elastic sides, so that they remain open when divided, and present a regularly circular aperture. The sides may be separated into three strata of dissimilar substances, which are technically called coats. The innermost, which is generally termed the cuticular coat, is very thin, but very strong and inelastic. Upon this circumstance depends the regularly circular form of an injected artery; for if the cuticular coat bursts from too great force being used in injecting, the exterior elastic coats are distended into an irregular and uncertain figure. The internal surface of this coat is perfectly smooth, so that the blood glides along it without impediment; the external surface is a little rough, and is connected by cellular substance to that coat which surrounds it. The middle or muscular coat consists of circular fibres which are scarcely visible in the largest arteries, but are very manifest and strong in the smaller ones: they are seen projecting in circular ridges, beneath the thin cuticular coat of a small artery, when it is slit open. The great increase of the muscular power of the small arteries is not only evident to the sight, but has been demonstrated by experiment. Mr. Hunter bled a horse to death, and afterwards examined the state of the arteries. The aorta was contracted about $\frac{1}{20}$ th part of its natural area, the iliac $\frac{1}{10}$ th, the radial $\frac{1}{3}$. See his *Treatise on the Blood, Inflammation, &c.* The external or elastic coat of the artery appears to be made of con-

densed cellular substance; it is powerfully elastic, and abounds in the larger arteries, but gradually diminishes in quantity as the size of the vessel decreases; so that the small arteries are quite flaccid, and collapse when divided. It is easy to perceive the use of these various degrees of elasticity and muscular power, which are given to the different sets of arteries. In the large arteries, muscular power seems unnecessary, for the force of the heart is fully adequate to the propulsion of the blood; but in the smaller arteries, where the effect of the heart's action declines, a proportionate muscular power is allotted to the vessel to urge on the circulating fluids. The arteries have their nutrient arteries and veins, their absorbents, and their nerves. All the arteries proceed from one great vessel, as the branches spring from the trunk of the tree; and we proceed to notice certain circumstances observable in

ARTERIES, the Ramification of the. 1. When a large artery gives off a branch, the conjoined areas of the two vessels make a greater space for the blood to move in, than the area of the original vessel. The increase of dimensions in the branches of a large artery is slight, but in those of a small one it is so considerable, that Haller has estimated it as surpassing by $\frac{1}{3}$ d that of the trunk from which they spring. The conjoined areas of all the small arteries so greatly exceed that of the aorta, that the same anatomist, in opposition to former opinions, says, these vessels may be considered as conical, the basis of the cone being in the extreme arteries, and the apex in the heart.

2. When a large artery sends off a branch, its course does not, in general, deviate further from that of the trunk, than an angle of 45 degrees. Sometimes a branch, which has gone off at an acute angle, returns, and proceeds in a contrary direction to that of the trunk; and these arteries are generally

generally called circumflex. Sometimes, indeed, a large artery does proceed from the trunk at a greater angle, nearly a right angle, as the renal arteries, &c. Though the large arteries generally ramify at acute angles, there is great diversity in the branching of the smaller ones.

3. Arteries, in general, do not pursue a straight, but serpentine course; in some instances it is remarkably the case; as in the spermatics, those of the face and occiput, and in most of the smaller arteries.

4. Though the ramification of arteries may be compared to the branching of trees, yet it differs materially in this particular, that the different branches frequently conjoin. This conjunction is technically termed, if we borrow the phrase from the Greek language, their "Anastomosis;" if from the Latin, their "Inosculation." This union of arteries rarely happens among the larger ones, but frequently among the smaller; and increases in number in proportion to the minuteness of the vessels. The utility of the inosculation of arteries is evident: were it not for this circumstance, if any arterious trunk were accidentally compressed, so that the current of blood in it should be for some time obstructed, the parts which it supplied must perish. But in consequence of the frequent communication of the arteries with one another, the blood can pass from the adjacent arteries into all the branches of any one accidentally obstructed.

When arteries inosculate, two currents of blood, moving in opposite directions, must come together, and retard each other's motion. This probably is the reason that larger arteries, through which it seems necessary that the blood should flow with rapidity, so seldom conjoin, whilst the small arteries, in which it is requisite the blood should move tardily, communicate in surprising numbers, and with a frequency proportionate to their minuteness. The very frequent communication of the minute arteries, almost as effectually prevents the prejudicial consequences of obstruction in the larger trunks, as if those arteries themselves were made to communicate by more direct and larger channels. All these minute arterious tubes are capable of enlargement, and it is an ascertained fact, that even the aorta itself may be gradually obstructed, without the parts which it supplies being deprived of nourishment. From an attentive consideration of all these circumstances, it has been concluded, that the moderate increase of the area of the branches of large arteries, the acute angles at which they divide, their nearly rectilinear course, and the rare occurrence of inosculation between them, are designed to facilitate the rapid motion of the blood in them, so that it may arrive unchanged and in the same state that it was projected from the heart, at that part of the body for the nourishment of which it is intended; whilst, on the contrary, the great increase of the area of the smaller vessels, the variety of their angles, their tortuous course, and their frequent communications, were designed to check the velocity of the blood's motion, when it has arrived at that part where secretion is to be performed, and nutrition is to take place. Contrary opinions have indeed been maintained; and for the further discussion of this subject, we must refer the reader to the *Circulation of the Blood*.

ARTERIES, Termination of. When the arteries have become very minute, they terminate in two ways; they either turn back again and become veins, and return the blood to the heart, or they send off fine vessels which abstract something from the circulating blood, and which are therefore called the secreting arteries. Though none but minute arteries are ever reflected so as to become veins, yet many of them are of sufficient magnitude to allow the passage of common waxen injection. The arrangement of the minute

veins can be demonstrated by impelling common waxen injection into the arteries, particularly if a degree of putrefaction be suffered to take place previously to the experiment. In the dissection of such a preparation, the continuity of the arteries and veins is very manifest. It seems therefore to follow from this facility of communication, that the mass of blood is constantly and freely circulating, in order to undergo that change which is effected in the lungs, whilst but a small part of it proceeds into the very minute arteries, for the purpose of having secretions made from it. For these arteries, however minute, must be considered large in comparison to the exility of others, which cannot be injected with wax and even reject the red globules of the blood, or admit them in such small proportion, that they do not impart the red colour to the fluid which moves in these vessels. Now we may venture to affirm, that these globules do not much exceed, in diameter, the 150,000th part of an inch, which circumstance sufficiently shews the minuteness of the lesser arteries. See the article *Blood*. But however minute arteries may become, still they must all end in the same manner; they must be continued into veins, for that is the route which the blood, or subtle injections pursue, and from the most minute arteries those which perform secretion arise.

The secreting arteries are too minute to admit commonly of demonstration: they are however evident in some glands; in the kidney for instance, they may be seen continued into the excretory vessels or tubuli uriniferi. Subtile injections, when thrown into the larger arterial trunks, may be seen oozing out on the surfaces of membranes, and into the cellular substance, and they are generally supposed to be poured forth from the open orifices of the secreting arteries. Analogy therefore, rather than actual demonstration, leads us to believe, that the secreting arteries abstract the particles of nutrition, or the materials which compose the fabric of the body, from the circulating fluids, and deposit them from their open mouths, so as by this means to build up and keep in repair the structure of the body.

ARTERIES, Distribution of. The great artery, whose branches supply the whole of the body, is named the "aorta." It comes off from the upper and back part of the left ventricle, where it is surrounded for a short part of its course by the fleshy fibres of the heart. Its origin appears externally to be divided into three distinct eminences, which denote the situation of its semilunar valves.

The aorta emerges from the basis of the heart, between the pulmonary artery, and the right auricle. It ascends at first rather to the right, till it arrives at the upper edge of the second rib. Then it begins to bend backwards across the division of the pulmonary artery and of the trachea, till it reaches the left side of the spine, in which situation it descends from the fourth or fifth dorsal to the last lumbar vertebra.

By the "arch of the aorta," is meant that part of the vessel which arises from the heart, and bends across the chest. It sends off the following branches: viz. the two coronary arteries, whose mouths are situated just above the upper edge of the semilunar valves. They depart from the trunk at right angles, and are distributed to the heart itself. The most convex part of the arch sends off three large branches; first, the arteria innominata; secondly, the left carotid artery; and thirdly, the left subclavian artery. Varieties not unfrequently occur in the number of arteries which arise from this upper part of the arch: a long list of them may be seen in *Soemmerring de corporis humani fabricâ*, tom. v. p. 120.

The right coronary passes in the groove between the right auricle and ventricle, covered by fat, to the flat surface

face of the heart. It gives off five large branches chiefly to the right ventricle; the last of these, which is the longest, anastomoses near the apex of the heart with the left coronary artery.

The left coronary artery is found between the pulmonary artery, and the left auricle. It divides into two branches. The anterior branch takes a serpentine course along the convex surface of the heart, in the direction of the septum ventriculorum; it communicates at the apex with the right coronary. The posterior branch passes between the left auricle and ventricle towards the left margin of the heart, and is distributed to the left ventricle.

Observation. Both the coronary arteries send branches to the roots of the great vessels, as they come off from the heart, and they communicate with the phrenic, internal mammary, and bronchial arteries.

The arteria innominata passes obliquely in front of the trachea, and behind the subclavian vein. After a course of an inch or an inch and a half, during which it gives off no branch, it divides into the right carotid and right subclavian arteries: the rest of the description of these arteries, is the same on both sides of the body.

The common carotid artery emerges from the chest by the side of the trachea, where it is covered by the insertion of the sternocleidomastoideus muscle. It mounts upwards in front of the vertebrae, and parallel with the trachea, till it reaches the upper margin of the thyroid cartilage, without giving off a single branch. During its course along the neck, it is closely connected to the internal jugular vein, and the eighth pair of nerves. At the upper margin of the thyroid cartilage, it divides into the external and internal carotid arteries, the former of which is distributed to the outside of the head, the latter to the brain.

The external carotid continues its course upwards between the ramus of the jaw and the ear, being imbedded in the substance of the parotid gland. About the middle of the ramus of the jaw, it divides into the superficial temporal, and the internal maxillary arteries.

The Branches of the External Carotid Artery.

The superior thyroid artery is the first branch of the external carotid artery. It pursues a tortuous course downwards and forwards to the upper part of the thyroid gland, to which it is almost entirely distributed, communicating freely with the thyroid branch of the inferior thyroidal artery. It sends however a superficial branch under the os hyoides, which unites with its fellow of the opposite side. Another branch goes to the lower part of the thyroid cartilage, and is distributed to the neighbouring muscles. The laryngeal artery is the most constant branch of the superior thyroidal; it enters the larynx between the thyroid and cricoid cartilages, together with the recurrent nerve, or at a hole in the side of the thyroid cartilage, and is distributed to the muscles of the arytenoid cartilages, and to the membrane which lines the larynx.

The lingual artery comes off from the external carotid immediately above the former; it accompanies the lingual nerve, passing above the corner of the os hyoides, and within the hyoglossus muscle; it gives a branch (the ramus hyoideus of authors) to the muscles above the os hyoides; then it sends a pretty large artery (dorsalis linguae) to the back of the tongue, epiglottis, &c. Afterwards the trunk divides into two branches: the sublingual, which passes between the sublingual gland and the geniolyoides muscle to the chin, where it terminates superficially; and the ramal, which is the larger and more important branch: it continues its course along the inferior surface of the tongue, preserving a considerable size to the very apex.

The labial artery, which is also called the facial, external maxillary, or angular artery, arises from the external carotid under the digastric and stylohyoides muscles; it advances in a tortuous manner to the basis of the jaw, passing through a deep fissure which is made for it in the submaxillary gland; by a bold and sudden turn it bends over the basis of the jaw at the anterior margin of the masseter muscle, and then follows a serpentine course over the cheek to the side of the mouth and nose, under the zygomatic muscles.

Before it passes over the jaw, it sends off the following branches. 1. The ascending palatine artery, goes under the styloid muscles to the pharynx, Eustachian tube, soft palate, and uvula. 2. An artery to the back of the tongue and tonsils. 3. A number of small branches to the submaxillary gland, the neighbouring lymphatic glands, the skin, the membrane of the mouth, &c. 4. The submental comes off just before the artery makes its turn; it runs forward on the mylohyoides muscle towards the chin; there it turns over the symphysis of the jaw, and is distributed to the skin and muscles of the chin, communicating with the inferior labial artery.

When the artery has passed over the basis of the jaw, it sends off; 1. A branch to the surface of the masseter, which communicates with the masseteric branch of the temporal. 2. The inferior labial artery, which supplies the lower part of the lower lip, and communicates with the submental, and with the coronary artery of the lower lip. 3. The coronary artery of the lower lip, which pursues a winding course under the orbicularis oris, till it meets and anastomoses with its fellow of the opposite side. It is sometimes produced by the inferior labial. 4. The coronary artery of the upper lip may from its superior magnitude be considered as the continuation of the trunk; it follows the edge of the upper lip, lying on the membrane of the mouth, and in the middle of the lip has a large and free communication with the opposite artery; it sends off a large branch to the side of the nose, and two smaller branches which run along the front of the septum nasi; these communicate on the ala nasi with the branches of the ophthalmic and infra-orbital arteries. The branches which the labial sends off to the face vary much in size and number; sometimes it terminates in producing the coronary of the lower lip (vide Halleri Icon. fasc. ii. tab. arter. faciei); sometimes the nasal arteries are entirely given off from the ophthalmic; sometimes the nasal branches of the labial extend over the nose to the forehead; sometimes the branches of one side differ from those of the other.

The ascending pharyngeal artery of Haller (Halleri Icon. fasc. ii. tab. arter. pharyng.), which is the smallest branch of the external carotid except the posterior auricular, either arises from the back of the carotid opposite the lingual, or from the point of bifurcation. Its course along the neck is straight; it is found in front of the rectus capitis major, and on the side of the pharynx, being absolutely hidden by the two carotids. Its anterior branches supply the bag of the pharynx; its posterior branches go to the superior cervical ganglion of the great sympathetic nerve, to the paravagum, and sternomastoideus muscle: the termination of the trunk enters the skull at the foramen jugulare, and ramifies on the dura mater. The occipital artery is covered at its origin by the digastric muscle; it passes in front of the jugular vein, then gets between the mastoid process and the atlas, under the muscles of the neck. Arriving near the ligamentum nuchae, it penetrates the complexus muscle, and becomes cutaneous. It sends off branches to the muscles along which it passes, one of which is much larger than

than the rest, descends along the outer side of the complexus, and communicates with the transversalis colli. A branch of the occipital artery enters the skull at the foramen jugulare, and supplies the dura mater of the cerebellum. The trunk of the occipital artery branches over the back of the scalp, being distributed to the occipital portion of the occipito-frontalis, and to the skin. Its branches communicate freely with those of the temporal artery.

The posterior artery of the ear, the smallest branch of the external carotid is given off higher up than any of the above-mentioned branches. Indeed it does not arise until the trunk has entered the parotid gland. It follows the course of the digastric muscle, ascends behind the external ear, and distributes its branches to the ear and scalp, communicating with the temporal and occipital arteries. It sends off the arteria stylomastoidea, which entering the foramen of that name, supplies the internal ear.

The superficial temporal artery continues its course through the parotid gland; it mounts over the zygomatic arch, and distributes its widely spreading branches over the side of the head.

Branches of the Temporal Artery.

Branches to the parotid gland; one or two small twigs to the front of the ear, called the anterior auricular arteries; a branch to the articulation of the lower jaw; and one or two branches to the masseter muscle. The transverse artery of the face is given off by the temporal, while it is passing through the parotid gland; it emerges from that gland in company with the parotid duct, crosses over the masseter muscle, and advances to the corner of the mouth, communicating with all the arteries of the face. The middle temporal artery, which is to be distinguished from the superficial temporal on the one hand, and the deep-seated temporal on the other, runs under the temporal aponeurosis, and extends as far as the fronto-occipitalis muscle.

After the temporal artery has passed over the zygoma, it divides sooner or later into the anterior and posterior temporal branches; these communicate with each other; the anterior branch communicates also with the frontal and supra-orbital branches of the ophthalmic; the posterior branch communicates with the posterior auricular and occipital arteries.

The internal maxillary artery is much larger than the temporal, and should therefore, if size be adopted as the criterion, be considered as the continuation of the carotid. It passes forwards and downwards between the external pterygoid muscle and the jaw; then following a serpentine course, it arrives at the sphenomaxillary fissure, where it terminates by dividing into three branches.

Branches of the Internal Maxillary Artery.

A small twig entering the tympanum by the fissura Glaseri; another entering the skull at the foramen ovale.

The spinous or middle meningeal artery mounts straight upwards through the spinous hole of the sphenoid bone, and is distributed widely over the dura mater; it causes the deep grooves which impress the inner surface of the parietal bone; it communicates with the posterior meningeal vessels, which come from the vertebral and occipital arteries, and with the anterior ones from the ophthalmic.

The inferior maxillary artery enters the canal of the lower jaw, in company with the nerve of the same name; it sends branches to the teeth and to the substance of the jaws; arriving at the foramen mentale, it divides into two branches; one of these goes forwards to supply the incisor teeth; the other comes out at the foramen mentale, and anastomoses with the artery of the lower lip.

The pterygoid branches are distributed to the pterygoid muscles.

The deep temporal arteries are two in number, and ramify deeply in the temporal muscle.

The artery of the cheek (arteria buccalis) runs along the buccinator muscle, and communicates with the arteries of the face.

The alveolar artery, or artery of the upper jaw, bends round the tubercle of the jaw, and advances towards the face. Its chief branch enters a canal in the upper jaw, and supplies the teeth.

The infra-orbital artery enters and passes through the infra-orbital canal of the superior maxillary bone, and comes out upon the face at the infra-orbital foramen. It is distributed chiefly to the muscles of the face, and communicates with the coronary artery of the upper lip, and its nasal branches; with the transverse artery of the face, and the artery of the cheek.

The superior or descending palatine artery is one of the three branches, into which the internal maxillary divides at the sphenomaxillary fissure; it passes through the pterygo-palatine canal, and comes out at the posterior palatine foramen. After sending a branch backwards to the soft palate, the artery comes forwards under the arch of the teeth. A small branch of it passes by the foramen incisivum into the nose.

The upper pharyngeal artery is sent to the upper and back part of the pharynx.

The nasal artery, which is the continuation of the trunk, goes through the sphenopalatine foramen to the back of the nostrils; there it gives small twigs to the ethmoid and sphenoid cells, and larger branches to the septum and floor of the nostrils and atrium maxillare.

The internal carotid artery pursues a serpentine course along the front of the bodies of the vertebræ, till it arrives at the entrance of the carotid canal. It is connected with the par vagum, and the great sympathetic nerve, and also with the rectus anterior muscle. It follows the course of the canal of the temporal bone, passing first directly upwards, then turning horizontally forwards, and then ascending again in a straight direction, and entering the cavernous sinus. While in this sinus, it passes from the back of the sphenoid bone to the anterior clinoid process, where it suddenly doubles back upon itself, and branches out to the brain.

Branches of the Internal Carotid Artery.

While in the cavernous sinus, it sends off the two arteries of the receptaculum, which are spread upon the neighbouring parts of the dura mater.

Having risen to the anterior clinoid process, it sends off the ophthalmic artery, which enters the orbit with the optic nerve. The artery is situated at first on the outside of the nerve; entering the orbit, it crosses obliquely over the nerve, and arrives at the internal angle of the eye. It sends off the following branches.—The lacrymal artery supplies the lacrymal gland, and sends forward two small branches to the tarsus of the upper and lower eyelid. The posterior ethmoidal artery passes through the posterior orbital hole to the ethmoid cells. The supra-orbital or superior muscular artery passes along the upper part of the orbit, supplies the levator palpebræ, the rectus superior, and rectus internus oculi, quits the orbit at the superciliary foramen, and communicates with the arteries of the scalp. The central artery of the retina plunges into the optic nerve, runs along its axis, and ramifies beautifully on the retina. One of its branches penetrates the vitæ us humor, and is distributed to the crystalline lens. The ciliary arteries do not all come off from the trunk of the ophthalmic, but many are produced

by its branches. They may be divided into three classes.—The posterior or short ciliary arteries surround the optic nerve; they divide into twenty or thirty branches, which perforate the back of the sclerótica, and are distributed to the choroid. The long ciliary arteries are two in number; they perforate the sclerótica at one-third of the distance between the optic nerve and the cornea; arriving at the orbiculus ciliaris, they divide into two branches, which follow the outer circle of the iris, and communicating together, form the zona major of the iris; the branches of this form the zona minor on the inner circumference of the iris. The anterior ciliary arteries penetrate the front of the sclerótica, and contribute to the formation of the zones of the iris. These vessels in the fœtus produce the arteries of the membrana pupillaris. The inferior muscular artery goes to the muscles which are found beneath the globe of the eye; viz. the obliquus minor, the rectus inferior and externus. The anterior ophthalmic artery passes through the anterior orbital hole; and entering the skull, is distributed to the dura mater. The superior and inferior palpebral arteries are destined for the upper and lower eyelids. The trunk, arriving at the inner angle of the eye, splits into two branches: the nasal branch crosses the lacrymal bag, descends along the ala nasi, and communicates with the labial artery. The frontal branch is distributed to the scalp, and communicates with the temporal.

After the carotid has arrived at the anterior clinoid process, it sends off several small branches, some one of which goes to the choroid plexus.

Then it sends off the communicating artery, which meeting and anastomosing with a similar branch of the vertebral, contributes to form the celebrated circle of Willis.

The artery then divides into an anterior and a posterior branch.

The anterior branch, or the artery of the corpus callosum, comes forward in the division between the two anterior lobes of the brain. Here it approaches the artery of the opposite side, and has a short but large communication with it just above the junction of the optic nerves. This communication completes the circle of Willis in front. The rest of the trunk passes first upwards, and then turns backward over the corpus callosum, and between the two hemispheres of the brain.

The posterior branch, or artery of the fissura Sylvii, runs directly outwards, and enters the fissura Sylvii; its branches supply the middle part of the brain chiefly.

Observation. All the arteries of the brain and cerebellum ramify first upon the pia mater, and then enter the cortical substance of the brain. They do not follow the directions of the convolutions. They are composed of thinner coats than other arteries, whence the blood may be seen even through the coats of the larger arteries.

The subclavian artery ascends behind the head of the clavicle and the insertion of the sterno-clidomastoides muscle, towards the scaleni muscles; it passes between the anterior and middle scalenus, and then bends over the first rib into the axilla, where it takes the name of the axillary artery. The outer edge of the scalenus may be considered as the boundary between the subclavian and axillary portions of the vessel.

Branches of the Subclavian Artery.

The internal mammary artery comes off from the front of the subclavian; it passes behind the articulation of the sternum and clavicle, then goes along the middle of the cartilages of the ribs, and terminates on the rectus abdominis by communicating with the epigastric, intercostal, and lumbar arteries. It sends an artery to the thymus; a small branch which accompanies the phrenic nerve; two arteries

to the pericardium; and some small twigs to the anterior mediastinum, and back of the sternum. Other branches come off at the intervals between the cartilages of the ribs, communicate with the intercostal arteries, and then go out to the muscles on the outside of the chest.

The inferior thyroideal artery arises from the upper part of the trunk, where it is covered by the sterno-clidomastoides; it divides almost immediately into four branches.

1. The proper thyroid branch bends in a tortuous manner under the carotid artery, till it arrives at the thyroid gland, to which it is distributed, communicating with the superior thyroideal artery. This branch sends one or two small twigs down along the trachea.
2. The ascending thyroid branch is a small but constant artery, which passes upwards in front of the transverse processes of the cervical vertebræ, and is distributed to the neighbouring muscles and nerves.
3. The transverse artery of the neck goes along the side of the neck, and is distributed to the trapezius and neighbouring muscles of the scapula.
4. The transverse artery of the shoulder (transversalis scapularis, or scapularis superior) passes along the root of the neck towards the scapula, giving off branches to the neighbouring muscles. The trunk passing through the notch in the superior costa of the scapula, takes the name of the supra-scapular artery; it sends off many branches to the supra-spinatus muscle, then descends under the acromion to the lower part of the scapula, where it communicates very largely and freely with the infra-scapular artery.

Observation. Sometimes the transverse artery of the shoulder is a branch of the superficial cervical artery. Sometimes it comes off as a distinct trunk from the axillary artery, and then the name of supra-scapular is applied to the whole of it. In these cases the fourth branch of the thyroideal is small, and only reaches to the surface of the trapezius, deltoid, &c.

The vertebral, which is an artery of great magnitude, arises from the upper part of the subclavian, behind the inferior cervical ganglion of the great sympathetic nerve: it ascends through the foramina of the transverse processes of the cervical vertebræ, entering at the sixth, fifth, or fourth vertebra. In passing from the second to the first vertebra, it makes a great turn; then it again bends backwards along that groove of the atlas which is destined to receive it. Entering the skull at the foramen magnum, it ascends along the basilar process of the occiput, and under the medulla oblongata to meet the artery of the opposite side at an acute angle; by the union of the two trunks the basilar artery is formed. The vertebral artery, as it passes through the transverse processes, gives off some branches to the spinal marrow. While it is passing through the occipital hole, it sends off the posterior meningeal artery, which supplies the dura mater on the occiput, and extends as far as the sphenoid bone. The inferior artery of the cerebellum arises immediately before, or after the union of the vertebrals; it comes off near the origin of the par vagum, and having distributed several branches to the inferior surface of the cerebellum, terminates in the fourth ventricle. The anterior and posterior spinal arteries are usually given off before the union of the vertebrals. They descend along the front and the back part of the medulla spinalis, and keep up their size almost to the bottom of it by means of frequent communications with branches from without. The basilar artery passes along the middle of the tuberculum annulatum to its anterior margin, giving several small branches to its inferior surface. Then it divides into four branches, two for each side of the brain. The superior artery of the cerebellum bends round the crura cerebri, and is distributed to the upper part of the cerebellum; it also gives branches

of the crura cerebri, thalami, tubercula quadrigemina, and pons. The deep-seated artery of the brain is separated from the former branch by the nerve of the third pair. Ascending between the cerebellum and posterior lobe of the cerebrum, it sends off the communicating branch, which meeting and anastomosing with a similar branch of the carotid, completes the circle of Willis. The rest of the artery is distributed to the back of the brain.

The superior intercostal artery goes off from the back of the subclavian, and descends over the heads of the first and second ribs. It gives small twigs to the œsophagus; two branches to the spinal marrow; two others which penetrate to the muscles of the back; and two branches for the first and second intercostal spaces, which communicate with the other intercostal arteries.

These four branches are usually given off before the subclavian passes between the scapula; the two following arise while it is passing, or immediately after it has passed.

The deep-seated cervical artery goes under the muscles of the neck, almost touching the vertebrae. It is entirely distributed to the surrounding muscles, and reaches almost to the occiput.

The superficial cervical artery is hidden under the brachial nerves; its first branches go to those nerves, and to the scapula muscles; the rest of the trunk goes to the muscles behind the neck, as the trapezius, complexus, trapezius, and levator scapulae.

The artery, having left the scapula muscles, recedes from the trunk of the body, and assumes the name of axillary; it bends obliquely downwards over the middle of the first and second ribs, and under the clavicle into the axilla. Emerging from under the clavicle, it is covered by the brachial nerves, by the axillary vein and glands; externally it is protected by the pectoral muscles. It is situated in the axilla, between the serratus anticus and subscapularis muscles; at the lower margin of the tendon of the latissimus dorsi, it changes its name for that of the humeral artery.

Branches of the Axillary Artery.

The first or upper thoracic artery arises near the upper margin of the pectoralis minor muscle, behind which it descends; its branches supply the serratus anticus, pectoral, and some of the intercostal muscles.

The long or second thoracic artery, which is sometimes a branch of the posterior circumflex, or infra-scapular arteries, passes also behind the pectoralis minor, as far as the sixth rib. Its branches go to the axillary glands and mammae, also to the serratus, pectoralis minor, and intercostal muscles.

These two thoracic arteries anastomose with the intercostals, and the internal mammary.

The thoracic artery of the shoulder (arteria thoracica humeralis) comes off near the second rib, and penetrating between the pectoralis major and deltoid, is distributed chiefly to the former muscle, and the neighbouring integuments.

The deep or fourth thoracic branch (arteria thoracica alaris), supplies the axillary glands, the pectoralis minor, and subscapularis.

Observation. The thoracic arteries are subject to considerable variety in number, size, and distribution.

The infra-scapular or subscapular artery, which is a very large trunk, comes off near the neck of the scapula. Its first branches go to the subscapularis, to the capsule of the shoulder joint, and to the muscles, which arise from the coracoid process. A very large muscular branch is distributed to the teres major and minor, the serratus, latissimus dorsi, subscapularis, &c. The principal part of the

trunk turns over the inferior costa of the scapula, and ramifies on the dorsum of the bone, supplying the infra-spinatus, and teres minor, and communicating with the supra-scapular artery.

The posterior circumflex artery goes off between the teres major and subscapularis; it passes backwards between these, and under the long head of the triceps, and is reflected round the head of the humerus, being connected with the deltoid. Its branches go to the deltoid and other muscles about the scapula, and communicate with the profunda humeri.

The anterior circumflex artery is a much more slender branch; it goes under the biceps and coracobrachialis, and terminates on the deltoid.

The brachial or humeral artery leaving the axilla, pursues its course along the middle of the biceps muscle; it passes over the brachialis internus, and advances gradually towards the front of the arm. In this course the large median nerve lies in front of it. Arriving at the bend of the elbow, it goes under that production which the tendon of the biceps sends off to the fascia of the fore-arm, and is lodged deep in the hollow which is left between the two masses of muscles on the fore-arm, where it divides into the radial and ulnar arteries. The median nerve still remains in front of the artery; the cephalic vein is situated considerably on the outside of the artery; and the median vein crosses over it to join the cephalic.

Branches of the Brachial Artery.

Branches of little consequence go to the teres major, latissimus dorsi, triceps, coracobrachialis, biceps, and nerves of the arm.

The larger deep-seated artery of the shoulder (profunda humeri major or collateralis magna) arises high up in the arm, and is frequently given off by the inferior scapular, or posterior circumflex arteries. It bends backwards between the long and the external head of the triceps, giving many large branches to that muscle, and comes out at the back of the arm, where it divides into two branches; these communicate at the back of the elbow with the radial and ulnar recurrents.

The nutrient artery of the humerus comes off near the insertion of the coracobrachialis, and having distributed branches to the neighbouring muscles, enters the substance of the bone.

The smaller deep-seated branch, or branches, go to the outside of the brachialis internus, supinator radii longus, extensores carpi radiales, &c. and communicate with the recurrents of the fore-arm.

The great anastomosing branch (ramus anastomoticus magnus) comes off from the inside of the trunk, within a short distance of the joint, and proceeds towards the inner condyle; its branches communicate above with the profunda, below with the recurrents.

The two last-mentioned branches, with one or two more which descend along the triceps to communicate with the arteries of the fore-arm, are sometimes described under the name of collaterales minores.

The radial artery, which is smaller than the ulnar, seems to be given off as a branch from the ulnar; it passes along the surface of the pronator teres, and then goes on the inside of the supinator longus to the wrist. It bends under the extensor tendons of the thumb, and penetrates the abductor indicis to arrive in the palm of the hand. Here it passes along the heads of the metacarpal bones, and having formed the arcus profundus volæ, communicates on the opposite side of the hand with a large branch of the ulnar.

Branches of the Radial Artery.

The recurrent branch of the radial artery is reflected towards the outer condyle, between the brachialis internus, and the radial extensors of the carpus; there it has numerous communications with the collateral arteries of the arm.

The superficial artery of the palm of the hand is given off just as the trunk begins to turn over the radius; it goes over the abductor pollicis, or through its fibres, to communicate with the ulnar, and thereby complete the superficial arch. This branch varies much in size; sometimes it is very small, and does not reach to the ulnar artery; sometimes it is so large, as to give off the branch to the outside of the thumb; or even to both sides of the thumb.

At the back of the hand, the radial gives off an artery or two to the back of the thumb, another to the back of the fore-finger, and a third to the back of the carpus (*dorsalis carpi*), which communicates with the interossea, and sends small branches between the metacarpal bones.

After the radial artery has entered the palm of the hand, it sends off the great artery of the thumb, which runs along the side of the first phalanx of the thumb, and then divides into three branches. Two of these are for the two sides of the thumb, and the third for the radial side of the fore-finger. The branches of the deep-seated arch are small, and supply the interossei muscles, and come out at the back of the wrist and hand.

The ulnar artery goes under the pronator teres, flexor carpi radialis, flexor digitorum sublimis, and palmaris longus, and passes within the edge of the flexor carpi ulnaris to the wrist. There it is situated just within the pisiform bone, bends across the palm of the hand, over the flexor tendons, so as to form the superficial arch of the palm of the hand, which is situated under the palmar fascia, and opposite to the middle of the metacarpal bones. It terminates at the opposite side of the palm by communicating with the superficial branch of the radial artery.

Branches of the Ulnar Artery.

The recurrent branch of the ulnar goes under the flexor muscles to the back of the internal condyle, where it communicates freely with the collateral arteries of the arm.

The interosseous artery comes off very soon from the ulnar: it immediately sends a large branch through the interosseous ligament to the back of the fore-arm; this branch gives off the interosseous recurrent, and then passes down the fore-arm to the wrist, supplying the extensor muscles. The trunk of the interosseous artery descends along the ligament to the pronator quadratus; there it perforates the interosseous ligament, and communicates with the other branch of the interosseous artery and with the dorsal branches of the radial and ulnar arteries.

An artery to the back of the hand (*dorsalis manus*), communicates with the interosseous arteries.

The deep palmar branch goes off just below the pisiform bone; it dips under the flexor tendons, and communicating with the radial artery, completes the deep palmar arch.

The convex part of the superficial arch then produces three large digital arteries, which, passing between the metacarpal bones, and arriving at the root of the fingers, divide each into two branches, which go along the side of the fingers to their very apex, where they communicate.

Observation. The arteries of the fore-arm are subject to great varieties. The brachial sometimes divides long before it arrives at the elbow, even as high as the axilla, in some subjects. Then the course of these arteries is natural in other respects. Sometimes, however, where this high division takes place, the ulnar artery, instead of going under the

muscles, which have been mentioned, goes over them and just under the skin. Sometimes the radial, ulnar, and interosseous arteries proceed straight into the palm of the hand, and are distributed to the fingers without forming any arches at all.

The aorta having formed its arch, passes gradually behind the lungs to the left side of the bodies of the vertebræ. It descends in a straight course along the back of the posterior mediastinum until it arrives at, and passes through, the crura of the diaphragm; this portion of the vessel is termed the thoracic aorta.

Branches of the Thoracic Aorta.

The common bronchial artery comes off high up from the front of the aorta; it divides into two branches, one for either lung.

The right and left bronchial arteries arise lower down; and often there is a fourth or inferior bronchial artery.

These arteries are destined for the nourishment of the substance of the lungs: they supply also the bronchial glands, and the roots of the great vessels, which come off from the heart. They are remarkable on account of their communications with the pulmonary artery.

The œsophageal arteries are about five or six in number; they run upon the surface of the œsophagus, and communicate below with the coronary artery of the stomach.

The lower intercostal arteries are nine or ten in number, according to the number of ribs, which are unsupplied by the intercostal branch of the subclavian artery. They arise from the back of the aorta, and follow the course of the lower or grooved edge of the ribs. The upper ones are the smallest, and ascend somewhat; the lower ones are nearly transverse in their course. The arteries of the right side are longer, as they have to pass over the bodies of the vertebræ. They all give off: 1. a branch which enters into the spinal marrow as the nerves pass out: 2. a larger branch, which goes to the muscles at the back of the spine: 3. an upper branch which coming off at the angle of the rib goes along the upper edge of the rib below. The continuation of the trunk communicates with the mammary and thoracic arteries above; with the epigastric and lumbar arteries below.

The aorta, having passed through the crura of the diaphragm, takes the name of the abdominal aorta. It is still situated on the left side of the bodies of the vertebræ; it is separated from the vena cava by the left lobe of the liver and the crus of the diaphragm. It approaches gradually to the middle of the vertebræ, and gets in company with the vena cava, a little above the kidneys. At the last lumbar vertebra, or at the interspace between the fourth and fifth, it divides into the two common iliac arteries.

Branches of the Abdominal Aorta.

The right and left phrenic arteries are the first branches of the abdominal aorta; sometimes they arise from the celiac artery; sometimes a single trunk, either from the aorta or from the celiac, produces both the right and left phrenic arteries: they cross over the crura of the diaphragm, and then bend round the central tendon, sending off branches to the flesh of the diaphragm in all directions: they give branches to the renal capsule and fat of the kidney.

The celiac is a large short trunk, coming off from the front of the aorta, while it is still between the crura of the diaphragm. It is surrounded by the lesser arch of the stomach; beneath it is the pancreas, and on the left side the lobulus Spigelii. After a course of a few lines, it divides into three branches; the coronary artery of the stomach, the hepatic, and the splenic arteries.

The coronary artery of the stomach is the central branch of the celiac; it mounts upwards towards the œsophagus, sends

sends a large branch to the great extremity of the stomach, and then returns along the lesser arch: its branches are distributed over both surfaces of the stomach, and it communicates in the neighbourhood of the pylorus, with the superior pyloric branch of the hepatic: sometimes the coronary artery is a very much larger than usual; then its trunk passes from the oesophagus to the left lobe of the liver.

The hepatic or right branch of the celiac comes off behind the pyloric extremity of the stomach; it ascends towards the right, is contained in the left side of Glisson's capsule, and divides under the neck of the gall-bladder into the right and left hepatic arteries, which are distributed to the right and left lobes of the liver; where the coronary stomachic artery is contained to the liver, the hepatic artery only supplies the right lobe. The hepatic artery gives off the following branches. 1. The duodeno-gastric artery, which passes behind the duodenum, gives branches to the pylorus (pylorica inferior, duodenum (duodenales superior), and pancreas (pancreatica transversa): it is contained under the name of the right gastric, or gastro-epiploic artery, along the greater curvature of the stomach; it gives branches 1. to both surfaces of the stomach, and communicates by the termination of its trunk with the left gastric artery. 2. The superior pyloric artery is reflected towards the lesser arch of the stomach, and communicates with the coronary stomachic. 3. The cystic, which is generally a branch of the right hepatic, goes along the left side of the gall-bladder, which it supplies.

The splenic artery is the largest branch of the celiac, in the adult. It pursues a tortuous course along the upper edge of the pancreas, then divides into six or eight branches, which enter the notch of the spleen. As the splenic artery passes along the pancreas, it sends off many short branches to the substance of that gland; also the posterior gastric arteries to the back of the great extremity of the stomach. The artery sends off, after its division, the vasa brevia, which are three or four branches to the great extremity of the stomach, and the left gastro-epiploic artery, which runs along the greater curvature of the stomach, and communicates with the right artery of the same name.

Observation. Both the gastro-epiploic arteries send many small branches to the omentum.

The superior mesenteric artery is the largest branch of the abdominal aorta, and arises a few lines below the celiac: here it is situated between the pancreas, and the last turn of the duodenum, to both of which it gives branches; then it descends over the duodenum, and is received between the two layers of the mesentery: it bends from the left side of the spine towards the right groin, making a large arch, convex towards the left. From the left or convex side of this arch, are sent off from twelve to twenty arteries, each of which soon after divides into two branches. These communicating with each other form arches, from the convexity of which other branches come off, which divide and recommunicate in a similar manner. This is repeated a third, and when the branches are long, a fourth, and even a fifth time, until the last branches go straight to the intestines, divide and surround them. From the opposite or concave side of the artery are sent off two branches. 1. The middle colic artery passes along the mesocolon to supply the ascending and transverse parts of the colon: the left branch of this has a very large communication with the left colic artery; the right branch communicates with the ileocolic artery. 2. The ileocolic artery goes to the junction of the ileum with the caecum. It sends an ascending branch to communicate with the middle colic artery; and a descending branch, which communicates with the termination of the superior mesenteric trunk.

The renal or emulgent artery arises from the side of the aorta, between the superior and inferior mesenteric arteries. The left renal artery passes over the vein near the kidney; the right renal artery goes under the vena cava, and is covered by its corresponding vein. The artery divides into three or four branches, which enter at the notch of the kidney. The renal artery gives branches to the renal capsules to the fat of the kidney, and ureter.

The spermatic artery is a long slender vessel, arising from the front of the aorta. On the left side it frequently comes from the renal artery; it pursues a tortuous course, and gets into company with its vein upon the psoas muscle. In men, it goes through the abdominal ring at the back of the chord, and supplies the testes. It sends off branches to the fat of the kidney, and to the ureter.

The spermatic artery of females passes along the ligament of the uterus to the ovary. Its posterior branches supply the ovary; its anterior ones pass on with the Fallopian tube to the uterus, where it communicates with the uterine arteries.

The inferior mesenteric artery comes off low down from the left side of the aorta. It descends a little on the left side of the two bodies of the vertebrae, and sends off the left colic artery. This supplies the descending colon, and by communicating with the middle colic artery, forms the famous mesenteric arch. The continuation of the trunk under the name of the internal hemorrhoidal artery goes along the back of the rectum; its branches reach almost to the extremity of that intestine, and communicate with the middle and external hemorrhoidal arteries.

As the arteries of the renal capsule vary much in size and number, they may be divided into three classes: the upper capsular arteries are branches of the phrenic; the middle ones generally arise from the side of the aorta, between the celiac and mesenteric arteries; the lower ones are from the renal arteries.

The adipous arteries are those which supply the renal fat; they arise above from the capsular arteries; below from the renal and spermatic arteries, and from the aorta.

The ureteric are also derived from various sources: the upper ones are from the renal and spermatic arteries; the middle from the aorta or common iliac artery; and the lower ones from one of the vesical arteries.

The lumbar arteries are five in number, arising from the back of the aorta, at the intervals of the vertebrae, as the intercostal arteries do in the chest. They supply the muscles in the circumference of the body; they give branches to the spinal marrow, and others which penetrate to the muscles of the back; the last lumbar artery communicates with the ileolumbar artery.

The common iliac artery of the right side passes over the lower part of the vena cava; on the left side, it is situated exteriorly with respect to its vein: it passes obliquely downwards and outwards, and divides over the sacro-iliac symphysis into the internal iliac, or hypogastric, and the external iliac arteries.

The middle sacral artery usually arises from the point of bifurcation of the aorta; it descends along the middle of the sacrum to the coccyx, and communicates on both sides with the lateral sacral arteries.

The internal iliac artery descends immediately into the pelvis. In the adult it is of the same size as the external artery, but in the fetus it is four or five times larger; and after having descended into the pelvis, becomes attached to the side of the bladder, and rises again to reach the umbilicus, under the name of the hypogastric artery. At this period, the arteries of the pelvis are small branches
coming

coming from the lower or convex part of the hypogastric. Where the artery approaches the bladder in the adult, it is converted into a fibrous substance, which still remains pervious to a certain extent.

Branches of the Internal Iliac Artery.

The ileolumbar artery ascends between the psoas magnus and iliacus internus, towards the crista of the ilium. Its branches are distributed to the neighbouring muscles, and communicate with the last lumbar artery.

The lateral sacral arteries vary in number from one to three, four, or even five. They descend on the side of the sacrum, communicate with the middle sacral artery, and send branches through the sacral holes to the cauda equina.

The vesical arteries are three or four in number, arising from that part of the hypogastric which still remains pervious, as it approaches the bladder. One or more of these, which goes to the bottom of the bladder, and gives branches to the vesiculae raminales, prostate, &c. in men, to the rectum and vagina in women, is distinguished by the name of the lower vesical artery.

The middle hemorrhoidal artery comes off between the pudendal and gluteal branches, passes along the front of the rectum, and communicates with the external arteries. It sends branches to the bottom of the bladder, &c. in men; and a large one (which sometimes comes off distinctly from the internal iliac) to the vagina in women.

The uterine artery comes off near the former; it sends a branch down to the vagina, then ascends along the side of the uterus, on which it communicates with the spermatic artery.

The obturator artery, which frequently arises from the epigastric, passes along the side of the pelvis, at the upper edge of the obturator internus, accompanied by the nerve and vein of the same name, and goes through the passage which is left for it at the upper part of the thyroid hole. Having quitted the pelvis, it divides into an external and an internal branch, which are distributed to the obturator muscles, to the capsule of the hip, and to the origin of the triceps. They communicate with the internal circumflex branch of the profunda femoris.

The gluteal or posterior iliac artery is the largest branch of the internal iliac. It arises from the back part of the trunk, bends downwards and backwards, and quits the pelvis at the upper margin of the pyriformis muscle. It sends a large branch between the gluteus maximus and medius. Another branch, more deeply seated, goes under the gluteus medius, and sends an artery close to the dorsum of the ilium at the origin of the gluteus minimus.

The ischiatic artery goes out of the pelvis at the lower margin of the pyriformis muscle, together with the great ischiatic nerve: it is here covered by the gluteus maximus, and descends towards the thigh: it sends off a coccygeal branch, which turns back between the sacro-ischiatic ligaments towards the coccyx. The other branches of this artery are distributed to the gluteus maximus, and other muscles at the back of the thigh, and are remarkable on account of their numerous communications with the circumflex branches of the profunda.

The pudendal artery goes out of the pelvis, in company with the ischiatic: it is smaller, and situated further from the sacrum: it merely passes over the great sacro-ischiatic ligament, and enters the pelvis again at the smaller sacro-ischiatic hole. Then it goes along the inside of the iliac crista and ramus of the ischium. It sometimes sends off small branches before it quits the pelvis to the rectum, prostate, &c. While it is passing over the sacro-ischiatic ligament, and the tuberosity of the ischium, it gives off branches

which communicate with the circumflex arteries. Also the external hemorrhoidal arteries to the fat of the perineum, sphincter ani, &c. which communicate with the middle and internal hemorrhoidal arteries. At the ramus of the ischium the artery divides into, 1. The perinaal artery, which ascends between the accelerator urinæ and erector muscles, and supplies the muscles, skin, and fat of the perineum. 2. The artery of the penis, which is the continuation of the trunk. At the symphysis of the pubis it divides into, 1. The dorsal artery of the penis, which runs along the back of that organ as far as the glans, the root of which it encircles. 2. The deep-seated artery of the penis, which enters the corpus cavernosum of its own side, into the cells of which it opens, and gives branches to the spongy substance of the urethra. The vessel, which is analogous to the artery of the penis of males, is termed the clitoridea in females. Its distribution to the clitoris is the same as that of the above-mentioned artery is to the penis.

Observation. The branches of the internal iliac artery are constant in their destination, but vary much in the order and manner of their origin.

The external iliac artery passes along the inner edge of the psoas muscle, being situated on the outside of its vein. It is surrounded by the lymphatic vessels, which come up from the lower extremity, and by the glands, through which they pass. It descends under Poupart's ligament, still keeping to the inner edge of the psoas muscle, and there it takes the name of the femoral artery. Here the vein lies close on the inside of it, and the anterior crural nerve is situated on the outside, but at some distance from the artery.

Branches of the External Iliac Artery.

The epigastric artery arises from the inner side of the trunk, near Poupart's ligament: frequently indeed its origin is absolutely below the ligament. It is reflected upwards and inwards behind the spermatic chord; then crossing the upper part of the abdominal ring, it gets behind the rectus muscle, and ascends to the navel. The epigastric artery generally sends a pretty large branch down the spermatic chord, which communicates with the spermatic artery. The other branches of this artery are merely muscular ones: the trunk communicates at the upper part of the rectus abdominis with the internal mammary artery.

The circumflex artery of the ilium arises opposite to the epigastric; it turns back, and runs along the crista ilii, between the attachments of the obliquus internus and transversalis abdominis muscles, as far as the back of the bone, where it communicates with the lumbar and ileolumbar arteries. Its branches are distributed to the neighbouring muscles.

The femoral artery is surrounded below Poupart's ligament by the inguinal glands, and much fat. After a course of an inch and a half or two inches, it divides into two branches of nearly equal magnitude. The branch which continues in the direction of the trunk retains the name of the femoral artery; while the other, which descends among the muscles of the thigh, is named the deep-seated artery of the thigh (arteria profunda femoris). The common trunk sends off some trivial branches to the integuments, lymphatic glands, and neighbouring muscles; two or three larger branches supply the skin and fat of the pudend.

The profunda comes off from the back of the femoral artery: it passes backwards, and descends for a short space, then gets between the heads of the triceps muscle, and sends its branches through that muscle.

Branches of the Profunda.

The external circumflex artery, which is the first branch of the profunda, goes under the latissimus and rectus

cles, towards the root of the great trochanter. It sends off in its course numerous branches to the muscles along which it passes. Some of its branches communicate with the internal circumflex and perforating arteries at the back of the thigh. A large branch descends along the inside of the vastus internus to the knee, and communicates with the superior articular, and with the great anastomotic branches.

The internal circumflex artery comes from the opposite part of the trunk. It goes backward to the trochanter minor, and turning round the bone, appears between the quadratus femoris and triceps muscles. Its branches are distributed to the muscles on all sides; they communicate with the obturator, ischiatic, and gluteal arteries.

The two perforating branches of the profunda (the second is the continuation of the trunk) pierce the triceps muscle, to which they give branches, and are distributed to the flexors of the leg. They communicate above with the circumflex arteries, and below with the articular arteries. The inferior perforating branch gives off the great nutritious artery of the thigh-bone.

The femoral artery passes from the front of the thigh gradually towards the inside. It is at first covered by the lymphatic glands, then it goes under the sartorius muscle, and arrives at the tendon of the triceps, through which it penetrates into the ham, and takes the name of the popliteal artery. During this course, the femoral artery sends off small branches to the glands, to the sartorius, rectus, and other muscles. The great anastomosing branch comes off as the trunk enters the tendon of the triceps muscle; it plunges into the substance of the vastus internus, from which it emerges at the knee to communicate with the articular arteries, and also with the descending branch of the external circumflex. Two branches go through the tendon of the triceps to the muscles at the back of the thigh; they are called by Murray the superior and inferior perforating branches of the femoral. They communicate with the perforating branches of the profunda.

The popliteal artery passes from the tendon of the triceps through the middle of that space which is termed the ham, and arrives at the upper extremity of the soleus muscle, where it divides into the anterior and posterior tibial arteries. In this course it lies between the flexor muscles, and almost close to the bone. It descends between the condyles of the thigh-bone and the heads of the gastrocnemius, in contact with the capsule of the knee. It gives off small muscular branches to the flexor muscles, and other larger ones to the gastrocnemius and soleus. The articular branches of the popliteal are five in number: three of them come off above the joint, and are therefore called the superior articular arteries, the middle of these three is distributed to the back of the capsule; the other two bend round the former just above the external and internal condyles. The inferior articular arteries are two in number, one for the inside, the other for the outside of the joint. The four last-mentioned branches arrive in front of the knee, where they form a vascular net-work by their numerous communications with each other, and with the recurrent branch of the anterior tibial, the anastomotic branch of the femoral, and the descending branch of the external circumflex.

The anterior tibial artery comes off at the lower margin of the popliteus muscle, and immediately penetrates the interosseous ligament. It descends in the front of this ligament between the tibialis anticus and the extensor pollicis longus, becoming more and more superficial as it approaches the ankle. It passes under the transverse ligament of the ankle in company with the extensor tendons, then goes between the extensor pollicis longus and the extensor digi-

torum pedis longus to the root of the first metatarsal bone, where it plunges into the sole of the foot, and terminates by a large communication with the external plantar artery.

Branches of the Anterior Tibial Artery.

The recurrent branch is given off immediately after the trunk has passed through the interosseous ligament. It goes through the tibialis anticus muscle to the front of the knees, where it communicates with the articular arteries.

Small muscular branches arise throughout the whole course of the artery along the leg.

The external and internal malleolar arteries supply the ankle joint and neighbouring part of the tarsus. The external malleolar artery communicates with both the anterior and posterior branches of the peroneal artery. The tarsal artery goes under the extensor digitorum brevis along the second phalanx of tarsal bones. It gives small branches to the ankle-joint, extensor brevis, &c. It also sends off three arteries, which run along the intervals of the metatarsal bones to the roots of the toes, where they join the digital arteries at the point of bifurcation.

The metatarsal artery runs along the heads of the metatarsal bones, and varies in size according to the magnitude of the tarsal artery. Sometimes it is large, and produces all the branches which have been described as coming from the tarsal artery.

The artery of the back of the great toe comes off just before the anterior tibial descends into the sole of the foot; it runs between the first and second metatarsal bones, and is distributed to the back of the great toe and of the second toe.

The posterior tibial artery is situated under the soleus muscle, and between the flexor communis digitorum and the tibialis posticus. It descends to the lower extremity of the tibia in this situation; then becoming more superficial, it bends behind the inner ankle, and enters the sole of the foot between the abductor pollicis pedis and the concave surface of the os calcis; here it divides into the external and internal plantar arteries.

Branches of the Posterior Tibial Artery.

Large muscular branches to the soleus.

The nutritious artery of the tibia.

The peroneal or fibular artery, which varies much in size, descends between the tibialis posticus and flexor longus pollicis, giving branches to those muscles in its passage to the bottom of the leg, where it divides into an anterior and a posterior branch. The posterior branch descends in the direction of the trunk to the outside of the os calcis, where it communicates with the external plantar and external malleolar arteries. The anterior branch comes through the lower part of the interosseous ligament, and advancing to the ankle, communicates with the external malleolar artery.

Branches throughout the course of this artery to the neighbouring muscles.

Two large branches to the bottom of the os calcis.

The external plantar artery is the largest branch of the posterior tibial; it runs along the inside of the abductor minimi digiti till it reaches the fifth metatarsal bone; there it bends inwards to the first metatarsal bone, where it anastomoses with the tibialis anticus, and forms the plantar arch. This artery sends off many branches to the adjacent muscles, and to the bones of the tarsus. The convexity of the arch gives off four arteries, which pass between the metatarsal bones to the roots of the toes, where each of them divides into two; these are distributed along the sides of the toes. The arch also sends off three or four branches, which penetrate to the back of the foot.

The internal plantar artery keeps along the inside of the foot in the direction of the abductor pollicis; it terminates

by

by communicating with those branches of the external plantar which supply the great toe.

ARTERY, *wounded*. See ANEURISM.

ARTHA, in *Geography*, a river of South Wales, which runs into the sea about ten miles south of Aberystwith in Cardiganshire.

ARTHEDON, in *Ancient Geography*, an island of Asia Minor, upon the borders of the Troade. Pliny.

ARTHEL, something cast into a court, in Wales, or its marches; whereby the court is letted or discontinued for the time. The casting of arthel is prohibited by 26 Hen. VIII. cap. 6.

Arthel is a British word, more correctly written *Arddelw*, or *Ardbel*, and signifies *to avouch*; as if a man were taken with stolen goods in his hand, he was to be allowed a lawful *arthel*, or voucher, to clear him of the felony. This was part of the law of Howel Dha, according to whose laws, every tenant, holding of any other than the prince, or the lord of the fee, paid a fine "pro defensione regiâ," which was called *arian ardbel*.

ARTHEMIS, in *Zoology*, a genera of worms in the *Mollusca* tribe established by Poli in his work on the shells of the two Sicilies. See VERMES.

ARTHES, in *Geography*, a town of France, in the department of the lower Pyrenées, and chief place of a canton in the district of Orthes, five leagues north-west of Pau.

ARTHRITICA, in the *Materia Medica*, medicines suited to cure the diseases of the joints, particularly the gout; but the term is so vague and of so indeterminate a meaning as to be altogether improper.

ARTHRITIS, formed from *αρθρον*, *articulus*, *joint*, in *Medicine*, a disease better known under the name of the GOUT.

ARTHROCECE, in *Surgery*, is a disease of the joints, or the extremities of bones, more commonly named SPINA VENTOSA, which see. When this disorder affects children, it is called POEDARTHROCECE. We do not recollect any author to have distinctly treated of this complaint before Rhazes the Arabian physician, who has entered at large into the consideration of diseased joints.

ARTHRODIA, formed from *αρθρον*, *articulus*, and *δισυμμασι*, *recipio*, I receive, in *Anatomy*, a species of articulation, admitting of a very small degree of motion; as each bone composing the joint must have nearly a plain surface. Such is the articulation of the humerus with the scapula. See ARTICULATION.

ARTHRODYNIA, in *Surgery*, is a chronic rheumatic affection of the joints. This name was first imposed by Dr. Cullen, in his Synopsis Nosologiæ Methodicæ. See RHEUMATISM and WHITE SWELLING.

ARTHROPUOSIS, is a suppuration of the joints, or at least a strong tendency to form pus. In this case there is a deep-seated inflammation, obtusely painful, sometimes throbbing, and accompanied with febrile symptoms. The treatment is described under the articles, ABSCESS, SPINA VENTOSA, WHITE SWELLING, INFLAMMATION, and RHEUMATISM.

ARTHROSIS, formed from *αρθρον*, *articulus*, in *Anatomy*, a juncture of two bones designed for motion; called also articulation.

ARTHUR, in *Biography* and *History*, the most remarkable name among the Britons. As a hero and a consummate warrior, he appears illustrious in our history; but as a being of romance, his splendor has dazzled the world. It has been generally inferred that the great achievements of this hero created those illusory actions and scenes depicted in the Mabinogion, or Juvenile Tales; and some

authors, with such phantoms playing before their eyes, have denied existence to such a person altogether. But that there was a prince of this name, who often led the Britons successfully to battle against the Saxons, in the commencement of the sixth century, there ought not to be any doubts; for he is mentioned by cotemporary writers, whose works are still extant; namely, Llywarc, Merzin, and Taliessin; and he is likewise often recorded in the Triads, which are documents worthy of credit; but neither by these poets, nor in the Triads, is he in any respect exalted to that rank in which the world now beholds his name, or extolled above other princes who held similar stations in the country.

About the year 516, or 517, Arthur was elected by the states of Britain to exercise sovereign authority, as other princes had been chosen, in dangerous times; and he obtained that pre-eminence in consequence of his superior abilities and bravery; being until that time only a chieftain of the Silurian Britons. He continued to present a successful opposition to the increasing power of the Saxons, until a fatal dissension broke out between him and Medrod; a radical evil among the Britons, in consequence of their being divided into many small states; and which, about the year 540, kindled into a civil war; and Medrod joined his power with the Saxons, which ultimately produced the battle of Camlan, equally fatal to the leaders on both sides, and which brought disastrous ruin on the Britons.

Such was the career of Arthur, as exhibited by the bards and the Triads. The hero under the same name in the dramatic tales called Mabinogion, is totally of different features, and in fact is a distinct personage altogether. The last is then a mythological character of times so remote as to be far beyond the scope of history: his attributes in the dramatic tales before mentioned point him out as such. Memorials of this being, and of several others connected with him, have been traditionally preserved in various and very distant parts of the world; and if we mistake not, their memorials are written in the heavens, and some of the constellations bear their names. Arthur is the Great Bear, as the epithet literally implies: and perhaps this constellation being situated so near the north pole, and visibly describing a circle in a small space of the heavens, is the true origin of the famous round table.

By confounding the Arthur of history with that of mythology, the chroniclers of the middle ages have committed a monstrous anachronism; and thus have blended the real feats of the former with the allegorical attributes of the other; and this confusion is still increased by all the succeeding writers of romance.

There are some very extraordinary things related concerning the mythological Arthur, in the Mabinogion, and particularly in the story of the pursuit of Olwen: therein we recognise the Indian Menu, exactly by name, and with similar attributes, acting as one of the agents of Arthur, to recover Olwen, the representative of the fecundity of nature.

To the above rational and credible account, for which the editor is indebted to an ingenious writer, it may not be improper to subjoin, for the gratification of the curious reader, some other particulars, transmitted by Geoffrey of Monmouth, and other historians, of more doubtful authenticity.

From them we learn, that Arthur was the son of Uther, the pendragon or dictator of the Britons, by an adulterous connection with Igera, wife of Gorlois duke of Cornwall, favoured by the aid of Merlin's magical skill. Upon the death of Uther, in 516, Arthur, at the age of 15, or ac-

According to Buchanan, 18, years, ascended the throne. With a competent army, which his extraordinary fame enabled him speedily to raise, he routed Colgrin, the Saxon duke, and all his forces, consisting of Angles, Scots, and Picts, who were committing horrid devastations in Britain. Having pursued him to York, he was obliged, in consequence of the succour afforded to Colgrin by Cordie, king of the Saxons, to raise the siege and to march to London. Assisted by a supply of troops, furnished by his nephew, Hoel, king of Armorica or Brittany, he marched to Lincoln, which was besieged by the Saxons, whom he defeated; and he then compelled the survivors to surrender, on condition of being allowed to leave the kingdom. These men, after having embarked, repented, and relanded on the western coast; and proceeding to lay siege to Badon, or Bath, Arthur was obliged to decline his intended pursuit of the Scots and Picts, and to make forced marches for the relief of the city. After a very obstinate and severe engagement, which lasted two days, Arthur, having performed extraordinary feats of valour, took their camp, and slew Colgrin, and another of the principal leaders. He then bravely returned to relieve his nephew Hoel, who was invested by the Scots and Picts at Dumbritton in Scotland. Having succeeded in this enterprise, he directed his course to York; where he is said to have established the Christian worship on the ruins of the Pagan, and to have married a lady called Guanhumara, who, under the name of Guenever, became the subject of various metrical romances. Fabulous history reports, that he invaded and subdued Ireland, Iceland, Gothland, and the Orkneys; and having finished these exploits, governed his kingdom for 12 years with undisturbed tranquillity, and very extraordinary splendour. At this time he instituted his famous order of knights of the round table. Having also, as fable relates, conquered Norway and Denmark, invaded France, and taken Paris, and in nine years made himself master of the whole kingdom, the provinces of which he distributed among his domestics, he returned, and held a grand assembly of his tributary kings and nobles at Caerleon in Monmouthshire, where he was solemnly crowned. Whilst he was afterwards pursuing his conquests, and marching for Rome, his nephew, Modred, who in his absence had prevailed on his queen, Guanhumara, to marry him, set up the standard of revolt, and called in to his assistance the Saxons and other barbarians. Arthur hastily returned, and three battles were fought between him and Modred; in the last of which, Arthur, though victorious, received so many wounds, that, retiring to the isle of Avalon, he died, A.D. 542, and was buried in that place. "Every nation," says Gibbon (Hist. vol. vi. p. 392.), "embraced and adorned the popular romance of Arthur and the knights of the round table; their names were celebrated in Greece and Italy."—"At length the light of science and reason was rekindled; the talisman was broken; the visionary fabric melted into air; and by a natural, though unjust reverse of the public opinion, the severity of the present age is inclined to question the *existence* of Arthur." Mr. Whitaker (Hist. Manchester, vol. ii. p. 31—71.) has framed an interesting, and even probable narrative of the wars of Arthur: though it is impossible to allow the reality of the round table. He supposes him to have been the *Arb-ar*, great man, or sovereign of the Silures, and to have fought under the auspices of Ambrosius, the peadrigon of the Britons, who sent him to the relief of the northern Britons, oppressed by the Saxons. After great success in those parts, he fought his twelfth battle in the south of England, after he was elected to the pendragonship, against Cordie the Saxon. Mr. W. believes in

the reality of his institution of a military order, the origin of all others of a like kind on the continent of Europe. He speaks in high terms of the glories of his reign, at length fatally terminated by the civil wars, which put an end to the hero's life. Biog. Brit.

ARARUR KENT, or *Ararur Bay*, in *Geography*, lies on the coast of New Jersey, in America, and is formed by the union of Passaic and Hackinback rivers.

ARTIACA, in *Ancient Geography*, a town of Gaul, in the road from Milan to Gessioracum, by the Cottian Alps.

ARTICENA, a country of Asia, which made part of the kingdom of Parthia. Ptolemy.

ARTICHOKE, in *Botany*. See CYNARA.

ARTICHOKE, *Frutulum*. See HELIANTHUS.

ARTICLE, *ARTICULUS*, a little part or division of a book, writing, or the like.

ARTICLE is also applied to the several clauses or conditions of a contract, treaty of peace, or the like.

In this sense we say, articles of marriage, articles of capitulation, preliminary articles, &c.

ARTICLES of the clergy, *ARTICULI cleri*, are certain statutes touching persons and causes ecclesiastical, made under Edward II. and III.

The statute made in the reign of Edw. II. A. D. 1316. was made for terminating the disputes between the temporal and spiritual courts, about the limits of their respective jurisdiction. As this statute was procured by the clergy at a time when their assistance was much needed, it was very favourable to their shameful and exorbitant claims of exemption from civil authority. By the last chapter it is granted, that when clerks confess before temporal judges their heinous offences, as theft, robbery, and murder, they cannot be judged or condemned by those temporal judges upon their own confession, without violating the privilege of the church; and that the privilege of the church being demanded in due form by the ordinary, shall not be denied. This statute was actually pleaded, and admitted in favour of a bishop of Hereford, A. D. 1324, under accusation of high treason. The statute *de clero*, 25 Edw. III. ch. 3. c. 4. provided, that clerks convicted for treasons or felonies touching other persons than the king himself, or his royal majesty, should have the privilege of holy church.

ARTICLE of faith is by some defined a point of Christian doctrine, which we are obliged to believe, as having been revealed by God himself, and allowed and established as such by the church.

The thirty-nine articles of the church of England were founded, for the most part, upon a body of articles compiled and published in the reign of Edward VI.

The articles of king Edward were 42 in number, and framed by archbishop Cranmer and bishop Ridley; and after having been submitted to the correction and amendment of the other bishops and learned divines, they were reviewed by the archbishop, and then presented to the council, where they received the royal sanction. These articles, though not brought into parliament, nor agreed upon in convocation, as the title seems to express, and as they ought to have been, were announced as "Articles agreed upon by the bishops, and other learned men in the convocation held at London, in the year 1552, for the avoiding diversity of opinion, and establishing consent touching true religion." In the reign of queen Elizabeth, they were reviewed by the convocation, and the 42 articles were reduced to the present 39; the following articles were omitted: viz. Art. 39. "The resurrection of the dead is not passed already." Art. 40. "The souls of men deceased do neither perish with their bodies, nor sleep idly." Art. 41. "Of the Millen-

Millenarians." Art. 42. "All men not to be saved at last." Some of the other articles underwent a new division, two being joined into one, and in other parts one is divided into two; but without any remarkable variation of doctrine. It has been a subject of dispute, whether the first clause of the 20th article, viz. "The church has power to decree rites and ceremonies, and authority in controversies of faith," was a part of the article which passed the synod and was afterwards confirmed by parliament in 1571. It is certain it did not make a part of king Edward's articles, nor is it in the original MS. of the articles subscribed by both houses of convocation with their own hands, and preserved in Bennet college library. The dispute, however, is of little consequence to the present subscribers, as this clause made a part of the article confirmed by parliament in 1562. These articles, having passed the convocation, Jan. 31, 1562, were subscribed immediately by most of the members of both houses of convocation; but they did not pass into a law, and became a part of the establishment, till nine years after this time. In the year 1571, an act was passed, confirming all the doctrinal articles agreed upon in the synod of 1562; and enjoining subscription on all persons ordained to be deacons or priests, and on all who held any ecclesiastical livings, as well as licensed lecturers and curates. 13 Eliz. c. 12. It has been said (Neal's Hist. Puritans, vol. i. p. 179, 4to.), that this act established only the doctrinal articles; those, as they are expressed, "which only concern the confession of the true faith, and the doctrine of the sacraments;" and, therefore, that the articles of the church, which relate to its discipline, were not designed to be the terms of ministerial conformity. These articles were ratified by parliament at the restoration of Charles II., in 1662; and subscription to them enjoined on the heads of colleges, chancellors, officials, and commissaries, and also on schoolmasters, 13 and 14 Car. II. c. 4.

By 1 W. & M. II. c. 18. commonly called the toleration act, dissenting teachers are to subscribe all these articles, except the 34th, 35th and 36th, and part of the 20th; and in the case of anabaptists, except also part of the 27th; or, if they scruple subscribing the same, they shall make and subscribe the declaration prescribed by stat. 19 Geo. III. c. 44. professing themselves to be Christians and protestants, and that they believe the scriptures to contain the revealed will of God, and to be the rule of doctrine and practice; otherwise they are exempted from the benefits of the act of toleration. Dissenting schoolmasters are excused from subscription to the articles by the same act. See TOLERATION.

Concerning these articles, very different opinions have been entertained by those who subscribe them; and they have also differed in their sentiments and views with regard to the nature and extent of subscription. Some have interpreted them more laxly, and others more rigidly; and they have not been agreed as to the strictness or latitude with which they may be subscribed. For the reasons that have been urged in favour of subscription, and against it, and the manner in which it has been interpreted and understood, see SUBSCRIPTION.

ARTICLES, *Lambeth*, were nine articles on the subject of predestination, perseverance, and the limitation of saving grace, drawn up by archbishop Whitgift and other learned divines, subscribed by them, and enjoined on the students of the university of Cambridge, in consequence of a complaint occasioned by a debate in that university, which commenced with a sermon of a Mr. Barret, who attacked the believers of predestination with great fervor. The primate, in his letter to the university, represents them not

as new decrees, but as an explication of certain points, "corresponding to the doctrine professed by the church of England, and already established by the laws of the land." But as they had not the queen's sanction, who, however, is said to have been fully persuaded of their truth, he desired that they might not become a "public act," but used privately and with discretion.

ARTICLES, *Statute of the six*, or *Black Statute*, was an act for abolishing diversity of opinion in certain articles concerning the Christian religion: 31 Hen. VIII. c. 14. By this law, the doctrine of the real presence, the communion in one kind, the perpetual obligation of vows of chastity, the utility of private masses, the celibacy of the clergy, and the necessity of auricular confession, were established. The denial of the first article subjected the person to death by fire, and to the same forfeiture as in cases of treason; and admitted not the privilege of abjuring; a severity unknown to the inquisition itself. The denial of any other of the five articles, even though recanted, was punishable by the forfeiture of goods and chattels, and imprisonment during the king's pleasure; an obstinate adherence to error, or a refusal, was judged to be felony, and punishable with death. The marriage of priests was subjected to the same parliament; their commerce with women was, on the first offence, forfeiture and imprisonment, on the second, death. The abstaining from confession, and from receiving the eucharist at the accustomed times, subjected the person to fine and imprisonment during the king's pleasure; and if the criminal persisted after conviction, he was punished by death and forfeiture, as in cases of felony. The rigour of these articles was somewhat abated by the 35th Hen. VIII. c. 5. in consequence of the interference of Cranmer. By this statute persons were not to be convicted but upon the oaths of 12 men; the prosecution was required to be within a year; and a person who preached against them, was to be informed against within 40 days. Nevertheless several were burnt at this time for denying the doctrine of transubstantiation. Upon the accession of Edw. VI. the statute of the six articles was repealed.

ARTICLES of War, in *Military Language*, denote certain regulations for the better government of the army in the kingdoms of Great Britain and Ireland, dominions beyond the seas, and foreign parts dependent upon Great Britain. These may be altered and enlarged at the king's pleasure. In certain cases they extend to those that are not military persons; as when by proclamation any place is put under martial law or when people follow any camp or army for the sale of merchandises, or serve in any menial capacity. It is ordained, that the articles of war shall be read in the circle of each regiment belonging to the British army every month, or more frequently if the commanding officer thinks proper. A recruit or soldier is not liable to be tried by a military tribunal, unless it can be proved that the articles of war have been duly read to him.

ARTICLES of the Navy, are certain express rules and orders directing the method of ordering seamen in the royal fleet, and keeping up a regular discipline: first enacted by the authority of parliament soon after the restoration, stat. 13 Car. II. II. 1. c. 9. but since new modelled and altered by stat. 22 Geo. II. c. 23. amended by 19 Geo. III. c. 17. In these articles of the navy almost every possible offence is set down, and the punishment thereof annexed; in which respect the seamen have much the advantage over their brethren in the land service; whose articles of war are not enacted by parliament, but framed from time to time at the pleasure of the crown. Judge Blackstone suggests, that this distinction proceeded from the perpetual establishment of

of the navy, which rendered a permanent law for their regulation expedient, and the temporary duration of the army, which subsisted only from year to year, and might therefore with less danger be subjected to discretionary government. He adds, "whatever was apprehended at the formation of the MUTINY Act, the regular renewal of our standing force at the entrance of every year, has made this distinction idle. For if from experience past we may judge of future events, the army is now happily engrafted into the British Constitution, with this singularly fortunate circumstance, that any branch of the legislature may annually put an end to its legal existence, by refusing to concur in its continuance." Bl. Com. vol. i. p. 420.

ARTICLES, *Lords of*, in *Scots History*, a committee of ancient institution in the Scottish parliament, existing as far back as records enable us to trace the constitution of parliaments in Scotland. It was their business to prepare, and to digest all matters which were to be laid before the parliament; every motion for a new law was first made there, and approved or rejected by them at pleasure; what they approved of was formed into a bill, and presented to parliament; what they rejected could not be introduced into the house. The lords of articles, then, not only directed the whole proceedings of parliament, but possessed a negative before debate. The committee was chosen and constituted in such a manner as put this valuable privilege entirely in the king's hands. It is extremely probable, that the king once had the sole right of nominating the lords of articles. They were afterwards elected by the parliament, and consisted of an equal number out of each estate; and most commonly of 8 temporal and 8 spiritual lords, of 8 representatives of boroughs, and of the 8 great officers of the crown. Capable either of influencing their election, or of gaining them when elected, the king commonly found them no less obsequious to his will, than his own privy council; and by means of his authority with them, he could put a negative upon his parliament before debate as well as after it. James VI. in order the more effectually to preserve his influence over the lords of articles, obtained an act appointing four persons to be named out of each estate, who should meet twenty days before the commencement of parliament, to receive all supplications, &c. and rejecting what they thought frivolous, should engross in a book what they thought worthy the attention of the lords of articles. This select body would of course be appointed by the king. In 1633, when Charles I. was beginning to introduce those innovations which gave so much offence to the nation, he dreaded the opposition of his parliament, and in order to prevent it, used an artifice for securing in favour of the crown the lords of articles. The temporal peers were appointed to choose 8 bishops, and the bishops 8 peers; these 16 met together, and elected 8 knights of the shire, and 8 burghers, and to these the crown officers were added as usual. In this way all the lords of articles would be the tools and creatures of the king. This practice, so inconsistent with liberty, was abolished during the civil war, and the statute of James VI. was repealed. After the restoration parliaments became more servile than ever; and what was only a temporary device in the reign of Charles I. was soon converted into a standing law. Upon the accession of king William the III. this practice was abolished, with many other oppressive and despotical powers, which had rendered our nobles abject slaves to the crown, while they were allowed to be tyrants over the people. Robertson's Hist. of Scotland, vol. i. p. 83.

ARTICLE, *articulus*, in *Anatomy*, denotes a joint or juncture, of two or more bones of the body.

ARTICLE of *Death*, *articulus mortis*, the last pangs or agony of a dying person. The pope usually sends his benediction to the cardinals, &c. in *articulo mortis*.

ARTICLE, in *Arithmetic*, signifies the number 10, or any number justly divisible into ten parts; as 20, 30, 40, &c. — These are sometimes called decads, and sometimes round numbers.

ARTICLE, in *Grammar*, denotes a particle used in most languages for the declining of nouns, and denoting the several cases and genders thereof.

The use of articles arises chiefly hence, that in languages which have no different terminations to express the different states and circumstances of nouns, there is something required to supply that office.

The Latins have no articles; but the Greeks, and most of the modern languages, have had recourse to them for fixing and ascertaining the vague signification of common and appellative names.

The Greeks have their *ι*, the eastern tongues their *ε*; *emphaticum*, from which, perhaps, the Greek article was derived, unless we derive the Greek *ε*, *ς*, *ω* from the relative *ος*, or both, by a kind of contraction very common in words, much used, from the demonstrative *ος*. The Spaniards and the Italians have their *il*, *lo* and *la*, which appear to be the latin *ille*. The French their *le*, *la* and *les* seemingly derived from either the Spanish or Italian. The Germans their *der*, *das*, *dat*. The English have also two articles, *a* and *the*; which being prefixed to substantives, apply their general signification to some particular things. See letter A.

Some grammarians make the article a distinct part of speech; others will have it a pronoun; and others a noun adjective. See SPEECH, and PRONOUN.

Articles, in the distribution of the ingenious Mr. Harris, belong to the species of words which he denominates definitives; because, being associated with a noun, they serve to define, determine, or ascertain any particular object, so as to distinguish it from others of the class to which it belongs, and, of course, to denote its individuality. Although there be a near relation between pronouns and articles, and it may be sometimes doubted concerning particular words to which class they ought to be referred, yet they may be commonly distinguished by this rule: the genuine pronoun always stands by itself, assuming the power of a noun, and supplying its place; whereas the genuine article never stands by itself, but appears at all times associated to something else, requiring a noun for its support, as much as attributives or adjectives. Mr. Harris distributes articles into those strictly and properly so called, and the pronominal articles, such as *this*, *that*, *any*, &c. The reason and use of the former he illustrates in the following manner. When a certain object occurs, with which as an individual we are unacquainted, we refer it to its proper species, and call it *dog*, *horse*, *lion*, or the like. If none of these names suit it, we refer it to the genus, and call it *animal*. But the object which we are contemplating, is perhaps neither a species nor a genus, but an individual. Of what kind? *known* or *unknown*? *seen* now for the *first* time, or *seen* before, and now remembered? In this case we shall discover the use of the two articles *a* and *the*. *A* respects our *primary* perception, and denotes individuals as *unknown*. When an object passes by which I never saw before, I say, "There goes a beggar with a long beard." When the same man returns at some future time, I say: "There goes the beggar with the long beard." The article only is changed, the rest remains unaltered. The individual *once* vague, is now recognised as *something known*, and that merely by the efficacy of this

th's latter article, which tacitly insinuates a kind of *previous* acquaintance, by referring the present perception to a like perception already past. The articles *a* and *the* are both of them definitives, as they circumscribe the latitude of genus and species, by reducing them for the most part to denote individuals; with this difference, that the article *a* leaves the individual itself unascertained, whilst the article *the*, ascertains the individual also; and on that account is the more accurate definitive of the two. Hence the former article *a*, being applied to objects or names taken in their more vague and general signification, is called *indefinite*; and accordingly some have derived it by contraction, from *any*; whereas the article *the* is called *definite*, because it appropriates or fixes the sense of the word to which it is prefixed to one individual thing.

Besides, the article *a*, as it separates one individual from the class to which it belongs, cannot be applied to plurals; but the article *the*, specifying or defining objects distinct from others of the same class, is alike applicable to both numbers. To this rule, however, there is an exception, as in the use of the adjectives *few* and *many*, which though joined with plural substantives, yet admit of the article *a*, as *a few men* and *a great many men*. Mr. Lindley Murray (Grammar, p. 31.) observes, that the reason of this is manifest; from the effect which the article has in these phrases, it means a small or great number collectively taken, and therefore gives the idea of a whole, that is, of unity.—Thus likewise, a dozen, a score, a hundred, a thousand, is one whole number, or an aggregate of many collectively taken; and therefore still retains the article *a*, though joined as an adjective to a plural substantive. The indefinite article is much more limited in its use than the definite: and therefore the Greek and Hebrew languages have it not, though they both have the definite article. The Greek δ corresponds precisely to our *the*: as δ βασιλευς *the king*, $\tau\omicron$ δωρον *the gift*; however they differ in this respect, that the Greek article admits of variation adapted to number and gender, whereas the English *the* is invariable. It has been already observed, that the article has no meaning but when it is associated to some other word; and the words to which it may be annexed are those which, though indefinite, are yet capable by means of the articles of becoming definite. Upon this principle it is absurd to say O Eγω , *the I*, or O Συ , *the thou*, because nothing can make those pronouns more definite than they are. The same is true of proper names. By the same rule we cannot say in Greek Oι Αμφότεροι , or *the both*, because these words are in their own nature perfectly defined; hence the numeral $\tau\omicron\upsilon\omicron$, when it is indefinite, is found to assume the article whenever it would become definite: thus the $\tau\omicron\upsilon\omicron$ in English, and ω δυο in Greek, mean nearly the same thing as *both* or $\Delta\mu\phi\omicron\tau\epsilon\rho\iota$. As some words admit of no article, because they are by nature as definite as may be, there are others that do not admit it, because they are not to be defined at all: of this sort are all interrogatives. Upon the whole, the natural associates with articles are all those common appellatives which denote the several genera and species of beings. The definite article *the* is frequently applied to adverbs in the comparative and superlative degree, and its effect is to mark the degree more strongly, and to define it the more precisely; as “*the more I examine it, the better I like it*.”—“*I like this the least of any*.” Besides the articles already enumerated, which are articles strictly so called, there are the *pronominal articles*, such as *this*, *that*, *any*, *other*, *some*, *all*, *no* or *none*, &c. which may be sometimes taken as pronouns, and sometimes as articles; but if it be the essence of an article to define and ascertain, they are much more properly articles than any thing else. See PRONOUN. Harris's Hermes, p. 214. &c.

Articles are of great service in a language, as they contribute to the more neat and precise expressing of several properties and relations, which must otherwise be lost. Without articles, or some equivalent invention, men could not employ nouns to any of the purposes of life, or indeed communicate their thoughts at all. And hence one great disadvantage of the Latin above other languages which have articles, is that the article being either expressed, or left out, makes an alteration in the sense, which the Latins cannot distinguish. Thus, when the devil said to our Saviour, “*si tu es Filius Dei*,” it may either be understood, “*if thou art a Son of God*,” or, “*if thou art the Son of God*.”—Scaliger, from the want of articles in the Latin, has concluded them useless, and bestowed upon them opprobrious language, calling the article, “*otiosum loquacissimæ gentis instrumentum*,” and the abbé Girard has degraded them to the humble station of “*avant-coureurs*,” merely to announce the approach or entrance of a noun. Mr. Horne Tooke, “*Diversions of Parley*,” has vindicated the honour of the article, and endeavoured to restore it to its primitive dignity. For this purpose he recurs to the reasonings of Mr. Locke, on the use and importance of general terms; and he observes, that it is the business of the article to reduce the generality of terms, and, upon occasion, to enable us to employ general terms for particulars. If, in combination with a general term, it is a substitute, yet it is a necessary substitute, which (he adds) is more than can be said of ABBREVIATIONS that have been advanced into distinct parts of speech, for they are not essential to the communication of our thoughts. The Italians even prefix articles to proper names, which do not naturally need any, because they of themselves signify things individually.—Thus they say, *il Ariosto, il Tasso, il Petrarca*.—Even the French join the article to the proper names of kingdoms, provinces, &c. as *la Suède, la Normandie*.—And we likewise annex it to the names of certain mountains and rivers; as the *Rhine*, the *Danube*, the *Alps*, &c.

Fa. Buffier distinguishes a third kind of articles in French, which he calls *intermediate* or *partitive*, serving to denote part of the thing expressed by the substantives they are added to: as, “*des savants ont cru*,” “*some learned men have supposed*,” &c.; I want “*de la lumiere*,” “*some light*,” &c. The use and distinction of the definite and indefinite articles *le* or *la*, and *de* or *du*, make one of the greatest difficulties in the French tongue, as being utterly arbitrary, and only to be acquired by practice.—We may add, that in the English, though the articles be so few, yet they are of such frequent use, that they easily discover any stranger from a natural Englishman.

ARTICULARIS, in *Medicine*, an epithet applied to a disease which more immediately infects the articuli, or joints. The morbus articularis is the same with the Greek $\alpha\rho\theta\rho\iota\sigma\mu\omicron\varsigma$, and our gout.

ARTICULATE Sounds are those which express the letters, syllables, &c. of any alphabet or language.

Brutes cannot form articulate sounds, or they cannot articulate the sounds of their voice; excepting some few birds, as the parrot, pyc, raven, starling, &c.

ARTICULATED Libel, *libellus articulatus*, that wherein the parts of a fact are set forth to the judge in short distinct articles. This amounts to much the same with what is otherwise called *libellus positiualis*.

ARTICULATED Leaf. See LEAF.

ARTICULATED Radius, in *Natural History*. See RADIUS *Articulatus*.

ARTICULATION, $\alpha\rho\theta\rho\iota\sigma\mu\omicron\varsigma$, in *Anatomy*, the juncture or connection of two bones. Articulation is technically divided into diarthrosis, or moveable articulation; synarthrosis,

or immoveable; and amphiarthrosis, which is defined to be a compound of both the others. The immoveable connection of bones is said to be by Symphysis, Harmonia, Suture, Gomphosis, Syndesmosis, Synchondrosis, Synneurosis or Syndesmosis, and Symplosis; for the explanation of which we refer to the separate articles. The moveable articulations, which alone appear to deserve that term, are divided into Enarthrosis, Ginglymus, and Arthrodia. When the spherical head of one bone is received into a corresponding cavity of another, a joint is formed, which admits of motion in every direction; this is Enarthrosis, which is called in English a ball and socket joint, and of which the hip joint is a good specimen. When the articular surface of one bone has a riddle groove with lateral eminences, and the corresponding bone has a middle ridge with lateral depressions, a joint is formed which admits of motion backwards and forwards only, like a hinge; this is called ginglymus, and the elbow joint, as far as the ulna is concerned in its formation, or the second and third joints of the fingers and toes, exemplify this mechanism. Mr. Winslow divides ginglymus into the angular ginglymus, or that joint by which the first vertebra turns round upon the second; and he applies the same term to distinguish the articular connections of bones at different parts, as happens between the radius and ulna in the forearm. When two bones forming a joint are applied together by nearly plain surfaces, they may glide a little upon one another, but no extent of motion can take place. This is called arthrodia; and the junction of the collar bone to the acromion, and the metacarpal bones to the bones of the carpus, may be mentioned as specimens of this kind of articulation.

ARTICULATION, in *Botany*, denotes the connection of parts that consist of joints or knees, such as the pods of French honey-suckles, which, when ripe, divide into as many parts as there are knees or joints, and which usually send forth branches.

ARTICULATION, in a *general sense*, is that form or character which the voice acquires, by means of the mouth and its several organs, the teeth, the tongue, the lips, &c. The voice by articulation is not made more loud or soft, which are its primary qualities, but it acquires in addition to these character, certain others, which may co-exist with them. The simplest of these new characters are those acquired through the mere openings of the mouth, as these openings differ in giving the voice a passage, and from the various configurations of these openings proceed **VOWELS**. There are other articulate forms which the mouth makes, not by mere opening, but by different contacts of its several parts; such, e. g. as it makes by the junction of the two lips, of the tongue with the teeth, of the tongue with the palate, and the like. These contacts are preceded or immediately followed by the opening of the mouth; and the articulations so produced are called **CONSONANTS**. There are other subordinate distinctions of these primary articulations, which are denoted in the language of grammarians, by the name of **LETTERS**; because articulations of every other kind are derived from them and resolved into them. Under their smallest combination, they produce a **SYLLABLE**; syllables properly combined produce a **WORD**; words duly combined produce a **SENTENCE**; and sentences properly combined produce an **ORATION** or **DISCOURSE**. Thus it is, says Mr. Harris (*Terms* p. 22), that to principles apparently so trivial as about twenty thousand variety found, we owe that variety of articulations which have been sufficient to explain the sentiments of the human mind, a multitude as all the present and past generations of men. See Dr. Hutton's paper on the nature of articulation, in *Edinb. Transf.* vol. ii. p. 7. See also **CONSONANTS**.

ARTICULATION, in a more *confined sense*, is a branch of Elocution; and in this sense, a good articulation consists in giving every letter in a syllable its due proportion of sound, according to the most approved custom of pronouncing it; and in making such a distinction between the syllables of which words are composed, that the ear shall, without difficulty acknowledge their number, and perceive at once to which syllable each letter belongs. Where these points are not observed, the articulation is proportionably defective. Exactness in founding the words rightly, corresponds to propriety in spelling; and the articulation should be so clear and distinct, that the hearer may with ease keep pace with the speaker. Among the Greeks and Romans, who paid particular attention to speaking and regularly taught it, the smallest error in pronouncing was equally disgraceful in them, as false speaking is with us. A good articulation is the foundation of a good delivery, in the same manner as the founding of the simple notes in music with exactness, is the foundation of good singing. As for the grosser faults of articulation, such as fluttering, hesitation, lipping, and inability to pronounce certain letters, they can never be cured by mere precept, but require the constant aid of a person skilled in the causes of those faults, who by teaching each individual how to use the organs of speech rightly, and by shewing him the proper position of the tongue, lips, &c. may gradually bring him to a just articulation. Demosthenes, it is said, when he first spoke in public, could not pronounce the first letter of his art, "Rhetoric;" but by indefatigable pains he overcame the difficulty, and supplied this deficiency in his eloquence, even after he had arrived at the age of manhood. The first and most essential point in articulation is distinctness, and its opposite is the greatest fault. The chief source of indistinctness is too great precipitancy of speech. To this hasty delivery, which drops some letters, and pronounces others too faintly; which runs syllables into each other, and clusters words together, is owing that thick, mumbling, cluttering utterance, of which examples are too frequent. Demosthenes had this fault; and this, it is not improbable, was the impediment or defect of speech, which he remedied by exercising himself in declaiming with pebbles in his mouth. For curing any imperfections in speech arising originally from too quick an utterance, the most effectual method will be to employ an hour every morning in reading aloud, in a manner much slower than is necessary; let a friend or some person attend, whose business it shall be to remind the reader, if he should quicken his pace and recur to his old habit of rapid utterance. Those words should be marked which are passed over most hastily, and they should be repeatedly pronounced every morning slowly and distinctly. As in our language, words of more syllables than one have one syllable accented, and peculiarly distinguished from the rest, either by a smart percussion of the voice, or by dwelling longer upon it, the other syllables are often negligently articulated. In order to bring those, whose utterance is so rapid to a due medium, they should accustom themselves to pronounce the unaccented syllables more fully, and to dwell longer upon them. See Sheridan's *Lectures on Elocution*, p. 19—29.

ARTICULATION, in reference to *Grammar*, is that part of it which treats first of sounds and letters, then of their combinations, for the composing of syllables and words. Hence he who pronounces his words clearly and distinctly, is said to pronounce them *articulately*.

ARTICULATION, in *Vocal Music*. This word, which belongs to every kind of elocution, as well as music, is too familiar to be called technical. Yet, as it is extremely important, and much neglected, it shall furnish an article.

M. Framery (Encycl. Meth.) says, that "in France, it has for some time past been imagined, that the Italians, particularly the women, scarcely ever *articulate* their words in singing; they even suppose inarticulation favourable to the melody; that it is even necessary to connect and smooth the sounds; and that in an art where all the consonants of a language are sacrificed that the vowels only may be heard, melody is rendered more sweet and enchanting by this means."

This does not indeed seem to have been an idea which the English have cherished, systematically; for the *Bassi*, in her recitative, is admired even by those who are totally ignorant of the Italian language, for the firm, pointed, clear, and *articulate* manner in which she pronounces the words. Yet our own vocal performers are so deficient in this particular, that it is difficult to discover in what language they are singing.

It is not merely the softness of the Italian language, which renders it so much fitter for song than any other that is known; but the neatness and energy of articulation of the inhabitants of Italy, in speaking it. The number of nasal sounds in the French, of gutturals in the German, and of harsh terminations of our words by consonants, obstruct sound and respiration. (See a list of these in the Essay on the Euphony of Languages, Hist. Mus. vol. iv.) In Dryden's sublime Ode for Music on St. Cecilia's day, the letter *d* predominates, terminating, in the course of the poem, no less than three and thirty lines. The letter *t*, like a gag at the end of a word, not only stops all sound, but respiration. A clear and distinct articulation, without harshness, is perhaps difficult in all languages; but there is a degree of distinctness possible, without injuring the melody, even in our harsh language, which Mrs. Sheridan possessed, and for which Mr. Incedon is justly admired, that conveys both sense and sound uninjured to the ears of an audience. We wish our public singers, who have merit of other kinds, would take this circumstance into consideration in the course of their studies: as *the not understanding the words* in our theatres and concerts, however the voice and manner of singing may be approved, is a general complaint.

The Italians carry articulation, perhaps, to the extreme, by not only pronouncing all the consonants in their several words, according to the genius of their language, which has no nasal or guttural sounds, but even adding a kind of mute *c* at the end of words, terminated by contraction with a consonant; as thus, in singing

La pace del mio cor—

Voglio vederti almen—

Mi fanno delirar—

They pronounce the last syllable as if it were written *cor-è*, *almen-è*, *delirar-è*. But they will tell you, that these words originally end with a vowel; as *cor* at full length is *cuore*; *almen*, *almeno*; and the infinitive mood of the last word, *delirar*, is *delirare*; and that it is for the sake of euphony that they soften the termination of contracted words by a mute *c*.

For the articulation of notes in the performance of instrumental music, see STACCATO and SCIOLTO.

ARTICULATION, *diseases of the*, in Surgery. See JOINTS.

ARTIER, in Geography, a river of France, in the late province of Auvergne, which runs into the Allier.

ARTIFICERS, those who work with the hands, and manufacture any kind of commodity in iron, brass, wood, &c.

Artificers are the same with what we otherwise call handicrafts and mechanics: such are smiths, carpenters, tailors, shoemakers, weavers, and the like.

The Roman artificers had their peculiar temples, where they assembled, and chose their own patron, to defend their causes: they were exempted from all personal services. Taruntenus Paternus reckons thirty-two species of artificer, and Constantine thirty-five, who enjoyed this privilege. The artificers were incorporated into divers colleges or companies, each of which had their tutelar gods, to whom they offered their worship; and several of these, when they quitted their profession, hung up their tools, a votive offering to their gods. Artificers were held a degree below merchants, and *argentarii*, or money-changers, and their employment more fordid. Some deny, that in the earliest ages of the Roman state, artificers were ranked in the number of citizens; others, who assert their citizenship, allow that they were held in contempt, as being unfit for war, and so poor that they could scarce pay any taxes. For which reason they were not entered among the citizens, in the censor's books; the design of the census being only to see what number of persons were yearly fit to bear arms, and to pay taxes towards the support of the state. It may be added that much of the business of artificers was done by slaves and foreigners, who left little for the Romans to mind but their husbandry and war. Dion. Hal. lib. ii. By means of the arts, the minds of men are engaged in inventions beneficial to the community; and thus prove the grand preservative against the barbarism and brutality which ever attend on an indolent and inactive stupidity.

By the English laws, a stranger, being an artificer in London, &c. shall not keep above two stranger servants; but he may have as many English servants and apprentices as he can get. 21 Hen. VIII. c. 16. And as to artificers in wool, iron, steel, brass, or other metal, &c. persons contracting with them to go out of the kingdom into any foreign country, are to be imprisoned three months, and fined in a sum not exceeding one hundred pounds. And such as going abroad, and not returning on warning given by our ambassadors, &c. shall be disabled from holding lands by descent or devise, from receiving any legacy, &c. and be deemed aliens. Stat. 5 Geo. I c. 27. By 23 Geo. II. c. 13. § 1. penalty of 500*l.*, and of imprisonment for twelve months, for the first offence; and for the second, of 1000*l.* and of imprisonment for two years, is also inflicted on persons seducing artificers to go abroad. By 14 Geo. III. c. 73, 15 Geo. III. c. 5. and 21 Geo. III. c. 37, heavy penalties are inflicted on masters of ships assisting in such seduction. See MANUFACTURERS.

Ramazini has a treatise on the diseases of artificers.

ARTIFICER *by fire*, a denomination sometimes given to chemists, and workers in metal.

ARTIFICIAL, something made by art; not produced naturally, or in the common course of things.

ARTIFICIAL is also frequently used for *spurious*. Thus we have artificial sal ammoniac, artificial borax, &c.

ARTIFICIAL *fireworks* are compositions of inflammable materials; chiefly used on solemn occasions, by way of rejoicing.

ARTIFICIAL *Grasses*, in Agriculture, are such grasses as are introduced into field husbandry, and cultivated either for the purpose of being made into hay, or for being fed off by cattle. *Clver*, *lucerne*, *jointain*, *trifol*, *rye-grass*, and some others are of this nature. See these different heads.

The cultivation of artificial grasses has been practised in some districts of the kingdom for more than a century, while in others it has only been attended to within these few years, and there are still others that have but just begun to introduce these kinds of grasses. Wherever they have, however, been properly cultivated, so various and so manifest have been

found the advantages arising from them, that they form a very lucrative branch of husbandry, and are consequently grown in abundance in many parts of the kingdom. Those which, according to the author of the Synopsis of Husbandry, are most usually propagated and found to bring the most considerable profit to the farmer, are saintfoin or cloverfoil, clover, trefoil, hop-clover or non-such, and lucerne. One or other of these different species of grasses may indeed be beneficially cultivated on almost every soil, as where the poverty of the ground will not admit of sowing either lucerne or clover, saintfoin or trefoil, from their requiring a less depth of mould, may turn out a weighty crop. Saintfoin, clover, and trefoil, are indeed now so universally raised from seed of English growth, that they have become in a manner naturalized to the soil, there being scarcely any country in Europe where larger crops are grown than in this. Lucerne, though it be sometimes reserved for seed here, is most successfully raised from seeds of foreign growth. In respect to burnet, spurry, and timothy grasses, which are by some considered as artificial grasses, although their virtues have been highly celebrated by many, they have, perhaps, but seldom it is observed, been found to answer in the cultivation in any degree equal to the sanguine commendations bestowed on them.

It is judiciously remarked by Mr. Kent, in the Agricultural Survey of Norfolk, that artificial grasses should always be chosen agreeably to the soil. Saintfoin should, says he, be introduced where there is a chalky, marly, or even a gritty bottom. White clover should be the principal grass, where land is designed to be laid for a continuance. Trefoil and burnet upon high and poor uplands, designed for sheep-walks. Perennial darnel, or what the farmers call rye-grass, is, he thinks, proper upon light arable land, for though it is an exhauster, it serves better than any other to brace the surface. A few acres of lucerne he likewise recommends to every farmer who has a piece of loamy tillage, and near his house.

And in the Survey of the County of Somerset it is remarked, that on the stone-brash and free-stone-grit soils saintfoin takes the lead; and that though the seed is very expensive, the quantity and quality of its produce, together with its durability, make an ample return of profit, particularly if sown when the land is clean. Next to saintfoin, rye-grass, marl-grass, and white Dutch clover, are in deserved repute, when the land is intended to remain some years in grass; but when it is intended to be ploughed again in the course of a year or two, broad clover is preferred to all other artificial grasses. It is remarked, however, in the able Survey of Northumberland, that these few of the artificial grasses are ever grown alone, except red clover when intended to continue only one year, and even then a small portion of rye-grass, as from one to three gallons per acre are generally sown with it; and the writers suppose, with much propriety, as it not only comes early in the spring, but thickens the crop and facilitates making the clover into hay. When the land is intended to continue for three or more years in grass, they are generally mixed in the proportion of eight or ten pounds of red clover, four pounds of white clover, and half a bushel of rye-grass seed per acre; to the above quantities are sometimes, it is observed, added three or four pounds of rib-grass and hop-medick, as the soil suits. See GRASSES.

ARTIFICIAL Lightning. See ELECTRICITY, and LIGHTNING.

ARTIFICIAL Lines on a sector or scale, are certain lines so contrived, as to represent the logarithmic lines and tangents; which, by the help of the line of numbers, will

solve all questions in *trigonometry, navigation, &c.* pretty exactly.

ARTIFICIAL Magnets. See MAGNETS.

ARTIFICIAL Music, that which is composed according to the rules of art. There is no natural music but the warbling of birds, which is confined to the melody of the aviary, of which the tones are too high, and the intervals too minute for our appreciation. Rigorously speaking, all music is a work of art, particularly instrumental, in which the instrument itself is an artful contrivance for imitating vocal tones, and the hand of the performer must be guided by art. But the artifices of composition and performance are innumerable. In composition, fugues, canons, double counterpoint, ingenious and elaborate accompaniments, are included in artificial music; and in the performance upon instruments, the artifices of bowing on the violin, fingering on keyed instruments, double-tonguing on the German flute, &c. are only known and taught by great masters. The generating musical tones from glasses and other subtilities, not included in the three expedients for producing sounds by instruments, which the ancients as well as the moderns have confined to three several species, as strings, pipes, and percussion, is doubly entitled to the epithet artificial. The harmonies of a single string on the *Æolian* harp, have, perhaps, a better claim to the title of natural music, than any other sounds produced without human assistance.

ARTIFICIAL Pastures, in *Agriculture*, such pasture grounds as have been cultivated and sown down with plants of the artificial grass kind, or such others as are capable of affording a large proportion of green food for the feeding of cattle and other animals. See PASTURE.

ARTIGIS, in *Ancient Geography*, a town of Spain, in the country of the Turduli, supposed to be the present *Albama*, between Grenada and the sea.

ARTIGNI, ANTHONY GACHET, in *Biography*, a writer of literary history, was born at Vienna, and became censor of the archiepiscopal church of that city. His work, intitled, "Memoires d'Histoire de Critique et de la Littérature," published in seven volumes 12mo. at Paris, in 1749, manifests considerable talents for literary research and criticism. He died at Vienna in 1769. *Nouv. Dict. Histor.*

ARTIK-ABAD, in *Geography*, a town or district of Asiatic Turkey, in the government of Siwas, between the town of Siwas and that of Tocat or Tokai; abounding with grain and fruit.

ARTILLERY is originally a French word signifying *archery*. In a general sense, it denotes the offensive apparatus of war, particularly of the missile kind; and in modern acceptation, is more immediately applied to fire-arms mounted on carriages, and ready for action, with their balls, bombs, grenades, &c. In a more extensive meaning, the term includes the powder, matches, utensils of ordnance, the machines which facilitate their motion and transport them, the vehicles over which they traverse rivers, every thing necessary to them, and all that enters into the form of a train of artillery. The same word, still farther extended in its meaning, likewise comprehends the men destined for the service of the artillery, the people who provide the artillery with materials and implements when engaged, the cannoniers, the bombardiers, the officers of every rank, and engineers of every kind. By artillery is likewise understood the science which the officers of artillery ought to possess. See ENGINEERING.

In the most ancient times, when war was made with quickness and impetuosity, the use of artillery was unknown. Something like military engines seem hinted at in the book of Deuteronomy (chap. xx. v. 20.); but the earliest

least precise mention of artillery is in the second book of Chronicles (chap. xxvi. v. 15.), where we are told, that Uzziah, who began his reign 809 years before the Christian era, "made in Jerusalem engines invented by cunning men, to be upon the towers and upon the bulwarks, to shoot arrows and great stones withal." This also is particularly mentioned by Josephus, who represents Uzziah's care of Jerusalem as toward the end of his reign.

The Greeks, who were desirous of appropriating to themselves every improvement of science they gathered from the East, would fain have been believed the inventors of artillery. But so far from being in possession of artillery, they had not in their early times, if we may judge from Homer's writings, one military engine that was calculated to shake a wall. The earliest instance in profane history is probably to be sought for in the siege of Molyta, about 370 years before Christ, where Dionysius, having battered the fortifications with his rams, advanced to the walls, towers rolled upon wheels, whence he galled the besieged with continual volleys of arrows and stones thrown from his catapults. (Anc. Univ. Hist. vol. vi. p. 401.) The next memorable instance that occurs is the siege of Rhodes by Demetrius Poliorcetes, where even Grecian ingenuity was exhausted in the invention and improvement of artillery. (Diod. Siculus, l. xx.) Another instance of notoriety occurs when Hannibal besieged Saguntum, 219 years before the Christian era; and the Saguntines hindered his soldiers from using the battering-ram, by an incessant hurling of darts, stones, and other missile weapons. See the account in Livy (l. xxi. c. 7. edit. Freinsh.) who has also supplied us (l. xxvi. c. 46, 47.) with a curious inventory of the warlike engines which Scipio, eight years afterwards, found among the stores of Carthage. There were no less than an hundred and twenty catapults of the larger size, two hundred and eighty-one of the smaller, of the greater balista twenty-three, of the lesser fifty-two; beside an innumerable quantity of scorpions of different sizes, arms, and missile weapons. Two years, however, previous to this, Marcellus had laid siege to Syracuse, a city proverbially fatal to the armies that attacked it. Archimedes was at that time resident in Syracuse; and at the earnest solicitation of Hiero, king of Sicily, exerted the powers of his mind in the invention of artillery and other warlike engines. Marcellus had brought with him an amazing engine called *farbutaca*, upon eight galleys; which the mathematician destroyed by discharging single stones of enormous weight upon it, while it was at a considerable distance from the walls. The chief instruments he used were balista, a sort of crow lowered by a lever, which hoisting the ships of the Romans by the prow, plunged them to the bottom of the sea; grapples; and scorpions. Archimedes, however, left no account of these military engines in writing; because he considered all attention to mechanics as mean and sordid, placing his whole delight in those intellectual speculations which, without any relation to the necessities of life, have an intrinsic excellence arising from truth and demonstration only; and reckoning such inventions but among the amusements of geometry. See the life of Marcellus in Plutarch.

To multiply the enumeration of ancient sieges where artillery was used, would not only be tedious but endless. Every siege, it is probable, gave rise to some invention or improvement. Tacitus indeed mentions an extraordinary instance (Hist. l. iii. c. 23. 29.) of an engine with which the fifteenth legion fought against the troops of Vespasian, at Cremona. It was a balista of an enormous size, which the Vitellians played off with dreadful execution; and dis-

charged maffy stones of weight to crush whole ranks at once. Inevitable ruin, we are told, must have followed, if two soldiers had not signalized themselves by a brave exploit. Covering themselves with the shields of the enemy, which they found among the slain, they advanced undiscovered to the battering engine, and cut the ropes and springs. At last, after a vigorous assault from Antonius, the Vitellians being no longer able to sustain the shock, and enraged at their disappointment, in a fit of despair, rolled down their battering-engine on the heads of the besiegers. Numbers were crushed by the fall of such a prodigious mass. It happened, however, that the machine drew after it a neighbouring tower, the parapet and part of the wall, affording the besiegers an easier access to the city. The continued use of these enormous engines must be remembered by every reader of history; as well as that the Romans had regular batteries both of balistas and catapults.

The credit of introducing artillery into our own country must undoubtedly be given to the Normans, whom William of Malmshury describes (l. iii. p. 57. col. 2.) as having a peculiar delight in war, and assures us, that they excelled in all the arts of attacking their enemies, when their forces were sufficient. The Normans first introduced among our castles the keep, placed upon a mount, whence they annoyed the surrounding enemy with their darts, stones, and other offensive weapons. (Strutt's Manners and Customs of the English, vol. i. p. 93.) Their method of attacking castles seems generally to have been by mere force; blockade was little practised; and the iron ram, which the Romans found so serviceable, was rendered in a great measure useless by the deep ditches which surrounded their fortifications. The principal machines which the Normans employed, were of course of the projectile kind; and they were not only used in regular sieges, but occasionally so contrived as to be used on ship-board. See Matt. Paris, p. 1091.

Machines for throwing stones occur so early as in the battle of Hastings (Will. Pictavien. p. 201.); and Robert de Brunne, in his wars against the Saracens, informs us, that when Richard the First set out against the Holy Land, he had in his barges and galleys mills turned by the wind which by force of the sails threw fire and stones.

The benefit which the English manners derived from the crusades, is a topic on which we shall have other opportunities of enlarging; but the accessions to the knowledge of our ancestors in the art of war were singularly conspicuous. From the Saracens they obtained a sort of wild-fire of so subtle a composition, that there was no method of extinguishing it but by smothering it with heaps of dust or vinegar. It was by this device that the Black Prince set fire to Remountine; and it was often thrown in pots from the catapults.

The Greek and Roman writers afford us many instances of the superior force which the catapults and balistas of the ancients could occasionally display; nor are parallel instances wanting in the annals of Britain. Camden informs us, that with the mangonels, trebuches, and bricoleas, our forefathers used to cast forth mill-stones; and Holinshed (p. 539.) relates, that when Edward the First besieged Strively castle, he caused certain engines of wood to be raised against it, which shot off stones of two and three hundred weight.

The catalogue of projectile machines in the eleventh and twelfth centuries, exclusive of the balista, catapulta, onager, and scorpion, were the mangonel, the trebuchet, the petrary, the robinet, the mategriffon, the bricole, the bugle or bible, the espringal, the matafunda, the ribaudequin, engine a verge, and the war-wolf (Grose Milit. Hist. vol. i. p. 381.),

whose form, construction, and particular history, will be described under their respective articles. Singular, however, as it may seem, not only the form of these curious instruments, but even the method of using them, is entirely lost. And so defective have our historians been in this particular, that after all the strict examinations that have been made, little more of some of them can be collected than their names.

The connection between the modern and the old artillery need hardly be prefaced by recapitulating the discovery of gunpowder. For some time after that singular composition was applied to military purposes, the machines and pieces of ordnance were very ponderous and unwieldy, and of course unfit for expeditions service. Military people at that time possessed but a small share of learning of any kind, and almost none at all of a mechanical or mathematical nature. What they did in their profession was entirely the effect of practice. The form of their artillery, as well as of the warlike engines and instruments for conducting it, was only such as the most obvious hints suggested, or the rudest and most uncultivated invention dictated. Their first pieces were not only clumsy and unmanageable, but as they succeeded to the machines of the ancients, they were employed like them in throwing stones of a prodigious weight, and therefore were necessarily of an huge and enormous bore, consisting usually of pieces of iron fitted together lengthways, and hooped with iron rings. Some of them were so large that they could not be fired above four or five times a day. Such were those with which Mahomet II. battered the walls of Constantinople in 1453, being some of them of the calibre of no less than twelve hundred pounds; and Guicciardin, in the first book of his History, informs us, that so large a portion of time interfered between the different chargings and dischargings of one of those pieces, that the besieged had sufficient time to repair at their leisure the breaches made in their walls by the shock of such enormous stones. (See Glennie's Hist. of Gunnery, p. 1.)

After such a relation we cannot be surpris'd to find that not only the moveable towers, but catapults of various descriptions, were retained in use. The extreme awkwardness visible in the construction of cannon, and the great cost of gunpowder, added to the difficulty of procuring it, account for the preference which was still given to the old engines for discharging stones. Henry V. in the fourth year of his reign, employ'd the tripget, which shows that cannon had not then superseded the old artillery. (Strutt's Manners and Customs, vol. ii. p. 32.)

Under Hen. III. of France, the use and practice of artillery was not advanced beyond its infancy. D'Etrees, who occupied the post of master-general of the ordnance, in 1558, at the siege of Calais by Francis duke of Guise, and who eminently contributed to its capture, was the first person among the French who made any considerable progress in the construction of batteries. Anterior to D'Etrees, continual accidents took place from the bursting of cannon; and it was customary to cool them with vinegar, in order to prevent misfortunes. Armies were then but slenderly provided with artillery, which was considered as more requisite for sieges, than indispensable for the operations of the field. (See Wrexall's Hist. of France, vol. ii. p. 249, 250.) In England, however, the science of artillery had occupied attention at a more early period; and lord Herbert observes, that in 1544, king Henry VIII. had himself invented small pieces of artillery to defend his waggons.

The length and diameter of cannon was by degrees much diminished, and of course their weight; and practice and experience in time discovered how much might be re-

duced with propriety from their magnitude, without hurting the grand effects which it was necessary on some occasions they should produce. See CANNON, GUNNERY, and PROJECTILES.

Dr. Smith observes (Wealth of Nations, vol. iii. p. 70.), that the great change introduced into the art of war by the invention of fire-arms, has enhanced still further both the expence of exercising and disciplining any particular number of soldiers in time of peace, and that of employing them in time of war. Both their arms and their ammunition have become more expensive. A musquet is a more expensive machine than a javelin or a bow and arrows; a cannon or a mortar, than a balista or a catapulta. The powder which is spent in a modern review, is lost irrecoverably, and occasions a very considerable expence. The javelins and arrows which were thrown or shot in an antient one, could easily be picked up again, and were besides of very little value. The cannon and the mortar are not only much dearer, but much heavier machines than the balista or catapulta, and require a greater expence, not only to prepare them for the field, but to carry them to it. As the superiority of the modern artillery too, over that of the antients, is very great, it has become much more difficult, and consequently much more expensive to fortify a town so as to resist even for a few weeks the attack of that superior artillery. In modern times, many different causes contribute to render the defence of society more expensive. The unavoidable effects of the natural progress of improvement have, in this respect, been a good deal enhanced by a great revolution in the art of war, to which a mere accident, the invention of gunpowder, seems to have given occasion.

ARTILLERY-Park, the place in the rear of both lines in the army for encamping the artillery, which is drawn up in lines, of which one is formed by the guns; the ammunition waggons make two or three lines, sixty paces behind the guns, and thirty distant from one another; the pontoons and tumbrils make the last line. The whole is surrounded with a rope, which forms the park; the gunners and matrosses encamp on the flanks; and the bombardiers, pontoon-men, and artificers, in the rear. Of late when an army has been upon the point of engaging, or in expectation of an action, the artillery has been encamped in two parks, upon both flanks.

ARTILLERY Train, or Train of, a certain number of pieces of ordnance mounted on carriages, with all their furniture, fit for marching.

ARTILLERY Company, the, had its origin about 1585, when London being wearied with continual musters, a number of its gallant citizens who had served abroad with credit, voluntarily exercised themselves, and trained others to the ready use of war. The ground they used was at the north-east extremity of the city, near Billingsgate, and had before been occupied by the "fraternity of artillery," or gunners of the Tower. Within two years there were near three hundred merchants and others sufficiently skilled to train common soldiers; and in 1588, some of them had commissions in the camp at Tilbury; but their association soon after fell to decay. (Ellis's History of Shoreditch, p. 348.) From the company's register, the only book they saved in the civil wars, it appears that the association was revived in 1611, by warrant from the privy council; and the volunteers soon amounted to six thousand. Three years after this they made a general muster, when according to contemporary authority, the men were better armed than disciplined. (See Niccoll's London Artillerie, p. 104.) In 1622 they erected an armoury, towards

toward which the chamber of London gave above 300*l.*; it was furnished with five hundred sets of arms of extraordinary beauty, which were all lost in the civil wars. Their captain, during a part of those affrighted times, was a Mr. Manby, who irrecoverably detained for his own purposes, the arms, plate, money, books, and other goods of the company. The protector was in vain solicited to enforce their being restored. (Ellis's *Hist. of Shored.* p. 349.) In 1640 they quitted their old field of discipline, and entered upon a plot of ground in Bunhill-fields, leased to them by the city.

This company, at present, forms a regular battalion of infantry, consisting of a grenadier, light infantry, and hat divisions; together with the matross division for the use of two field pieces, presented in the year 1780, by the city. There is also kept up a division of archers; archery being the art cultivated by the company in days when the bow was an instrument of war. The command of the battalion is vested in officers who are annually elected. This municipal corps is authorized and privileged by many royal patents and warrants; and particularly by one of his present majesty, under the royal sign manual, wherein his royal highness the prince of Wales is declared captain-general. It consists of gentlemen of character and property, bound by a solemn declaration and obligation of attachment and fidelity to the king and constitution, and of readiness to join in supporting the civil authority, and defending the metropolis. It is regulated by a court of assistants, consisting of a president, vice-president, treasurer, the field officers; the lord mayor, aldermen, and sheriffs for the time being, and twenty-four elective members. (See the company's address to the inhabitants of London.)

ARTILLERY is also used for what we otherwise call *pyrotechnia*, or the art of fire-works, with the instruments and apparatus belonging to it.

ARTINGAL, in *Geography*, one of the PELEW Islands in the Pacific ocean.

ARTIS, in *Ancient Geography*, a place of Asia Minor, in Ionia.

ARTISAN. See ARTIST, and also ARTIFICERS, and MANUFACTURERS.

ARTISIGA, in *Ancient Geography*, a village of Africa, in Mauritania-Cæsariensis, situate on the sea-coast north-west of the mouth of the river Malva, about 27 miles west of Siga.

ARTISCUS, in *Medicine*, from *arctos*, bread, denotes a troche, but more particularly that prepared of viper's flesh, mixed up with bread, to be used in the composition of Venice troche. These are more particularly called *artifici theriaci*, or *theriacal troches*. They were formerly in great vogue, and brought with much parade from Venice; but Zwelfer discovered their vanity; since which time viper's powder has been generally substituted for them, in the preparation of the troche.

ARTISON, in *Natural History*, a common name among the French for various kinds of insects that injure furniture, skins, stuffs, &c. such as the Dermestes, Mites, &c.

ARTIST, in a general sense, a person skilled in some art; or, according to Mr. Harris's definition, a person possessing an habitual power of becoming the cause of some effect, according to a system of various and well-approved precepts. In this sense, we say, an excellent, a curious artist. The pre-eminence is disputed between ancient and modern artists, especially as to what relates to sculpture, painting, and the like. At Vicenza, we are told of a privilege granted to artists, like that of clergy in England; in virtue of this, criminals adjudged to death save their lives, if they can prove themselves the most excellent and consummate work-

men in any useful art. This benefit is allowed them *in favorem artis*, for the first offence, except for some particular crimes, of which poisoning is one. The exception is just, since here the greater the artist, the more dangerous the person. Evelyn's *Disc. of Medals*, ch. vii. p. 237, &c.

Artists are persons who practise those arts which must necessarily be combined with a considerable degree of science, distinguishing them from such as are properly artificers or mechanics. Artists are particularly those who study and effect what are termed the polite arts, i.e. painting, sculpture, and architecture, to which may be added engraving. An account of the most eminent artists, ancient and modern, will be found in this work alphabetically arranged, to which our readers are referred. It appears that all civilized nations in every age have produced artists, and that with a degree of excellence generally answerable to their civilization and opulence. In every nation where the arts have flourished, the artists have made but rude essays, and by degrees they have been nurtured up to excellence, except in such instances where they have been transplanted, as from Greece to Rome. It is universally acknowledged respecting statuary and architecture, that ancient Greece has produced the best artists in the world; their works which have escaped the ravages of time are the standing monuments of their fame, and are still considered as the models of perfection; there is however an uncertainty whether their painters were equally skilled with their statuaries. With some reason, many judicious persons have supposed they were not, while others contend, that so much excellence produced in one branch, must have contemporary artists who would excel in the other also. While we cannot doubt of the genius of the Grecian artists, and of their ability to produce works of excellence, yet it may not be allowed that this argument will be found to be so conclusive as it may at first appear, since Chinese and Indian models are found in a more perfect state than either their drawings or paintings. Sir Joshua Reynolds has given a hint upon this subject in his notes to Mr. Mason's translation of Du Fresnoy, which may be consulted upon one side of the question: and Mr. Webb, on the other, will not fail to interest any reader who may be inclined to believe in favour of ancient painters. When the Goths overran Italy, the arts were destroyed; and, with Grecian architecture, painting, and sculpture, lay in one common grave forgotten, until they revived under some artists in the twelfth and thirteenth centuries, who ought not to be named as artists, but for the succeeding effects to which their efforts prepared the way. and in a short time after produced Michael Angelo, Raphael, Corregio, Titian, Algardi, Bernini, &c. painters, sculptors, and architects, to whose works the living artists are almost as much indebted as these illustrious characters were to the ancient monuments they dug from the ruins of old Rome. While painters continued to pursue their wretchedly dry and barbarously gothic method of design, prior to these enlightened artists, even then, the bronze gates of the baptistry of the church at Florence were produced; upon a sight of which, M. Angelo cried out with emotion when he saw them, that they deserved to be the gates of paradise! Casts of these gates may be seen in the Royal Academy in London. This we notice to justify a remark which we have made, that painting does not always accompany with equal steps the efforts of sculpture.

An Englishman will observe with pleasure the progress which has lately been made, and is still making under the protection of our gracious sovereign, in this once barren land, by artists in painting, sculpture, and architecture.

ARTIST, *artista*, in an academical sense, denotes a philo-

sophor

Isopher or proficient in the faculty of arts. See ARTS.

ARTIST is more peculiarly understood of a chemist or alchymist. In which sense it is that Paracelsus and other adepts use the word.

ARTIZOOS, from $\alpha\rho\tau\acute{\iota}$, *short*, and $\zeta\omega\sigma$, *life*, is used by some ancient physicians for an infant short-lived, by reason of a difficult birth, whereby he was long detained in the passage from the womb.

ARTOARTA, in *Ancient Geography*, a town of India on this side of the Ganges. Ptolemy.

ARTOBRIGA, a town of Vindlicia, mentioned by Ptolemy, and supposed by some to be Altzburgh in Bavaria, on the Danube, below Ingepladt; but by Cluverius, to be Labenau, on the Saltzbach, below Lauffen, in the archbishopric of Saltzburgh.

ARTOCARPUS, in *Botany*, bread-fruit tree (from $\alpha\rho\tau\acute{\iota}$ and $\kappa\alpha\rho\pi\acute{\iota}\tau\omicron\varsigma$). Lm. gen. Schr. 1393. Supp. 61. Forst. gen. 51. Juss. 422. *Sitodium* Soland. *Garten*. t. 71, 72. *Radermachia* Thunb. Nov. Gen. 24. Class, *Monocelia monandria*. Nat. Ord. of *Urtica*. Juss. Gen. Char. * Male flowers, Cal. none; ament cylindrical, all covered with florets. Cor. to each two petals, oblong, concave, blunt, villose. Stam. filament single, within each corolla, filiform, the length of the corolla; anther oblong. * Female flowers, on the same tree. Cal. and Cor. none. Pist. germs very many, connected into a globe, hexangular; style to each, filiform; stigma single or two, capillary, revolute. Per. fruit ovate, globular, compound, muricate. See for each germ solitary, oblong, covered with a pulpy aril, placed on an ovate receptacle.

Ess. Gen. Char. Male, ament. calyx none. Cor. two-petalled. Female. Cal. and Cor. none; style one; berries one-seeded, connected, and forming a roundish muricated fruit.

Species, 1. *A. incisa*, bread-fruit tree. Forst. Esenl. Anst. 23. *Sitodium incisum*. Thunb. Phil. Trans. v. lxix. p. 465. *Radermachia incisa*. Thunb. Act. Holn. vol. xxxvii. p. 250. Le Rima, ou fruit à pain. Sonnerat Voy. 99. t. 57—60. See also the voyages of Dampier, Anson, Hawksw. Cook, King's Narr. Ellis Monogr.

α Fructu apyreno, fruit without seeds.

β Fructu femisifero, with seeds in the fruit.

Leaves: *gamb.* Forster, whose description of this tree appears to be more complete than that of any other writer, says it is the thickness of a man, and upwards of forty feet high; the trunk is upright, the wood soft, smooth, and yellowish, the inner bark white, composed of a net of flitchy fibres, the outer bark smooth, but full of chinks, pale ash-colour, with small tubercles thinly scattered over it. Wherever the tree is wounded, it pours out a glutinous milky liquor. The branches form an ample almost globular head; the lower ones, which are the longest, spring from the trunk ten or twelve feet above the ground, spreading almost horizontally, scattered, and in a sort of whorl; twigs ascending, bearing flowers and fruit at their ends. Leaves alternate, petioled, ovate, deeply divided above the middle into seven or nine lanceolate acute lobes, with rounded sinuses; they are otherwise quite entire, smooth on both sides, even, spreading, bright green, paler underneath, membranaceous, a foot and a half in length, eleven inches wide, veined, having a thick nerve to each lobe, diverging from the common rachis. The younger leaves, like all the more tender parts of the tree, are glutinous to the touch: petioles roundish, even, ascending, two inches in length; stipules in pairs, involving the younger leaves, lanceolate, acuminate, concave, entire, smooth within, hairy on the outside, deciduous, three inches long; peduncles at the ends of the twigs, and in the

axils of the upper leaves, solitary, round, upright, having a few hairs, and two inches in length. The male flowers are among the upper leaves; and the female flowers at the ends of the twigs. The male ament is club-shaped, fleshy, upright, a span long, covered with innumerable small, sessile florets. The proper perianth is very small, two-valved; valves equal, oblong, blunt, concave, closely adhering, shut, yellowish-brown. These have no spathes. The female flowers have bivalve spathes, ovate-lanceolate, compressed, acuminate, upright, bent at the tip, soft, a span in length, at first closed, then deciduous, placed at the end of the peduncle; spadix globular, covered with many connate germs, these are obconical, immersed in the receptacle, somewhat convex at the top; styles scarcely any; stigmas projecting point, withering; in some varieties these are bifid, according to Thunberg. The fruit is a globular berry, smoothish, marked with hexagons on the surface, pale green, often nine inches in length, filled with a white, farinaceous, somewhat fibrous pulp, which, when the fruit is ripe, becomes juicy and yellow; it is fastened to a club-shaped, fleshy receptacle, which is longitudinally fibrous, and a hand in length.

In captain Cook's voyage it is observed, that the bread-fruit tree is about the size of a middling oak; its leaves are frequently a foot and a half long, oblong, deeply sinuated like those of the fig-tree, which they resemble in consistence and colour, and in exuding a milky juice when broken. The fruit is the size and shape of a child's head, and the surface is reticulated not much unlike a truffle; it is covered with a thin skin, and has a core about as big as the handle of a small knife; the eatable part lies between the skin and core; it is as white as snow, and of the consistence of new bread. It must be roasted before it is eaten, being first divided into three or four parts; its taste is insipid, with a slight sweetness, somewhat resembling that of the crumb of wheaten bread mixed with Jerusalem artichoke. The fruit not being in season all the year, there is a method of supplying this defect, by reducing it to four paste called *mabié*; and besides this, cocoa-nuts, bananas, plantains, and a great variety of other fruits, come in aid of it.

This tree not only supplies food, but also clothing, for the bark is stripped off the suckers, and formed into a kind of cloth. To procure the fruit for food costs the Otahaitians no trouble or labour but climbing a tree; which though it should not indeed shoot up spontaneously, yet, as captain Cook observes, "if a man plant ten trees in his life-time, he will as completely fulfil his duty to his own and future generations, as the native of our less temperate climate can do by ploughing in the cold winter, and reaping in the summer's heat, as often as these seasons return; even after he has procured bread for his present household, he should convert a surplus into money, and lay it up for his children. But where the trees are once introduced in a favourable soil and climate, so far from being obliged to renew them by planting, it seems probable that the inhabitants will rather be under the necessity of preventing their progress; for young trees spring abundantly from the roots of the old ones, which run along near the surface. Accordingly they never plant the bread-fruit tree at Otahaiti." The bread-fruit is distinguished into that which is destitute of seeds, and that in which seeds are found. The natives of Otahaiti reckon on least eight varieties of trees which produce the former. The most common of these is named *uru* or *coroo*, bearing a globular, smooth, even fruit. The *maira* has an oval, smooth fruit, with the leaves more deeply cut. The *patea* has a fruit oblong and rough, with a scaly appearance. The *tatarra* has an oval fruit, with mammillary germs, muricated by the permanent style.—Probably, by extending the culture

culture to distant countries, the varieties may be still farther increased. The parts of fructification in those trees which bear fruit without stones, are said to be defective, as the ament never expands, and the styles are also deficient. In the variety β , the fruit contains a considerable number of seeds, almost as large as chestnuts, oblong, somewhat angular, produced into a point at each end. They are farinaceous like the chestnut, and are eaten in some places by the savage inhabitants, either boiled, or roasted in embers. It will easily be supposed that this fruit, abounding less in pulp, and being both more fibrous and less juicy than that which has no seeds, must be much inferior as an article of food; and, accordingly, before the discovery of the South Sea islands, the bread-fruit had not acquired that degree of reputation which it is now found to deserve. It has been long known in many parts of the East Indies, but not being wanted there for food, and consequently not having received any degree of cultivation, it has continued nearly in its natural state, without receiving that improvement from the care of men, which probably necessity first urged them to exercise. Accordingly, captain Cook remarked the great inferiority of the *fecum* which he found at Batavia, to the *eroco* of the South Sea islands.

This most useful tree is distributed very extensively over the East Indian continent and islands, as well as the innumerable islands of the South Seas. It was found by Dampier in the Ladrone islands: it is a native of Amboina, Banda, and others of the Molucca islands: of Java and others of the Maldivy islands: of Timor, Balega, and Madura, of Prince's island, &c. M. Sonnerat conveyed some of the trees from the island of Luçon to the isle of France. M. Poivre naturalized them both there and in the isle of Bourbon; and they are cultivated both in Malabar and Coromandel. In the South Seas both varieties are still found in the Marian islands, in the New Hebrides, and Friendly islands; but most abundantly in the Society, Marquiza, and Sandwich islands. In Otaheite however, and some others, the evident superiority of the seedless variety for food, has caused the other to be neglected, and it is consequently almost worn out. We are informed by captain King, that in the Sandwich islands these trees are planted and flourish with great luxuriance on rising grounds; that they are not indeed in such abundance, but that they produce double the quantity of fruit which they do on the rich plains of Otaheite; that the trees are nearly of the same height, but that the branches begin to strike out from the trunk much lower, and with greater luxuriance; and that the climate of these islands differs very little from that of the West Indian islands, which lie in the same latitude.—This relection probably first suggested the idea of conveying this valuable tree to our islands in the West Indies. For this purpose, his majesty's ship the *Bounty* sailed for the South Seas, on the 23d of December 1787, under the command of lieutenant William Bligh. But a fatal mutiny prevented the accomplishment of this benevolent design. His majesty, however, not discouraged by the unfortunate event of this voyage, and fully impressed with the importance of securing so useful an article of food as the bread-fruit to our West Indian islands, determined, in the year 1791, to employ another ship for a second expedition on this service, and in order to secure the success of the voyage as much as possible, it was thought proper that two vessels should proceed together on this important business. Accordingly, a ship of four hundred tons, named the *Providence*, was engaged for the purpose, and the command of her given to Captain Bligh; and a small tender called the *Assitant*, commanded by lieutenant Nathaniel Portlock. Sir Joseph Banks, as in the former voyage, directed the

equipment of the ship for this particular purpose. Two skilful gardeners were appointed to superintend the trees and plants, from their transplantation at Otaheite, to their delivery at Jamaica, and Captain Bligh set sail on the second of August 1791. He arrived at Teneriffe on the twenty-eighth, at St. Jago on the thirteenth of September, and at the cape of Good Hope on the sixth of November. He sailed from thence on the nineteenth of December; arrived at Adventure's bay on the ninth of February 1792, and at Otaheite on the eighth or ninth of April. The business of procuring and embarking the bread-fruit tree, &c. took up three months and nine days; though the natives of Otaheite gave all possible assistance to Captain Bligh and the gardeners. They sailed on the eighteenth or nineteenth of July; arrived at Coupang in Timor on the second of October; at St. Helena on the seventeenth of December, and at St. Vincent's on the twenty-second of January 1793. Here they layed seven days, to leave a part of their cargo, and on the fifth of February they arrived at Jamaica, and delivered the remainder. The number of plants taken on board at Otaheite, was 2634, in 1281 pots, tubs and cases; and of these 1131 were bread-fruit trees. When they arrived at Coupang, 200 plants were dead, but the rest were in good order. Here they procured ninety-two pots of the fruits of that country. They arrived at St. Helena with 830 fine bread-fruit-trees, besides other plants. Here they left some of them, with different fruits of Otaheite and Timor, besides mountain rice and other seeds; and from hence the East Indies may be supplied with them. On their arrival at St. Vincent's, they had 551 cases, containing six hundred and seventy-eight bread-fruit-trees, besides a great number of other fruits and plants to the number of 1245. Near half this cargo was deposited here under the care of Mr. Alexander Anderson, the superintendent of his majesty's botanic garden, for the use of the Windward Islands; and the remainder, intended for the Leeward Islands, was conveyed to Jamaica, and distributed as the governor and council of Jamaica pleased to direct. The exact number of bread-fruit trees brought to Jamaica was 352, out of which five only were reserved for the botanic garden at Kew. Though the principal object of this voyage was to procure the bread-fruit tree, yet it was not confined to this only, for the design was to furnish the West Indian isles with the most valuable productions of the South Seas and the East Indies. Accordingly, the gardeners were instructed to procure plants of sweet plantain called *meia*, the Otaheitean apple or *avee*, the root called *paab*, of which the islanders make a kind of pudding, and a species of yam much larger and better than any in the West Indies. They were also to obtain at Timor and other places in the East Indies such plants and fruits as are used for food or otherwise by the natives, as the *lanja*, *mangestian*, *durion*, *jambou*, *nanca*, *tchan*, *padla*, *blimbing*, *jambolan*, *boelidarra*, *salac*, *bleek*, long pepper, &c. together with some bushels of dry or mountain rice, which is cultivated without being overflowed with water; and they were to make themselves acquainted with the mode of managing it in order to communicate the same to the inhabitants of the West Indies. Captain Bligh had the satisfaction, before he quitted Jamaica, of seeing the trees which he had brought with so much success, in a most flourishing state; insomuch that no doubt remained of their growing well and speedily producing fruit; an opinion which subsequent reports have confirmed. But though the fruit has been produced in great abundance, it is said not yet to have arrived at that high state of perfection in which it is described to be at Otaheite. Thunberg sent seeds of the East Indian bread-fruit tree from Batavia

to the botanic garden at Amsterdam, in 1775. In 1777, he sent some small living plants; and the year following, he brought with him to Europe a great number of plants, both of this and the following species. But the true seed-lands sort, from the South Seas, was first introduced into the islands of St. Vincent and Jamaica, and into the botanic garden at Kew, by Captain Bligh, in 1793.

The bread-fruit, when perfectly ripe, is pulpy, sweetish, putrescent, and in this state is thought to be too laxative; but when green it is farinaceous, and esteemed a very wholesome food, either baked under the coals, or roasted over them. The taste is not unlike that of wheaten bread, but with some resemblance to that of Jerusalem artichokes or potatoes. It was mentioned before that a sort of cloth was made of the inner bark: to this we may add, that the wood is used in building boats and houses; the male catkins serve for tinder; the leaves for wrapping their food in, and for wiping their hands instead of towels; and the juice for making bird-lime, and as a cement for filling up the cracks of their vessels for holding water. Three trees are supposed to yield sufficient nourishment for one person. In the Malay language the bread fruit is called *pacan*, in Java *sakau*, in Amboina *siun* or *siune*, in Makassar *bakar*, in Ternate *gomu*, in Timian *rimo*, the Dutch call it *jack-f-boom*, the Germans *brodbaum*, the French *rima* or *fruit à pain*.

2. *A. integrifolia*, Indian Jaca tree; "leaves entire;" *Sitodium macrocarpon*, Thunb. Phil. Transf. v. 69. p. 254. *Sitodium cauliflorum*, Gertn. fruct. 1. 345. *Soccus arboreus nanea*, Rumph. Amb. 1. t. 30—31. *Tsjacca-maram*, *J. Jacca*, Rheed. Mal. 3 t. 26, 27, 28. The East Indian Jacca, or Jack-tree, is about the same size as the foregoing or perhaps larger. Branches alternate, spreading; the twigs hirsute with long stiff hairs; leaves alternate, petioled, ovate-oblong, blunt, obscurely serrate, undivided, nerved, bright-green, and very smooth on the upper surface, paler beneath, and hirsute with stiff hairs, spreading, a span in length. The younger leaves are evidently toothed, but the teeth disappear. The foot-stalk is somewhat triangular, smooth, an inch in length; stipules as in the foregoing; flowers male and female distinct on the same stem or branch; peduncle either simple or branched, pendulous an inch thick, and a foot long; pedicels three, five, or more, the length and thickness of a finger. The fruit weighs thirty pounds and upwards; it has within it frequently from two to three hundred seeds, three or four times as big as almonds; they are ovate-oblong, blunt at one end, sharp at the other, and a little flattened on the sides. These two species of artocarpus cannot be distinguished with certainty either by the form of the leaves, or the situation of the fruit; for the leaves in this are sometimes lobed as on that; and the situation of the fruit varies with the age of this tree, being first borne on the branches and then on the trunk, and finally on the roots. The Jacca tree is a native of Malabar and the other parts of the East Indies. The fruit is ripe in December, and is then eaten, but is esteemed difficult of digestion; the unripe fruit is also used pickled, or cut into slices and boiled, or fried in palm-oil. The nuts are eaten roasted, and the skin which immediately covers them, is used instead of the areca nut in chewing betel. The wood of the tree serves for building. No less than thirty varieties of the fruit are enumerated in Malabar. It was introduced into the royal botanic garden at Kew, in 1778, by Sir Edward Hughes knight of the bath.

Propagation and Culture. Those varieties which bear seeds may be propagated by them, sown in a pot of rich earth, and plunged in the bark-bed. Those which have no seed in the fruit may be increased from suckers, in which they abound very much, or by layers. In hot climates

they succeed best in a rich soil; for though they will grow in an indifferent one, yet they by no means arrive at that magnitude, nor is the fruit so well-flavoured as when they are planted in a good one. In the East Indies they thrust a fruit of the Jacca into the ground whole, and when the numerous seeds germinate and grow up, they tie the stems altogether with withes, and by degrees they form one stem, which will bear fruit in six or seven years if not placed in too wet a situation. See Martyn's Miller's Dict.

ARTOIS, in *Geography*, a province of France before the revolution, is one of the most fertile and most productive of grain and fruit in the whole kingdom. It was formerly one of the seventeen provinces of the Netherlands; but since the revolution it is principally included in the department of *pas de Calais*, or *fruits of CALAIS*. The chief city is ARRAS. This province is about twenty-three leagues long, and twelve broad; and is bounded on the west and south by Picardy, on the north-east by Flanders, and on the east by Hainault and Cambresis. The name of *Artois* is derived from the *Atrabati*, who occupied this part of Gallia Belgica in the time of Cæsar. From the dominion of the Romans it passed to that of the French kings, who possessed it in 865; in 1237 it was erected into a Comté by St. Louis, and given to his younger brother Robert I. It was surrendered by Charles VIII. the son and successor of Louis XI. to Maximilian of Austria, by the treaty of Senlis, in 1493. The houses of Austria and of Spain possessed it in succession till the year 1640, when Louis XIII. obtained it by conquest from Philip IV. king of Spain; and from his time it has been subject to France. The peace of the Pyrenees, in 1659, secured it to him, with the exception of the towns of Aire and St. Omer, which, together with their respective territories, were referred to Spain, but afterwards ceded to Louis XIV. in 1678, by the treaty of Nimègue, confirmed by subsequent treaties, and particularly by that of Utrecht in 1713. Its commerce consists principally in grain, flax, hops, wool, and linen cloth.

ARTOLICA, in *Ancient Geography*, a town of the Sallasi, in Gallia Cispadana, at the foot of the Alps, now called *la Tuile* by the inhabitants, a hamlet of Savoy, in the duchy of Aouit, at the foot of mount St. Bernard the Lefs.

ARTOMELI, from *αρτος*, bread, and *μελι*, honey, in *Ancient Pharmacy*, a kind of cataplasin prepared of bread and honey, applied chiefly to the precordia.

ARTON, in *Geography*, a town of France, in the department of the lower Loire, and chief place of a canton in the district of Paimbœuf, seventeen miles south-west of Nantes.

ARTONNE, a town of France, in the department of Puy de Dome, and chief place of a canton in the district of Riom, five leagues north of Clermont, and two and a half north of Riom.

ARTOTYRITES, or ARTOTYRITÆ, in *Ecclesiastical History*, a branch of the ancient *Montanists*, who first appeared in the second century, chiefly in Galatia.

They use bread and cheese in the Eucharist, or perhaps bread baked with cheese.—Their reason was, that the first men offered to God not only the fruits of the earth but of their flocks too.

Hence, according to St. Augustine, came their name, which is composed of *αρτος*, bread, and *τυρος*, cheese.

The Artotyrites admitted women to the priesthood and episcopacy; and Epiphanius says, that it was common to see seven girls enter at once into their church, in white robes, with torches in their hand, where they bewailed with tears the miseries of human life.

ARTRO, in *Geography*, a river of North Wales, which runs to the sea near Llanbeder in Merionethshire.

ARTUSI, GIO. MARIA, of Bologna, in *Biography*, though he is ranked only among the minor writers on music, yet if his merit and importance are estimated by the celebrity and size of his volumes, certainly deserved the attention of students and collectors of musical treasures. In his "Arte del Contrappunto ridotta in tavole," published at Venice, 1586, he has admirably analysed and compressed the voluminous and diffuse works of Zarlino and other anterior writers on musical composition, into a compendium, in a manner almost as clear and geometrical as that in which M. d'Alembert has abridged the theoretical works of Rameau. In 1589, Artusi—who, like most of the musical writers of Italy, was an ecclesiastic, published a second part of his "Arte del Contrappunto," which is a useful and excellent supplement to his former compendium. And in 1600 and 1603, this intelligent writer published at Venice the first and second part of another work, "Delle Imperfezioni della moderna musica." Here the author gives a curious account of the state of instrumental music in his time; and in describing a grand concert that was made by the nuns of a convent at Ferrara, in 1598, on occasion of a double wedding between Philip III. king of Spain with Margaret of Austria, and the archduke Albert with the infanta Isabella, the king's sister, he enumerates the several instruments that were employed, and points out their excellencies and defects. Among these, though the violin is just mentioned, yet nothing is said of its properties, while the cornet, trumpet, viol, double-harp, lute, flute, and harpsichord, are honoured with particular remarks both on their construction and use: but among these, the cornet, which has been supplanted in the favour of the public by the hautbois, seems to have stood the highest in the author's estimation. The elder Doni, in his dialogue written about fifty years before, mentions the cornet more frequently than any other instrument: "Il divino Antonio da cornetto perfettissimo—et M. Battista dal Fondaro con il suo cornetto ancora; che lo suona miracolosamente."

I have not been able, says Dr. Burney, to discover what instrument is to be understood in this dialogue, when Girolamo Parabosco says, "Io suonero lo strumento;" and when it is said, "M. Gio. Vaniacopo Buzzi so suonando di violone il soprano, come egli fa miracolosamente." I am utterly unable to guess what instrument is meant, unless the word *violone*, by a typographical error, has been printed for *violino*. But to return to Artusi's remarks upon instruments: his hero on the cornet was Girolamo da Udine. In speaking of defects in the intonations of different instruments, I expected the violin would be celebrated for its superior perfection in that particular; but by the author's silence on that subject, I am convinced that it was either then but little used in concert, or was very ill played. Burney's Hist. Mus. vol. iii. p. 174.

ARTYMNÆSUS, in *Ancient Geography*, a town of Asia, in Lycia, where the Xanthians are said to have established a colony.

ARTZ, in *Geography*, a district of the island of Zealand, belonging to Denmark, in the prefecture of Kallundborg, which includes nine churches.

ARTZBACH, a river of Germany, which runs into the Ens, four miles south of Reiffing, in the duchy of Stiria.

ARTZBERG, a town of Germany, in the archduchy of Austria, near the Ens, twelve miles south-east of Steyr.

ARU, or **AROR**, a small island in the Indian sea, between the island of Sumatra and the peninsula of Malacca. See **ARRO**.

ARU, in *Ichthyology*, a name by which the Russians distinguish a species of mackerel found in the seas about Kamtschotka: the natives call it *luna*.

ARUA, in *Ancient Geography*, a town of Spain, in the district of Hispalia, now *Alcala*, a citadel of Argalanda on the banks of Guadalquivir, seven leagues above Seville.

ARVA, in *Geography*, a town and castle of Hungary, the capital of a county which extends to Tilly, lying on the frontiers of Sclavia and mount Crap, between the north of Rosenburg.—Also, a river of Hungary, which runs into the Waag, eleven miles north of Arva.

ARVAD, in *Ancient Geography*, the same as **ARVA**.

ARVALIS FRATRES, in *Antiquities*, a society of priests, in ancient Rome, who officiated in the temple of Saturnus *Arvalis*, celebrated every year to commemorate the fertility and prosperity of the principal fruits of the earth, viz. the corn and wine.

They were instituted by Romulus, and were twelve in number; all of them portions of the first fruits of the founder land. He is supposed to have divided the land into three equal parts, and to have reserved one of them for himself. They constituted a college called *Arvalis fratres*, or *Arvalis*.

The mark of their dignity was a golden cornucopia of ears of corn tied with a white ribbon; the youngest of them was the first crowned in his office.

According to Fulgentius, Aeca Laurentia, Romulus's nurse, was the first founder of this order of priests; for, it seems, had twelve sons, who used to walk but in procession to the sacrifice; one of whom dying, Plautus, in favour of his nurse, promised to take his place; and he, he says he, came this sacrifice, the number twelve, and the name of brother.—Pliny (lib. xvii. cap. 2.) seems to indicate the same thing, when he mentions that Romulus substituted priests of the fields, after the example of Aeca Laurentia, his nurse.

ARUANUS, in *Conchology*, a species of the *Murex* genus, that inhabits New Guinea. It is a coarse and heavy shell, usually of a black or bluish colour, and divided with rings; the aperture is angulated; the tail rather long, and spire pointed. The specific character is thus defined: tail parulus; spire crowned with spines. *Obj.* This is the *lucium aurum* of Rumphius.

ARVARI, in *Ancient Geography*, an ancient people of India, on this side of the Ganges.

ARVAS, a town of Asia, in Hircania. Q. Curtius.

ARUBA, in *Geography*, one of the Little Antilles islands in the West Indies, subject to the Dutch; it lies near the coast of Terra Firma, fourteen leagues west of Curacao, is uninhabited, and produces little else besides corn and wood. N. lat. 12° 30'. W. long. 67° 55'.

ARUBA, a town of Persia, in the province of Meeran, near a cape of the same name in the Indian ocean, thirty leagues east of Meeran.

ARUBIUM, or **ARRUBIUM**, a town of Lower Mesia, on the Danube.

ARUBO, a river on the coast of Guiana, west of Tequisito gulf.

ARUBOTH, or **ARABOTH**, in *Ancient Geography*, a town or country of Palestine, in the tribe of Judah.

ARUCCI NOVUM, a town situate on the confines of Lusitania and Bætica, placed by Antonine thirty miles from *Pax Julia*; now *Moura*, a small town of Portugal, near the confluence of the Ardia and Guadalquivir.

ARUCCI VERUS, a small town of the Turdetani, in Bætica; now *Arabic*, a hamlet of Andalusia, on the confines of Portugal and Lisbon, distant on the river Guada, seven leagues to the east of *Algarve*. A monument in its vicinity called *Aruchenna* derives its name from it; now *la Seta d'Arabic*.

ARUCIA, a town of Illyria, in the interior parts of Liburnia. Ptolemy. According to some, it is now *Bregua*; but according to others, *Ostjburg*, a citadel of Munichia.

ARUDIS, a town of Asia, in Syria, situate on the Euphrates, south-east of Samofata. Ptolemy.

ARUDY, in *Geography*, a town of France, in the department of the Lower Pyrenees, and chief place of a canton in the district of Oleron, 11 miles south of Pau.

ARVE, a famous and violent river of Savoy, which rises from the Alps, in the county of Faucigny, and runs into the Rhine near Geneva.

ARVEDORUM MONTES, in *Ancient Geography*, mountains of India, on this side of the Ganges. Ptolemy.

ARVENSIS, in *Entomology*, a species of *CURELLO* described by Müll. Zool. Dan. It is grey, with three lines on the thorax; wing-veins rufous, and faintly tessellated.

ARVENSIS, a species of *CICADA* found in Denmark. It is yellow; front, abdomen beneath and tibiae black. Müll. Gmel. &c.

ARVENSIS, a species of *PHALENA* (*N. Fua* Linn.) The wings are brown, with a transverse yellow spot in the middle; margin brown. Gmel. Fab. &c.—*N. Fua lruvna* of Wien. Schmettel. This insect is of the middle size, and the under-side is brown; the larva is naked, brown, and spotted with white; the lateral line is bluish; head black, with two white lines.

ARVENSIS, a species of *VESPA* that inhabits Europe. It has four yellow bands on the abdomen, the third of which is interrupted. Linn. Fn. Sv. Schæff. &c.

ARVERNI, in *Ancient Geography*, a denomination given to one of the most powerful nations of Gaul, whose country, according to Strabo, was situated between the ocean, the Pyrenees, and the Rhine. They claimed affinity with the Romans, as the descendants of Antenor; to this purpose, Lucan says of them,

“Arvernique aussi latio se dicere fratres
Sanguine ab Iliaco populi.”

And Pliny says, that after their conquest by the Romans, their ancient liberty was preserved to them on account of their bravery. When Cæsar took possession of Gaul, it was divided into two factions, the Arverni, and the Ædui; and it is said, that the complaints preferred at Rome by the Ædui against the Arverni, were one of the causes which brought the arms of the Romans into Gaul, under the command of Fabius Maximus and Domitius Ahenobarbus. According to Steph. Byz. they were one of the most warlike nations among the Celts. Their country was comprised in Aquitania Prima, and their capital was “Augullonematum,” now Clermont, in Auvergne. N. lat. 45° 42'. E. long. 3° 20'.

ARVERON, in *Geography*, a river which rises in a glacier of Montanvert, in the Alps, and runs into the Arve.

ARVICITO, a town of Italy, in the kingdom of Naples, on the east coast of Calabria Ultra, four miles south of Stilo.

ARVICOLA, in *Entomology*, a species of *SCARABÆUS* (*Aph. lucida* Fab.) found in Russia, and greatly resembling *S. i. rucicola*. The shield of the head is reflected; body black and immaculate. Gmel. &c.—*Of.* It is hairy; and the thorax is tinged with blue.

ARVIEUX, LAURENT D', in *Biography*, was born of a family of rank at Marseilles, in 1635, and accompanied a relation to Seyde in 1653. In this place, and in other parts of Syria and Palestine, he resided 12 years, perfecting himself in the eastern languages, and extending his acquaintance with the history, manners, and politics of the Levant.

Returning to France in 1665, he was deputed as an envoy to Tunis in 1668, for the purpose of negotiating a treaty. While he was successfully conducting this business, he procured the liberation of 300 French slaves, who, upon being restored to their country, offered him a purse of 600 pistoles, which he declined accepting. At Constantinople, whither he was sent in 1672, he obtained every thing he asked; and surpris'd the Turks by holding all his conferences without an interpreter. He was afterwards, viz. in 1675, sent to Algiers, and obtained the freedom of 240 French slaves. In 1679, he was preferred to the consulate at Aleppo, where he performed various services, which recommended him so much to pope Innocent XI. that he sent him a brief for the bishopric of Babylon, empowering him to appoint another person if he himself chose to decline it. Accordingly he nominated father Pidon to the office. In 1686, he returned to Marseilles, and principally devoted himself to literary pursuits. He wrote several memoirs on Modern History, and the affairs of the Levant; and he employed the last years of his life in the study of the scriptures in their original languages, aided by the eastern commentaries and paraphrases. He died in 1702, aged 67. In 1717, M. De la Roque printed, in 12mo., a MS. which he had left unfinished, containing an account of a journey to the grand emir of the Arabs, with a description of the manners and customs of that people; and in 1734 there appeared, “Memoirs of the chevalier D'Arviens,” with an account of all his travels, &c. in 6 vols. 12mo., collected and arranged by father Labat, a Dominican. Moreri. Gen. Biog.

ARVIL, in *Ancient Geography*, a people of Gallia Lyonenfis, mentioned by Ptolemy, who are supposed, by M. d'Anville, to have occupied that part of Gaul which corresponds to part of Maine. Some vestiges of their ancient capital have been discovered in *La Cité*, on the river Erve, which runs into the Sarthe.

ARVIL-Supper, an entertainment made at funerals in the northern parts of England; and *arvil*-bread is the bread delivered to the poor on such occasions. Arvil has also been used for the funeral rites themselves.

ARVIRAGUS, in *Biography*, a British king, flourished, according to Geoffrey of Monmouth, and other native writers, in the time of the emperor Claudius. Geoffrey's account is generally deemed fabulous; however, he says, that he was the son of Kymbeline; that upon the death of his father and brother, he headed the Britons, and gained a victory over Claudius; that upon Claudius's return to Rome, he became a powerful prince, and assumed independent authority; that upon the arrival of Vespasian, he made a compromise with him, and retained his dominions; and that, having governed the kingdom in peace, his life was protracted to a good old age; that he was loved and feared even by the Romans; and that he was buried at Gloucester, in a temple he had built and dedicated to the honour of the emperor Claudius. An old tradition reports, that, in the time of this king, Joseph of Arimathea came over to Britain, and planted the gospel in this country. Biog. Brit.

ARUM, in *Botany* (supposed from *arv*, noxa, injury). Linn. g. 1028. Schreb. 1387. Germ. t. 84. Juss. 24. Clafs, *graminia polyandra*. *Monocia monandra*, Schreb. Nat. Ord. *Piperis*.—*Arvodee*, Juss. Gen. Char. ♂ Male flowers on the same spatix with the females, closely placed between a double row of threads. *Cal.* spathe one-leaved, very large, oblong, convolute at the base, converging at the top; the belly compressed, coloured within; spatix club-shaped, quite simple, a little shorter than the spathe, coloured, fenced at bottom with germs, and shrivelling above them; perianth proper none. *Cor.* none; nectaries? thick at the base, ending in

in threads or tendrils, in two rows, arising from the middle of the spadix. *Stam.* filament none; each anther sessile, four-cornered. * Female flowers on the lower part of the spadix, close to each other. *Cal.* spathe and spadix common to them with the males; perianth proper none. *Cor.* none. *Pist.* germ each obovate; style none; stigma branched. *Per.* berry globular, one-celled. *Seed.* several, roundish.

Eff. Gen. Char. spathe one-leaved, cordate; spadix naked above, female below, staminate in the middle. *Species:*

* *Without flowers; leaves only.*

1. *A. crinitum*, hairy sheathed arum; "leaves pedate, with the lateral segments involute; spathe hairy within; spadix rametaceous above;" root leaves cut into four parts, which are lanceolate, nerved, middle part broadest; the leaves are sagittate, or five-cleft, variegated; petioles round, sheathing at both ends, scape very short, round; spathe as in the common arum; spadix subcylindrical, a little shorter than the spathe; club many times longer than the other parts, having remote violet-coloured fimbles scattered over it. The flower smells strong like carrion, by which flies are enticed to enter, but when they would retreat, the reversed hairs prevent them, and they are there starved to death. It is a native of Misorea, and introduced in 1777, by Mr. Malcolm. It flowers in March. 2. *A. draconculum*, long sheathed arum or common dragon, "leaves pedate, leaflets lanceolate, entire; lamina ovate, longer than the spadix;" this has a large tuberous belly root, which in the spring puts up a straight stalk about three feet high, spotted like the belly of a snake; at the top it spreads out into leaves, which are cut into several narrow segments almost to the bottom; at the top of the stalk the flower is produced, which is in shape like the common arum, having a very long spathe, of a dark purple colour, standing erect, with a large spadix of the same colour, so that when it is in flower, it makes no unpleasing appearance, but the flower has so strong a scent of carrion, that few persons can endure it. It is a native of the southern parts of Europe, flowering in June and July. Cultivated by Gerard in 1556. 3. *A. draconthion*, short-sheathed arum, or green dragon, "leaves pedate, leaflets lanceolate, entire, longer than the spathe, which is shorter than the spadix;" it rises about eight or nine inches high; leaves petioled, upright, smaller than those of the common dragon; leaflets broad, lanceolate, commonly in threes; spadix awl-shaped, slender, longer than both spathe and leaves. It flowers with us in June, and grows in moist places in Virginia and New England, also in Japan and China. Cultivated by Miller in 1739. 4. *A. venosum*, purple-flowered arum, "leaves pedate, leaflets suboval, entire, lamina lanceolate, longer than the spadix;" the native country of this species is not known. It flowers in March, and was introduced by Mr. Malcolm in 1774. 5. *A. pontaphyllum*, five-leaved arum; "leaves quinque;" it grows about a foot high, subcaulescent, upright; leaflets lanceolate, entire, smooth. A native of the East Indies and China. 6. *A. triphyllum*, three-leaved green-stalked arum; "leaves ternate, lamina lanceolate, acuminate, the length of the spadix;" it is subcaulescent, with the scape arising from the petiole; some scapes are male, others female, from the same root; the male spathe is erect, the female has the *Sp.* inflected. The Brazilian plant has the side leaflets lobed outwards. The Virginian plant has them only gibbous, but the structure of the flower is the same in both. This plant according to Linnæus differs in China from the foregoing, in having the leaflets distinct, not pedate. It flowers in June and July, and appears from Evelyn's calendar to have been cultivated here, in 1664. 7. *A. abrotanum*, three-leaved purple-stalked arum.

A. triphyllum, γ Lin. Sp. p. "Leaves ternate, lamina ovate, shorter by half than the spadix." A native of Virginia, and cultivated by Miller in 1738. It flowers in June and July. 8. *A. ternatum*, "leaves ternate, receptacle longer than the spathe." Found in Japan by Thunberg, flowering in May and June.

** *Without stems; leaves only.*

9. *A. calycifera*, Egyptian arum, *Curch.* car. 2. t. 45. "Leaves peltate, ovate, repand, semibifid at the base;" it has a thick large oblong root, rounded at the base; leaves thick, smooth, ash-coloured, in form and size resembling those of the water-lily; petioles thick, upright, roundish, whitish, spreading out at the bottom; scape short, with a foliolate reflex first sheath. A native of the Levant, Egypt, Sicily, &c. This plant is esteemed a wholesome food. 10. *A. bicolorum*, two-coloured arum, "leaves peltate, sagittate, coloured on the disk, spathe contracted in the middle, subglobular at the base, lamina roundish, acuminate; upright, somewhat concavate." This is cultivated in Madras, and was introduced here in 1773, by Messrs. Kennedy and Lee. It flowers in June and July. 11. *A. esculentum*, ciculent arum, or Indian kale. Sloan. Jam. t. 1. 156. "Leaves peltate, ovate, entire, emarginate at the base;" the root is large, tuberous, subovate, brown, with small tubers growing at the side of it. The plant is about three feet in height; leaves smooth, of a bright green, semibifid at the base, and roundish; petioles round, dilated at the base, embracing the inner ones; spathe spreading, straight, not cowed, longer than the spadix. The Jamaica plant seems to be smaller than that of the east; for Sloane says that it only rises a foot from the ground. He says, in that island this species is planted very carefully in moist plantations; that the roots are eaten, but that the leaves are most valued, which are boiled and used as coleworts. It would seem indeed that the *A. ciculentum* is a plant highly useful and very generally cultivated in warm climates, and by none more than by the natives of the South Sea islands. The acrimony of the root in its recent state is so great, that when eaten raw, it will excoriate the mouth, but on being baked, this acrimonious quality is wholly dissipated. This species was cultivated by Miller in 1739. 12. *A. macrorrhizon*, long-rooted arum. Flor. Aub. n. 329. "Leaves peltate, cordate, repand, two-parted at the base;" this has a very large root, or rather subterraneous trunk, the thickness and length of the human arm; leaves very large and wide, shining on both sides, furnished with strong prominent nerves; their very long hollowed petioles form at bottom, where they embrace each other closely; stem three feet long, and as thick as a man's arm. The flower is white and very sweet; all the florets are hermaphrodite. This species, which is distinguished by its great size, is a native of China, and Cochin-China, the East Indies, Ceylon, and the islands of the Southern Ocean, and is eaten by the natives like the foregoing. 13. *A. peregrinum*, "Leaves cordate obtuse mucronate; angles rounded." A native of America. Mr. Miller says that he has received three sorts of arum from the West Indies, by the title of Edder, but he supposes this to be most commonly cultivated there for its roots. 14. *A. divaricatum*, "leaves cordate-hastate, divaricate." Rheed. Mal. II. 39. t. 20. Spathe revolute; spadix subulate, longer than the spathe. A native of Malabar and Ceylon. 15. *A. trilobatum*, three-lobed arum, Mill. fig. t. 52. f. 2. "Leaves sagittate-trilobate; flower sessile." Miller describes this plant as follows: root tuberous; leaves remaining most part of the year; spathe six inches long, inclining downwards, having a long point twisted like a screw, inside deep purple, outside green; spadix long, slender, purple;

ple; sent out from the spathe, turn upwards, the flowers being contained in a leaf brought from Ceylon in 1758, and first sold in the Chelsea garden. It has been here in May and June, and is a *var. triflorum*, narrow-leaved arum, Jacq. Hort. 2. 121. Brown's Jam. and Sloane's Jam. 1. 75. t. 27. f. 2. Hort. Coch. 536. "Leaves sagittate, the angles obtuse, acute;" upright four feet high; leaves large, dusky green, held at the base, diverging, all the angles acute; footstalks round, spotted with red and black; spathe long, white, longer than the spadix, which is club-shaped. A native of the Spanish West Indies, China, and Occident." Cultivated by Miller in 1731. In Jamaica it is called handler Indian kale, and cultivated there by several persons for the same purposes as the *A. rotundifolium*, *A. rotundifolium*, common arum, Curt. Lond. 2. 63. Woods. 1. 27. Smith Flor. Brit. Herb. Wither. Lightf. 2. Common arum without spots. *β* Common spotted arum. *γ* Italian arum. "Leaves hastate, entire; spadix club-shaped." It has a tuberous whitish root about the size of a large nutmeg, growing transversely, sending forth on every side a great number of single fibres, propagating itself by lateral tubercles; leaves radical, from two to four, shining, veiny, frequently marked with dark purple or black spots, sometimes streaked with white, standing on sheathing triangular footstalks; spathe usually green, and often spotted like the leaves; spadix varies from a yellowish green, to a fine purple; berries scarlet, in a naked cluster, each containing one or two seeds. It is common in moist parts of Europe, and is the only species of the genus indigenous in Britain. It is usually found under hedges, flowering in May, and ripening its berries in the autumn. 18. *A. virginicum*, Virginian arum. "Leaves hastate-cordate, acute; angles obtuse." It grows wild in wet places in Virginia, Carolina, Pennsylvania, &c. The savages boil the spadix with the berries, and devour it as a great dainty. 19. *A. prostratum*, Apennine arum, arifarium, Tournef. Boec. Muff. 2. 61. t. 50. "Leaves hastate, spathe declinate, filiform-subulate." A native of the Apennines. Spathe shaped like a monk's cowl; leaves on very short footstalks. 20. *A. arifarium*, broad-leaved hooded arum, or friar's cowl. Hort. Chil. 435. Sabb. Hort. 2. t. 79. "Leaves cordate-oblong, aperture of the spathe ovate; spathe entire and bent inwards above, below not convolute;" about a foot and a half high; leaves sharpish; spathe shorter than the leaves; spadix curved; berries red, one-seeded. A native of the south of Europe. Dr. Smith observes, that the Italians call this plant *illume*, from the striking resemblance of its flower, when reversed, to a lamp with its wick. Cultivated by Gerard in 1596. 21. *A. pictum*, painted arum. "Leaves cordate, painted with coloured veins;" root-leaves three or four, petioled, painted on the upper surface with white veins; spathe sessile, radical, inflated at the base, green, except at the top where it is purpleish; spadix with an ovate-oblong, dark purple club; germ. subglobose, green; anthers immediately above them; upper filaments remote. See Supp. Plant. 410. 22. *A. ovatum*, Rumph. Amb. 5. 312. t. 108. "Leaves ovate-oblong; spathe scabrous." A native of the East Indies. 23. *A. tenaxifolium*, grass-leaved arum, or narrow-leaved friar's cowl. "Leaves lanceolate; spadix bristle-shaped, declinate." This species usually has five or six shining leaves resembling those of narrow-leaved plantain; spathe long, pointed, reflex, white; spadix seven inches long, purple or greenish, pointed. It grows wild about Rome, Montpellier, also in Dalmatia and the Levant. We learn from Lebel that it was cultivated here in 1570. 24. *A. cannesifolium*, Supp. Plant. 410. "Leaves lanceolate, veinless;" leaves few, two feet long, resembling those of canna; scape very short; spathe rather

obtuse, red without, white within. In the spadix there is no space between the stamens and pistil. A native of Surinam, on trees, parasitical.

25. *Gaultheria*.

25. *A. arborea*, tree-arum, Plum. Amer. 44. t. 51. g. & h. "Straight; leaves sagittate." A native of South America. 26. *A. ferruginea*, dumb cane arum, Jacq. Amer. 239. t. 151. pict. t. 229. Miller's fig. 295. See Sloane and Brown's Jam. "Nearly upright; leaves lanceolate ovate." It rises to the height of six or seven feet, with a green jointed stalk, as large as a walking-cane. Leaves placed irregularly at the top of the stalks in a cluster; they are oblong, of a light green colour, and sometimes punched with holes, as in the *dissectum* *fertissimum*. On the side of the stalks, between the leaves, the flowers appear with a long spathe of a pale green colour, marked with white spots. The female flowers and stamens are ranged only on one side of the spadix, a circumstance which distinguishes it from all its congeners. It is a native of the Sugar Islands, and the warmer parts of America. Cultivated in 1759, by Miller. The whole plant abounds with an acrid juice, so that if applied to the tongue, this organ swells so much as to lose the power of articulation, and hence the name of *dumb-cane*. In this way it is said to have been used as a punishment for negroes. The juice is sometimes employed to assist the lime in promoting the granulation of sugar. 27. *A. bellarum*, ivy-leaved arum, Jacq. Amer. t. 152. pict. 230. "Radical; leaves cordate, oblong, acuminate; petioles round." A native of the West Indies. 28. *A. lingulatum*, tongue-leaved arum, Brown, Jam. 333. n. 12. Sloane's Jam. 1. 75. t. 27. f. 2, 3. "Creeping; leaves cordate lanceolate; their footstalks edged with membranes." It readily climbs trees, and becomes more succulent and luxuriant towards the top. A native of the West Indies. 29. *A. auricom*, ear-leaved arum, Brown Jam. 331. n. 2. Sloan. t. 169. "Radical; leaves ternate; those on the side one-lobed." A climbing plant, sending out roots from the stems and branches; leaves large heart-shaped, having three lobes or ears; flowers enclosed in a large spathe. A native of the West Indies. Found on all the hills of Jamaica, climbing the trees, and is the only arum with compound leaves in that island. Cultivated by Miller in 1748. 30. *A. indianum*, Indian arum, Lour. Coch. 536. Rumph. Amb. 5. t. 106. "Nearly upright; leaves ovate; bilobed at the base, rounded; spadices axillary;" stem five feet high, as thick as a man's arm; leaves very large, with many transverse parallel ribs, on foliulate, erect, stem-clasping footstalks; spathe axillary, small, acute, straight, convolute; spadix tapering, erect; berries pale, small. A native of the East Indies. Cultivated in Cochinchina, where the stalk is boiled and eaten. 31. *A. cucullatum*, cowed arum, Lour. Cochinch. 356. "Upright; leaves peltate, cordate, with the ears cowed;" stem two feet high; leaves acuminate, on long round footstalks; spadix short, almost wholly covered with florets. A native of the suburbs of Cantou. 32. *A. spirale*, spiral arum, Retz. Obs. 1. 30. n. 104. "Stemless; leaves lanceolate; spathe spiral sessile;" leaves acute, naked, with the footstalks dilated at the base, membranaceous, veined. A native of Traquebar in the East Indies, discovered by Koenig. This species ought to have been placed in the second division. It may here be observed, that in the arum, every pistil and every anther is to be considered as a distinct flower, consequently it ought to be removed to the class *monoecia*; and this has been done by Schreber and Withering. Thunberg and Swartz place it in the class *polyandria*. We see no advantage however in removing it from the class *gynandria*, where it was left by the great author of the sexual system.

Medicinal

Medicinal qualities. Common arum is the only species of this genus included in the *Materia Medica*; and its use is confined to the root, which in a recent state is lactescent and extremely acrimonious, inasmuch that when cut into slices and applied to the skin, it has been found to blister the part; and upon being chewed, it excites an intolerable sensation of burning and pricking in the tongue, which continues for several hours. This acrimony, however, is gradually lost by drying, and may be so completely dissipated by the application of heat, as to leave the root a bland farinaceous aliment. Its medicinal efficacy, therefore, resides wholly in the active volatile matter. It is a very powerful stimulant, and by promoting the secretions, may be properly employed in cachectic and chlorotic cases, in rheumatic affections, and in various complaints of phlegmatic, torpid constitutions; but more especially in a weakened or relaxed state of the stomach, abounding with viscid mucus. If the root is given in powder, great care should be taken that it be young and newly dried, when it may be used in the dose of a scruple or more twice a day; but in rheumatism and paralytic affections, requiring the full effects of this medicine, the root should be given in its recent state; and to cover the insupportable pungency it discovers on the tongue, Dr. Lewis advises us to administer it in the form of emulsion with gum arabic and spermaceti, increasing the dose from ten grains to upwards of a scruple, three or four times a day; in this way, he says, "it generally occasioned a sensation of slight warmth about the stomach, and afterwards in the remoter parts, manifestly promoted perspiration, and frequently produced a plentiful sweat." As several obstinate rheumatic pains were removed by this medicine, it is recommended to further trial. See *Woodv. Med. Bot.* p. 75.

Propagation and Culture. Species 2. is very hardy, and will grow in any soil or situation; autumn is the proper time for transplanting it. 3. should have a moist, shady situation; it is with difficulty preserved in gardens. 6, 7, 8. are propagated by offsets; they will live in the open air, if planted in a sheltered situation, or if the surface of the ground be covered with tan. 9, 10, 11, 12, 13, 14. and 16. are to be propagated by offsets planted in pots, and plunged into a hot-bed, and after having acquired sufficient strength, kept upon shelves in a dry stove. 15. requires the tan-bed or bark-stove. Common arum ought to be transplanted soon after the seeds are ripe. 19, 20, 21. These multiply fast by offsets, and should have a shady situation. 25, 26, 27, 28, 29. are propagated by cutting off the stalks, into lengths of three or four joints, which must be laid to dry six weeks or more; for if the wounded part be not perfectly healed over before the cuttings are planted, they will rot and decay; they should be put in small pots filled with light sandy earth, and plunged into a moderate hot-bed of tan, being careful that they have little wet till they have made good roots, when some of them may be placed in a dry stove, and others plunged in the tan-bed, in the bark-stove, where they will produce more flowers. They are tender plants, and must be constantly kept in the stove. See *Martyn's Diet.*

ARUM Tibiopicum. See *CALLA*.

ARUM Scandin. See *DRACONTIUM*.

ARUMATIÆ, in *Entomology*, a name given by *Maregrave*, in his *Natural History of Brazil*, to the species of *MANTIS* called *Gigas* by *Linnaeus*.

ARUN, in *Ancient Geography*, a village of Palestine, in the neighbourhood of Samaria.

ARUN, in *Geography*, a river of England, which runs into the sea at Little Hampton in Suffolk, famous for its red mullets.

ARUNCI. See *AURASCI*.

ARUNCI, in *Pharmacology*, a species of *CICADA*, described by *Scopol.* This insect is entirely of a ferruginous colour, with brown eyes.

ARUNCO, in *Zoology*, a species of *RANA* or toad, that is larger than the common frog, but nearly of the same colour. It inhabits Chili; and is described by *Molina*. All the feet of this kind are palmated, and the body warted. *Dr. Shaw* specifically describes it thus: *R. corpore verrucolopedibus omnibus palmatis.* *Gmelin* seems to think the palmated feet are a sufficient criterion by which it may be distinguished, "*pedibus omnibus palmatis.*" *Gmel.*

ARUNCUS, in *Botany.* See *SPIRÆA*.

ARUNDA, in *Ancient Geography*, a town of Spain, in *Bætica*, seated on the *Annas* or *Gadiana*; now said to be *Ronda*, in the province of *Granada*, on the confines of *Andalusia*. N. lat. $36^{\circ} 26'$. W. long. $5^{\circ} 46'$.

ARUNDEL, *THOMAS*, in *Biography*, archbishop of *Canterbury* in the reigns of *Richard II.* *Henry IV.* and *Henry V.*, was the second son of *Robert Fitz-Aldar*, earl of *Arundel* and *Warren*; and at the age of twenty-one years, in 1374, promoted from the archdeaconry of *Taunton* to the see of *Ely*, and enthroned with the usual solemnities in 1376. While he held this see he almost rebuilt the episcopal palace in *Holborn*, and, beside other donations, presented it with a table of massive gold, enriched with precious stones, which he had bought of prince *Edward* for three hundred marks. Upon his translation to the archbishopric of *York*, in 1388, he expended a large sum in building an archiepiscopal palace, and in furnishing the church with several pieces of silver-gilt plate, and other ornaments. After his advancement to the see of *Canterbury*, in 1396, he was a great benefactor to that church; for he built the southern tower and great part of the nave, and gave it a ring of five bells, called "*Arundel's ring*," several rich vestments, a mitre encased with jewels, a silver-gilt crozier, a golden chalice for the high altar, and another to be used only on *St. Thomas Becket's* day. He held the office of lord high chancellor of *England*, with some interruptions, from the year 1386 to 1396; and in 1395, he removed the courts of justice from *London* to *York*; partly with a view of mortifying the pride and insolence of the inhabitants of *London*, and principally for the purpose of enriching those of the latter city, over the diocese of which he presided: but after the experience of one or two terms, the courts returned to their first and more convenient station. Soon after his accession to the metropolitan see, he revived an old institution, by which the inhabitants of the several parishes of *London* were obliged to pay to their rector one half-penny in the pound out of the rent of their houses.

The interference of archbishop *Arundel* in the civil affairs of the kingdom, terminated in his impeachment and exile. Having taken an active part in the first attempt that was made to deliver the nation from the oppression of *Richard II.* by obtaining a commission to the duke of *Gloucester*, his brother the earl of *Arundel*, and others, in which commission he himself was included, for governing the kingdom, he was impeached by the commons, sentenced to be banished, and ordered to leave the kingdom within forty days, on pain of death. *Pope Boniface IX.* seizing this opportunity of testifying his displeasure against the king and parliament of *England*, gave *Arundel* a cordial reception at *Rome*, nominated him archbishop of *St. Andrews*, and promised him other preferments. The king's remembrance, however, prevailed with his holiness to withhold the grant of the further favours which he had intended to confer on the exiled prelate. The dissatisfaction of the people of *England* with

the government of Richard II. increasing, archbishop Arundel had an opportunity of returning to his country, and regaining his dignities. Whilst he was in Britany, in his way home, he was employed to solicit Henry duke of Lancaster, who had been banished by Richard, to return from France, and assume the crown: and having obviated the duke's scruples, the accession of Henry IV. was accompanied with the restoration of Arundel to the metropolitan see: and he had the pleasure of placing the crown on the head of his new master. At an early period of this reign, a design was formed of seizing the revenues of the church, in order to supply the exigencies of the public service. In a parliament held at Coventry in 1404 or 1405, and called "PARLIAMENTUM INDOCTUM," this measure was proposed for execution. Arundel was present, remonstrated against the proposal, and urged "that the clergy were at least as serviceable to the king by their prayers, as the laity by their arms; and that the kingdom could not expect to prosper as long as the prayers of the church were despised." His spirited exertions prevented, for the present, the further prosecution of this violent measure. The archbishop having thus rescued the temporalities of the church from depredation, manifested equal zeal in preserving inviolate its internal constitution. He exerted himself for restraining the progress of those new opinions, with regard both to doctrine and worship, which were disseminated by the Lollards or Wickliffites; and as the university of Oxford was beginning to be infected with these opinions, he appointed visitors to examine and to report the state of that seminary. He proceeded, in consequence of the information he received from the inquisitorial committee, delegated and functioned by his authority, to persecute, with an absurdity and cruelty which nothing but the ignorance and bigotry of the times can in any degree extenuate, those who were found chargeable with this new heresy. Upon the authority of the act for burning heretics, which passed in the reign of Henry IV. and which remained for a long time a disgrace to our statute books, a Lollard was condemned to the flames in 1410; and in the beginning of the reign of Henry V. sir John Oldcastle, lord Cobham, a principal patron of the Lollards, was indicted by the primate, convicted of heresy, and sentenced to the flames. He had some time before attempted to procure an order from the pope to dig up the bones of Wickliff, which was refused; and he actually procured a synodical constitution, which prohibited the translation of the scriptures into the vulgar tongue. It is said that whilst the archbishop was pronouncing sentence of excommunication and condemnation on lord Cobham, he was seized with an inflammation in his throat, which prevented his taking any sustenance, and soon terminated in his death, Feb. 20th, 1413. The death of the prelate, as to the time and manner of it, was attributed by the Lollards to the immediate interposition of God: but however superstitious such judgments may be deemed in the present enlightened age, the intolerance and cruelty of the archbishop will be universally condemned, and they will entail just reproach on his name and character as long as any records of him remain. *Biog. Brit.*

ARUNDEL, in *Geography*, a corporation and borough town of England, in the county of Sussex, seated on the river Arun, whence its name. It sends two members to parliament; the corporation consists of a mayor and twelve burgesses; it has two markets weekly, on Wednesday and Saturday; and is distant from London sixty-one miles. It has a harbour which admits vessels of one hundred tons burthen, and which was repaired in 1733. The castle, which stands on the north-east part of the town, was constructed by the empress Maud on William le Albano, as a

recompence for his defence of it against king Stephen. It descended to the Norfolk family in 1579, and the present duke has expended large sums in repairing and adorning it. To this place belongs the peculiar privilege of conferring the title of earl on its possessors without any patent or creation from the crown; and Arundel is the premier earldom in England. N. lat. 50° 45'. W. long. 0° 25'.

ARUNDEL, a township of America, in York county and district of Maine, situate between cape Porpoise and Biddeford on the north-east, on the river Saco, twenty-one miles north-east from York, and ninety-six north-east from Boston. It contains 1158 inhabitants.

ARUNDELLIAN MARBLES, *Marmora Arundelliana*, or *Oxford Marbles*, called also *Parian Chronels*, are supposed to be ancient stones, whereon is inscribed a chronicle of the city of Athens, engraven in capital letters in the island of Paros, one of the Cyclades, 264 years before J. C. Christ. They take their name from Thomas earl of Arundel, who procured them out of the East, or from Henry his grandson, who presented them to the university of Oxford.

These marbles, and other ancient relics, were purchased in Asia Minor, Greece, and the islands of the Archipelago, by Mr. William Petty, who was employed, in the year 1624, by Thomas earl of Arundel, in making such collections for him in the East. They were brought into England about the year 1627, and placed in the gardens belonging to Arundel house in London. Soon after their arrival, they excited very general curiosity among inquisitive and learned persons; and Sir Robert Cotton engaged Mr. Selden to explain the Greek inscriptions. Accordingly Selden and two of his friends, Patrick Young, or Patricius Junius, and Richard James, immediately undertook the business; and in the following year Selden published a small volume in 4to. under the title of "Marmora Arundelliana," containing about thirty-nine of the inscriptions, with annotations. During the civil wars, Arundel house was often deserted by its illiberal proprietors, and some of the marbles were defaced or broken, and others stolen or used for the ordinary purposes of architecture. The chronological marble, in particular, was broken and defaced; and the upper part containing thirty-one epochs, is said to have been used in repairing a chimney in Arundel house. In the year 1667, the Honourable Henry Howard, afterwards duke of Norfolk, the grandson of the first collector, presented these curious remains of antiquity to the university of Oxford; and as Mr. Selden's work was become scarce, bishop Fell engaged Dr. Prideaux, dean of Norwich, to publish a new edition of the inscription, which was printed at Oxford in 1676, with additional notes and translations, under the title of "Marmora Oxoniensia, ex Arundellianis, Seldenianis, et aliis collata." In 1731, Mr. Mattheus favoured the public with a more comprehensive view of these marbles than either of his predecessors; and in 1763, Dr. Chandler published a new and improved copy of them, in which he corrected the mistakes of the former editors, and supplied the beams in some of the inscriptions, particularly those of the Parian chronicle, by many ingenious conjectures.

These marbles, in their perfect state, contained a chronological detail of the principal events of Greece during a period of 1318 years, extending from the commencement of the reign of Cecrops in the year before Christ 1582, to the close of the archonate of Diognetus in the year before Christ 264. But the chronicle of the last 90 years is lost, so that the part now remaining terminates with the archonship of Diognetus, 354 years before Christ; and in this fragment the inscription

Inscription is very much corroded and effaced, and the sense can only be discovered by very learned and indoltrious antiquaries, or supplied by their conjectures. For a translation from the Greek of this ancient remain, see Tab. i. Pnyfair's Chronology, p. 297. Almost every event in this table between the destruction of Troy and the annual magistracy of Athens, is dated twenty-six years earlier than in the canons of Eusebicus, and those of other approved chronologists; so that this number of years must be subtracted from the dates in the marbles, during the time mentioned, in order to accommodate them to those of Eratosthenes, Dion. Halicarnassensis, Eusebicus, and other ancient writers. These valuable remains of antiquity have been applied to the elucidation of many parts of ancient history that had been long involved in obscurity. However their inconsistency with other authentic historical accounts has depreciated their importance and use; and Sir Isaac Newton, as well as some other modern philosophers, have paid little or no regard to them. Their authenticity has indeed of late been the subject of particular discussion between Mr. Robertson, who, in his "Parian Chronicle," 8vo. 1788, questioned it; and Mr. Hewlett, in his "Vindication of the Authenticity of the Parian Chronicle," 8vo. 1789, defended it. See an account of the arguments on both sides, under the article *PARIAN CHRONICLE*.

ARUNDINACEA, in *Con. biology*, a species of *SABELLA* found in rivers in some parts of Europe. It is subconic, open at both ends, and composed of fragments of the bark of reeds placed on each other. Gmelin, &c.

ARUNDINACEA, in *Entomology*, a species of *ARANEA* that is found among reeds. The abdomen is sub-globose, and white spotted with pale brown. Linn. Fn. Suec.

ARUNDINACEUS, in *Ornithology*, a species of *TURDUS* that inhabits reedy marshes of Europe, and is called *La Rousserolle*, ou *Roucherolle*, by Brisson, Buffon, and other French writers. Ray and Willughby named it *Junco*, or greater reed sparrow; and Dr. Latham, the reed thrush.

This bird is rather larger than the common lark; the colour is ferruginous brown; white with a testaceous tinge beneath; quill feathers brown, reddish at the end. Gmel. &c. Of this species Gmelin enumerates three varieties; viz. *β. Turdus arundinaceus uropygio caudaque rufis*: var. with rufous rump and tail. *γ. Turdus arundinaceus supra fuscus nigris variis*: var. varied above with black arrow-shaped spots. *δ. Turdus arundinaceus minimus, supra ex lutescente virens, tectricibus alarum ferrugineis*: var. small, above yellowish green, wing ferruginous. In the southern parts of Russia, and in Poland, this species, it is said, is very common. It makes its nest on the mossy hillocks among reeds and rushes, or according to Cramer, suspends the nest between two or three reeds which are fastened together to support it. The female lays five or six eggs; and the male, it is likewise observed, is perpetually singing while the female is sitting; and hence it has acquired the name of water nightingale.

ARUNDINETI, in *Entomology*, a species of *TIPULA* described by Linnæus and Fabricius. It is whitish; antennæ villose; eyes black. A native of Europe, and inhabits reedy marshes.

ARUNDINIS, a species of *PHALÆNA* (*Noctua* Linn.) that lives on the stalks of reeds. It is an European kind; the wings are cinereous with black dots, and marginal lunules of the same colour; and the wings beneath marked with a central brown spot. Fabricius, &c.

ARUNDINIS, a species of *APHIS*, that lives on the leaves of *arundo epigeios*. The body is green; head and thorax brown, and covered with white dots. Fabricius, Gmelin, &c.

ARUNDO, in *Botany*, Reed (supposed to be derived from *areo*, because it soon becomes dry). Lin. g. 53. Schreb. 124. Juss. 32. Clafs, *triandra digynia*. Nat. Ord. *Gramineæ* or *grassæ*. Gen. Char. *Cal.* glume one, or many-flowered, two-valved, erect; valves oblong, acuminate, awilefs; one shorter. *Cor.* two-valved; valves the length of the calyx, oblong, acuminate; from their base arises a *limbus*, almost the length of the flower; nectary, two-valved, very small. *Stam.* filaments three, capillary; anthers forked at both ends. *Pist.* germ oblong; styles two, capillary, reflex, villose; stigmas simple. *P.r.* none; corolla adheres to the seed without gaping; seed single, oblong, acuminate at both ends, furnished with long down (pappus) at the base. Eff. Gen. Char. *Cal.* two-valved; florets congregated, furrowed with wool.

Species, 1. *A. bambos*; bambu or bamboo-cane; *A. bambos*. Lour. Cochinch. 56. *A. arbor*, Bauh. Pin. 18.—*syriaca*, Balu Java. Rumph. Amb. l. 6. c. 4. Hb. Rheed. Mal. i. 25. t. 16. *Bambos arundinacea*, Retz. Obs. 5. 24. n. 58. "Calyxes many flowered, (one-flowered.) *Lour.* spikes in threes, (unequal in number, Retz.) sessile." Lin. flowers six-stamened; panicle diffusid, with imbricate spikelets, branches of the culm spiny; calyxes one-flowered. Loureiro. Panicle branched, divaricate, hard; spikes heaped alternately, unequal in number, sessile. Retz. The bamboo has a woody hollow round straight culm, forty feet high and upwards, simple and thinning; the internodes a foot in length and in circumference; sheaths thick, hairy, rough, convolute, deciduous; branches alternate, slender, solid, spiny, reclining, springing out from the base to the top; the lower ones being usually cut off; leaves small, entire, lanceolate, roundish at the base, striated, rough, on alternate round petioles. For the parts of inflorescence we refer to the specific characters. It grows almost every where within the tropical regions. Over a great part of Asia it is very common: in China, Cochinchina, Tonquin, Cambodia, Japan, Ceylon, the peninsula of India, and the islands. The bamboo-cane has been long since introduced into the West Indies, and flourishes also in South Carolina. Mr. Miller cultivated it here in 1730, and if our faves were high enough, these plants would probably rise to the height of forty feet, as a strong shoot from the root has been found to attain to half this height in six weeks.

There is perhaps no plant used for such a variety of purposes as bamboo. In the East Indies, great use is made of it in building, and the houses of the lower class of people are almost entirely composed of it. Bridges are also made of it, mats for their boats, boxes, cups, baskets, mats, &c. Paper is also made of it by bruising and steeping it in water, and thus forming it into a paste. It is the common fence for gardens and fields, and is frequently used as pipes for conveying water. The leaves are generally put round the tea which is sent in chests to Europe from China. A substance called *Tabaskeer* or *Tabasbir*, which is a concretion of the liquor in the cavities of the cane, and extracted at certain seasons, is said to be indestructible by fire, to resist the action of the strongest acids, and by fusion with alkali to form a transparent permanent glass which may be decomposed by acids &c. The tabaskeer is much esteemed as a medicine by the orientalisfs, and indeed several parts of the bamboo, according to Loureiro, possess medicinal virtues. *A. arboræa*, and *A. orientalis*, of Miller, seem to be only varieties of *A. bambos*, and we learn from Loureiro and others, that there are still more varieties, if not found to be distinct species. 2. *A. donix*, cultivated reed. *A. fétida*. Bauh. Pin. 17. Raii Hist. 1275. Mor. Hist. f. 3. t. 8. f. 5. "Calyxes five-flowered, panicle diffusid, culm shrubby," culm from six

to twenty feet in height, hard, and woody, knotted or knotted, with diaphragms. Above each joint a leaf embracing the culm, with a yellow sheath, two feet long, and three inches broad. The top of the culm ends in a point, the leaves rolling in the form of a cone; panicle a foot and a half long, erect, many flowered. Number of flowers in the calyx variable, often two, but more commonly three. It is a native of the south of Europe, Siberia, Egypt, Cochinchina, &c. It was cultivated in 1768, in the Oxford botanic garden, and flowers here in July and August. The canes are brought to us from Spain and Portugal, for the use of weavers, and for making fishing-rods &c. There is a variety of *A. obnox*, with striped leaves, noticed by Miller and others. 3. *A. phragmites*, common reed. Smith Flor. Brit. 144. Hudf. 53. With. 166. Relb. 51. Eng. Bot. 401. "Calyx five-flowered, panicle loose;" root perennial, creeping; culm annual, erect, simple, six feet high, round, jointed, leafy, smooth, white within; leaves lanceolate, acuminate, spreading, striated, rough at the edges, underneath very smooth and glaucous; sheaths cylindrical, striated, smooth; stipules very short, hairy on both sides; panicle erect, diffusid, much branched; glumes of the calyx very unequal, lanceolate, acute, the larger three-nerved; florets from four to six, surrounded at the base with a silky wool; interior glume ciliated, half the length of the exterior; seed covered with the indurated corolla. A variety of this species with variegated leaves is noticed by Rellian. It is common in ditches, standing waters, and on sides of rivers, flowering from July till September. The common reed is used for screens in gardens, also as a foundation for plaster in ceilings, and for various other purposes. 4. *A. epigejos*, wood reed. Eng. Bot. t. 422. Smith Flor. Brit. 145. *A. calamagrostis*, Hudf. 54. Relb. 52. Lightf. 106. *calamagrostis lanceolata*, With. 122. *gramen arundinaceum panicula molli spadicæa majus*, Raii. Syn. 401. "Calyx one-flowered, longer than the corolla, panicle erect, leaves lanceolate;" root creeping; culm nearly as high as the preceding, but weaker, and often branched at the base; leaves lanceolate acuminate, nervose, underneath glaucous and rough at the edges; sheaths smooth, striated; stipule lanceolate, many times divided, naked on both sides; panicle erect, rough, spreading; flowers in clusters all on the same side, nodding; glumes of the calyx nearly equal, lanceolate, acute, nervose, rough on the keeled part; floret solitary, much shorter than the calyx, white, membranaceous, inserted in a woolly substance longer than the petals, often cloven at the apex; near the base, and from the back arises an awn, which is jointed, and nearly the length of the wool. We are told by Dr. Smith, that the wool and awn here noticed, were, from an error, not represented in the figure referred to in Eng. Bot. It grows in shaded ditches and wet meadows; and flowers in July. 5. *A. calamagrostis*, small reed. Eng. Bot. 423. Flor. Dan. 180. Smith Flor. Brit. 146. 178. *A. epigejos*, Hudf. 54. Relb. 51. *Calam. epigejos*, With. 123. "Cul. minor glumis rufis & viridibus, Lul. in Raii's Syn. 401. "Calyx one-flowered, longer than the corolla; panicle erect, diffusid; flowers feathery, erect; leaves linear." Smith. Root perennial, fibrous, scarcely creeping; culm erect, three or four feet high, round, very smooth, leafy, much slender than the preceding, and sometimes branched; leaves linear, acute, narrow, somewhat involute, pale green underneath, rough above, sometimes hairy; sheaths long, close, striated, almost smooth; stipule lanceolate, often lacinated, decurrent, smooth on both sides; panicle very branching, diffusid; flowers scattered, erect; glumes of the calyx of a chestnut or purple colour, nearly equal, lanceolate, acute, keeled, rough on the back, scarcely nervose;

florets solitary, much shorter than the calyx, white, torn at the apex, included in wool longer than the petals, a final awn at the apex, between the divisions of the larger petal. It grows in groves, hedges, and wet situations, flowering in July. 6. *A. arenaria*, sea-reed. Mariam. Sea-mat-weed, Smith Flor. Brit. 148. Hudf. 54. Mart. Flor. Rull. t. 32. Dickf. 11. S. Fide. 12. 5. Flor. Dan. t. 917. *Calamagrostis arenaria*, With. 123. "Calyx one-flowered, longer than the corolla; panicle spicate; flowers erect, awnless; leaves rolled inwards, pungent." Root perennial, creeping, jointed, spreading itself to a great extent; culm about three feet high, stiff, round, smooth, articulated, leafy; leaves erect, patent, rigid, turning inwards, sharply pointed, glaucous, smooth on the under side, on the upper furrowed; sheaths nervose, smooth; panicle erect, spike-like, with short erect branches; flowers lanceolate, acute, compressed, keeled, obscurely three-nerved; florets solitary, rather shorter than the calyx; glumes lanceolate, unequal, nervose, with a rough keel, the outer broadest, crooked at the apex, and embracing the other; wool about one-third the length of the floret. Common on the sea-coasts, growing in the sand. By means of its extensive creeping roots, it is of great use in giving stability to driving sands which gather about it in hills or banks. It is planted about Wells in Norfolk to aid in repelling the sea; a purpose for which it seems peculiarly well adapted. 7. *A. colorata*, Canary reed-grass. Soland. in Ait. Hort. Kew. Smith Flor. Brit. 147. *Phalaris arundinacea*. Sp. Pl. Hudf. Relb. Flor. Dan. 259. *Cal. variegata*. With. 123. *Gramen arundinaceum accrosi glumâ nostras*. Raii. Syn. 400. β . *G. arundinaceum accrosi glumâ Jersianum*. Raii. Syn. 400. 7. *Phalaris arundinacea*; β . *picata*. Sp. Pl. 80. "Calyx one-flowered, equal to the corolla; panicle erect, glomerate; flowers inclining to the same side, awnless; leaves flat." Root perennial, creeping, scaly, or turfy; culm erect, three to five feet high, round, leafy, striated, smooth, furnished with many joints; leaves spreading, lanceolate, striated, with a smooth margin on both sides, on the variety β . glaucous, in γ . variegated; sheaths nervose, somewhat inflated, smooth; stipule short, obtuse; panicle erect, branched, in lobes, branchlets angular, rough; flowers rolled together, inclining to one side, variegated with white and purple; glumes of the calyx equal, compressed, keeled, three-nerved; florets solitary, the length of the calyx, lanceolate, rather compressed, awnless, furnished with two nectarious pencil-shaped substances at the base; glumes or valves hairy, equal in length, but the exterior broader than the other. It grows in stagnant waters, and on the banks of rivers. The variety γ . cultivated in gardens, and called ribbon-grass, was also found wild near Cambridge by Mr. Rellian. The following are new species. 8. *A. cynffinea*. Forst. Fl. Austral. n. 48. "Calyx one-flowered; panicle loose, from erect spreading; awn of the outer petal reflex, and very long." A native of New Zealand. 9. *A. agrestis*. Lour. Cochinch. 57. *Arundarbor spinosa*. Rumph. Amb. l. 6. c. 7. t. 4. "Flowers six-stamened; panicle spike-like; spikelets clustered; lower branches of the culm very spiky; calyx one-flowered." It grows to the height of thirty feet, and to the thickness of a man's arm. A native of Cochinchina, growing on mountains and dry desert places. 10. *A. mitis*. Lour. Cochinch. 57. *arundarbor fera*, Rumph. Amb. l. 6. c. 7. t. 4. "Flowers six-stamened, panicle erect, contracted; spikes long, imbricate; culm very even, unarmed; calyx one-flowered." This is rather a higher and thicker plant than the *A. agrestis*. It is cultivated in Cochinchina, and being cut into long pieces, it is used for weaving into hats, coffers, baskets, and a variety of utensils, which are very elegant. 11. *A. multiflex*, Lour. Cochinch. 58. *Arundalbor*,

labor, &c. Rumph. Amb. l. 6. c. 1. t. 1. "Flowers six-flowered: spikes interrupted; spikelets in whorls; culm divided; calyxes one-flowered." Culm perennial, twelve feet high, with very long internodes; leaves linear-lanceolate. A native of the northern provinces of Cochinchina. 12. *A. bengalensis*, Retz. Obf. 5. 20. n. 45. "Calyxes two-flowered, panicle erect, with three flowered pedicels." Culms lofty, thick, leafy; leaves two feet long. A native of Bengal. 13. *A. pifcaloria*. Lour. Cochinch. 55. "Calyxes one-flowered, spike terminating, culm branched, leaves minute." It rises eight feet, with a perennial culm; knots approximating; leaves lanceolate-linear. A native of Cochinchina. Being tough and tapering towards the end, it is well adapted for fishing-rods. 14. *A. diuca*, Lour. Cochinch. 55. "Calyxes one-flowered, spikes in bundles, compound; spikelets linear;" culm perennial, eight feet high; knots distant; flowers dioecous. A native of Cochinchina, in woods.

Propagation and Culture. The bamboo must be preserved in a warm stove, and as the roots spread very wide, it should be planted in a large tub, filled with rich earth; this must be plunged into the hot-bed in the bark stove, and must have plenty of water. When the tub decays, if the plant be permitted to root in the tan, it will grow to a larger size; but then care must be taken, when the bed is refreshed with new tan, to leave a sufficient quantity of the old tan about the roots. It may be propagated by slips from the roots, taken off in the spring. 2. The cultivated reed will bear the cold of our winters in the open ground, provided it be planted in a soil not too wet; and if the winter should prove very severe, a little mulch be laid over the roots. The stem dies in autumn and a new one rises the succeeding spring, which will grow to ten or twelve feet high during the summer, if properly supplied with water in dry weather. It is very proper to be intermixed with trees and shrubs, where it will have a pleasing effect in adding to the variety. It is propagated by parting the roots in the spring before they begin to shoot. It never flowers in England. The variety with variegated leaves is more tender, and must be sheltered in this country during the winter. See Martyn's Miller's Dict.

ARUNDO. See AGROSTIS, ANDROPOGON, CENCHRUS, MELICA, SPINIFEX, and ZIZANIA.

ARUNDO Florida et Indica. See CANNA.

ARUNDO Rotang. See CALAMUS.

ARUNDO Saccharifera. See SACCHARUM.

ARUPINUM, ARUPIUM, or ARYPIUM, in *Ancient Geography*, a town of Liburnia, being one of the four which were occupied by the Japodes or Japydes, according to Strabo.

ARURA, in *Antiquity*. See AROURA.

ARURA, in *Middle Age Writers*, denotes a field ploughed and sowed.

ARUSINI CAMPI, in *Ancient Geography*, erroneously written by Cluverius *Taurassini*, plains in Lucania famous for the last battle fought between Pyrrhus and the Romans. Pyrrhus being at Tarentum, and hearing that the two consuls, Curius Dentatus and Cornelius Lentulus, had divided their forces, the one invading Lucania, and the other Samnium, divided a chosen detachment of his army into bodies, and marched with his Epirots against Dentatus, in hopes of surprising him near Beneventum. The consul prepared to meet him, repulsed his van-guard; and having thus far succeeded, marched into the Arusian fields, and drew up his army in a plain, which was wide enough for his troops, but too narrow for the Epirot phalanx to act with its full effect. However, the king's eagerness to try his strength and skill induced him to engage, notwithstanding

this great disadvantage. Upon the first signal, the action began, and as one of the king's wings gave way, victory seemed to incline to the Romans. But the wing under the king's own immediate command repulsed the enemy, and drove them to their intrenchments. Dentatus perceiving that this advantage was partly owing to the elephants, commanded a corps de reserve, posted near the camp, to advance, and to attack those animals with burning torches; which so terrified them, that they turned about, broke into the phalanx, and occasioned the utmost disorder. The Romans, availing themselves of the confusion, charged with such fury, that the enemy were entirely broken and defeated. Upon this disaster, Pyrrhus retired to Tarentum, leaving the Romans in full possession of his camp; which they so much admired, that they made it a model which they followed ever after. Pyrrhus, after this defeat, determined to leave Italy, and prepared for setting sail for Epirus, where he at length arrived with 8000 foot and 500 horse, regretting that he had spent six years in Italy and Sicily to no purpose. Anc. Un. Hist. vol. ix. p. 91.

ARUSIS, a town of Asia, in the interior part of Media. Ptolemy.

ARUSPICES, an order of priests among the *Ancient Romans*, who foretold things to come, chiefly by inspecting the entrails of beasts which were killed in sacrifice. They also took their observations from the victims before they were cut up; from the flame that used to rise while they were burning; and from the flour, bran, frankincense, wine, or water, used in the sacrifice. The word seems more properly written *haruspices*; as being derived from *haruga*, which signifies the entrails of victims; and *aspicere*, to view or consider; others derive *aruspices*, *ab aris aspiciendis*, from their looking on the altar. These diviners were all at first taken from Hetruria, where their art was in great repute; but afterwards the senate ordered twelve of the sons of the chief men of Rome to be sent into that country to acquaint themselves with the rites and ceremonies of the Etruscan religion, of which this science was the chief part; the ceremony, however, of consulting the entrails of victims was practised among the Greeks before it was introduced into Hetruria. An instance of it occurs at the battle of Platea; and it was recurred to on other occasions among the Asiatics. But the Etruscans were perhaps the first who reduced it to an art, and established the rites by which it was conducted. The doctrine or discipline of the aruspices was formed into a precise art, called *aruspicina*. Cato, who was an augur, used to say, he wondered how one aruspex could look at another without laughing in his face; by which we learn what opinion he had of the solidity of the aruspicina. Constantine passed several laws against the aruspices; and though he allowed the Pagans to consult them, he forbade their entering the houses of private persons, upon pain of being burnt alive, and such as received them were to forfeit their estates, and be banished for life. His intention was to prevent all private sacrifices and consultations, and by one law he obliged those who consulted the aruspices to send their answers to his secretary.

ARUSPICI libri, a kind of sacred writings among the ancient Hetrurians, wherein the laws and discipline of the aruspices were described. They were also called *rituales*, sometimes *fulgurales libri*, as directing how to take indications from thunder, lightning, &c.

ARVUM, in *Ancient Agriculture*, properly denoted ground ploughed but not sowed. Though the word is also sometimes extended to all arable or corn land, in contradistinction from pasture.

ARWACAS BAY, in *Geography*, lies on the east coast

of South America, and has the river Amona to the west. It has a good road for large ships, well sheltered from south and westerly winds, but exposed to the north.

ARWANGEN, a town and castle of Swisserland, in the canton of Berne, seated on the Aar, 12 miles east of Solere.

ARX, in the *Ancient Military Art*, a town, fort, or castle, for the defence of a place. The arx, in ancient Rome, was a distinct edifice from the capitol, though some have confounded the two. According to Ryekius, the arx, properly speaking, was a place on the highest part of the Capitoline Mount, stronger and better fortified than the rest, with towers and pinnated walls; in which was also the temple of Jupiter Capitolinus. *Strav. Synt. Ant. Rom. c. ix. p. 522.*

ARX also denoted a consecrated place on the Palatine Mount, where the augurs publicly performed their office. Some will have the arx to have been the augural temple; but Varro expressly distinguishes between the two.

ARX was particularly used for a public place in Rome, set apart for the operations of the augurs. In this sense, arx amounts to the same with what is otherwise called *auguraculum*, and *auguratorium*, and in the camp *augurale*. Out of this arx it was that the *fidials*, or heralds, gathered the grans used in the ceremony of making leagues and treaties. *Liv. i. c. 24.*

ARX *Britannica*, in *Ancient Geography*, a citadel of Batavia, near the old mouth of the Middle Rhine. Its foundation is seen at low water, and after a strong south-westerly wind. Some suppose it to be the pharos or very high tower of Caligula, as Suetonius calls it; a monument of his pretended conquest of Britain; others imagine that it was built by Drusus, with an altar, erected by Claudius, on his expedition into Britain. But the usual passage was from Gesforiacum, and Suetonius says expressly, that Claudius passed over from thence. Its ancient name is no where expressed; it is now called t'huys te Britten or Brittenburg, i. e. Arx Britannica; but it does not appear from what authority. Cellarius.

ARXAMA, a town of Asia, in the interior part of Mesopotamia. Ptolemy.

ARXANA, a town of Asia, in Armenia Major, near the river Nymphias.

ARXATA, a town of Armenia Major, on the confines of Atropatene. Strabo.

ARXEN, a town of Thrace.

ARXIANUS AGER, a plain of Asia near the river Lerma.

ARYCA, a town of Greece, in the country of the Locrian Epienemidii. Diod. Sic.

ARYCANDA, a town of Asia, in Lycia. Steph Byz.

ARYCANDUS, a river of Asia, in Lycia, that discharged itself into the Limyra. Pliny.

ARYES, in *Geography*, a people of South America, in Brazil, in the neighbourhood of Capitanía, or the government of Porto Seguro.

ARYMAGDUS, or ORYMAGDUS, in *Ancient Geography*, a river of Asia, in Cilicia. Ptolemy.

ARYMPHÆI, a people who inhabited the territory adjoining to the Palus Mæotis and Tanais. They were clothed like the Scythians, spoke a peculiar language, and lived in the woods. They were honoured as a sacred people, and their country served as an asylum. They are mentioned by Herodotus and Mela.

ARYS, in *Geography*, a town of Italy, belonging to the republic of Venice, in the province of Friuli, ten miles W. S. W. of Palma la Nuova.

ARYTENOIDES CARTILAGO, in *Anatomy*, a cartilage situated at the back part of the larynx. There are two cartilages which bear this name.

ARYTENOIDEUS MUSCULUS, is subservient to the motions of the above mentioned cartilages. For an account of both these articles, see LARYNX.

ARYTHMUS, or ARYTHMUS, formed from the primitive *α*, and *ῥυθμος*, modulus or measure, in *Medicine*, is used by some for a sinking or failure of the pulse, so that it can no longer be felt: but it more properly denotes an irregularity, or want of due order and proportion of the pulse.

ARZAC, in *Geography*, a town of France, in the department of the Lower Pyrenées, and chief place of a canton in the district of Orthes, five leagues north of Pau.

ARZACHEL, or ARZCHAL, in *Biography*, a Spanish mathematician, lived in the tenth or eleventh century, and wrote a book on astronomy, intitled "Observationes de Oblongitate Zodiaci." Voisius.

ARZAMAS, in *Geography*. See ARSAMAS.

ARZANNO, a town of France, in the department of Finistère, and chief place of a canton in the district of Quimperlé, five miles E. N. E. from Quimperle.

ARZBERG, a town of Germany, in the circle of Franconia, and principality of Baruth, seven miles east of Worstedel.

ARZENGAN, or ARZINGAN, a town of Asiatic Turkey, in the province of Akadulia, eighty miles south-east of Erzerum. It was taken in 1242 by the Mogul Tartars.

ARZENI BAY lies on the coast of Barbary, in the Mediterranean, on the east side of cape Ferrat or Ferrol, and extends to the north-east as far as cape Dyvy or Ivoy. The town is at the south-west, in the bottom of the bay, and before it is good anchorage. It stands on the east side of the river which here falls into the bay.

ARZENZA, or CHERVESTA, a river of European Turkey, in Albania, discharges itself into the gulf of Venice, between Durazzo and Pirgo.

ARZES, in *Ancient Geography*, a town of the island of Cyprus, formerly a considerable city, and see of a Greek bishop, but since the reduction of the island by the Turks, reduced to a village.

ARZES, a town of Asia, situate towards the middle of the northern part of the lake Arissa.

ARZEW, in *Geography*, a sea-port of Africa, in the western province or province of Tlen fan, twelve miles S. S. E. of cape Ferrat. It is called by the Moors, the port of the "Beni Zéian," after the name of the neighbouring Kabyles, who were formerly a considerable community. Ptolemy places his "Deorum portus" betwixt Quiza and Arsenaria, which, says Dr. Shaw, can be no other than this, provided Geeza or Warran is the ancient Quiza; as Arzew is, without doubt, the ancient *Arsenaria*. Arzew is at the distance of three Roman miles from this port, as Pliny places his Arsenaria. The country behind it is a rich champaign ground, but towards the sea there are steep rocks and precipices, which must have served for its defence in that direction. The water now used by the inhabitants lies lower than the sea, and of course is brackish. But for obtaining a supply of fresh water, the whole city was formerly built upon cisterns, of which several still remain, and serve for dwellings to the inhabitants. Several ancient ruins of capitals, bases, and shafts of pillars, with sepulchral inscriptions, are scattered over this place. Five miles from the sea-coast are the salt-pits of Arzew, which supply the neighbouring communities with salt. This commodity, as the pits are inexhaustible, would

would be a very valuable branch of trade under any other government than that of the Turks. Shaw's Travels, p. 14.

ARZILLA, a sea-port town of Africa, on the coast of the Atlantic, in the empire of Morocco, built by the Romans at the mouth of a river, situate five leagues from Tangiers, and now inhabited by Moors and Jews, who carry on no trade. It was formerly a Roman colony, afterwards fell under the government of the Goths, and was next taken by the Mahometans. It was taken and burned by the English; after which it remained waste and uninhabited for thirty years, but was rebuilt by the caliphs of Cordova. In the year 1470, it was taken by Alphonso, king of Portugal, called the African; and abandoned by the Portuguese about the end of the sixteenth century. N. lat. 35° 30'. W. long. 5° 30'. Chenier's Morocco, vol. i. p. 22.

ARZUS, in *Armenia Cappadocia*, a river of Thrace, which ran into the Propontis at the latitude of about 42°.—Also, a town of Thracia, called also *Arzum* and *Affus*, situate between Opizus and Sabzupara, eighteen miles from the former, and twenty miles from the latter.

AS, among *Antiquaries*, sometimes signifies a particular weight; in which sense the Roman *as* is the same with the Roman *libra*, or pound. See LIBRA.

The word is by some derived from *as*, which, in the Doric dialect, is used for *as, anz, q. d.* an entire thing; though others will have this money named *as*, quasi *as*, because made of brass.—Budæus has written nine books *De asse, & ejus partibus*: “Of the *as*, and its parts.”

The *as* had several divisions. See the table under AS, an integer. See also WEIGHT.

AS was also the name of a Roman coin, which was made of different materials and different weights, in different ages of the commonwealth.

Under Numa Pompilius, according to Eusebius in his “Chronicon,” the Roman money was either of wood, leather, or shells. In the time of Servius Tullius, who reigned in Rome about 578 years before Christ, it was copper or brass, and was called *as, libra, libella, or pondus*, because actually weighing a pound, or twelve ounces. Mr. Pinkerton is of opinion, that we may value the *as libralis* of ancient Rome at about eight-pence English. This was called *Æs grave*; and these *asses* were weighed, and not counted. The coinage of Tullius seems to have been confined to the *as*, or piece of brass, with the impression of Janus on the one side, and the prow of a ship on the other, because Janus arrived in Italy by sea. Varro, however, informs us, that the first coins of Tullius had the figure of a bull, or of other cattle upon them, like the Etruscan coins, of which they were imitations; and hence it is said they were called *ævuntia*. Those *asses* with the figure of Janus and the prow of a ship upon them, may be supposed, according to Mr. Pinkerton, first to have appeared about 400 years before Christ; but, in a short time, various subdivisions of the *as* were coined. The *semis*, or half, is commonly stamped with the head of Jupiter laureated; the *triens* or third, with four cyphers, as being originally of four ounces weight, has the head of Minerva; the *quadrans* or quarter, marked with three cyphers, has the head of Hercules wrapt in a lion's skin; the *sextans* or sixth, with two cyphers, is marked with the head of Mercury with a cap and wings; and the *uncia*, having one cypher, is marked with the head of Rome. All these coins appear to have been cast in moulds, by a considerable number at a time; afterwards the smaller divisions were struck, instead of being cast; but the larger continued to be cast until the *as* fell to two ounces. At this time, however, it was called *libra*, and accounted a pound of copper; though larger de-

nominations of it were coined, such as the *liffes* or double *as, treffis* and *quadryffis* of three and four *asses*, and even as far as *decuffis* or ten *asses*, marked X. The smaller parts of the *as* seldom occur, owing to their small value; though some are still found, such as the *semis, triens, quadrans, sextans, and uncia*, coined in the times of Nero and Domitian. Some coins occur which exceed the *as libralis* in weight; and these are supposed to be prior to the time of Servius Tullius. The Romans reckoned by *asses* before they coined silver, in the 485th year of the city, or 267 before Christ, and afterwards they kept their accounts in sesterces.

Pliny says, that when the first Punic war had exhausted the treasury, they reduced the *as* to two ounces. They thus gained fifteen parts, and were enabled to pay their debts. Mr. Pinkerton is of opinion, that Pliny, in asserting that the *as* continued of a pound weight till the end of the first Punic war, is mistaken. Coins, that refute this assertion, are still found; and he thinks it probable that the *as* decreased gradually and slowly in weight, as from a pound to eleven ounces, then to ten, nine, &c.; but neither the *as* nor its parts were ever correctly sized. In the second Punic war, when the Romans were much pressed by Hannibal, about the year of Rome 538, or 216 before Christ; Fabius Maximus being dictator; the *asses* were further reduced to an ounce each; and the silver denarius was made to pass for sixteen *asses*, the quinarius for eight, and the sesterce for four; and the republic gained upon the copper money one half. This took place about thirty-six years after the former reduction. The *as libralis*, with the face of Janus upon it, is the form most commonly occurring before it was reduced to two ounces. Mr. Pinkerton supposes, that this continued for at least a century and a half after the coinage of Tullius, till about 300 before Christ, in the year of Rome 454, between which and the 502d year of Rome, a gradual diminution of the *as* to two ounces must have taken place. The following table exhibits, according to Mr. Pinkerton, the dates of the Roman coinage. The *libralis* coined by Tullius with the figures of oxen, &c. about 167 years after the building of Rome, according to sir Isaac Newton, or about the year before Christ 460, or 587 according to Blair;

<i>As libralis</i> , with Janus and the prow of a ship	400
<i>As</i> of 10 ounces	300
8	290
6	280
4	270
3	260
2, according to Pliny	250
1, according to the same	214

Lastly, by the Papirian law, the *as* was reduced to half an ounce: and it is generally thought that it rested here all the time of the commonwealth, and even till Vespasian's reign. This last was called the Papirian *as*, because the law just mentioned was passed in the year of Rome 563, or, according to the Varronian computation, 191 before Christ, by C. Papirius Carbo, then tribune of the people. Thus, there were four different *asses* in the time of the commonwealth. The figure stamped on the *as* was at first a sheep, ox, or sow; and from the time of the kings, a Janus with two faces on one side, and the *rostrum* or prow of a ship on the reverse.

The *triens* and *quadrans* of copper had the figure of a small vessel called *ratis* on the reverse. Thus Pliny: *Nota æris (i. e. assis), fuit ex altera parte Janus geminus, ex altera rostrum navis: in triente vero & quadrante rates*. Hist. Nat. lib. xxxiii. cap. 3. Hence these pieces were sometimes called *ratiis*.

After the Romans began to have an intercourse with Greece, various elegant figures appear upon the parts of the

as, though not on the as itself till after the time of Sylla. Towards the latter end of the republic, *dupondis*, or double *asses*, were coined, together with the *sestertii aeri*, which supplied the place of the *quadryssis*, when the denarius began to be reckoned at sixteen *asses*; probably at the time when the latter was reduced to half an ounce. M. Paucton, in his "Metrologie," estimates the value of the *as*, from the foundation of Rome till the year 537, at 20 sols, or a livre; though it was sometimes 20 sols: from the year of Rome 537 to the year 544, at 3 French sols, its weight being two Roman ounces of copper: from 544 to 586, at 1 sol 10½ deniers, its weight being one Roman ounce; from 586 to the reign of Claudius or of Nero, 1 fol 1½ denier: from the reign of Claudius or of Nero to that of Constantine, about 1 fol. See COIN, and COINAGE.

As was also used to denote any integer, or whole.—Whence the English word *ace*.

Thus, *as* signified the whole inheritance; whence *heres as asse*, the heir to the whole estate.

So the *jugerum*, or Roman acre of land, being reckoned the *integer*, was called *as*, and divided, like it, into twelve *uncie*.

The *as*, and its parts or divisions, stand thus:

1	<i>As</i>	12	<i>Uncie</i>	12	<i>Semis</i>	6	<i>Uncie</i>
1/2	<i>Deuns</i>	11		11	<i>Quincuns</i>	5	
1/3	<i>Dextans</i>	10		10	<i>Triens</i>	4	
1/4	<i>Dodrans</i>	9		9	<i>Quadrans</i>	3	
1/5	<i>Bes</i>	8		8	<i>Sextans</i>	2	
1/6	<i>Septunx</i>	7		7	<i>Uncia</i>	1	

As, or *Ash*, in *Mythology*, a name given to a deity of the inhabitants of the north. Sperlingius suggests, that when the Asiatics were driven from their country by Pompey, they retired into the northern regions; but as they were a delicate and polished people, they despised the barbarous names of the north, and they were regarded among the rude inhabitants of these countries as superior to mortals, or as a species of divinities. Accustomed therefore to express any thing that was sublime and excellent by the terms *Asha* and *Æsis*, they applied these appellations to their gods.

ASA, in *Scripture Biography*, a king of Judah, was the son of Abijam, and succeeded him A. M. 3049, B. C. 955. He was zealous in the establishment and maintenance of true religion, and active in demolishing altars created to idols, and in restraining and punishing such as were addicted to the infamous practices connected with idolatry, and restoring the worship of Jehovah. He obtained a decisive victory over Zerah, king of Ethiopia, in the plain of Zepathbah or Zepathah near Marefbah. In his contest with Baasha, king of Israel, he called in the assistance of Benhadad, king of Syria, for which he was reproached by the prophet Hanani, whom he severely punished. He died A. M. 3090, B. C. 913, after having held the sceptre of Judah nearly forty-one years. 1 Kings xv. 8, &c. 2 Chron. xiii—xvi.

ASA, in *Geography*, a river of Germany in the archduchy of Aultria, which runs into the Danube two miles north of Efferding.

ASA, among *Naturalists*. The writers of the later ages have formed this word *asa* from the *asar* of the ancients, and attributed it to a gum very different from that anciently known by the name they have thus corrupted. The *asa* of the ancients was an odouriferous and fragrant gum; and the *asa* of the after ages had so little title to this epithet, that they distinguished it by one, expressing its being of an offensive or stinking smell. The Arabian writers, according to this distinction, describe two kinds of *asa*, the one stinking, the other aromatic; and the modern Greeks appro-

priated the name *asa*, or *lybor*, to the stinking gum the Latins called by that name, but added a distinctive epithet to express its smell, and called it *stercoriferum*.

ASA *Daleis*, in the *Materia Medica*, a name by which some authors have called the *benjamin* or BENZOIN of the shop. Dale.

ASA *Fatida*, or ASSA *Fatida*. See FERULA.

ASABORUM PROMONTORIUM, in *Ancient Geography*, a promontory of Arabia, in the straits of the Persian gulf. Ptolemy.

ASABRA, in *Geography*, a river of Spain, which runs into the Aragon near Morillo.

ASAD, a town of Persia, in the province of Faristan, forty-seven leagues north-east of Schiras.

ASAD-ABAD, a large and populous town of Persia, in the province of Irac-Agemi, on the frontiers of Kurdistan, twenty-two leagues N. N. E. of Amadan.

ASÆI, in *Ancient Geography*, a people of Asia, in Sarmatia. Ptolemy.

ASAM, or ASSAM, in *Geography*, a country of Asia, situate to the north-east of Bengal, and bounded on the north by Thibet, on the west by Hindostan, on the south by Meckley, and on the east by part of the Birmah empire, or Ava. Its districts commence, where those of Bengal end, in N. lat. 26°. and E. long. 91°. This country is divided into two parts by the river Brahmaputra, or Burrampooter, which flows from Khata. The northern part is called Utaraul, and the southern Daethincul: the former begins at Gowahutty, the boundary of the Mogul possessions, and terminates in mountains inhabited by a tribe called Meeri Meelmi; and the latter extends from the village Sidea to the hills of Strinagar. Asam is of an oblong figure; its length about 200 standard cos, and its breadth from the northern to the southern mountains about eight days journey. Several rivers flow from the southern mountains of Asam, and fall into the Burrampooter; and the chief of these is the Dhonee. Between these rivers is an island well inhabited, and in an excellent state of tillage, containing a spacious and pleasant country that extends about fifty cos. The cultivated tract is bounded by a thick forest, which harbours elephants, and where those animals may be caught, as well as in four or five other forests of Asam. These animals are so numerous, that five or six hundred may be procured in a year. Across the Dhonee, on the side of GHERGONG, which is the capital of the country, is a wide, agreeable, and level country, the face of which is marked with population and tillage, and presents every where delightful prospects of ploughed fields, harvests, gardens, and groves. This island lies in the part called *Daethincul*. As the country is overflowed in the rainy seasons, a high and broad causeway has been raised for the convenience of travellers from Salagerch to Ghergong; each side of which is planted with bamboos, the branches of which meet and are intertwined, and thus afford a pleasant shade. Amongst the fruits which this country produces are mangoes, plantains, jacks, oranges, citrons, limes, pine-apples, and punialeh, a species of amlech, which has such an excellent flavour, that every person who tastes it prefers it to the plum. There are also cocoa-nut trees, pepper-vines, areca-trees, and the *sadi*, or malabathrum, in great plenty. The sugar-cane excels in softness and sweetness, and is of three colours, red, black, and white. There are ginger which is free from fibres, and betel vices. Such are the strength and fertility of the soil, that any seed that is sown, or slips that are planted, always thrive. The principal crop of the country consists in rice and mash, which is a species of grain: wheat and barley are never sown. The silks are excellent, and resemble

resemble those of China; but they manufacture few more than are required for use. They embroider with flowers, and weave velvet and also tautband, a kind of silk, of which they make tents and kenauts, or the walls that surround them. Salt is precious and scarce; but it is found at the bottom of some of the hills, of a bitter and purging quality; a better sort, extracted from the plantain-tree, is more common. The mountains, inhabited by a tribe called "Nanac," produce plenty of excellent lignum aloes, which the natives annually import into Afam, and barter for salt and grain. These people are naked, and feed on dogs, cats, snakes, mice, rats, ants, and locusts. The hills of Camrup, Sidea, and Luettigereh, supply a fine species of lignum aloes, which sinks in water. Several of the mountains contain milk-deer.

The country of *Uttarcul* on the northern side of the Burampooter, is in the highest state of cultivation, and produces plenty of pepper and areca nuts: it even surpasses Dacshinul in population and tillage. The breadth from the banks of the river to the foot of the mountains, where the climate is cold, and in which there is snow, is various; but it is no where less than fifteen nor greater than forty-five cofs. The inhabitants of the mountains are strong, have a robust and respectable appearance, and are of the middling size. Their complexions, like those of the natives of all cold climates, are red and white; and they have also trees and fruits peculiar to frigid regions: several of the hills in the country of Dereng, on the side of Gowahutty, supply musk, kataus or mountain-cows, bhoat and peere, which are two kinds of blanket, and two species of horses called goont and tanyans. Gold and silver are procured here, as also in the whole country of Afam, by washing the sand of the rivers. This, indeed, is one of the sources of revenue. It is supposed that 12,000, and some say 20,000 inhabitants, are employed in this occupation; and each of them pays a fixed revenue of a tola of gold to the rajah; a tola containing eighty reti-weights and eight retis being equal in weight to twenty-four barley corns or seven carats among jewellers. The people of Afam (says the writer whose account is here cited) are a base and unprincipled nation, and have no fixed religion. They follow no rule but that of their own inclinations, and make the approbation of their own vicious minds the test of the propriety of their actions. They do not adopt any mode of worship practised either by Mahometans or Heathens; nor do they concur with any of the known sects which prevail amongst mankind: unlike the pagans of Hindostan, they do not reject victuals which have been dressed by mussulmans, and they abstain from no flesh except human. They even eat animals that have died a natural death. It is not their custom to veil their women. The men have often four or five wives each, and publicly buy, sell, and change them. They shave their heads, beards, and whiskers, and reproach and admonish every person who neglects this ceremony. It has been asserted that their language has not the least affinity with that of Bengal; but others say, that young Brahmans often come from Afam to Nadiya for instruction, and that their vulgar dialect is understood by the Bengal teachers. Their strength and courage are apparent in their looks; but their ferocious manners and brutal tempers are also betrayed by their physiognomy. They are superior to most nations in corporal force and hardy exertions. They are enterprising, savage, fond of war, vindictive, treacherous, and deceitful. The virtues of compassion, kindness, friendship, sincerity, truth, honour, good faith, and purity of morals, have been left out of their composition. Their dress consists of a cloth tied round their heads, another round their loins, and

a sheet thrown upon their shoulders; but it is not customary to wear turbans, robes, drawers, or shoes. There are no buildings of brick or stone, or with walls of earth, except the gates of the city of Ohergong, and some of their idolatrous temples. The habitations of the rich and poor are constructed of wood, bamboos, and straw. The rajah and his courtiers travel in stately litters; but the opulent and respectable persons among his subjects are carried in lower vehicles, called doolies. Afam produces neither horses, camels, nor asses; but those animals are sometimes brought thither from other countries. The fatal inhabitants, from a congenial impulse, are fond of feeding and keeping asses, and they buy and sell them at a high price; but they are much surpris'd at seeing a camel; and are so afraid of a horse, that if one trooper should attack 100 armed Afamians, they would all throw down their arms and fly, or if unable to escape, would surrender themselves prisoners. Yet if one of this detestable race should encounter two men of another nation on foot, he would defeat them.

The ancient inhabitants of this country, were divided into two tribes, the Afamians and the Cultanians. The latter excel the former in all occupations except war and the conduct of hardy enterprizes, in which the former are superior. A body guard of 6 or 7000 Afamians, fierce as demons, of unshaken courage, and well provided with arms and warlike accoutrements, always keep watch near the rajah's sitting and sleeping apartments: these are his loyal confidential troops and patrol. The martial weapons of this country are the musket, sword, spear, and arrow and bow of bamboo. In their forts and boats they have plenty of cannon, zerbzen or swivels, and rancehgee, in the management of which they are very expert. Whenever any of the rajahs, magistrates or principal men die, they dig a large cave for the deceased, in which they inter his women, attendants, and servants, and some of the magnificent equipages and useful furniture which he possessed in his life time, such as elephants, gold and silver, badcash or large fans, carpets, clothes, victuals, lamps, with plenty of oil or a torch burning, for they consider these articles as stores for a future state. They afterwards construct a strong roof over the cave upon thick timbers. The rajahs of this country have neither yielded submission and obedience, nor paid tribute and revenue to the most powerful monarch; but they have curbed the ambition, and checked the conquests of the most victorious princes of Hindostan. When an invading army has entered their territories, the Afamians have covered themselves in strong posts, and distressed the enemy by stratagems, surpris'es, and alarms, and by cutting off their provisions. If these means have failed, they have declined a battle in the field, but have carried the peasants into the mountains, burnt the grain, and left the country empty. But when the rainy season has set in upon the advancing enemy, they have watched their opportunity to make excursions, and vent their rage; and the famished invaders have either become their prisoners, or been put to death.

The preceding account of the Afamians, who are probably superior in all respects to the Mogals, exhibits a specimen of the malignity and intolerance with which it was usual, in the reign of Aurengzebe, to treat all those whom the crafty, cruel, and avaricious emperor, was pleas'd to condemn as infidels and barbarians. It is extracted from "A description of Afam," written by Mohammed Cazim, and translated from the Persian by Henry Vanfittart, esq. Asiatic Researches, vol. ii. p. 171—185. It should be recollected, in justice to the people of Afam, that the author was an enemy, and a rigid Mahometan, resident at

the court of Aurenzobe. The diet of the Afameis, though less restricted than that of the Hindus of Bengal, is by no means promiscuous; and their religion does not materially differ from that of Hindoos, as might be proved by their coins, on which are inscribed the names of the Hindoo deities.

ASAMA, or ASANA, in *Arab. Geography*, a river of Africa, in Mauritania Tingitana.

ASAMON, a mountain of Palestine, in Galilee, over-against Sephoris. Josephus.

ASANAMARA, a town of India, on this side of the Ganges. Ptolemy.

ASANCA, a town of Germany. Ptolemy.

ASANCHIE, in *Geography*, a town of Asia, in the country of Diarbekir, situate on the Tigris, on the borders of Armenia.

ASANGARO, a jurisdiction of South America, under the bishop of Cusco, in Peru, fifty leagues from that city, in which are bred many cattle. In the north-east part of it there are some silver mines.

ASAPH, in *Biography*, a celebrated musician in the time of David, was the son of Barachias of the tribe of Levi. Asaph, and also his descendants, presided over the musical band in the service of the temple. Several of the psalms, as the 50th, the 73d to the 83d, have the name of Asaph prefixed: but it is not certain, whether the words or the music were composed by him: with regard to some of them, which were written during the Babylonish captivity, they cannot in any respect be ascribed to him. Perhaps they were written or set to music by his descendants, who prefixed to them his name, or by some of that class of musicians of which the family of Asaph was the head. 1. Chron. vi. 39. 2. Chron. xxix. 3. xxxv. 15. Nehem. xii. 46.

ASAPH, *St.* a monk of North Wales, was descended of a good family, and belonged to the church of Llan-Elvy, over which Kentigern the Scotch bishop of that place presided. Upon the removal of this prelate to his own country, he assigned his convent and cathedral to St. Asaph, so that after his death Llan-Elvy lost its name and took that of the saint. He was a diligent preacher, and frequently repeated this saying, "They who withstand the preaching of God's word, envy man's salvation." He flourished about the year 590, under Carentinus king of the Britons; but the time of his death is unknown. The see seems to have continued vacant above 500 years, till it was filled by Geoffrey of Moamouth. St. Asaph was eminent in his time for learning and sanctity; he wrote the "Ordinances" of his church, the "Life" of Kentigern his master, and some other pieces. Biog. Brit.

ASAPH, *St.* in *Geography*, a city and bishop's see in Flintshire, which derived its name from St. ASAPH. The diocese consists of part of Denbigh, Flint, Montgomery, and Merionethshire, and a small part of Shropshire; containing 121 parishes, and 131 churches and chapels, most of which are under the patronage of the bishop. The see is valuable, and the patronage extensive. The town is seated on an eminence near the sea, at the termination of the vale of Clwydd. Although it is denominated a city, it is merely a village in extent. Its fine Gothic cathedral has been lately improved in its external decoration, and its palace has been rebuilt by the late bishop (Shiplcy); which being situated above the town, fronting the hill towards Holywell, commands a pleasant view.

ASAPHIENS, ἀσάφεις, from α, negative, and σαφής, clear, open, in Hippocrates, in Prorrh. & Coac. are such patients as do not utter their words in a clear manner. The defect is occasioned, as Galen says, Comm. 2. in Prorrh. "either

by some hurt which the organs of speech have contracted from a disorder of the nerves, or else by a *dilatium*."

ASAPHIDAMA, in *Ancient Geography*, a town of Syria, in the Cheneidic territory. Ptolemy.

ASAPPLS, or AZAPES, an order of soldiers in the Turkish army, whom they always expose to the first shock of the enemy; to the end that the enemy being thus fatigued, and their swords blunted, the spahis and janissaries may fall on, and find an easy conquest.

The word is derived from the Turkish *asph*, which signifies *range*, from whence they have formed *asph*, to range in *camp*.

The asappes are said to be held of so little value, that they frequently serve as bridges for the cavalry to pass over in bad roads, and as fences to fill up the ditches of places besieged.—The greatest part of them are natural Turks; they travel on foot, and have no pay but the plunder they can get from the enemy.

ASAR, in *Commerce*, a Persian coin worth 6s. 6d. sterling.

ASARABACCA, or ASSARA-BACARA, in *Botany*. See ASARUM.

ASAR-ILADDON, or ASSARHADON, in *Biography*, son of Sennacherib king of Syria, succeeded his father about 709 years before Christ, and having reigned 29 years in Nineveh, he became also king of Babylon, in the year 680 before Christ. He sent a colony of Babylonians and Chaldeans into Samaria; and his generals having taken captive king Manasse, sent him loaded with chains to Babylon. His reign terminated in the year 667 before Christ.

ASARINA, in *Botany*. See ANFIRRHINUM, and CHE-LONIA.

ASARO, in *Geography*, a town of Sicily, in the valley of Noto, eight miles south of Nicosia.

ASAROTA, ἀσάρωτα, from α and σαρω, I sweep, a kind of painted pavements, in use before the invention of mosaic work. The most celebrated was that at Pergamus, painted by Sesus, and exhibiting the appearance of crumbs, as if the floor had not been swept after dinner, whence according to Pliny, the denomination. Perrault supposes them to have been a black kind of pavements of a spongy matter. Plin. Nat. Hist. lib. xxxvi. cap. 25. Perrault ad Vitruv. lib. vi. cap. 5.

ASARUM, in *Botany*, *Afarabacca*. Lin. gen. 589. Schreb. 861. Juss. 73. Gaertn. t. 14. Class, *dodecandria monogynia*. Nat. Ord. *Sarmentaceae*. *Ar. Isobolice* Juss. Gen. Char. *Cal.* perianth one-leafed, bell-shaped, three or four cleft, coriaceous, coloured, permanent; clefts erect bent in at the apex. *Cor.* none. *Stam.* filaments twelve, subulate, half the length of the calyx; anthers oblong, fastened to the middle partition of the filaments. *Pist.* germ inferior or concealed within the calyx; style cylindric, the length of the filaments; stigma stellate, six-parted. *Per.* capsule coriaceous, usually six-celled. *Seeds*, several, ovate.

Ess. Gen. Char. *Cal.* three or four cleft, placed on the germ. *Cor.* none. *Capsule* coriaceous, crowned. *Stigma*, six-cleft.

Species, 1. *A. europaeum*, common afarabacca. Hudf. 265. With. 440. Smith Flor. Brit. 509. Med. Bot. t. 86. Flor. Dan. t. 633. "Leaves kidney-shaped, obtuse, in pairs;" root perennial, creeping; stems short, simple, round, pubescent, one-flowered, and commonly two-leaved; leaves opposite, on long footstalks, reniform, perfectly entire, somewhat downy; flower terminal, pitcher-shaped, of a dark purple colour, villose, on a slender peduncle. It has been found in the north of England, in woods, particularly in Lancashire, but it is a very scarce plant in Britain. The time of its flowering is in May.

Medicinal

Medicinal Properties. The leaves and roots of *Asarabacca* are strongly emetic and cathartic; the latter indeed has been observed to excite vomiting so invariably, that they have been proposed as a substitute for ipecacuanha. At present, however, this plant is seldom given internally, as the evacuations expected from its use, may be procured with more certainty and safety by various other medicines: it is now chiefly employed as an erubine or sternutatory, and is found to be the most useful and convenient in the *Materia Medica*. For this purpose the leaves, being less acrid than the roots, are preferred. A few grains snuffed up the nose several evenings produce a considerable watery discharge, which sometimes continues for several days, by which head-ache, tooth-ache, ophthalmia, and some paralytic and sponific complaints, have been effectually relieved. The college directs a pulvis asari compositus. See Woodv. Med. Bot. p. 258. 2. *A. canadense*, Canadian *Asarabacca*. Mill. fig. 53. t. 6. "Leaves kidney-shaped, mucronate;" the leaves of this are much larger than those of the preceding; their foot-stalks are also longer; in this species the leaves are pointed and hairy, and the flower greenish on the outside. A native of Canada, cultivated by Miller in 1731. It flowers from April to July. 3. *A. virginicum*, sweet-scented *Asarabacca*. Lour. Cochinch. 292. Pluk. Alm. t. 78. f. 2. Mor. t. 7. f. 3. "Leaves heart-shaped, blunt, smooth, petioled;" the leaves of this are veined and spotted on their upper surface, like those of the autumnal cyclamen. The flowers are shaped like the others, but stand on longer peduncles, and are of a darker purple. A native of Virginia and Carolina; also of several provinces in China. Both this and the second species were found in Japan by Thunberg. Cultivated by Miller in 1759.

Propagation and Culture. These plants delight in a moist shady situation, and may be increased by parting the roots in autumn. Much wet in winter will rot the Canadian species, and the last species will not bear too much sun. See Martyn's Miller's Dict.

ASARUM Hypocistis. See **CYTINUS**.

ASASI, a name given by the people of Guinea to a tree, the leaves of which being boiled in water, and held to the mouth, cure the tooth-ach. This tree in its form and manner of growing resembles the laurel; the leaves are very hard and stiff, and grow alternate on the stalks; they have short pedicles, and the branches are blackish and rugged, but they are variegated with small reddish spangles, or scaly protuberances. Phil. Trans. N^o 232.

ASAWNILLY, in *Geography*, a town of Hindostan, in the circle of Oudipour, eighteen miles south-west of Oudipour.

ASBAMÆA, in *Ancient Geography*, a fountain dedicated to Jupiter, near Tyana in Cappadocia. Philostratus, in his life of Apollonius, says, that the waters, though in a state of ebullition, were cold, and that they were pleasant and refreshing to those who observed their oaths, but poisonous and fatal to liars and perjured persons. Jupiter had a temple near this fountain.

ASBANIKEI, a town of Asia, in Mawaralnaher Trans-Oxana, or Zagatai.

ASBECK, in *Geography*, a town of Germany, in the circle of Westphalia, four miles south-east of Ahauz.

ASBESTINE, something incombustible, or that partakes of the nature and qualities of the *Lapis asbestos*. Such as asbestine paper and cloth. See **ASBESTUS**.

ASBESTINITE and **ASBESTRID** of Kirwan, in *Mineralogy*. See **STRAHLSTEIN**.

ASBESTINUM, in *Natural History*, a species of **ALCYONISUM**, described by Petiver, Pallas, and others. It inhabits the American seas, is very porous, white, and rosy

within; the specific character is, stem rather simple, roundish, with largish, oblong pores scattered on every part. Gmelin, &c. Petiver calls this kind *Porus spongoides Americana*, Gaz. t. 23. f. 2. 2.

ASBESTOS, *falsè*, is a name given to plume-alum. See **ALUM**.

ASBESTUS, in *Chemistry*, formed of the priv. *α*, and *σβειναι*, to *extinguish*. *Asbest non vivit*. Fr. *Asbestus immaturus* of the old mineralogists. *Gemeiner asbest*. Germ. *Talcum asbestus vulgaris*. Werner. The most usual colour of asbestus is leek-green; sometimes mountain or olive-green, more rarely greenish or yellowish grey. It occurs in mass. Hexahedral prismatic crystals of asbestus are also mentioned as having been found at Griefbach near Passau, and rhomboidal prisms of the same at Genundt in Carinthia, and at Bagnères; according, however, to Emmerling and Lenz, these are not crystals of asbestus, but of Strahlstein. Internally it is shining, or little shining with a silky or waxy lustre. Its fracture is parallel fibrous, either straight or curved, sometimes also splintery. It generally flies, when broken, into long splintery fragments. It is translucent at the edges: is tender, passing into half-hard; is brittle, slightly elastic; somewhat unctuous to the touch. Sp. gr. according to Kirwan, 2.547.

Asbestus does not effervesce with acids; before the blow-pipe it fuses without addition, but very difficultly, into a greyish black slag: at 160° of Wedgewood, it forms a grey porous porcelain, of sufficient hardness to give fire with steel.

The results of the analysis of this mineral are as yet but little satisfactory. Bergman analysed three specimens, from which it appears, that asbestus consists of 60.67 per cent. of silicæ, 13.16 carbonated magnesia, 6.12 carbonated lime, and a very variable proportion of alumine and iron. Weigleb on the other hand, found in the asbestus of Zöblitz 48.45 magnesia, 46.66 silicæ, 4.79 iron. It is so lately, however, that the art of chemical analysis has been brought even to an approximation of certainty, and the causes of error are still so numerous, that, with the exception of Klaproth, Vanquelin, Chenevix, and perhaps a few others, hardly any authority is to be attached to the various chemists who have been engaged in this very important but most difficult branch of mineralogical science.

Asbestus is found in serpentine rock, and, in general, in the same situations as amiantus. It is sometimes mixed with indurated tale and magnetic iron.

The more flexible varieties have been applied to the manufacture of incombustible cloth, in the same manner as **AMIANTHUS**; which see. Kirwan's Mineralog. vol. i. 159. Brochant. Mineralog. v. i. 497. Widenmann. Handbuch der Mineral. p. 451. Lenz. Versuch, &c. v. i. p. 373.

ASBISI, in *Geography*, a small kingdom of Africa, in Guinea, on the gold coast.

ASBOTUS, in *Ancient Geography*, a town of Greece, in Thessaly. Steph. Byz.

ASBROIT, in *Geography*, a town of Sweden, in South Gothland, six miles north of Wardberg.

ASBURG, a town of Germany, in the circle of Westphalia, and county of Meurs, two leagues east of Meurs, and six west of Duisburg.

ASBYSTÆ, in *Ancient Geography*, a people of Africa, in Libya, placed by Herodotus above Cyrene. Euthathius places them near the temple of Jupiter Ammon, and the fountain of the sun.

ASCA, in *Geography*, the name of a town of Arabia Felix.

ASCAGNE, **ASCANTIUS**, in *Zoology*, a new species of **SIMIA**

SIMIA or monkey, described by Audebert in his "Histoire des Singes," fam. 4. sect. 2. fig. 13; and by Somini in his late edition of the works of Buffon, t. 36. This animal was brought alive from Marseilles to Paris, where it was painted; but the native country is unknown. It is conjectured to be a native of the American continent, being of the family which the French naturalists call *guenons*, as it is observed that all the species hitherto discovered of that family, are inhabitants of America. This is a small kind, measuring about thirteencinches from the muzzle to the tail; all the upper parts of the body are of a dusky olive colour; beneath a deep greyish; face violet-blue, with a flat white nose, and a kind of black whiskers that reach from the mouth to the ears; on the temples are tufts of white hair; the eyes are red; beard and breast grey. This is a fond, lively, and agreeable animal, and very partial to fruit.

ASCAIN, in *Geography*, a town of France, in the department of the Lower Pyrenees, four leagues from Bayonne.

ASCALINGIUM, in *Ancient Geography*, a town of Germany. Ptolemy.

ASCALON, a maritime town of Palestine, and one of the five Satrapies of the Philistines, situate on the Mediterranean, and placed by Josephus at the distance of 320 furlongs west of Jerusalem, between Azotus to the north, and Gaza to the south. It was esteemed the strongest on the Philistine coast; and yet the tribe of Judah, to whose lot it fell, made themselves masters of it soon after the death of Joshua. Venus, called Urania or Cœlestis, was worshipped in this city; and Herodotus relates, that this temple was pillaged by the Scythians about 630 years before the Christian era. There was another divinity, which was the object of worship in this place, called by Diodorus Siculus, Derceto, represented as half a woman and half a fish; and near it was a lake full of fishes, consecrated to this goddess, which the inhabitants, on this account, refrained from eating, as they also did from pigeons, supposed to be under her protection. This city had its own kings, and was successively under the dominion of the Assyrians, Persians, Greeks, and Romans. It was the native place of Herod the Great, who was hence called Afealonites, and who built a palace, which Augustus, after the death of Herod, gave to his sister Salome. The port of Afealon was at some distance from the city. This city was made an episcopal see from the earliest ages of Christianity; and, during the holy war, was adorned with many stately edifices, all which have been since ruined by the Saracens and Turks. It is still in being, though reduced to a small village called *Scalona*. It was anciently famous for its escallions, which took their name from this town. N. lat. 31° 30'. E. long. 16° 44'.

ASCALPIUS, in *Entomology*, the name of a Fabrician genus of neuropterous insects, which in the Linnean system belong to that of *Myrmelom*. The character is, palpi nearly equal, and filiform; jaw ciliated; lip horny, rounded, and entire. In other works of Fabricius it is thus defined: palpi six, nearly equal, and filiform; antennæ elongated and clubbed. *Gaelia* forms a subdivision of his genus *Myrmelom*, under the name *ascalpus*, in which are included the species *longicornis*, *barbarus*, *australis*, and *cayennensis*, all of which are truly *ascalpi* of Fabricius.

ASCANDALIS, in *Ancient Geography*, a town of Asia Minor, in Lycia. Pliny.

ASCANIA, a name given by Pliny to one of the islands of the Archipelago.

ASCANIA, a country of Asia Minor, in Bithynia, extending from the river and lake Afean, between the sea, the river Sengar, and mount Olympus. Sallust.

ASCANIÆ, small islands on the coast of the Troade. Pliny.

ASCANTI, in *Entomology*, a species of *CURCULIO*, of a cylindrical shape, black, and blueish on the sides. Fabricius, Herblt, &c.—*Obs.* *Curculio cylindricus* of Herblt apud Fuesli (Archives des Insectes). is considered by Gmelin as a variety (β) of this insect. Inhabits the south of Europe.

ASCANIUS, in *Biography*, called also *Iulus* or *Ilus*, the son of Æneas by Creusa, the daughter of Priam; or, as others say, by Lavinia, accompanied his father in his flight and dangers, and succeeded him in the government of Lavinium, in the year before Christ 1177. He was called *Ascanius* from a river of that name in Phrygia, and *Ilus*, changed into *Iulus*, from Ilium or Troy. Having defeated Mezentius, king of the Tuscans, who demanded of the Latins a tribute of all the wine produced in Latium, he made peace with him upon condition that the Tiber should be the boundary between the Latin and Hetrurian territories. When he found it expedient to resign Lavinium to Lavinia and his son Sylvius, he determined to build another city for the place of his residence, and the capital of his kingdom, which he called *Alba Longa*. Here he resided about 12 years; and, after a reign of about 38 years, died in this city in the year before Christ 1140. Dion. Hal. l. i. p. 51, &c. Livy, l. i. c. 3.

ASCANIUS, in *Entomology*, a species of *PAPILIO* (*Eg. Tro.*). Above and beneath black, with a common white band; posterior wings clouded with red. Fabricius, &c. Inhabits Brasil.—The body of this insect is black, and the breast is spotted with red.

ASCANIUS, in *Ancient Geography*, a river of Asia Minor, in Bithynia, according to Ptolemy, by which the lake Afean or Afeanias discharged its waters into the sea. Pliny places it in a gulf near Etheleum.—Also, a port of Asia, placed by Pliny near the city of Phocæa.—Also, a lake of Asia Minor, in Bithynia, now the lake of Iznich, near which Pliny places the city of Nicæa.

ASCARA, in *Geography*, a town of Japan, in the province of Simoodfuke.

ASCARDIC, the capital of the country of Asia, called *Little THIBET*.

ASCARINA, in *Botany*, (from *ασκαρίς*, a little worm: the anther having that shape). Schreb. 1487. Forst. Gen. 59. Juss. 442. Class, *diœcia monandria*. Generic Char. * Male flowers. *Cal.* amentum filiform; stilocules scattered, sessile; *Petalanth.* a very short scale. *Cor.* none. *Stam.* filaments single, very short; anther oblong, from spreading recurve, four-furrowed, large. * Female flowers in a different plant. *Calyx* as in the male. *Cor.* none. *Pist.* germ globose; style none; stigma flat, three-lobed, growing to the germ. *Per.* drupe? *Seed.* single.

Eil. Gen. Char. ament filiform. *Cor.* none. Male anther wormshaped. Female, style none; stigma three-lobed; drupe?

Species, 1. *ascarina polyslachya*. Forst. Flor. Austral. n. 364. A native of the Society isles in the South seas.

ASCARIS, in *Natural History*, is the generic name of those creatures belonging to the tribe of *VERMES intestina*, which have a round and elastic body, tapering towards each extremity; three protuberances at the head; tail obtuse or subulate; and the intestines spiral, milky white, and pellucid.

The knowledge of the ancients concerning these animals was apparently very limited; and they invariably confounded the *ascarides* with other intestinal worms. To Redi much credit is due for directing his researches to this intricate subject; and though his discoveries are not of material moment, he was certainly the first among modern writers who endeavoured to improve upon that knowledge which

the ancients had left us. He describes the ascarides of the eagle, the raven, the swan, and several other creatures, in his work "De animalculis vivis quæ in corporibus animalium vivorum reperiuntur Observationes." Amst. 1708. Some further observations were made by different persons after the time of Redi, but many years intervened before any considerable advances were made in this important branch of scientific inquiry.

Although it is evident that several species of the ascarides were most clearly ascertained before the time of Linnæus, that celebrated naturalist has thought proper to insert only two species of them in his *Systema Naturæ*, which are *A. vermicularis* and *A. lumbricoides*. In the last edition of that work, Gmelin has availed himself of more recent discoveries, and has augmented that number to seventy-eight: some species have even been discovered by naturalists since the publication of that work, of which one or two is described by Dr. Pulteney in the *Transactions of the Linnæan Society of London* for the year 1800; and there can be no just reason to doubt, that many other kinds of them exist in different animals, which have hitherto escaped investigation.

Professor Pallas published an elaborate work on the ascarides and other intestinal vermes, intitled, "Thesis de infectis viventibus intra viventia." It was printed at Leyden in 1760, and deservedly acquired a very distinguished reputation. In this book the author has judiciously collated every useful information the labours of his predecessors could afford him, as well as his own experience and observations, and has given ample descriptions and accurate specific distinctions, by which the kinds he describes may be ascertained.

O. F. Müller has assiduously pursued the same inquiry, and greatly extended our knowledge of these creatures. The royal society of Copenhagen also, aware of the vast importance of this subject to the welfare of mankind, proposed a premium for the best dissertation on the origin, generation, and best means of destroying the various kinds of *tenia*, *ascarides*, *fasciola*, and other pernicious vermes, about the year 1780. This excited the diligence both of M. Bloch and M. Goëze, and to each of them a prize was assigned as a reward for their labours. M. Bloch afterwards published his dissertation in the German language, at Berlin, in 1782; and in 1788, a translation of it into French appeared in Strasburgh, under the title of "Traité de la generation des vers des intestines et des vermifuges." That of M. Goëze was published in German with forty-four illustrative plates, and is also a work of considerable merit and utility.

Among the French naturalists of the present day M. Lamarck's "*Système des animaux sans vertèbres*," and "*L'Histoire naturelle des vers*," a sequel to *Deterville's* edition of *Buffon*, are much esteemed. "In spite of the observations of all the writers who have treated on the ascarides," says a modern French author, "it is to Lamarck and Cuvier we are indebted for circumscribing the number of species within the proper limits." M. Chabert, a man of acknowledged skill in the veterinary art, has also written on the intestinal vermes; as a naturalist, it seems he has incurred some blame; his species may however be ascertained, and what is of equal if not greater moment than the mere accuracy of arrangement and scientific definitions, he has endeavoured to point out the best means of extirpating them.

From the observations of different writers it appears, that the ascarides are of the two sexes; and that the female is oviparous and very prolific. All the species that are

truly ascarides, live in the stomach of man or of animals; and their origin, which it is of the utmost consequence to ascertain, is still a matter of profound obscurity. The three tubercles at the head have been mistaken by some for the accompaniments of the vent, because there is obviously an aperture or pore in the middle, but this is unquestionably the mouth, and Brugière notices two little transverse openings below, which he names *stigmates*; and these, it is conjectured, are the organs of respiration.

It will be proper to observe, that besides the prodigious number of ascarides already ascertained, there is a numerous host of similar internal enemies peculiar to different animals which do not possess the generical character of the ascaris, and are therefore arranged in the new genera *trichocephalus*, *flaria*, *uncinaria*, *scœlex*, *tygula*, *strongylus*, *cechy-norhynchus*, *haruca*, *cucullanus*, *caryophyllæus*, *linguatula*, *fasciola*, *tenia*, &c. The species of ascaris described by Gmelin are arranged in the following order:

Infesting Man, and the Mammalia.

Vermicularis, *lumbricoides*;—vespertilionis, in the long-eared bat:—*Phocæ*, *bifida*, *canis*, *visceralis*, *lupi*, *vulpis*, *leonis*, *tigridis*, *felis*, *cati*, *martis*, *bronchialis*, *renalis*, *me-phitidis*, *gulonis*, *talpæ*, *muris*, *hirci*, *vituli*, *equi*, *suis*, *apri*.

Infesting Birds.

Aquilæ, *albicillæ*, *buteonis*, *milvi*, *subbuteonis*, *herma-phodita*, *cornicis*, *coracæ*, *cygni*, *anatis*, *fuligulæ*, *lari*, *ciconiæ*, *tardæ*, *papillosa*, *gallopavonis*, *galli*, *gallinæ*, *phasiani*, *tetraonis*, *columbæ*, *alaudæ*, *sturni*, *turdi*.

Infesting Reptiles.

Testudinis, *lacertæ*, *bufonis*, *pulmonatis*, *rubetræ*, *trachealis*, *ranæ*, *intestinalis*, *dyspnœos*, *infons*.

Infesting Fishes.

Anguillæ, *marina*, *blemmii*, *rhombi*, *percæ*, *globoicola*, *lacustris*, *siluri*, *farionis*, *truttæ*, *maræniæ*, *acus*, *halecis*, *argentinæ*, *gobionis*, *rajæ*, *squali*, *lophii*.

Infesting Worms.

Lumbrici.

In the sequel of this article we shall confine ourselves to the two species of ascarides that belong to the human body; viz. the *A. lumbricoides* and *vermicularis*, referring for their scientific characters to their specific names.

The ascarides of the first species generally infest the small intestines; sometimes they ascend through the duodenum into the stomach, and creep out of the mouth and nostrils; they seldom descend into the large intestines, except on the exhibition of medicines increasing the action of the intestines. Sometimes they are very numerous. Dr. Hooper (to whose excellent Paper in the *Memoirs of the Medical Society of London* we are indebted for much of this detail) relates a case of a girl eight years old who voided per anum upwards of 200 in the course of a week. Sometimes, however, they appear even solitary. When recently excluded, they are transparent, and appear as if they had been sucking water tinged with blood; this colour, however, soon disappears, and they become at length of a light opaque yellow. After being evacuated, their motion is feeble, and they soon die; sometimes when they have been hastily evacuated, they will be very lively, and by means of putting them into warm milk and water, they will continue so for some time. Their motion is serpentine, and in no respect resembles the motion of the lumbricus terrestris, or earth-worm, which has the power of diminish-

ing its length and extending itself again, while the length of the ascaris lumbricoides is never diminished; the head is always cut forward by the worm ending itself into circles, and suddenly extending it with considerable force to some distance.

It is said that the ascaris lumbricoides is not hermaphrodite. The worm here described is considered as the female. Dr. Hooper says he has examined a very considerable number, and has never met with any other appearances than these.

Anatomical Description. Cuticle.—The covering or external membrane of the worm, which may be considered as the cuticle, is very strong, elastic, thin, smooth, and transparent, and easily separates from the parts underneath by maceration in water; under this we find the cutis or true skin, which is considerably thicker than the former, and retains marks of the muscles which it covers; it is also very strong, elastic, and transparent. When the cutis is removed, the muscles, observable through the skin, present themselves; they do not entirely surround the worm as they at first appear, but are two distinct orders acting in opposition to each other, for the two longitudinal lines which extend from one extremity of the worm to the other, are each of them composed of two distinct tendons, separable from one another; these tendons serve for the attachment of the femi-lunar muscles which cover the worm from the head to the tail. Upon carefully removing the femi-lunar muscles from the head to the depressed band, a number of minute vesicles are to be seen (by means of a glass) filled with a submucous fluid which issues out upon puncturing them. This cellular or parenchymatous apparatus closely embraces the intestinal canal from the head to the depressed band; but from thence to the tail there is merely a fibrous kind of cellular membrane. When the muscles are removed from the depressed band to the tail, an extremely delicate membrane appears, which as a peritoneum embraces the abdominal viscera, and lines the cavity of the abdomen, which cavity extends from the depressed band to the tail; it is distended with a transparent fluid, and contains the intestinal tube, and an apparatus supposed to be subservient to generation. The intestinal tube or canal begins from the mouth, and continues nearly half an inch in a parallel form, which Dr. Baillie calls œsophagus; it then becomes larger and transparent, increasing in size till it arrives to the beginning of the abdomen, closely embraced by the parenchymatous substance; it now obtains the dimensions of a crow quill, and passes straight, still enlarging, through the whole length of the worm to within an eighth part of an inch, where it suddenly becomes narrow, and terminates in an anus. This canal is generally filled with a greenish coloured fluid of the consistence of mucus. If a portion of this tube be macerated a few days in water, it exhibits distinct tunics, the external of which is a portion of the peritoneum; it is externally covered with filaments, which may be vessels of nutrition. The second viscus is considered by some as peculiar to the female, and all agree it is for the purpose of generation; it begins about the middle of the worm, where the cavity of the abdomen commences by a slender tube which is continued from the punctiform aperture situated in the depressed band between the two longitudinal lines. This tube, which is termed the vagina, soon becomes larger, when it commences uterus, and divaricates into two large crura, which for the space of four or five inches are of an uniform diameter, then suddenly diminish and appear like opaque threads, embracing in every direction the intestinal tube. Werner considers these as Fallopian tubes. This con-

volute apparatus is composed of very fine transparent membranes; it is never found empty, but always distended with an opaque fluid, in which are a number of ova containing young worms. Some have considered these threads (which always protrude if the skin of the worm be divided) as young worms, and have contended that the ascaris was viviparous; but it is not; and ova, similar to those found in the Fallopian tubes, will be found in the mucus surrounding the worm in the intestines.

As the ascaris lumbricoides has long been confounded with the lumbricus terrestris, or earth-worm, it may be proper to mention that the lumbricus terrestris has but one vesicle at its head, in the middle of which is its mouth; it is flat towards the tail, and is furnished with sharp bristles on its under surface that serve it for feet, which the animal can erect or depress at pleasure; its annula are very large and strongly marked, and its colour is of a dusky red. Upon the under surface there is a large femi-lunar fold in the skin, into which the animal can draw its head or thrust it out at will; in all these it is strongly distinguished from the ascaris lumbricoides. This lumbricus has also an elevated belt in its middle, the ascaris a depressed band; on each side of the ascaris there is a longitudinal line; on the lumbricus, there are three lines upon its upper surface.

The ascaris vermicularis, called the maw or thread worm, when full grown, is about half an inch in length, and in thickness resembling a piece of fine thread; the head, or obtuse extremity, is divided into three vesicles or papillæ, in whose middle is an aperture, which is the mouth. The body is about a third of the length of the animal, beginning from the head, and terminating in the tail, and is of a rugose, pellucid, annular fabric; the tail commences at the small aperture or anus, and becomes less and less, terminating in a fine point.

These worms are mostly confined to the rectum and colon, and that principally of children; but they are often found in the cæcum and small intestines, and even the stomach, and frequently get into the vagina, and even uterus, bladder, &c. Their number sometimes exceeds all bounds; in which case the excrements, when first evacuated, appear quite alive from being covered with them; generally a small number are evacuated from the rectum every day, producing a most unpleasant sensation of itching by their piercing the skin in a degree with their awl-shaped tails. Their constant action is one of their most striking characters, appearing to be never at rest. On exposure to the air, they have the power of piercing the fæces, and burying themselves in it almost instantly. From the extreme action of this species, the genus has obtained the name *ascaris*, for *ασκαρῖς* signifies the same as *σκαρῖζω*, *scartare*, *inquieto movere*.

They are not hermaphrodite: the male does not exhibit any of the gyrated apparatus; the stomach and intestinal canal have in appearance a different arrangement from those in the female: but the male organs of generation have not been detected, probably they are too minute. The female has upon its external surface, about the eighth of an inch from the head, a small punctiform aperture through which the young are protruded, and when highly magnified, its internal cavity appears filled with the convoluted apparatus; and Dr. Hooper says he has seen upwards of one hundred young ones escape through this aperture all alive, and very vivacious several hours after the death of the mother; upon a little pressure being made upon it.

Anatomical Observations. The integuments of this species are similar to those of the lumbricoid ascaris, and consist

fit of cuticle, cutis, and one set of annular muscles; there do not appear to be any longitudinal lines on its external surface. The cavity, containing the viscera, begins at a very small distance from the head, and terminates where the tail commences, at which place is a very small opening, or the anus. The only viscera in the male worm are œsophagus, stomach, and intestines: the œsophagus begins at the mouth, gradually enlarges for a small space, and terminates in the stomach; the stomach is a round bag, so that œsophagus and stomach together resemble a glass pebble which, according to Goëze, constitutes a distinguishing specific character. The stomach evacuates its contents into the intestinal canal, which continues through the worm more or less contracted and dilated to the anus: the contents of the stomach and intestines is always of a brown colour. The female has, besides these viscera, an apparatus subservient to generation, which begins by a slender tube leading from the small punctiform opening situated nearly in the body of the worm; it soon becomes much larger, embraces the intestinal tube in every direction, and fills up the cavity of the worm. This gyrated apparatus is not bifurcated as in the *ascaris lumbricoides*, nor has it the same filiform appendages; its end or fundus is as large as any other part; it appears under a high magnifier like a bladder distended with worms, for its young are seen distinctly moving about from one end to the other.

Symptoms of Worms. When these worms exist in any number, they produce more or less emaciation, paleness of the countenance, with sometimes flushing of the face, a bluish circle about the eyes, itching of the nose, restlessness with starting and talking during sleep, thirst in the morning, nausea and disgust for food, though more frequently great appetite, fetid breath, purching, griping, and tenderness in the belly, especially about the navel; belly frequently much enlarged, flatulency, colliqueness sometimes, at other times purging, weakness, languor, epileptic fits, and more or less symptomatic fever, pulse weak and sometimes intermitting. These symptoms arise more from the *lumbricoides* than the *vermicularis*; but where the latter are numerous, they will occasion nearly as violent symptoms; otherwise they are more known by their effects in and about the rectum and its neighbourhood, producing itching there more or less intolerable, with tenesmus, and even *stator albus*. There are a number of other symptoms brought on by the existence of worms; these, however, are the principal and most decisive; but the best and most satisfactory evidence is their being seen in the evacuations.

Cure. The indications for the cure of *ascarides* are of two kinds, first, the expulsion of them, their young, their ova, and the mucus containing them, from the bowels; and second, the correction of that weak state of the bowels, or other morbid dispositions of them, whatever they may be, which favour the production of them, and that mucus which becomes a nidus for their propagation. For although the only place in nature where these two species of insects are known to be generated, is the human intestines, during life, and therefore it might be reasonable to suppose, they might exist in them (not in great numbers) in a state of health, yet they are generally found in them when at least in a state of less vigour, as in infancy and age, or when weakened by any foreign means, among the causes of which (it may be proper to mention here) the drastic purgatives, employed to get rid of them. These frequently weaken so much that the patient rather submits to the inconvenience of them, especially the *ascaris vermicularis*, than to the pernicious effects of vermifuges upon the digestive organs.

There is hardly a purgative, especially among the drastic ones, which has not been employed for this purpose. These should be used with every precaution; and are hardly ever necessary for the expulsion of the *ascarides*. The *lumbricoides* is not very tenacious of life, and is easily destroyed and evacuated by means of calomel, with scammony or jalap, and other milder purgatives, in moderate doses, adapted to the strength of the patient. The purgative should be several times repeated, at short intervals, in order to remove such worms and ova as have been loosened by the folds of the intestines, or in the naucis, from the action of the preceding dose. The same means are employed to remove the *ascaris vermicularis*, but not with the same success. This is much more tenacious of life, and as it is generally seated so far from the stomach, medicines administered by the mouth have little other effect upon it than as they evacuate the contents of the rectum in common with the other viscera; but administered by glyster, the relief they afford is very considerable, though not in all cases certain. A small quantity of aloes, dissolved in some mucilaginous fluid, and employed as a glyster, is very powerful in this way, assisted at the same time by medicine, to evacuate them from above. There are cases where no effectual remedy has been found to remove these troublesome vermin. We shall below transcribe the accurate history of a case of these worms, given by the late Dr. Heberden in the first volume of the Medical Transactions, which will greatly illustrate this part of our subject.

The second indication of cure, the removal of that weak and morbid state of the intestines which proves favourable to the generation of the *ascaris*, is by no means the least; and it is on this principle perhaps only that bitters have been ranked with worm medicines: it is hardly probable that insects always bred in bitterness, and which have been found in the ductus communis choledochus, and even gall bladder, should be poisoned by bitters. Bitters, and tonics, as preparations of steel and other mineral and vegetable tonics, will be found nearly as useful as the medicines which simply expel them. The consideration of other remedies employed in the removal of worms, we must refer to the article TÆSTIA.

Dr. Heberden tells us, that being acquainted with an experienced and intelligent physician, who had from his infancy been troubled with *ascarides*, he desired to be informed by him what were the inconveniences which they had occasioned, and what was the success of the remedies which he had used: to which he replied, that according to his experience the peculiar symptoms of this species of worms are, a great uneasiness in the rectum, and an almost intolerable itching of the anus. These sensations usually come on in an evening, and prevent sleep for several hours; they are attended with a heat, which is sometimes so considerable as to produce a swelling in the rectum, both internally and externally; and if these symptoms be not soon relieved, a tenesmus is brought on with a mucus discharge. Sometimes there is a griping pain in the lower part of the abdomen, a little above the os pubis. If this pain be very severe, there follows a bloody mucus, in which there are often found *ascarides* alive. They were sometimes suspected of occasioning disturbed sleep, and some degree of head-ache. Purgings and irritating clysters were injected with very little success. One drachm and a half of tobacco was infused in six ounces of boiling water, and the strained liquor being given as a clyster occasioned a violent pain in the lower part of the abdomen, with faintness and a cold sweat. This injection, though retained only one minute, acted as a smart purge, but did little or no good. Lime water was also used

as a clyster, which brought on a colic, but had no good effect. Six grains of felt of steel were dissolved in six ounces of water, and injected. This clyster in a few minutes occasioned an aching in the rectum, and griped a little without purging, and excited a tenesmus. Some few ascarides were brought off with it, but all of them were alive. The uneasy sensation occasioned by this clyster did not abate till some warm milk was thrown up. Wherever the tenesmus or mucus stools were thought worth taking notice of, warm milk and oil generally gave immediate relief. If purging was necessary, the lenient purges, such as manna with oil, were in this case made use of; rhubarb was found too stimulating. But, in general, the most useful purge, and which therefore was most usually taken, was cinnabar and rhubarb, of each half a drachm: this powder seldom failed to bring away a mucus as transparent as the white of an egg, and in this many ascarides were moving about. The cinnabar frequently adhered to this mucus, which did not come off in such large quantities, when a purge was taken without the cinnabar. Calomel did no more than any other purge, which operates briskly, would have done; that is, it brought away ascarides, with a great deal of mucus. Oil, given as a clyster, has sometimes brought off these animalcules: the oil swam on the surface of the mucus, and the ascarides were alive moving in the mucus, which probably hindered the oil from coming in contact with them and killing them. The same mucus may reasonably be supposed to preserve these worms unhurt, though surrounded with many other liquors, the immediate touch of which would be fatal. If the ascarides be taken out of their mucus, and exposed to the open air, they become motionless, and seem to die in a very few minutes.

The general health of this patient did not seem to have at all suffered by the long continuance of his disorder, nor the immediate inconveniences of the disorder itself to have increased. It is perhaps universally true that this kind of worm, though as difficult to be cured as any, is yet the least dangerous of all. They have been known to accompany a person through the whole of a long life, without any reason to suspect that they have hastened its end. As in this example there was no remarkable sickness, indigestion, pain of the stomach, giddiness, nor itching of the nose, possibly these symptoms, where they have happened to be joined with the ascarides, did not properly belong to them, but arose from other causes. There is indeed no one sign of worms, but what in some patients will be wanting. From this case it further appears, that mucus or slime is the proper nest of the ascarides, in which they live, and perhaps the food by which they are nourished. It is hard to satisfy ourselves by what instinct they find it out in the human body, and by what means they get at it; but it is observable in many other parts of nature as well as here, that where there is a fit soil for the hatching and growth of animals and vegetables, nature has taken sufficient care that their feed should find the way thither. Worms are said to have been found in the intestines of infants who have been born dead. Purges, by lessening this slime, never fail to relieve the patients; and it is not unlikely that the worms which are not forced away by this quickened motion of the intestines may, for want of a proper quantity of it, languish and at last die. Experience furnishes no objections against supposing that the kind of purge is of little moment in the cure of all other kind of worms as well as of the ascarides, the worms being always defended from the immediate action of medicines; and that therefore those purges are the best which act

briskly, and of which a frequent repetition can be most easily borne. Purging waters are of this kind, and jalap; especially for children; two or more grains of which mixed with sugar are easily taken, and may be daily repeated.

ASCAROIDES, a species of *CUCULLANUS* found in the stomach of the *Silurus glanis*: it resembles the larva of the *musca*, is about an inch in length, of a whitish grey colour, and is gregarious. Goëze and Gmel. thus define its specific character: head orbicular, and hooked on each side; tail rounded, short, and pointed with two exerted spicules.

ASCAUCALIS, in *Ancient Geography*, a town of Germany. Ptolemy.

ASCOLUM, a town of Venetia, north-west of Tavium.

ASCENDANT, in *Astrology*, denotes the *horoscope*: or the ecliptic which rises upon the horizon, at the time of the birth of any one. This is supposed to have an influence on the person's life and fortune, by giving him a bent and propensity to one thing more than another. In the celestial theme this is called the *first house*, the *angle of the east*, or *oriental angle*, and the *significator of life*.—Such a planet ruled in his *ascendant*.—Jupiter was in his *ascendant*, &c. Hence the word is also used in a moral sense, for a certain superiority which one man has over another, from some unknown cause.

ASCENDANT, in *Genealogy*, is understood of ancestors, or such relations as have gone before us; such are father, grandfather, &c.—They are thus called in contradistinction to descendants, or the descending line. It is a canon in law, that inheritances never lineally ascend. See INHERITANCE. Marriage is always forbid between the ascendants and descendants, in a direct line. See MARRIAGE.

ASCENDENS *obliquus*. See OBLIQUUS.

ASCENDING, in *Astronomy*, is understood of those stars or degrees of the heavens, &c. which are rising above the horizon, in any parallel of the equator.

ASCENDING *latitude*, is the latitude of a planet when going towards the north pole. See LATITUDE.

ASCENDING *node*, is that point of a planet's orbit, wherein it passes the ecliptic, to proceed northward.

ASCENDING *signs*, among *Astrologers*, are those which are upon their ascent, or rise from the nadir, or lowest part of the heavens, to the zenith or highest.

ASCENDING, in *Anatomy*, is applied to such vessels as carry the blood upwards; thus part of the aorta, and the inferior cava, have been termed the ascending aorta, and ascending vena cava.

ASCENDING, in *Botany*, denotes growing first horizontally, and then bowed upwards; and the term in this sense is applicable to leaves, to stalks, to stems, as in spiked speedwell; or to stamens, as in all the speedwells.

ASCENDING *Harmony*, in *Music*, is modulating by 5ths; descending harmony is acquired by the base moving by 4ths.

ASCENSION, ASCENSIO, a rising or moving upward.

ASCENSION, in *Theology*, is particularly used for that miraculous elevation of our Saviour, when he mounted to heaven in the sight of his apostles. Acts i. 14, &c.

ASCENSION-Day, popularly called Holy Thursday, a festival of the church, held ten days before Whitsuntide, in memory of our Saviour's ascension. The appointment of this day for the festival of the ascension is traced to the

Apostolical

Apostolical Constitutions, l. v. c. 19. Its origin is not known; and hence some have been led to imagine, that it was received by tradition from the apostles.

ASCENSION, in *Astronomy*, is either right or oblique.

ASCENSION, *right*, of the sun, or of a star, is that degree of the equinoctial, accounted from the beginning of Aries, which rises with the sun, or star, in a right sphere. Or, right ascension is that degree and minute of the equinoctial, counted as before, which comes to the meridian with the sun, or star, or other point of the heavens. The reason of thus referring it to the meridian, is, because it is always at right angles to the equinoctial, whereas the horizon is only so in a right or direct sphere. The right ascension stands opposed to the right descension, and corresponds to the longitude of places on the earth. Two fixed stars, which have the same right ascension, i. e. which are at the same distance from the first point of Aries, or, which amounts to the same, are in the same meridian, rise at the same time in a right sphere, or with respect to people who live under the equator. If they be not in the same meridian, the difference between the times of their rising or coming to the meridian is the precise difference of their right ascension. In an oblique sphere, where the horizon cuts all the meridians obliquely, different points of the meridian never rise or set together; so that two stars, on the same meridian, never rise or set at the same time; and the more oblique the sphere, the greater is the interval of time between them. To find the right ascension of the sun, stars, &c. trigonometrically, say, for the sun, As radius is to the cosine of the sun's greatest declination, or obliquity of the ecliptic, so is the tangent of the sun's longitude to the tangent of the right ascension.

Let PESQ (*Astronomy*, Plate II. fig. 15.) represent the solstitial colure, the centre of which is φ , and let the diameter EQ be the equator and the diameter PS be the equinoctial colure. Suppose the obliquity to be $E\varnothing = 23^\circ 28'$, and the diameter $\varnothing\mathcal{V}$ to be the ecliptic, in which take $\varphi \odot$ for the sun's longitude or distance from the point $\varphi = 43^\circ 16'$; and through $P \odot S$ describe a circle of right ascension. Then in the right-angled spherical triangle $\varphi \odot B$, we have

Radius	-	-	-	10.00000
to t. sun's long.	=	$43^\circ 16'$		9.97371
As obl. ecl.	=	$23^\circ 28'$		9.96251
to t. right ascension	=	$40^\circ 48'$		9.93622.

While the sun is moving from φ to \varnothing , or in the first quadrant of the ecliptic, the given longitude is the hypothenuse in the triangle $\varphi \odot B$, the declination $B \odot$ is north, and φB is the right ascension. When the sun has past the solstice \varnothing , and is descending towards \sphericalangle , or in the second quadrant, his longitude or distance from φ being taken from 180° , the remainder $\sphericalangle \odot$ becomes the hypothenuse, and the declination is still north; but the arc $B \sphericalangle$ found for the right ascension is only the supplement, and must therefore be taken from 180° . The sun having past the point \sphericalangle , and descending towards \mathcal{V} , is in the third quadrant, and his longitude, reckoned from φ , will be greater than 180° ; in which case the excess above 180° , or his distance from \sphericalangle , will be the hypothenuse $\sphericalangle \odot$; the declination will be south, and the arc $\sphericalangle A$, found for the right ascension, must be added to 180° in order to obtain the right ascension estimated from φ . When the sun has past the solstice \mathcal{V} , and is ascending towards φ , he is then in the fourth quadrant; therefore the longitude will be greater than 270° , and must be taken from 360° , for the hypothenuse $\varphi \odot$. In this case the declination is south, and the right ascension, found by the above

proportion, must be taken from 360° , in order to have the right ascension from φ .

If the obliquity of the ecliptic, and the sun's declination were given, the proportion for the right ascension would be; radius to the cotangent of the obliquity of the ecliptic, as the tangent of the sun's declination to the sine of the right ascension.

The sun's right ascension in time is useful to the practical astronomer in regular observatories, who adjusts his clock by sidereal time. It serves also for converting apparent into sidereal time; as e. g. that of an eclipse of Jupiter's satellites, in order to know at what time it may be expected to happen by his clocks. For this purpose, the sun's right ascension at the preceding noon, together with the increase of right ascension from noon, must be added to the apparent time of the phenomenon set down in the ephemeris. The sun's right ascension in time serves also for computing the apparent time of a known star's passing the meridian: thus, subtract the sun's right ascension in time at noon from the star's right ascension in time, the remainder is the apparent time of the star's passing the meridian nearly: from which the proportional part of the daily increase of the sun's right ascension from this apparent time from noon being subtracted, leaves the correct time of the star's passing the meridian. The sun's right ascension in time is also useful for computing the time of the moon and planets passing the meridian.

For finding the right ascension of a star, supposing its latitude and longitude, and also the obliquity of the ecliptic, to be given the method is as follows. Let PESQ, (fig. 16.) or the primitive circle, be the solstitial colure; EQ the equator, PS its poles, and cb a parallel of latitude intersecting a circle of longitude $p A q$ in the place of a star. Suppose the latitude of the star to be $7^\circ 9' N$. and its longitude $\varphi 29^\circ 1'$, and the obliquity of the ecliptic $23^\circ 28'$. In the triangle $P A p$, we have Pp the distance of the poles of the equator and ecliptic, or the obliquity of the ecliptic $= 23^\circ 28'$, $p A$, or the complement of the latitude $= 82^\circ 51'$, and the contained angle $PpA = 60^\circ 59'$, or the longitude from the first point of \varnothing , and we are to find the angle pPA or the right ascension. The proportion is as follows: rad.: cosine PpA :: tang. pA : tang. M . Take the difference between the side adjacent to the required angle and M , and call it N : then say, sine N : sine M :: tang. PpA : tang. pPA . Or, first find the declination (see DECLINATION), which is $17^\circ 49' N$. Then say, S. co-declin. : S. long. :: S. co-lat. : S. co-right-ascension; i. e. S. $72^\circ 11'$: S. $60^\circ 59'$:: S. $82^\circ 51'$: S. co-right-ascension:—or, 9.9786554 : 9.9417492 :: 9.9966096 : 9.9597034 the sine of $65^\circ 41'$; and therefore the right ascension will be $24^\circ 19'$.

The right ascension and declination of a fixed star or planet, whose longitude and latitude, as well as (O) the obliquity of the ecliptic, are given, may be found by the following problem, communicated by Dr. Maskelyne to Dr. A. Mackay.

Tan. lat. — sine long. = tang. A, north or south, as latitude is. Call. O north in six first signs, and south in six last signs.

$$A + O = B.$$

A less than 45° , co. ar. cof. $A +$ cof. $B +$ tang. long. }
 A more than 45° , tang. $A +$ co. ar. sine $A +$ cof. B } =
 + tang. long.
 tang. right ascension of the same kind as longitude; unless B be more than 90° , when the quantity found of the same kind as longitude must be subtracted from 12 signs.

AR (right ascension) nearer III and IX signs than
 o and VI signs, sine AR + tang. B
 AR nearer o and VI signs than III and IX signs, } =
 tang. AR + cof. AR + tang. B
 tang. declination of same title as B, true to the nearest se-
 cond by Taylor's logarithms, to nearest 10" by Gardiner's
 logarithms, or to nearest minute by Sherwin's or Hutton's
 logarithms, without proportioning.

Example.

Let the moon's long. be 7° 14' 26" 21", and lat. 4° 0' 34" N.
 and the obliquity of the ecliptic 23° 27' 43". Required
 the right ascension and declination?

Lat. 5 4° 0' 34" tang. 8.3456713.
 Long. 224 26 21 sine 9.8451920 — tang. — 9.9914974

A = 5 43 0. 7 tang. 9.0004793 ar. co. cof. 0.0021654
 O = 23 27 48. S

B = 17 44 47. 3 S. — cof. — 9.9788260 tang. 9.5051970
 R.A. 223 21 11. 2 — tang. — 9.9724888 sine 9.3852940

Decl. 12 21 14. 6 S. tangent. — 9.3404910

N.B. The right ascension and declination may be found
 by the following formula:

Co-v. f. Decl. = v. f. long. a $\cos \times$ f. co. lat. \times f. ob.
 ecl. + v. f. co. lat. \times f. ob. ecl.

Cof. Right ascension from γ or α =
 secant decl. \times cof. lat. \times cof. long. from γ or α .
 Mackay's Theory and Practice of finding the Longitude &c.
 vol. i. p. 42.

For other methods of determining the right ascen-
 sion of a fixed star by Mr. Flamsteed, and Dr. Maskelyne,
 illustrated by examples, see Vince's Astronomy, vol. i
 p. 31, &c.

The practical method of finding the right ascension of a
 body from that of a fixed star, by a clock adjusted to sidereal
 time, is this:—Let the clock begin its motion from 0^h 0' 0"
 at the instant the first point of aries is on the meridian;
 then, when any star comes to the meridian, the clock would
 show the apparent right ascension of the star, the right
 ascension being estimated in time at the rate of 15" an hour,
 provided the clock was subject to no error, because it would
 then show at any time how far the first point of aries was
 from the meridian. But as the clock is liable to err, we
 must be able at any time to ascertain its error, or the dif-
 ference between the right ascension shewn by the clock and
 the right ascension of that point of the equator which is at
 that time on the meridian. To do this, we must, when a
 star, whose apparent right ascension is known, passes the
 meridian, compare its apparent right ascension with the right
 ascension shewn by the clock, and the difference will shew
 the error of the clock. E.g. let the apparent right ascension
 of Aldebaran be 4^h 23' 50" at the time when its transit over
 the meridian is observed by the clock; and suppose the time
 shewn by the clock to be 4^h 23' 52", then there is an error
 of 2" in the clock, as it gives the right ascension of the star
 2" more than it ought. If the clock be compared with
 several stars, and the mean error taken, we shall have more
 accurately the error at the mean time of all the observations.
 These observations, being repeated every day, will give the
 rate of the clock's going, or shew how much it gains or
 loses. The error of the clock, and the rate of its going,
 being thus ascertained, if the time of the transit of any body
 be observed, and the error of the clock at the time be ap-
 plied, we shall have the right ascension of the body. This
 is the method by which the right ascension of the sun, moon,
 and planets are regularly found in observatories.

To find the right ascensions mechanically by the globe, see
 GLOBE.

The arch of right ascension is that portion of the equator
 intercepted between the beginning of aries, and the point
 of the equator which is in the meridian: or, it is the num-
 ber of degrees contained in it. This coincides with the
 right ascension itself.—The right ascension is the same in
 all parts of the globe.

We sometimes also say, the right ascension of a point of
 the ecliptic, or any other point of the heavens. The right
 ascension of the mid-heaven is often used by astronomers,
 particularly in calculating eclipses by the nonagesimal deg-
 ree; and it denotes the right ascension of that point of
 the equator which is in the meridian, and is equal to the
 sum of the sun's right ascension and the horary angle or
 true time reduced to degrees, or to the sum of the mean
 longitude of the sun and mean time.

ASCENSION, *angle of right*. See ANGLE.

ASCENSION, *oblique*, is an arch of the equator intercepted
 between the first point of aries, and that point of the equa-
 tor which rises together with a star, &c. in an oblique
 sphere.

The oblique ascension is numbered from west to east; and
 is greater or less, according to the different obliquity of the
 sphere.

To find the oblique ascension of the sun by the globe,
 see GLOBE. See also ASCENSIONAL Difference.

The arch of oblique ascension, is an arch of the horizon in-
 tercepted between the beginning of aries, and the point of
 the equator, which rises with a star or planet in an oblique
 sphere.—This coincides with the oblique ascension itself.
 —The oblique ascensions change according to the latitude of
 the places.

ASCENSION and Descension, *Refraction of*. See REFRACTION.

ASCENSION, *Isle of*, in Geography, one of the African
 islands situate in the Southern Atlantic ocean. S. lat. 7°
 56' 30". W. long. 14° 22' 31". This dreary desolate island
 was first discovered in 1501, by J. de Nova Galego, a Portu-
 guese navigator, who called it "Ilha de Nossa Senhora de
 Concheas;" and it was seen a second time by Alfonso d'
 Albuquerque, on his voyage to India in 1503, probably on
 Ascension-day when it received its present name. Capt.
 Cook stopped at this island in 1775; and he says that it is
 about ten miles in length, from north-west to south-east, and
 about five or six in breadth. Its surface is composed of bar-
 ren hills and vallies, or a collection of rocks, and hollows,
 without a shrub or plant for several miles, and exhibiting by
 the stones and ashes which abound in it, sufficient evidence
 that at some period or other it was a volcanic production.
 Mr. Forster, in his account of this island, says, that they
 could discern from the ship, near the centre of it, a broad
 white mountain of considerable elevation, on which there
 was some verdure, and from this circumstance it obtained the
 name of the "Green Mountain." When they landed on
 the beach, through a high surf, they found themselves amidst
 rocks, which consisted of minute shell-sand, chiefly of a snowy
 white, deep and dry, and by the reflection of the sun intol-
 erable to the eyes. In their progress, they ascended through
 heaps of black cavernous stone, which perfectly resembled the
 common lavas of Vesuvius and Iceland. After a perpendi-
 cular ascent of about twelve or fifteen yards, they arrived at
 an extensive level plain, about six or eight miles in circuit,
 at the different corners of which they observed large hills, of
 a conical shape, and of a reddish colour, which were perfectly
 insulated. Between these hills the plain was covered with a
 great

great number of small hillocks, composed of lava similar to that which they found on the sea-shore, and the pieces of which founded like glass when struck against each other. Between the heaps of lava the soil was a firm black earth, and where the heaps did not appear, the whole was a red earth, so loose and composed of such minute particles, that the wind raised from it clouds of dust. The conic hills consisted of a different sort of lava, which was red and soft, and crumbled into earth. One of these hills stands directly in front of the bay, and has on its summit a wooden cross, whence the bay is said to take its name. The sides of the hill are very steep, but a path about $\frac{1}{2}$ of a mile long winds to the summit. The plain on which they stood, they concluded to have been once the crater of a volcano, by the accumulation of whole cinders and pumice stones the conic hills had been gradually formed; the currents of lava, which were now distributed in many heaps, had, as they conjectured, been gradually buried in fresh cinders and ashes; and the waters, flowing from the interior mountain in the rainy season, had carried every thing before them, and thus filled up by degrees the cavity of the crater. The rocky black lava was the residence of numberless men-of-war birds, and boobies, which sat on their eggs and allowed of a close approach. Here they found a New York sloop, which came to the island to catch turtles, in order to sell them at the Windward islands. The East India ships, it is said, touch at this island for the purpose of furnishing themselves with turtles, which are plentiful and very large. On a second visit to the island, Mr. Forster and his companions crossed the plain, and arrived at a prodigious current of lava, intersected by many channels from six to eight yards deep, which appeared to have been formed by torrents of water, but which they found dry, as the sun was in the northern hemisphere. In these gullies they perceived a small quantity of soil which was a black volcanic earth mixed with some whitish particles, that were gritty to the touch. This soil afforded sufficient nutriment to purslane, and a species of grass, the "*panicum sanguineum*." Having with difficulty climbed over this lava current, they came to the foot of the "Green mountain," which was surrounded by a lava, that was covered with purslane, and a kind of new fern, "*lonchitis adscensionis*," on which several wild goats were feeding. This mountain is divided in its extremities by various clefts into several bodies, which run together towards the centre, and form one broad mass of great height. The whole appears to consist of a gritty tuffaceous limestone, which has never been attacked by the volcano, but probably existed, as Mr. Forster suggests, prior to its eruption: its sides are covered with a kind of grass peculiar to the island, which Linnaeus has named "*aristida adscensionis*." The goats which fed on it were very numerous, but being very shy, they fled with great velocity over tremendous precipices, where it was impossible to pursue them. This island, with a little trouble, says this writer, might in a short space of time be rendered fit for the residence of men. The introduction of furze, "*ulex Europæus*," and some other plants which thrive best in a parched soil, and which are not likely to be attacked by rats or goats, would soon have the same effect as at St. Helena. The moisture attracted from the atmosphere by the high mountains in the centre of the island, would then not be evaporated by the heat of the sun, but gradually be collected into rivulets, and supply the whole island. A sod of grasses would everywhere cover the surface of the ground, and annually increase the stratum of the mould, till it could be planted with more useful vegetables. The outskirts of the island are represented to be beyond description dreary.

It is said that, as this island is visited by the homeward-bound ships on account of its sea-fowls, fish, turtle, and goats, there is in the crevice of a rock a place called by the sailors the "Post Office," where letters are deposited, shut up in a well-corked bottle, for the ships that next visit the island. Mod. Un. Hist. vol. xi. p. 458.

ASCENSION, or *Ascension, Isle of*, a small island about 120 leagues east from the coast of Brazil, N. lat. $20^{\circ} 30'$. W. long. $35^{\circ} 40'$. Some have supposed this island to be the same with the Isle of Trinidad or Trinity. M. la Perouse, who wished to ascertain the existence of the island of Ascension, made search for it, and avers (see his voyage vol. i. p. 24.) that no such island exists from the meridian of Trinidad to about seven degrees west longitude, between the latitudes of $20^{\circ} 10'$, and $20^{\circ} 50'$. M. le Pante d'Agelet also suspects (Mem. Acad. Sc. Paris, for 1788) the French geographers have committed an error with regard to the Isle of Trinity, which they have laid down in their maps of the African seas, but which he thinks is really the Isle of Ascension, which, by some error of reckoning, occasioned probably by currents, has been twice laid down. But M. Dapres (Neptune Oriental, p. 10.) has placed the island of Ascension 100 leagues west of Trinidad, and fifteen miles to the southward. It appears also, that though the latitudes of these two islands were nearly the same, their longitudes were very imperfectly ascertained; and from the minute and very different plans which Dalrymple has given of these two islands and their appearance, it is presumed that they are not the same. La Perouse did not pursue his researches far enough, as the Isle of Ascension is probably somewhat nearer the coast of Brazil than Dapres has placed it.

ASCENSION Bay, lies on the east side of the peninsula of Yucatan, in the bay of Honduras, having Amber bay on the north, and the northern point of Ambergrace key on the south, which forms a passage into Hanover bay, south from Ascension bay.—Also, a bay in the north part of the gulf of Mexico, situate between cape Balize at the mouth of the Mississippi, and the bay of Fresh-water on the west, in N. lat. 30° . and W. long. 92° .

ASCENSIONAL Difference, in *Astronomy*, is the difference between the right and oblique ascension of the same point on the surface of the sphere.

To find the ascensional difference trigonometrically, having the latitude of the place, and the sun's declination given, say, As radius is to the tangent of the latitude, so is the tangent of the sun's declination to the sine of the ascensional difference.

E. G. Let it be required to find the sun's ascensional difference at London, lat. $51^{\circ} 32'$ N. on the 21st of June, being the longest day, when the sun's declination $23^{\circ} 28'$ N.

Let the primitive circle PESQ (*Astron. Pl. II. fig. 17.*) represent the meridian of the place, and the diameter HR the horizon; take RP from R, the north point, for the latitude $= 51^{\circ} 32'$; draw the axis, or 6 o'clock hour circle, PS, and perpendicular to it draw the equator EQ; make En, Qm, each $= 23^{\circ} 28'$, the declination, and describe the parallel of declination nm, intersecting the horizon in O, the place of the sun at his rising or setting, and through this point describe the hour circle P \odot S.

In the spherical triangle $\varphi \odot A$, right-angled at A, the angle $Q\varphi R$, measured by the arc QR, is the co-latitude; $A\odot$ is the sun's declination; and the required ascensional difference is φA , which may be found by the proportion above stated; viz.

Rad.

Rad.	-	-	=	10.000000
To t. lat. P $\varphi \odot = 51^{\circ} 32'$				10.099913
As t. decl. A $\odot = 23^{\circ} 28'$				9.637611
To sine asc. dif. $\gamma A = 33^{\circ} 7'$				9.737524

This ascensional difference, $33^{\circ} 7'$, converted into time, gives $2^h 12' 28''$ for the time which the sun rises before, and sets after the hour of six, on the longest day. Hence it appears, that when the latitude and declination have the same name, the sun rises before, and sets after six; but when they are of contrary names, the sun rises after, and sets before six. And as the sun describes the parallel of declination nm in 24 hours, being at n when it is noon, and at m when it is midnight, the time in passing from m to \odot , or the time of rising being doubled, gives the length of the night; and the time of setting being doubled gives the length of the day. Consequently, $6^h + 2^h 12' 28'' = 8^h 12' 28''$, will be the time of setting, and $6^h - 2^h 12' 28'' = 3^h 47' 32''$, will be the time of rising; and $\frac{8^h 12' 28'' \times 2}{60} = 16^h 24' 56''$ the length of the day, and $\frac{3^h 47' 32'' \times 2}{60} = 7^h 35' 4''$ the length of the night.

But when it is the shortest day at London, that is, when the sun has $23^{\circ} 28'$ south declination, the lengths of the day and night will change places; the day being $7^h 35' 4''$, and the night $16^h 24' 56''$.

When the latitude and declination have the same name, the difference between the right ascension and the ascensional difference, is the oblique ascension; and their sum is the oblique descension; but when they are of contrary names, the sum is the oblique ascension, and the difference is the oblique descension.

The above solution is applicable to a star, as well as to the sun; but on account of the small change in the declination of the stars, the same star in any latitude may be considered as having the same ascensional difference through the year. Hence it appears, that the diurnal difference of the same star's rising, culminating, and setting in the same latitude, is nearly equal to the diurnal difference of the sun's right ascension. As the sun's mean apparent daily motion is $59' 8''$ nearly, or in time $3' 56'' 32'''$, this will be the daily difference in the rising, southing, and setting of any fixed star in the same latitude.

ASCENSIONIS, in *Ichthyology*, a species of PERCA that inhabits the sea about Ascension island; it is reddish above, whitish beneath, and the tail is bifurcated. Oib. It. p. 388.

ASCENSORIUM sometimes occurs, in our ancient writers, for a stair or step.

ASCENT, in a general sense, the motion of a body tending upwards; or the continual recess of a body from the earth. In this sense the word stands opposed to *descent*.

The Peripatetics attribute the spontaneous ascent of bodies, to a principle of levity inherent in them. The moderns deny any such thing as spontaneous levity, and shew, that whatever ascends, does it in virtue of some external impulse or extrusion. Thus it is that smoke, and other rare bodies, ascend in the atmosphere; and oil, light woods, &c. in water: not by any internal principle of levity, but by the superior gravity, or tendency downwards of the parts of the medium in which they are.

The ascent of light bodies in heavy mediums is produced after the same manner as the ascent of the lighter scale of a balance.—It is not that such scale has an internal principle by which it immediately tends upwards; but it is impelled upwards by the preponderancy of the other scale, the excess of the weight of the one having the same effect by augment-

ing its impetus downwards, as so much real levity in the other. because the tendencies mutually oppose each other, and that action and re-action are always equal. See this farther illustrated under the articles *SPECIFIC Gravity*, and *FLUID*.

ASCENT of Bodies on inclined Planes. See its doctrine and laws, under *Inclined PLANE*.

ASCENT of Fluids, is particularly understood of their rising above their own level, between the surfaces of nearly contiguous bodies, or in slender capillary glass tubes, or in vessels filled with sand, ashes, or the like porous substances. This effect happens as well *in vacuo*, as in the open air, and in crooked as well as straight tubes. Some liquors, as spirit of wine, and oil of turpentine, ascend with greater celerity than others; and some rise after a different manner from others. Mercury does not ascend at all, but rather subsides. The phenomenon, with its causes, &c. in the instance of capillary tubes, will be spoken of more at large under *CAPILLARY Tube*. Upon the same principle, two smooth polished plates of glass, metal, stone, or other matter, being so disposed as to be almost contiguous, have the effect of several parallel capillary tubes; and the fluid rises in them accordingly: the like may be said of a vessel filled with sand, &c. the divers little interstices of which form as it were a kind of capillary tubes. So that the same principle accounts for the appearance in them all. And to the same may probably be ascribed the ascent of the sap in vegetables. Thus Sir I. Newton.—“If a large pipe of glass be filled with sifted ashes, well pressed together, and one end dipped into stagnant water, the fluid will ascend slowly in the ashes, so as in the space of a week or fortnight to reach the height of thirty or forty inches above the stagnant water. This ascent is wholly owing to the action of those particles of the ashes which are upon the surface of the elevated water; those within the water attracting as much downwards as upwards: it follows that the action of such particles is very strong; though being less dense and close than those of the glass, their action is not equal to that of glass, which keeps quicksilver suspended to the height of sixty or seventy inches, and therefore acts with a force which would keep water suspended to the height of about sixty feet. By the same principle, a sponge sucks in water; and the glands in the bodies of animals, according to their several natures and dispositions, imbibe various juices from the blood.” Optics, p. 367.

If a drop of oil, water, or other fluid, be laid on a glass plane, perpendicular to the horizon, so as to stand without breaking, or running off; and another plane inclined to the former so as to meet a-top, be brought to touch the drop, then will the drop break, and ascend towards the touching end of the planes; and it will ascend the faster in proportion as it is higher, because the distance between the planes is constantly decreasing. After the same manner, the drop may be brought to any part of the planes, either upward, or downward, or sideways, by altering the angle of inclination. Lastly, if the same perpendicular planes be so placed, as that two of their sides meet, and form a small angle, the other two only being kept apart by the interpolation of some thin body; and thus immersed in a fluid tinged with some colour; the fluid will ascend between the planes, and this the highest where the planes are nearest; so as to form a curve line, which is found to be a just hyperbola, one of the asymptotes whereof is the line of the fluid, the other being a line drawn along the touching sides. The physical cause, in all these phenomena, is the same power of attraction. See *HYDROSTATICS* (*Pl. I. fig. 1.*), and *COHESION*.

ASCENT of vapour. See EVAPORATION, CLOUD, and VAPOUR.

ASCENT, in *Astronomy*, &c. See ASCENSION.

ASCENT, in *Logic*, denotes a kind of argumentation, wherein we rise from particulars to universals. As when we say, this man is an animal, and that man is an animal, and the other man, &c. therefore, every man is an animal.

ASCESIS properly denotes exercise of the body. It is formed from the verb *ασκω*, used by the ancients in speaking of the sports and combats of the athleteæ.

ASCESIS is also used by philosophers, to denote an exercise conducive to virtue, or to the acquiring a greater degree of virtue. Boddæus has a dissertation on this philosophical asceticism.

ASCETERIUM, in *Ecclesiastical Writers*, is frequently used for a monastery, or a place set apart for the exercises of virtue and religion. The word is formed from *ascetis* "exercise;" or *ascetra*, one who performs exercise. Originally it signified a place where the athleteæ, or gladiators, performed their exercises.

ASCETIC, derived from *ασκω*, "I exercise," an ancient appellation given to such persons as, in the primitive times, devoted themselves more immediately to the exercises of piety and virtue, in a retired life; and, particularly, to prayer, abstinence, and mortification. Mosheim (*Eccles. Hist.* vol. i. p. 193.) traces the origin of this sect in the Christian church to the second century. He says, that the ascetics owed their rise to certain Christian doctors, who maintained, that Christ had established a double rule of sanctity and virtue, for two different orders of Christians; the one was ordinary, and designed for persons in the active scenes of life; the other, extraordinary and more sublime, and intended for those who, in a sacred retreat, aspired after the glory of a celestial state. Accordingly, they distributed those moral doctrines which they had received either by tradition or writing into the two classes of precepts and counsels; the former being universally obligatory upon all orders of men, and the latter, relating to Christians of a more sublime rank, who proposed to themselves great and glorious ends, and breathed after an intimate communion with the Supreme Being. Persons of this latter description declared their resolution of obeying all the counsels of Christ, in order to their enjoying communion with God here; and also that, after the dissolution of their mortal bodies, they might ascend to him with the greater facility, and find nothing to retard their approach to the supreme centre of perfection and happiness. They looked upon themselves as prohibited the use of things which other Christians were allowed to enjoy, such as wine, flesh, matrimony, and commerce. See Athenagoras *Apol. pro Christ.* c. 28. They thought it their indispensable duty to extenuate the body by watchings, abstinence, labour, and hunger. They sought felicity in solitary retreats, and in desert places, where, by severe and assiduous efforts of sublime meditation, they raised the soul above all external objects and all sensual pleasures. Both men and women imposed upon themselves the most austere discipline, which, though at first it was the fruit of pious intention, proved in the issue extremely detrimental to Christianity. These persons were called *ascetics*, *Σπυδαίοι Εκκλησίαι*, and philosophers; nor were they distinguished from other Christians merely by their appellation, but also by their garb. In this century, such as embraced this kind of austere life, contented themselves with submitting to all these mortifications in private, without breaking asunder their social bonds, or withdrawing themselves from intercourse with mankind. In the next century, and particularly in the

reign of Constantine, these ascetics, who, as an elegant historian describes them, (*Gibbon's Hist.* vol. vi. p. 239.) "obeyed and abused the rigid precepts of the gospel, and were inspired by the savage enthusiasm which represents man as a criminal, and God as a tyrant;" fled from a profane and degenerate world to perpetual solitude, or religious society, and assumed the name of "Hermits," "Monks," and "Anachorets," expressive of their lonely retreat in a natural or artificial desert. The reasons which gave rise to this austere sect are sufficiently obvious. One of the principal was, the ill-judged ambition of the Christians to resemble the Greeks and Romans, many of whose sages and philosophers distinguished themselves from the generality by their maxims, by their habit, and, indeed, by the whole plan of life and manners which they had formed to themselves, and by which they acquired a degree of esteem and authority. Of all these ancient philosophers, there were none whose sentiments and discipline were so well received by the ancient Christians, as those of the Platonics and Pythagoreans, who prescribed in their lessons two rules of conduct, one for the sage who aspired to the sublimest heights of virtue, and another for the people involved in the cares and agitation of an active life. As the opinions of some of these philosophers were adopted by the more learned among the Christians, they were naturally led to embrace also the moral discipline which resulted from them. Some of the religious severities to which they recurred were deduced from the genius and temper of the people by whom they were first practised. This morose discipline originated in Egypt, which abounded with persons of a melancholy complexion, and produced, in proportion to its extent, more gloomy spirits than any other part of the world. Here the Essenes and Therapeutæ, those dismal and gloomy sects, principally dwelt, long before the coming of Christ, and also many of the ascetic tribe, who, led by a certain melancholy turn of mind, and a delusive notion of rendering themselves more acceptable to the Deity by their austerities, withdrew themselves from human society, and from all the innocent pleasures and comforts of life. From Egypt this four and unfociable discipline passed into Syria and the neighbouring countries, which also abounded with persons of the same dismal constitution with that of the Egyptians; and from thence, in process of time, its infection reached to the European nations. Hence sprung that train of austere and superstitious rites, that yet, in many places, cast a veil over the beauty and simplicity of the Christian religion. Hence the celibacy of the priestly order, the rigour of unprofitable penances and mortifications, the innumerable swarms of monks that withdrew their talents and labours from society, and who did this in the senseless pursuit of a visionary sort of perfection. Hence also proceeded the distinction between the theoretical and mystical life, and many other fancies of a similar kind. The ascetics acquired the respect of the world, which they despised; and the loudest applause was bestowed on this "divine philosophy," as it was called, which surpassed, without the aid of science or reason, the laborious virtues of the Grecian schools. When the monks came in fashion, the title of ascetic was bestowed upon them; especially upon such of them as lived in solitude. See HERMIT, and MONK.

ASCETIC is also a title of several books of spiritual exercises; as, the *Ascetics* or devout treatises of St. Basil, archbishop of Cæsarea in Cappadocia.

We also say the ascetic life, meaning the exercise of prayer, meditation, and mortification.

ASCERETIS. See SECRETARY.

A-SCHACH, in *Ornithology*, the name by which the

IANUS SCHACH of Linnaeus, or Chinese Shrike, is called in China, and under which it is described by Osbeck, Voy. p. 227. See IANUS SCHACH.

ASCHACH, in *Geography*, a town of Germany, in the circle of Franconia, and bishoprick of Wurzburg, thirty-two miles north of Wurzburg.

ASCHAFF, a small river of Germany, in the circle of the Lower Rhine, which runs into the Mayne near Stock-ladt.

ASCHAFFENBURG, a town of Germany, in the circle of Franconia, situate about twenty-five miles from Franfort on an eminence near the Mayne. It belongs to the elector of Mentz, who has a palace here, in which he resides during the greatest part of the year, on account of the salubrity of the air, and the singular beauty of the situation. The country surrounding the town is uncommonly fertile. At the distance of two miles towards the north-east is seen the "Speßart," one of the largest forests in Europe, forming a semicircle round part of this town, and sheltering it from the bleak winds. This forest occupies a space of fifty English miles in length, and the traveller through it meets with only one small village consisting of four houses, in which he may have any accommodation. The road through it is very good, and the elector of Mentz, to whom the greatest part of the country belongs, keeps it free from robbers, so that it may be passed any time of the day or night, without any apprehension of attack. For the security of passengers, a military establishment, consisting of a company of hussars, is fixed at Aschaffenburg; and these are travelling the road at stated hours in order to prevent the possibility of a robbery. N. lat. 49° 55'. E. long. 8° 55'.

ASCHAM, ROGER, in *Biography*, an English scholar of distinguished reputation, was born at Kirby-Wilke, near North-Allerton in Yorkshire, about the year 1515, of parents who, having lived together for sixty-seven years, with uninterrupted harmony, died at the same hour of the same day. Having discovered very promising talents at an early age, he was taken under the patronage of Sir Anthony Wingfield, and after making considerable progress in classical literature under the instruction of the domestic tutor of his sons, Ascham was removed by his patron, in 1530, to St. John's college at Cambridge. Here he enjoyed peculiar advantages for improvement under the tuition of two persons who were eminent for literature at a period when the study of the Greek and Roman classics was the object of particular attention. Of these advantages he availed himself with singular assiduity and emulation; and his proficiency was so considerable, that he gained very distinguished reputation in the university at a very early age. In order to perfect himself in the Greek language, he taught it to others: and learning very soon to discriminate with regard to the comparative excellence of different authors, he lost no time in the perusal of mean or unprofitable books. Upon the model of Cicero and Cæsar, whose works he diligently studied, he formed his style; and among the philosophers, he selected Plato and Aristotle; among the historians, Thucydides and Herodotus; and among the orators, Demosthenes and Isocrates; and on these two last authors he read lectures to his pupils, as he also did on the most celebrated of the Greek poets. At the age of eighteen, in 1534, he took his degree of bachelor of arts, and soon after in the same year was elected fellow of his college, though his attachment to the reformed religion raised some obstacles in the way of this appointment. These honours were considered by Ascham as inducements to his continued and increasing application; and such was his improvement, particularly in the Greek language, that

his lectures, both in the university and in his own college, were received with universal applause. In the year 1536, and at the age of twenty-one years, he was inaugurated master of arts. Such was the proficiency of those who attended his lectures, that one of them viz. William Grindal, was, at his recommendation, appointed to be tutor in the languages to the lady Elizabeth; an honour which it is probable he might have obtained for himself, if he had not declined it from a preference of the academical life to a station at court. At this time Sir John Cheke attempted to introduce a new mode of pronouncing Greek into the university, which for some time was opposed by Ascham; but upon maturer and more deliberate examination, he approved of it, and concurred in adopting and promoting it; and it has since generally prevailed in the schools of England. The purity and elegance of his Latin style was held in such estimation, that he was constantly employed in writing the public letters of the university. As a relaxation amidst his severer studies, he amused himself with the exercise of archery; and having thus given offence to some persons who were envious of his superior merit, he wrote a small treatise on the subject, intitled "Toxophilus," which was published in 1544. His design in writing this treatise was partly to vindicate himself from the aspersions of his enemies, and partly to improve the English language, by introducing a more natural, easy, and truly English diction, than that which was used by the common writers of his age. The author's views in both these respects were fully accomplished. This work, besides the purity and perspicuity of its style, abounds with learned allusions, with curious fragments of English history, and with ingenious observations on life and manners. Ascham honestly confesses, that he was actuated by another more selfish motive in the composition and publication of this treatise. He wished to make a tour into Italy, which was then the republic of letters, and particularly the seat of Greek learning, and he was desirous by dedicating his work to king Henry VIII., to obtain his patronage and encouragement in the prosecution of his plan. In this respect, his modest and laudable wish was gratified; for in 1544, the king granted him a pension of 10*l.* a year, equal according to Dr. Johnson, to more than 100*l.* at the present day. This pension, which was discontinued after the king's death, was restored by Edward VI., and doubled by queen Mary. In the same year, Ascham received the pecuniary benefit as well as honour of an appointment to the office of Orator to the university; which office, whilst he continued there, he occupied with great credit.

He had also for some years received an annual gratuity to an amount that is not ascertained, from Lee, archbishop of York. At length, viz. in 1548, upon the death of his pupil Grindal, he was called by the lady Elizabeth, to whom he had already given lectures in writing, from his college, to direct her studies. This charge he executed with equal diligence and success; but after two years, a cause of dissatisfaction occurred, and he returned from the service of the princess to the university. Notwithstanding this circumstance, the princess's regard for him continued; for in the same year, 1550, he was recalled to court, and appointed secretary to sir Richard Morysine, who was then going as ambassador to the emperor Charles V. During this expedition, which lasted three years, he had opportunity of conversing with many learned men in various parts of Germany which he visited, and made an excursion into Italy, where he was much disgusted with the manners of the inhabitants, particularly of the Venetians. One of the fruits of this tour was a curious tract, intitled, "A Report and Discourse of the

the Affairs and State of Germany," &c. which contains valuable information and judicious reflections.

On the death of Edward VI. in 1553, Morysine was recalled, and Aſcham returned to his college, with no other ſupport than his fellowſhip and ſalary as orator to the univerſity, and the liberality of his friends. But by the intereſt of biſhop Gardiner, who, though he knew him to be a proteſtant, did not deſert him, he was appointed Latin ſecretary to queen Mary, with a ſalary of ten pounds a year, and permiſſion to retain his college preferment. Aſcham by his prudence, without any fervile compliances that reproached his integrity, enjoyed the favour of the queen, and in the moſt perilous times, he maintained his intereſt with Elizabeth; and he was partly indebted to the fidelity of his friendſhip with Cecil for his proſperity in the next reign. Indeed, his learning, and the facility with which he wrote Latin, made him neceſſary at court. In his capacity as Latin ſecretary, he is ſaid to have written in three days forty-ſeven letters to perſons of ſuch rank that the loweſt of them was a cardinal. Upon the acceſſion of Elizabeth, Aſcham was continued in his former employments with the ſame ſtipend. He had daily acceſs to the queen, and read with her ſome portions of works in the learned languages for ſome hours every day, and of her proſiciency under ſuch a maſter many proofs remain. Notwithſtanding the benefit which the queen derived from his ſervices, and the intimacy with which ſhe honoured him by permitting him to play with her at draughts and cheſs, he obtained from her no other recompence than a penſion of twenty pounds a year, and the prebend of Wellwang in the church of York. This poor penſance has been aſcribed by ſome to the paſſion of the queen, and by others to her knowledge of the extravagance of Aſcham. He has been charged, and not unjuſtly, with a propenſity, diſgraceful to a man of letters and humanity, to cock-fighting. In his "Schoolmaſter," he intimates a deſign of writing a book "Of the Cockpit," which he reckons among the paſtimes fit for a gentleman. It is a ſubject, however, of regret, that whiſt the queen did not think him unworthy of her patronage, ſhe did not think proper to remunerate him for his ſervices with a liberality more ſuitable to her high ſtation. In the year 1563, a converſation occurred at ſir William Cecil's on the ſubject of education. Whiſt the ſubject was much agitated, and different opinions were entertained, ſir Richard Sackville was ſo much prepoſſeſſed in favour of Aſcham, by the arguments which he uſed for the mild treatment of boys, that he ſolicited his counſel and aſſiſtance with regard to the education of his ſon, and at the ſame time requeſted that he would write a treatiſe on the general ſubject of education. Thus was produced Aſcham's excellent performance, intitled, "The Schoolmaſter;" a work replete with erudition, and ſuggeſting uſeful advice on the beſt method of teaching the claiſics. Aſcham particularly recommends the method of "double tranſlation," which merits adoption in ſchools. This treatiſe was publiſhed after the author's death by his widow, in 1571; and reprinted with notes, in 8vo, at London, by Upton, in 1711. Aſcham's laſt illneſs was occaſioned by too ſedulous application to the compoſition of a poem, which he intended to preſent to the queen on the New Year's day of 1569. He died in his 53d year, December 23d, 1568. His death was generally lamented, and the queen expreſſed her concern by exclaiming, that "ſhe would rather have loſt 10,000 l. than her tutor Aſcham." His epiſtles, which have been much commended for the elegance of their ſtyle, and alſo for the abundance of hiſtorical matter which they contain, were publiſhed in 1577, by Grant, and dedicated to queen Elizabeth; and his miſcellaneous

pieces have been ſince collected by Bennett into one volume, with a life by Dr. Johnſon prefixed, and publiſhed in 1761, in 4to. Aſcham is ſaid to have been an elegant poet; but his verſes are not to be found in the beſt edition of his works. One of his biographers, ſpeaking of his works, ſays, "His Toxophilus was a good book for young men, his Schoolmaſter for old men, and his Epiſtles for all men." Mr. Wood aſcribes another work to our author, intitled, "Apologia contra Miſſam," printed in 1577, 8vo.

It appears from the writings of Aſcham, and thoſe records of him that remain, that his temper was amiable; that he was kind to his friends, and grateful to his benefactors; that he was inclined to free inquiry on the ſubject of religion, but too much engaged in other purſuits to beſtow much attention on this object; that he was, as a man, reſpectable; and that, as a ſcholar, he promoted correct taſte and found learning; and by thus ſerving both his contemporaries and poſterity, he deſerved much more ample recompence than he received. He died poor, and left a widow and ſeveral orphans in deſtitute circumſtances. His poverty has been aſcribed by ſome to his attachment to dice and cock-fighting; and it is noticed by Buchanan in the following ſhort epiſgram, ſaid by ſome to diſplay more wit than friendſhip, which he conſecrated to his memory:

"Aſchamum extinctum patriæ, Grææque Camææ
Et Latæ verâ cum pietate, dolent;
Principibus vixit carus, jucundus amicis,
Re modicâ, in mores dicere fama nequit."

Thus tranſlated, and paraphraſed:

"The Attic and the Latian muſe deplore
The fate of Aſcham, once their joy and pride;
His lays ſhall charm the liſt'ning crowd no more;
Eſteem'd by kings, lov'd by his friends, he died.
Fortune denied her treaſures;—juſt ſame
Honour'd his worth, and ſpread abroad his name."

Grant. Oratio de vita et obitu R. Aſchami. Biog. Brit. Johnſon's Life of Aſcham. Andrews's Hiſtory of Great Britain, vol. ii. p. 85.

ASCHARIANS, or ASHARIANS, followers of Aſchari, or Aſhari, one of the moſt celebrated doctours among the Mahometans, who died at Bagdat, about the year of the Hegira 329, or of Chriſt 940, and who was ſecretly buried, left the Hanbalites, by whom his opinions were reckoned impious, ſhould tear up his remains from the grave. The Aſcharians were a branch of the SEFATHIANS; and their opinions were, 1. That they allowed the attributes of God to be diſtinct from his eſſence, yet ſo as to forbid any compariſon to be made between God and his creatures. 2. As to predeſtination, they held that God hath one eternal will, which is applied to whatſoever he willeth, both of his own actions and thoſe of men, ſo far as they are created by him, but not as they are acquired or gained by them; that he willeth both their good and evil, their profit and their hurt; and as he willeth and knoweth, he willeth concerning them that which he knoweth. They went ſo far as to ſay, that it may be agreeable to the will of God that man ſhould be commanded what he is unable to perform. But while they allow man ſome power, they reſtrain it to ſuch a power that cannot produce any thing new. God, they ſay, orders his providence ſo, that he creates after or under, and together with, every created or new power, an action which is ready whenever a man wills it and ſets about it; and this action is called "caab," or acquiſition, being, in reſpect to its creation, from God, but in reſpect to its being produced, employed, and acquired, from man. This is generally eſteemed the orthodox opinion, and has been variously explained. 3. As to mortal ſin, the

Afcharians taught, that if a believer, guilty of such a sin, die without repentance, his sentence is to be left to God, whether he pardon him out of his mercy, or whether the prophet intercede for him, or whether he punish him in proportion to his demerit, and afterwards, through his mercy, admit him into paradise; but that it is not to be supposed he will remain for ever in hell with the infidels, since it is declared, that whosoever shall have faith in his heart, but of the weight of an ant, shall be delivered from hell-fire. This is generally received as the orthodox doctrine in this point, and is diametrically opposite to that of the *Motazalites*. D'Herbelot's *Bibl. Orient.* Sale's *Koran.* Prel. Disc. p. 165.

ASCHAUSEN, in *Geography*, a town of Germany, in the circle of Suabia, eight miles north of Ravensburg.

ASCHBARAT, a town of Turquestan, in the country of the Getæ, on the other side of the river Sihon.

ASCHBOURKAN, or **ASCH-FOURKAN**, a town of Persia, in the province of Chorasan.

ASCHEION, in *Ancient Geography*, a town of the Peloponnesus, in Achaia.

ASCHEGINSKOI, in *Geography*, a fortress of Siberia, on the confines of China, 130 miles S. S. W. of Selinginsk.

ASCHER, a district of the fief of Aggers-Herred in the Diocese of Christiania or Aggerhuus, in Norway.

ASCHERSLEBEN, a town of Germany, in the circle of Lower Saxony, and principality of Halberstadt, seated on the Eine. It was once the capital of a country to which it gave name, and was one of the most ancient provinces of the house of Anhalt. The circle of Aschersleben, or *Ascan*, comprehends the tract which was once the Aschersleben or Gatersleben lake, about two German miles long and half a mile broad; but being drained between the years 1703 and 1709, is now become good corn and pasture land.

ASCHIA, **ASCH** Cramer, **ASCHER** Gesner, &c., in *Ichthyology*, synonymous names of the fish called *Grayling* in England; and by Linnaeus *SALMO THYMALLUS*; which see.

ASCHOUR, in *Geography*, a river that passes by the town of Kasch in Turquestan, towards the north.

ASCHRAFF, in *Ancient Geography*, a city of Persia, in the province of Mazendran, near the Caspian sea, was once the favourite residence of Abbas the great, but now fallen into decay; the splendid palaces and gardens being sunk into a ruinous state, since the commotions that followed the death of Nadir Shah.

ASCHTIKAN, in *Geography*, a town of Asia, in Independent Tartary, sixteen leagues from Samarcand.

ASCHWOMSEE, a lake of Prussia, forty miles south-east of Konigsberg.

ASCIA, in *Antiquity*, an instrument, supposed to be of the same kind, used in the fabric of the Roman tombs, and frequently represented on them.

The formula "sub ascia dedicare," is frequently found inscribed on ancient tomb-stones. We also meet with "rogum ascia ne polito," among the antique laws of the Twelve Tables. These expressions, and the figure of the ascia, as seen on the tombs, have puzzled several antiquaries, who have formed very curious conjectures concerning it. F. Martin rejects all their opinions, and with considerable probability affirms, that the ascia was a hoe, or sort of pick-ax for digging up the ground, which is to this day called *assador*, or *assuidos*, in Languedoc. This ascia, he pretends, was not an instrument of common use, but consecrated and employed only for digging of graves; and that it is the same

with what Sidonius Apollinarius calls *rasrum funebre*, where-with the Gauls digged their graves. Lib. iii. ep. 12.

This, he thinks, appears plainly to be the signification of the word, from the Latin proverb, "ipse mihi asciam in crus imeggi," which often happens to those who work with this instrument.

On this footing the famous law of the Twelve Tables, wherein the ascia is mentioned, and the explication of which has puzzled all our antiquaries, contained only a prohibition to dig graves with an instrument of iron or copper, such as the ascia. In reality it was a tradition observed by the remotest antiquity, that no instrument made of those metals should be used in sepulchres.

Dom. Martin has given a dissertation concerning the funeral monuments of the Romans, consecrated "sub ascia." La Relig. des Gaul. tom. ii. liv. 5.

Mabillon, in his explication of the formula "sub ascia dedicare," &c. conjectures that the ancients, in dedicating their tombs to the manes, made imprecations against those who violated their sanctity; and these imprecations, he conceives, were expressed by the figure of the ascia, which bore a threatening aspect. Much to the same purpose is the opinion of Muratori, who apprehends that the formula "sub ascia," or the ascia itself placed upon the tombs, was a tacit but well-known supplication addressed by the person interred to the owner of the field in which the grave was dug, that the adjacent soil might be hoed, the briars removed, and the earth rendered light over the ashes of the deceased. Accordingly, "sit tibi terra levis," is part of an epitaph found on ancient monuments. The sentiments of Mabillon and Muratori have been illustrated and confirmed by count Caylus. Moreover it appears, that the Romans annexed no superstitious idea to the formula "sub ascia dedicavit," as the first Christians made use of it on their monuments.

ASCIA is also used, in *Surgery*, for a kind of bandage somewhat oblique or crooked; whose form and use are well described by Scultetus, in his *Armam. Chirurg.* p. 1. tab. 54. fig. 3.

ASCIBURGIUM, in *Ancient Geography*, a citadel on the Rhine, mentioned by Tacitus, in which were a Roman camp and garrison; situated in a place corresponding with a small hamlet, now called *Asburg*, not far from Meurs, in the duchy of Cleves.

ASCIDIA, in *Natural History*, the name of a genus of *VERMES* that belong to the *Mollusca* tribe, the body of which is fixed, roundish, and apparently issuing from a sheath; the apertures two, generally placed near the summit, one below the other, Gmel. &c. These creatures are more or less gelatinous, and have the power of contracting and dilating themselves at pleasure; some are furnished with a long stem, but most of them are sessile. Gmelin enumerates the following species: papillosa, gelatinosa, intestinalis, quadridentata, rustica, echinata, mentula, venosa, prunum, conchilega, parallelogramma, virginea, canina, patula, asperfa, scabra, orbicularis, corrugata, lepadiformis, complanata, tuberculum, villosa, clavata, pedunculata, mammillaris, globularis, phusca, gelatina, crystallina, octodentata, patelliformis, pyura, aurantium, globularis: which see respectively.

ASCII, formed of the primitive α , and $\sigma\omega\alpha$, *shadow*, in *Geography*, are those inhabitants of the globe, who at certain times of the year, have no shadow; such are the inhabitants of the torrid zone, because the sun is twice a year vertical to them, and they have then no shadow.—To find on what days the people of any parallel are *ascii*, see *GLOBE*.

ASCINDOE, in *Botany*, a name given by the people of Guinea to a shrub, which they use in medicine, boiling it in

water, and giving the decoction in gonorrhœas, and the like complaints. Petiver has named it the prickly Guinea shrub, with roundish crenated leaves, and filamentous flowers. The leaves are about an inch wide, and about an inch and a half long; they stand on short foot-stalks; and at the ends of the branches, there stand clusters of stameneous flowers. The thorns on the large branches are very strong. Phil. Trans. N^o. 232.

ASCITA, in *Ichthyology*, a species of SILURUS, that differs in several respects from other creatures of the same tribe, and is specifically described as having the dorsal fin fleshy, and eighteen rays in the anal fin. This fish inhabits the Indian seas, and is figured both by Bloch, and in Déterville's edition of Buffon. The mode of generation, or manner in which the young are produced, is singular, for it is neither oviparous, nor viviparous, but, partaking of both, forms a distinctly connecting link between those two natural divisions of fishes: the eggs are not composed like those of most other creatures, but consist merely of a yolk, without white, and surrounded by a thin skin to which the embryo is attached by means of an umbilical vessel on the outside, and by which it receives its proper nourishment till it is disengaged. Among other reasons it is asserted that it cannot be viviparous, because it does not receive its nourishment from the parent by means of a *placenta*, but from the yolk of the egg to which it is affixed while it remains in the matrix; and that it cannot be oviparous because the eggs are not as usual deposited when completely formed, nor are the young contained within the egg, but only attached to the outside of it.

ASCITÆ, derived from *ασκος*, a bag, or bottle, in *Antiquity*, a sect or branch of Montanists, who appeared in the second century.

The Ascitæ were so called, because they introduced a kind of Bacchanals into their assemblies, who danced round a bag or skin blown up; saying, these were those new bottles filled with new wine, whereof Jesus Christ makes mention, Math. ix. 17.—They are sometimes also called *Ascodrogitæ*.

ASCITÆ, in *Ancient Geography*, a people of Asia, placed by Pliny and Ptolemy in Arabia Felix.

ASCITES, in *Medicine* (from *ασκος*, *uter*, a sacculus or bladder), denotes a species of DROPSY which is seated in the abdomen. This disease is commonly divided into two kinds: viz. 1. When the water is contained within the peritonæum investing the general cavity of the lower belly; and 2. When the fluid is included within a bag, or cyst, in which case it is called an *incysted* dropsy: but the description of this disease, and its appropriate treatment, will be found under the articles DROPSY, and PARACENTESIS or TAPPING.

ASCITES, the operation for, in *Surgery*, is named TAPPING, which see. This operation is likewise technically called PARACENTESIS. It consists in drawing off from the abdomen, by means of a trocar, the water or other fluid which is contained therein.

ASCIUM, in *Botany*. Schreb. 903. *Norantea*, Aubl. 220. Juss. 245. Class, *polyandria monogynia*. Nat. Ord. *Putamineæ*? *Capparides* Juss. Gen. Char. *Cal.* perianth five-leaved, leaflets roundish, concave, coriaceous, coloured on the margin. *Cor.* petals five, ovate, acute, larger than the calyx, inserted into the receptacle. *Stam.* filaments very many (40 or 50), short, three-sided, inserted into the receptacle; anthers oblong. *Pist.* germ ovate; style very short; stigma headed. *Per.* berry? one-celled; containing many seeds.

Ess. Gen. Char. *Cal.* five-leaved, coriaceous. *Cor.* five-petalled; berry? one-celled, with very many seeds.

Species, 1. *Ascium norantea*, Aublet Guian. t. 220. This is a tree furnished with alternate entire thick leaves. The flowers grow in loose spikes from the ends of the branches; they are alternate, subsessile, and to each is a long bractæ, with a claw to it, resembling the cowled bag of margravia, to which genus this seems nearly allied. It is a native of Guiana.

ASCLEPIA, in *Antiquity*, feasts celebrated in various parts of Greece in honour of Æsculapius. They chiefly consisted of music, and a contest between musicians and poets. They were also called *Μηγαλασκληπεια*, or the great festivals of Æsculapius.

ASCLEPIAD, ASCLEPIADEUS, a Greek or Latin verse of four feet, containing a spondee, a choriambus, and two dactyls; or, which amounts to the same, a spondee, two choriambuses, and a pyrrhichius.

Such are the verses,

“Mæcenas atavis edite regibus.”

“Sublimi feriam sidera vertice.”

ASCLEPIADA, in *Entomology*, a species of CHRYSOMELA, discovered by Pallas in the vicinity of the rivers Volga and Irty, in Siberia. It is of a dusky blue, and glossy; antennæ black; dots on the thorax scattered; on the wing-cases disposed in lines. Pallas, Gmelin, &c.

ASCLEPIADES, ARTORIUS, in *Biography*, physician and friend to Cæsar Octavianus, by whose advice the emperor left his camp the evening before the battle at Philippi, by which his life was probably preserved, that part of the army being surprised and cut to pieces by Brutus. Artorius perished by ship-wreck soon after the battle at Actium, and the emperor caused a magnificent monument to be erected to his memory at Smyrna. He is said to have maintained, that the stomach is the part principally affected in the hydrophobia. Haller Bib. Med. Pract.

ASCLEPIADES, descendants of Æsculapius, so called; who were supposed to have preserved the tenets of their progenitor, and to have founded schools of medicine in various parts of Greece, which continued many ages. The most famous were those of Rhodes, Cnidos, and Cos, formed by different branches of the family. Hippocrates was derived from the latter branch: see article HIPPOCRATES.

ASCLEPIADES, a celebrated physician, born at Prusa in Bithynia, flourished somewhat before the time of Pompey, and formed an intimacy with Licinius Crassus the orator, and other persons of distinguished character. It is not known whence he took his name, as he was not of the family of Æsculapius. After completing his education, he went to Rome, where he commenced by teaching rhetoric; but not succeeding in that line, he applied himself to the study of medicine, in which he soon became famous; for, rejecting the doctrines of his predecessors in that art, he formed a new theory of diseases, and instituted new methods of curing them. He avoided all harsh and violent drugs, particularly vomiting and purging medicines, which he contended injured the stomach, and induced complaints more dangerous than those they were given to remedy, and professed to cure diseases, “*tutò, citò, et jucundè.*” Romæ cum viveret (Haller says) ad luxum et molliera Romanorum artem accommodavit. He was attached to the corpuscular philosophy, and supposed that the free motion of the corpuscles in the vessels constituted health, and that disease ensued when they were restricted or checked in their motion by the straitness of the vessels. “Thus pains, ardent fevers, intermittents, &c. were occasioned (he said) by corpuscles impacted in the pores.” A doctrine full as intelligible, “as the lentor of the humours obstructing the vessels,” the favourite theory of one of the most celebrated teachers

teachers in the last century. In fevers, he prohibited all food, and even drank to his patients for three or more days, but when by this means, the violence of the fever was abated, he indulged them with animal food, and with wine. When colic, he used glysters, which he frequently employed. In pleuritis, and in other complaints attended with violent pain, he prescribed bleeding, but in chronic complaints, he depended principally on abstinence, exercise, baths, and frictions. These, he said, opened the pores, and gave free exit to the obstructed particles.

That he was in high repute in his time, we have the authority of Celsus, Cilius Acrasianus, Galen, and Scribonius Largus, from whose writings what is known of his opinions and practice is principally taken, as none of his works have been preserved. Mithridates, king of Pontus, invited him to his court; but his employment at Rome was too lucrative to permit him to accept the offer.

But besides the reputation he acquired by his practice, his fame was further increased by the number of pupils or disciples who attended his school, and who continued to follow his method long after his decease. Themison, one of his disciples, in part adopting, and in part deviating from his doctrine, formed a new sect, under the title of the Methodist, which in its turn became popular. Asclepiades is said to have pledged his reputation on preserving his health, to have lived to a great age, and to have died at length in consequence of a fall. Le Clerc Histoire de la Médecine. Haller Bib. Med. Pract. who gives a detailed and particular account of his practice in a variety of diseases.

ASCLEPIADES, a Greek philosopher of the Eliac school, was born at Phlia, in Peloponnesus, and flourished about 250 years before Christ. He was the intimate friend and associate of Menedemus, whilst they both attended the school of Stilpo, and afterwards when they attended Phlodo's school at Elis. They were under a necessity of supporting themselves by the manual labour of masons. They left their country for the sake of enjoying the advantages of Plato's school at Athens, and gained a subsistence by grinding in the night in one of the public prisons, that they might be able to spend the day in the academy. When the Athenian magistrates, upon inquiring into their mode of subsistence, were informed of this circumstance, which manifested their ardent desire of knowledge, they applauded their zeal, and presented them with 200 drachmas. In advanced life Asclepiades lost his sight, but bore the affliction with cheerfulness. Athen. l. iv. c. 19. Cicero Tusc. Disp. l. v. c. 39. Diog. Laert. vit. Mened. Brucker by Enfield, vol. i. p. 197.

ASCLEPIAS, in Botany, swallow-wort. (From *Æsculapius*, the god of medicine.) Lin. gen. 306. Schreb. 429. Juss. 147. Gaertn. t. 117. Clafs, *pentandria digynia*. Nat. Order, *Contorta*.—*Apocynæ*, Juss. Gen. Char. *Cal.* perianth five-cleft, sharp, very small, permanent. *Cor.* monopetalous, flat, or reflex, five-parted; divisions ovate-acuminate, slightly bending with the sun; nectaries five, growing to the tube of the filaments, fleshy, or cowl'd; a sharp horn protruding from the bottom, bending inwards. *Stam.* filaments five, collected into a tube, swelling at the base; anthers oblong, upright, two-celled, terminated by an inflex membrane lying on the stigma, having a reversed wing on each side; the pollen is collected into ten corpuscles, inversely lanceolate, flat, hanging down into the cells of the anther by short threads, which are annexed by pairs to five cartilaginous twin tubercles, each placed on the tip of the wings of the anthers, adhering to the angles of the stigma, between the anthers. *Pist.* germs two, oblong, acuminate; styles two, subulate; stigma common to both, large, thick,

five-cornered, covered at the top by the apex of the anthers, umbilicate in the middle. *Per.* folicles two, large, oblong, acuminate, swelling, one-celled, one-valved. *Seeds*, numerous, imbricate, crowned with down; receptacle membranaceous, free.

Ess. Gen. Char. Contorted; nectaries five, ovate, concave, putting forth a little horn. Species:—

* *Leaves opposite, flat.*

1. *A. undulata*, waved-leaved swallow-wort, apocynum africanum, *Lapathi folio*, Comm. Rar. t. 16. "Leaves sessile, oblong, lanceolate, waved, smooth." A native of the cape of Good Hope. It was introduced into our gardens in 1783. Its flowers appear in July. 2. *A. crispata*, curled-leaved swallow-wort; apoc. erectum africanum, &c. Herin. par. 25. Comm. Rar. t. 17. "Leaves cordate, lanceolate, waved, scabrous, opposite; umbel terminal." Its stem is pubescent, branching at the bottom; leaves subsessile, repand; one umbel of yellow flowers terminates the stem. Found at the cape by Sparrman. Introduced into the Kew garden by Mr. Masson, in 1774. 3. *A. pubescens*, pubescent swallow-wort; apoc. afr. tuberosum, &c. Morr. Hist. 3. 610. Pluk. 139. f. 1. "Leaves ovate, veined, naked; stem shrubby; peduncles villose;" the stem is shrubby, simple or little branched, very shortly villose; leaves on very short footstalks, villose, pointed, much veined, rather crowded; peduncles and umbels villose; flowers purple. A native of the cape of Good Hope. 4. *A. volubilis*, twining swallow-wort, Rheed. Mal. 9. 21. t. 13. Rumph. Amb. 5. t. 175. f. 1. "Leaves ovate, entire, acuminate; stem rhizaceous, twining; umbels erect;" stem smooth; branches shining; leaves petioled, ovate-subcordate, veined; umbels simple, on peduncles the length of the petiole; flowers greenish. A native of Malabar and Ceylon. 5. *A. asthmatica*, asthmatic swallow-wort. "Leaves petioled, cordate-ovate, above smooth, entire; stem shrubby, twining, hirsute; umbels few-flowered." The whole plant is villose, except the upper surface of the leaves, which resemble those of laurel, heart-shaped at the base, pointed at the apex; umbels shorter than the leaves, often proliferous; flowers small. Found in the woods of Ceylon by Koëning. The root is esteemed in asthmatic cases. 6. *A. gigantea*, curled flowered gigantic swallow-wort, Brown. Jam. 182. 1. "Leaves obovate-oblong; petioles very short; segments of the corolla reflex, involute." It rises six or seven feet in height; leaves thick; flowers white; pods very large; nectaries without horns. Browne says, in Jamaica it is called auricula, or French jasmim. Cultivated at the royal garden, Hampton court, in 1690. It flowers from July till September. 7. *A. syriaca*, Syrian swallow-wort. Hort. Cliff. 78. *β A. exaltata*. Lin. Spec. 313. "Leaves oval, tomentose underneath; stem simple; umbels nodding;" root creeping; stem strong, four feet high, on the sides of which, and near the top, the flowers appear, these are of a dingy purple, succeeded by large oval pods. A native of North America, and cultivated by Parkinson in 1629. In Canada, the French eat the tender shoots as asparagus. Poor people collect the cotton from the pods, with which they fill their beds. On account of the silkiness of this cotton, Parkinson calls the plant Virginian silk. 8. *A. amona*, oval-leaved swallow-wort; apocynum, Dill. Elth. 31. t. 27. f. 30. "Leaves ovate, rather hairy underneath; stem simple; umbels and nectaries erect." From a foot and half to more than three feet high; stems round, smooth, the size of a swan's quill. At each joint are placed two large leaves, which are blunt, thickish, stiff, smooth, with purple nerves; lower leaves smaller and rounder; the umbels arise from the top of the stalk, and some of the upper axils; the nectaries approximate more,

are straighter, longer, stiffer, more acute, and less excavated than in the other species; the flowers are of a bright purple colour. Cultivated by Dr. Sherard, at Eltham, in 1732. A native of North America. 9. *A. purpurascens*, purple Virginian swallow-wort, Dill. Elth. 32. t. 28. f. 31. "Leaves ovate, villose underneath; stem simple; umbels erect; nectaries reflexed;" stems many, as thick as the little finger, at bottom obtusely quadrangular; leaves on short footstalks, from four to six inches long, with a purple midrib; flowers of a dusky herbaceous colour; horns of the nectaries horizontal. A native of North America. Cultivated by Dr. Sherard, in 1732. Linnaeus observes that this species is nearly related to *A. Syriaca*. 10. *A. variegata*, variegated swallow-wort, apoc. americanum, Dill. Elth. 32. Pluk. Alm. 34. t. 77. f. 1. "Leaves ovate, wrinkled, naked; stem simple; umbels subsessile; pedicels tomentose." According to Miller, this resembles the foregoing sort, but the leaves are rough, and the umbels of the flowers are more compact; they come out on the side of the stalk, are of an herbaceous colour, and not succeeded by pods in this country. A native of North America. We learn from Plukenet, that it was cultivated here in 1696. 11. *A. curassavica*, Curassoa swallow-wort, bastard ipecacuanha, Brown, Jam. 183, 2. Apocynum, Dill. Elth. 34. t. 30. f. 33. Sloan. 1. t. 129. f. 4, 5. "Leaves lanceolate, smooth, shining; stem simple; umbels erect, solitary, lateral." The stem is from one to two or three feet in height; leaves opposite, and decussated, petioled, acute, entire, smooth on both sides; flowers in umbels; umbelles terminal; involucre a few subulate leaflets; pedicels one-flowered; corolla reflex; the flowers, according to Brown, are of a saffron colour in the low lands, but in the cooler inland pastures they change to a white. This species so much resembles *A. nivea*, that Swartz doubts whether it be really distinct from it. Miller affirms that the roots have been sent to England for ipecacuanha. The juice of the plant has been used as a vermifuge. It is a native of South America, the West Indian islands, and China. In 1692, it was cultivated in the royal garden at Hampton-court, where it flowered from June till September. 12. *A. nivea*, white or almond leaved swallow-wort, Apocynum, Dill. Elth. 33. t. 29. f. 32. Flum. Spec. 2. f. 30. "Leaves ovate-lanceolate, smoothish; stem simple; umbels erect, lateral, solitary;" stems two feet high, straight, round, the size of a swan's quill, dark green; leaves like those of common persicaria, deep green above, pale beneath, smooth, rather stiff. The principal difference between this and the curassavica is in the flowers, which are green with white nectaries. A native of North America. Cultivated by Dr. Sherard in 1732. 13. *A. incarnata*, flesh-coloured swallow-wort, Jacq. hort. 2. t. 107. "Leaves lanceolate; stem divided at the top; umbels erect, twin." This puts out several upright stalks, about two feet high; at the top of which are produced close umbels of purple flowers in August. A native of North America. Cultivated by Miller in 1731. 14. *A. decumbens*, decumbent swallow-wort, "Leaves villose; stem decumbent." The stalks are declining, hairy, a foot and a half high; leaves narrow; umbels compact, at the extremity of the branches; flowers of a bright orange colour. A native of North America. 15. *A. laevis*, milky swallow-wort; "leaves ovate; stem erect; umbels proliferous, very short." This is so like the vincetoxicum as scarcely to be distinguished from it; the leaves however are less cordate, the corymbs compound, and scarcely longer than the petioles. A native of Ceylon. 16. *A. vincetoxicum*, official swallow-wort, Flor. Dan. 849. Woody. Med. Bot. Supp. β *A. lutea*, Mill. Dict. "Leaves ovate, bearded at the base;

stem erect; umbels proliferous;" root divided and fibrous; stems about two feet high, slender, woody, round, hairy, simple; leaves cordate-ovate, acuminate, smooth, entire, on short footstalks; peduncles axillary, many-flowered; corolla white; follicles ovate-acuminate; seeds small, brown, inclosed in cotton. It flowers during the months of June, July, and August. It is common in the northern parts of the continent. The medical virtues of the root are stated by Bergius to be diuretic, sudorific, emmenagogue, and alexipharmic. 17. *A. nigra*, black swallow-wort, Villars' Dauph. 487. "Leaves ovate, bearded at the base; stem twining a little at the top." This agrees with the official species in the shape of its roots, leaves, and flowers, but the stalks extend to a greater length, and at the upper part twist round other plants, &c. near them; the flowers are black. A native of the south of France.

* * * * * *Leaves revolute at the sides.*

18. *A. arborescens*, arborescent swallow-wort, apoc. frutesc. &c. Burm. Afr. 21. t. 13. "Leaves ovate; stem shrubby, subvillose;" stem upright, as thick as the finger, rough, with hairs; leaves opposite, on very short petioles, obtuse, but with a minute smooth point; peduncles from the summit of the stem, umbelled, villose; corollas white. A native of the cape of Good Hope. Cultivated by the dukes of Beaufort in 1714. It flowers in December. 19. *A. frutescens*, shrubby, or willow-leaved swallow-wort, *A. glabra*, Mus. Dict. n. 2. apoc. erectum africanum, &c. Mill. fig. 45. β *A. crassifolia*, Lin. Syst. ed. 13. "Leaves linear-lanceolate, stem shrubby;" the nectaries are compressed, without a claw, instead of which are two long reflex ears; follicles inflated, set with soft prickles. This is a native of the same place, and was cultivated in the same year, and by the same person, as the *A. arborescens*. 20. *A. repanda*, repand swallow-wort, apoc. erectum afric. subhirsutum, &c. Herm. Par. 45. Comm. Rar. t. 17. "Leaves revolute, repand, hairy;" this is given on the authority of Reichard. Its native country is unknown. 21. *A. sibirica*, Siberian swallow-wort, Mur. Comm. Gott. 1779. t. 7. Gmel. Sib. 4. 77. n. 21. "Leaves linear-lanceolate, opposite, or in threes, stem decumbent." This varies with alternate leaves. It is a native of Siberia, and cultivated in 1775, by Mr. J. Gordon. It flowers in July. 22. *A. verticillata*, verticillate swallow-wort, apoc. marianum, &c. Pluk. Mant. 17. t. 336. f. 4. "Leaves linear verticillate, stem erect;" stalks slender, upright; flowers small, white, in umbels at the top of the stems; leaves frequently four together. A native of North America. Cultivated by Miller in 1759.

* * * * * *Leaves alternate.*

23. *A. rubra*, red swallow-wort. "Leaves ovate, umbels many, from the same common peduncle." Stem upright, simple, annual; leaves acuminate; several umbels on a peduncle. A native of Virginia. 24. *A. tuberosa*, tuberous swallow-wort, apoc. Nova Anglia, &c. Herm. Lugdb. t. 647. Dill. Elth. 35. t. 50. f. 34. "Leaves lanceolate; stem divaricate, hairy." Stems a foot high, hairy, round, dusky red; leaves alternate, except at the upper part of the stem, and where the branches arise; flowers of a bright orange colour; the tuberous roots are very large. A native of North America, flowering in August. Cultivated in 1690, in the royal garden at Hampton-court.

* * * * * 25. *A. filiformis*, narrow leaved swallow-wort. "Leaves filiform; stem erect; umbels lateral, elongate, peduncled." This species was found at the cape of Good Hope, by Thunberg. 26. *A. grandiflora*, great flowering swallow-wort. "Leaves petiolate, oblong, hairy; stem simple, rough, erect; flowers axillary, peduncled." The flower of this is very large, coloured, and tessellated like that of the frutillar

fritillary. It also was found at the cape by Thunberg. 27. *A. carnosa*, fleshy-leaved swallow-wort. "Leaves ovate, fleshy, very smooth;" leaves about four inches long, without veins; petioles fleshy, half the length of the leaves; umbel simple, axillary, solitary; calyx minute; corolla scarcely half five-cleft, flat. This differs much from the other species. A native of China. 28. *A. scandens*, climbing swallow-wort, Mill. Dict. n. 19. "Leaves oblong, lanceolate, subhirsute; stem shrubby, climbing; umbels lateral, compact." It climbs to the height of ten or twelve feet. At the joints are two opposite leaves, on short foot-stalks. Flowers of a sulphur colour, and appear in August. A native of Carthage. Cultivated by Miller in 1759. 29. *A. proceris*, bell-flowered gigantic swallow-wort, Ait. Hort. Kew. *A. gigantea*, Jacq. Obs. 3, 17, t. 69. "Leaves obovate-oblong, petioles very short; corollas subcampanulate." A native of Persia. Cultivated in 1714 by the dukes of Beaufort. It flowers from July till September. This ought to be placed before *A. gigantea* at 6. 30. *A. parviflora*, small-flowered swallow-wort, Ait. Hort. Kew. t. 357. A native of Carolina and East Florida. Introduced by Dr. Fothergill in 1774. 31. *A. linaria*, toad-flax-leaved swallow-wort, Cavan. Hip. 42, t. 57. "Leaves scattered, subulate, channelled; umbels lateral, many-flowered." A foot high; leaves narrower at the base, numerous; corolla white. We are ignorant of its native country. It has been cultivated in the royal garden at Madrid since 1788, and flowers in autumn. 32. *A. mexicana*, Mexican swallow-wort, Cavan. Hip. 42, t. 58. "Leaves six together in whorls lanceolate; flowers umbelled." Stems upright, smooth, a foot and a half high; leaves quite entire, with a short petiole; corolla white, deeply five-parted. A native of Mexico, and cultivated at the royal garden Madrid. 33. *A. fusca*, Lour. Cochin. 170. "Stem creeping; leaves cordate, lanceolate; umbels axillary, in pairs." Stem herbaceous, twining, slender, much branched at the top; leaves opposite, small, bearded at the base; flowers dusky purple, small, with five ear-shaped nectaries. A native of Cochinchina. 34. *A. viminalis*, Swartz. Prodr. 53. Brown. Jam. 183, 3. Sloane, t. 207, t. 131. "Stem suffruticose, twining, filiform; leaves opposite, lanceolate, smooth; umbels lateral, many-flowered." Stalks slender, weak, spreading to the distance of some yards. It has very few leaves, but many flowers disposed in large umbellate groups; it abounds with a milky juice. A native of Jamaica, in woods.

Propagation and Culture. In this numerous genus, only two species, viz. 16. and 17. are European; two or three are from South America; the rest are natives of North America, the East and West Indies, or Africa. Such as are inhabitants of North America, 7—10, 12, 13, 14, 22—24. are, as well as the European, hardy enough to bear the open air, and therefore are proper for large borders in pleasure grounds, and to mix with shrubs. The other species require the protection of the green-house or stove; all of them are tall perennials, flowering from June till August or September, mostly dying down to the root in autumn. They should have little water, especially in winter: they may be propagated by seeds where they can be obtained, or by cuttings; the hardy sorts may be increased by parting the roots. 1, 2, 3, 18—20, 25—27, 30, must have the shelter of a green-house in winter; 4, 5, 6, 11, 15, 28, 29, 31—34. will not live but in a stove. These must be raised from seeds sown in the spring on a hot-bed, and being transplanted into pots filled with rich earth, must be plunged into the tan-bed in the stove. After the second year, the 21st sort becomes naked, and does not produce many

flowers, so that young plants ought to be raised to succeed them, especially as it produces plenty of seeds in England. All the Cape sorts, 1, 2, 3, &c. may be propagated by seeds sown in April on a bed of light earth in the open air, and when the plants are three or four inches high, they should be each planted in a small pot filled with light earth, and shaded till they have taken new root; then they may be placed with other exotic plants in a sheltered situation until October, when they may be removed into the green house or dry stove. They may also be increased by cuttings. The roots of the 8th and 22d should be planted in a warm border, and in winter covered with old tan. The 14th and 24th are propagated by seeds in pots placed in a moderate hot-bed, and gradually enured to the open air as soon as the weather will permit. When they are of a proper strength, they may be planted in a warm border, and treated as other tender plants. See Martyn's Miller's Dict.

ASCLOSTER, in *Geography*, a town of Sweden, in South Gothland, twelve miles south of Wardberg.

ASCO, a town of Spain, in Catalonia, seated on the Ebro, ten leagues from Tortosa.

ASCODRUTÆ, in *Antiquity*, a sect in the second century, who rejected all use of symbols and sacraments; on this principle, that incorporeal things cannot be communicated by things corporeal, nor divine mysteries by any thing visible.

ASCOGEPHYRUS, in *Middle Age Writers*, denotes a bridge supported on bags made of leather or bullocks hides, Such bridges appear to have been in use among the ancients, and to have given the denomination to a tribe of Arabs, hence called *Ascite*.

Hence also the appellation *ascmanni*, given to pirates, by reason of their using bridges, or rather boats made of leather. Plin. Hist. Nat. lib. vi. c. 9. Du-Cange.

ASCOLI, in *Geography*, a town of Italy, in the estate of the church, and marquise of Ancona, seated on a mountain between the rivers Tronto and Castillano; twenty leagues south of Ancona, twelve north-east of Aquila, and thirty north-east of Rome. N. lat. 42° 50'. E. long. 15° 5'.

ASCOLI de Satriaco, a town of Italy, in the kingdom of Naples, and province of Capitanata, the see of a bishop. This town was almost destroyed by an earthquake in 1399. N. lat. 41° 8'. E. long. 15° 32'.

ASCOLIA, in *Antiquity*, a feast which the peasants of Attica celebrated in honour of Bacchus.

They sacrificed a he-goat to him (as being the destroyer of vines); and of the victim's skin made a foot-ball, which they hlew up, and anointed with some unctuous matter; or, as Potter thinks, they made a bottle of it, which they filled with oil and wine. The young people playing at this, and keeping themselves always on one foot, whilst the other was suspended in air, by their frequent falls gave occasion of diversion to the spectators. He that held the sport longest, and made the largest hops, was the conqueror. Hence the game called *ascoliasm*. Ptitiscus.

ASCOMARIÏ, in *Ancient Geography*, a people of Asia, in Sarmatia. Pliny.

ASCONA, in *Geography*, a town of Switzerland, lying on the Locarno lake, in which which is a college for the instruction of youth, founded in the sixteenth century.

ASCONIUS, PADIANUS, in *Biography*, a Roman grammarian, was a native of Padua, and lived in the time of Augustus; the friend of Virgil, and the acquaintance of Quintilian and Livy. His notes on Cicero's orations are judicious, and still exist, though in a mutilated state. They were first published, with those of Lufcus, in folio, at Venice, in 1477;

and

and at Padua in 1493. They have been intermixed with those of other commentators, and may be found in Gronovius's edition of Cicero, published in 4to. in 1692. Fabr. Bib. Lat. l. iii. c. 6.

ASCORA, in *Geography*, a province of the empire of Morocco. See ESCURA.

ASCORDUS, in *Ancient Geography*, a river of Greece, in Macedonia, one day's journey from Agassá. Livy.

ASCOTANEÆ, a people of Asia, in Scythia, on this side of Imaus. Ptolemy.

ASCOYTIA, in *Geography*, a town of Spain, in the province of Guipuzcoa, on the river Urola, west of Tolosa, and two leagues east of Placentia.

ASCRA, in *Ancient Geography*, a town of Greece, in Bœotia, near mount Helicon. From its having been the place where Hesiod was brought up, though he was born at Cuma in Eolis, it was called his country.

ASCRIPTI, or ASCRIPTI, in *Antiquity*, those who entered their names in the colonies, and became *coloni*.

ASCRIPTIITII, or ASCRIPTIITII, a kind of villains, who, coming from abroad, settle in the lands of some new lord, whose subjects or servants they commence; being so annexed to the lands, that they may be transferred and sold with the same.

The ascriptitii are annexed to the land they hold, so that they cannot stir from it; besides that, whatever they acquire accedes to the benefit of the lord of the land. Du-Cange, and Calv. Lex. Jur.

ASCRIPTIITII is sometimes also used in speaking of aliens or foreigners, newly admitted to the freedom of a city or country.

ASCRIPTIITII was also used in the *Military Laws*, for the recruits appointed to supply the losses of the legions; called also ACCENSI.

ASCULUM APULUM, or *Asculum* of Apulia, in *Ancient Geography*, now *Ascoli* of Capitanata, was situated in the Trajan way which passed from Beneventum to Canusium, between Trivivum to the west, and Canusium to the north-east. This place is famous as the scene of the first battle in which the Romans obtained success against the Epirots, under the command of Pyrrhus. Of this action, however, historians give a different account. Plutarch pretends that Pyrrhus gained a complete victory; whereas Eutropius affirms, that he was entirely defeated, and fled to Tarentum. Dionysius of Halicarnassus says, that the victory was doubtful, and claimed on both sides, and that Pyrrhus being congratulated upon his success, replied, "Such another victory would undo me."

ASCULUM Picenum, now *Ascoli* of Ancona, was the capital of the Piceni. It was a municipal town, and a Roman colony. Cicero (De Orat. c. 46.) commends an orator, named "Betucius Barrus," who was born in this city, and of whose discourses delivered at Asculum, some remained in his time.

ASCURA, a town of Asia, in the greater Armenia. Ptolemy.

ASCURUS, a river of Colchis, according to Arrian.—Also, a town of Africa, in Mauritania.

ASCUS, in *Natural History*, a word used by De Laet, as the name of that pouch or bag with which nature has supplied the animals of the *Diadelphis* or *Opoffum* tribe, for the protection of their young; and in which they are contained in a state of imbecility, or time of danger. Later writers, as Linnaeus, Gmelin, and others, call this abdominal pouch, or receptacle, *folliculus*: it is not the womb, as is vulgarly

imagined, but a kind of skinny bag, situated under the belly, and in most species containing the teats of the animal.

ASCYRUM, in *Botany*, a genus of plants resembling St. John's wort (supposed from α , and $\sigma\kappa\upsilon\pi\omicron\varsigma$, or $\sigma\kappa\upsilon\pi\omicron\varsigma$, *asperatus*, not rough, a soft plant). Lin. g. 923. Schreb. 1225. Gaertn. 62. Juss. 254. Class, *polyadelphia polyandria*. Nat. Ord. *rotaceæ*.—*Hypericæ*, Juss. Gen. Char. *Cal.* perianth four-leaved: the outer leaves opposite, very minute, linear; the inner heart-shaped, large, flat, erect, all permanent. *Cor.* petals four, ovate; the outer opposite, very large; the inner less. *Stam.* filaments numerous, brittle-shaped, slightly united at the base in four parts; anthers roundish. *Pist.* germ oblong; style scarcely any; stigma simple. *Per.* capsule oblong, acuminate, one-celled, two-valved, inclosed by the larger leaves of the calyx. *Seeds*, numerous, small, roundish, fixed to the edge of the valves.

Ess. Gen. Char. *Cal.* four-leaved; petals four; filaments many, in four divisions.

Species, 1. *A. crux Andree*, common ascyrum, or St. Andrew's cross. "Leaves ovate; stem round; panicle dichotomous." Stalks about six inches high, slender, dividing into two towards the top; from between the divisions of the branches loose panicles of small yellow flowers are produced; capsule small, pointed at the end, compressed like a lens, obscurely two-furrowed. A native of North America. Cultivated by Miller, in 1759. It flowers in July and August. 2. *A. hypericoides*. Brown, Jam. 309. Swartz. Obl. 294. *Hypericoides*, &c. Plum. Gen. 51. t. 152. f. 1. "Leaves oblong; branches ancipital." An elegant little shrub three feet high, full of leaves and branches. Branches dichotomous; twigs compressed and ancipital; leaves opposite, subsessile, lanceolate, obtuse, entire, very finely perforated, smooth, at their base small glands; flowers terminating solitary, yellow; two leaflets of the calyx four times larger than the others. A native of South Carolina, Virginia, Maryland, and the cooler mountains of Jamaica. Cultivated by Miller. 3. *A. villosum*. "Leaves hirsute; stem stiff and straight." This grows about three feet high. The flowers are produced at the ends of the stalks, and are of the same shape and colour as those of common St. John's wort. It grows wild in Virginia, and was cultivated by Miller in 1759.

Propagation and Culture. These are perennial plants, the stems decaying in the autumn. The first may be increased by laying down its branches; it loves a moist soil and shady situation. The second sort rarely produces seeds in England, but may be propagated by cuttings of the young shoots in May, planted in pots, and plunged in a moderate hot-bed, and afterwards transplanted into a warm border; but in severe winters they must be defended from the frost by covering the roots with tan. The third may be increased by parting the roots in autumn, and planting them in a loamy soil. See Martyn's Miller's Dict.

ASCYRUM. See HYPERICUM.

ASDRUBAL, in *Biography*, a name given to several of the Carthaginian generals. *Asdrubal*, the son-in-law of Hamilcar, the father of Hannibal, accompanied Hamilcar into Spain after the first Punic war; and on his death, was elected by the army his successor. Having made considerable conquests in Spain, he built a city called New Carthage, now Carthagena, in order to secure them. Hannibal served during three campaigns under him. His administration in Spain was prosperous for eight years; but it terminated with his assassination, which was effected by a Gaul, whose master he had put to death. The assassin was so gratified with his revenge, that he smiled in the midst of the tortures

with which he was executed.—*Afdrubal Barca* was the son of Hamilcar and brother of Hannibal. He commanded in Spain, while his brother was in Italy. After extinguishing a rebellion of the natives, he was summoned to the assistance of his brother, but in his progress was completely defeated by the Romans. Afdrubal and the other Carthaginian generals maintained themselves with difficulty in Spain, and were frequently defeated by the two Scipios; but at length these two leaders were overpowered by the Carthaginians, and killed. Whilst he was advancing along the coast of the Adriatic to join his brother, and the existence of the Roman state was threatened by his numerous army, he was met at the river Metaurus, now Metaro, by the two consuls Livius and Claudius Nero with their united forces; and a bloody engagement ensued, which proved decisive, for Afdrubal was slain, and almost the whole of his army destroyed. Claudius Nero carried the head of Afdrubal to his station before Hannibal; and when it was thrown into the Carthaginian trenches, it was presented to Hannibal, who recognizing his brother's features, exclaimed "I perceive the fortune of Carthage," and then retired, in the year before Christ 203, into the extremity of Italy.—*Afdrubal*, the son of *Giseo*, served in Spain with the former Afdrubal, and afterwards in Africa, against Scipio. He was father of the celebrated Sophonisba.—Another *Afdrubal* defended Carthage in its last siege by Scipio, and foreseeing its fate, surrendered himself to the Romans. When his wife, who was left behind him with her two children in the temple of *Æsculapius*, perceived that the temple was set on fire, she appeared on the walls magnificently adorned, with her two children; and having reproached and execrated her husband for basely deserting her, she first stabbed her children, and then threw herself into the flames. See **CARTHAGE**.

ASDYNIS, in *Ancient Geography*, an island of Egypt, in the lake Mæris, according to Eudoxus, cited by Steph. Byz.

ASE, in *Biography*, a celebrated Jewish Rabbi, was born at Sora in Persia, and was chosen chief of the famous academy in that place in the fourteenth year of his age, which dignity he retained during sixty years, that is till the year 427, in which he died. Ase was the principal compiler of the Babylonish talmud. During his long residence at Sora, he published a collection of his decisions, which he divided into four parts: the first contained the rules and maxims of the Mishna, with the doubts and solutions relating to them: the second was chiefly occupied with the various questions of the doctors, and the sentiments of the Pharisaim and Gemarists: the third comprehended the decisions and maxims published since Judah the saint: and the last recapitulated the texts of scripture relating to law-suits, with the comments of their learned men. This was the first division of the Babylonish talmud; but as Ase did not live to complete it, his disciples altered his method, and made several additions, which are thought to have rendered the work more obscure. See **TALMUD**.

ASEA, in *Ancient Geography*, a town of Arcadia, north-east of Megalopolis.

ASEERGUR, in *Geography*, a town of Hindostan, in the Candish, fifteen miles from Burhampour, and eighty-five south of Indore.

ASEIAC, a town of Persia, in the province of Chuzistan, thirty leagues south-west of Ispahan.

ASEKI, or **ASEKAI**, the name which the Turks give to the favourite sultaneesses, who have brought forth sons. These are greatly distinguished above others in their apartments, attendants, pensions, and honours. They have

sometimes shared the government. The sultana who first presents the emperor with a male child, is reckoned the chief favourite, is called *buyuk aski*, and ranks as a legitimate wife: though from the time of Bajazet I. the sultans are forbid to marry by a public law, which Solyman II. violated in favour of Roxalana.

ASELLA, in *Entomology*, a species of **PHALÆNA** that is found in Germany. The wings are brownish, and without spots. Fab. It belongs to the Bombyx family.

ASELLI, in *Astronomy*, two fixed stars of the fourth magnitude, in the constellation Cancer.

ASELLI PANCREAS, in *Anatomy*. See **PANCREAS**.

ASELLINA, in *Natural History*, a species of **LERNÆA** described by Linnæus. Fn. Sv. The body is lunated, and the thorax heart-shaped. Found on the gills of some fishes.

ASELLUS, in *Ichthyology*, the name of a tribe or genus of fishes adopted by Willughby, Ray, and other old writers on Natural History. Linnæus arranges the fishes of this kind in the **GADUS** genus; as for example: *asellus major* of Aldrovandus, is *gadus argifrons* Linn. (Haddock.) *asellus fuscus* of Ray, is *gadus lugens* Linn. (Bib.) *asellus mollis minor* of Willughby and Ray, is *gadus minutus* Linn. (Poor), &c. &c. See **GADUS**.

ASELLUS, in *Entomology*, a specific name of the common wood-louse, or hog-louse as it is called in England. It belongs to the **ONISCUS** genus. It is of an oval shape; and has an obtuse tail, which is furnished with two simple styles. This well-known creature delights in moist places, lurking under stones, in walls, in damp and rotten wood, &c. The young are contained in a four-valved receptacle under the abdomen of the female.

ASELLUS, in *Conchology*, a species of **CHITON**, found in the North seas, most frequently adhering to *mytilus modiolus*. The shell consists of eight valves, is very black, convex above, with a yellowish dorsal spot on each valve. Chemnitz, Gmel. &c.

ASELLUS, a species of **CYPRÆA**, very common about the Madeira islands. It is white, with three brown bands. Linn. This shell is called *Asellus* also by Rumphius and Argenville. The shape is oblong; and the brown bands are bordered with yellow, or sometimes reddish.

ASEMOS, *ασμος*, from α negative, and *σμος*, a *sign*, is an epithet applied to events that fall out contrary to all appearance, and without any manifest cause.

ASEPTA, in *Medicine*, *ασπτα*, from α negative, and *σπτα*, *to putrefy*; signifies any thing unputrefied, or uncocted.

ASELE, *Asele-Lapmark*, or *Angermannland Lapmark*, in *Geography*, a province of Lapland, lying near the Angermannland river, borders on Angermannland towards the east, on Umea-Lapmark towards the north, and joins to the mountains on the west, and to Jamtland on the south. In length it is about thirty Swedish miles. In the reign of Charles XI. about the year 1673, measures were taken for improving the population of this country. In this Lapmark lies the parish of Asele, about eight or nine Swedish miles long; of which the southern part is inhabited by Swedish peasants. This district is not capable of much improvement, and few parts of it have been cultivated. Barley is the only grain that is sown, and when the crop fails, the inhabitants are reduced to the necessity of mixing the bark of fir-trees dried and pulverized with their barley-meal, and of this mixture to make their bread. They chiefly subsist by breeding of cattle and fishing. The country is infested by a kind of fetid gnats, which are very troublesome, against which they secure themselves by besmearing

smearing their faces with an ointment of tar and grease, and which they drive from the houses by smoke. Service is performed in a wooden church, built by queen Christina in 1648, once on every other Sunday; and the Lapps meet once a fortnight, on Friday evening, and continue till Sunday evening in their huts erected near the church, and the peasants in the houses built by them for the same purpose. At the fair which is held every year at Xenac near Asele church, the Lapps sell the flesh and skins of rein-deer, furs, whittings, fowls, &c.; and the Lapland peasants carry butter, cheese, dried fish, fowls and some sort of furs, to the same market.

ASELLIUS, GASPARI, of Cremona, in *Biography*, born toward the end of the sixteenth century, taught anatomy at Paris with great reputation. In 1622, while prosecuting his studies, he discovered "casu magis quam concilio," Douglas says, the lacteals running across the mesentery, in a dog that had been opened alive soon after eating a plentiful meal. He describes these vessels as passing from the intestines to the liver, not knowing their real course, and mistaking the lymphatics of that viscus for them. He saw their valves, preventing the regurgitation of the chyle. The lacteals, he candidly observes, had been mentioned by some of the earliest medical writers, but not described, or their functions stated, and as none of the modern restorers of anatomy noticed them, the discovery is properly attributed to him. Caspar Hoffman ridiculed the invention of them; and our great countryman, Harvey, supposed them to be only destined to convey the lymph.

Aseilius mistook a collection of glands in the mesentery for the pancreas, and described the pancreas as a new discovered gland, which, with his error in describing the course of the lacteals, threw much obscurity on his discovery. He died sometime in the year 1626, and was buried at St. Peter's at Milan, aged, as appears by the inscription on his tomb, only forty-five years. The year following, his friends, Alexander Padinus and Senator Septalius, published, from a manuscript that had been prepared by the author, "De lactibus seu lacteis venis, quarto vasorum mesaraicorum genere, novo invento, disertatio, cum figuris elegantissimis Mediolani, 1627, 4to." It was re-published at Basle 1628, at Leyden 1648, and afterwards among the works of Spigelius and Mangeti, in folio. Haller Bib. Anat. Eloy Dict. Hist.

ASENA, in *Ancient Geography*, a town of Spain, in the territory of the Carpetani.

ASENI, a people of India, whose capital was Bucephala. Pliny.

ASER, in *Geography*, a town of Asia, in the Arabian Iraq, situated on the Tigris, eight miles west-north-west of Bassora.

ASES, in *Ancient Geography*, a Scythian people, who inhabited the vicinity of the Cimberian Bosphorus.

ASFACA, in *Geography*, a town of Persia, in the province of Mecran, 52 leagues north-west of Mecran.

ASFELD LA VILLE, a town of France, in the department of the Ardennes, and chief place of a canton in the district of Rethel, thirteen miles north of Rheims.

ASFUN, or ASFOUN, a town of Egypt, four miles north of Ement. This is the site of one of the cities called APHRODITOPOLIS.

ASFUR, in *Ichthyology*, a species of CHAETODON, found on the coasts of Arabia. It is black, with a yellow transverse lunar-wedged band. Forks. Fn. Arab. The same author describes a variety of this fish, of a blueish colour, with oblique bands, blotches, and fine lines of violet. Length five inches; body oval, covered with rhombic scales, disposed in a quincunx order, and finely dentated; a strong

spine on the gill-cover half an inch in length; lateral line curved; dorsal and anal fin falcated; tail rounded, fulvous, and edged with black.

ASGILIA, in *Ancient Geography*, an island situated in the Persian gulf, on the coast of Arabia Felix. Pliny.

ASGILL, JOHN, in *Biography*, an English barrister of singular character, was born about the middle of the 17th century, and educated at Lincoln's Inn, under Mr. Eyre, a very eminent lawyer. His political talents and singular vein of humour were manifested in two pamphlets, which were printed in 1698, and which attracted public notice: the first was intitled, "Several Assertions proved in order to create another Species of Money than Gold and Silver;" and the second, "An Essay on a Regiltry for Titles of Lands." These were followed, in 1700, by another whimsical and enthusiastic treatise, intitled "An Argument, proving, that, according to the covenant of eternal life, revealed in the scriptures, man may be translated from hence, without passing through death, although the human nature of Christ himself could not be thus translated, till he had passed through death." This publication excited a general clamour against the author as an infidel and a blasphemer. Before this time he had removed into Ireland, and pursued the practice of the law with so much success, that he was enabled to purchase an estate, and to obtain a seat in the Irish parliament; but this publication occasioned his expulsion from the house, as a person whose blasphemous writings rendered him unworthy of representing a Christian people. On his return to England, he obtained a return to the British parliament, in 1705, for the borough of Bramber in Sussex, and held his seat for two years. But his want of economy involved him in debts which he was unable to discharge, and during the interval of privilege, he was arrested and committed to the Fleet prison. On the opening of the next session of parliament, in 1707, he was demanded by the serjeant at arms, released from custody, and resumed his seat. However, his embarrassed circumstances, and the consideration of his being a privileged debtor, created a prejudice against him in the house, and a committee was appointed to examine his offensive publication; in order to justify the proposed measure of his expulsion. This committee reported that his book contained several blasphemous expressions, and that it seemed to be intended for exposing the scriptures; and though Asgill made a spirited defence, and solemnly protested, that he published his treatise under a firm belief of the truth of the scriptures as well as of his own argument, he was expelled. In consequence of this measure, as his debts increased, he was thrown by his creditors into the King's bench prison, where he remained thirty years; furnishing himself with amusement and occasional supplies, by writing pamphlets, chiefly political, against the pretender, and by practising in the way of his profession. Notwithstanding his misfortunes, and the consciousness of his own indiscretion, he retained great vivacity of spirits, and peculiar powers of entertaining conversation, till his death, which happened within the rules of the King's bench, in 1738, at the age as some say of 80, or according to others 100 years. Asgill seems to have been a visionary and enthusiast, rather than an infidel or blasphemer; and his eccentricities rendered him more the object of contempt or pity, than persecution and punishment. Biog. Brit.

ASH, *Common, Flowering, and Manna, in Botany.* See FRAXINUS.

ASH, *Mountain.* See SORBUS.

ASH, *Poison.* See RHUS.

ASH-Balls, are formed of the ashes produced by a slow incineration of the green plants of fern, which contain a

considerable portion of alkali, and are used in making lye for the scouring of linen. See *FILIX*.

Ash Tree, in *Planting*, a tree of the deciduous kind, of which there are several species cultivated either for the sake of variety, or for the purpose of ornamenting pleasure grounds, &c.; but the kind which deserves attention here, is the common ash, so well known as a timber tree as to need no description. See *FRAXINUS*.

The ash tree will thrive in barren soils, and in the bleakest and most exposed situations; but it grows to the greatest advantage on such lands as have a tolerable depth of soil, and on which water is not liable to stagnate. It is found to be of so hardy a nature, as to withstand the effects of the sea-winds; it may therefore be planted on the coasts, where but few other kinds of trees are found to prosper. When planted on the sides of ditches, or in moist meadow lands, from the spreading of its roots it has been found to render the ground more firm and dry. From this, as well as other causes, it is, however, highly prejudicial when planted on arable land; it ought therefore to be chiefly planted on the waste nooks and corners of fields, or perhaps, on improvable swampy lands, and on the springy sides of hills, as it would not only render them useful as plantations, but, from the spreading of its roots make them more firm and dry.

This sort of tree propagates itself plentifully by means of seeds, which being scattered in autumn in places where cattle do not come, plenty of plants come up in the spring. Where any person is desirous of raising a quantity of these trees expeditiously, the seeds should be sown as soon as they are ripe, and the plants will then come up in the following spring; but if the seeds be kept out of the ground till spring, they will not come up till the second year. The ground should be kept clean all the summer where they are sown, and not disturbed, lest the seeds be turned out of the ground, or buried too deep to grow. When the plants are come up they must be kept perfectly clean from weeds during the summer months, and if they make good progress in the seed-bed, they will be fit to transplant by the following autumn; some ground should therefore be prepared to receive them, and as soon as their leaves begin to fall, they should be transplanted. In removing the plants, care should be taken not to break or tear off their roots; to prevent which, they should be taken up with a spade, and not drawn up, as is frequently practised; for as many of the plants which rise first from seed will outstrip the others in their growth, it is a frequent practice to draw out the largest, and leave the others to grow a year longer before they are transplanted; and to avoid hurting those that are left, the others are drawn out by hand, and consequently many of their roots torn off or broken. It is therefore much the better way to take all up, little or big, together, and transplant them out, placing the large ones together in rows, and the small ones by themselves. The rows should be three feet asunder, and the plants a foot and a half distant in the rows. In this nursery they should remain two years, by which time they will be strong enough to plant out where they are to remain; as the younger they are planted out the better they will grow, so that where they are designed for use they should be planted very young, and the ground where they are raised should not be better than that where they are to grow. For when plants are raised in good land, and afterwards planted into worse, they very rarely thrive well; on which account it is much the best method to make the nursery upon a part of the same land where the trees are designed to be planted, and then a sufficient number of trees may be left standing upon the

ground, which will generally outstrip those which are removed, and grow to a larger size.

Where planters reside in the neighbourhood of ash-trees, they may supply themselves with plenty of self-sown plants, provided cattle are not suffered to graze on the land; and where the seeds fall in hedge-rows and are protected by bushes, the plants mostly come up and thrive well; in such hedge-rows the trees are frequently permitted to grow till they have destroyed the hedge, for there is scarcely any tree so hurtful to all kinds of vegetables as the ash, as it robs every plant of its nourishment within the reach of its roots; it should therefore never be suffered to grow in hedge-rows, as the hedges are not only killed, but corn, or whatever is sown near them, greatly impoverished. If a plantation of this kind of trees be rightly managed, it will turn greatly to the advantage of the owner; for by the underwood which will be fit to cut every eight or ten years, there will be a continual income more than sufficient to pay the rent of the ground and all other charges, and still a stock will be preserved for timber, which, in a few years, may be worth forty or fifty shillings, or perhaps much more per acre. In the sixth volume of the *Bath papers*, Mr. South observes, that the growth of ash, in soils adapted to its nature, is little inferior to that of elm or beech; but that there is no timber whatsoever that differs more in its value than this does, according to its situation. The productions of dry and healthy grounds will prove acceptable to most purchasers; those of woods are generally clean in the shaft, and more valuable than the former. The nearer the ground the tougher is the timber; the shaft therefore is coveted, the brittle branch is rejected; the buyers of this timber accepting the shaft and its continuation, or bell bough; the rest, be they ever so large, go with the top. When this sort of timber is raised in damp meadows or moorish soils, it becomes light, spongy, brittle, and of small value in comparison of that on dry and healthy spots. In meadows these trees will attain a size which cannot be expected in moors and bogs; for when the roots reach the peat, the bark grows mossy, and the top decays: how long it may be productive of poles in such situations, remains to be determined; but experience determines that ash thus planted will never become timber of any value, as the roots must perish before the tree arrives to perfection. If ash-trees get disbarbed, though in appearance they should be flourishing, on being felled, the roots will be frequently found decayed, and the stems at bottom a complete shell; they ought not therefore, in point of profit, to be suffered to stand. These trees, when they stand among firs and larches if planted close, will grow too tall and slender, but thrive well when planted alone. They are frequently known to have thriven for at least ninety years, as may be seen by their ring. But in the first ten years, as well as the last, the growth has been observed slow. It is remarked by Mr. Marriall, in his *Rural Economy of the Midland Counties*, that in the intermediate years, the different thickneses of the rings in different years were striking. This kind of timber is generally esteemed next in value to that of the oak, and in some places even nearly equal to it. It is of great value to the coachmaker, the wheel-wright, and cartwright, for ploughs, axletrees, fellies of wheels, harrows, ladders, and other implements of husbandry; and also to the shipbuilder, for oar-blocks for pulleys, and many other purposes.

The best season for felling this sort of timber is from November to February; for if it be done either too early in the autumn, or too early in the spring, the wood will be
subject

subject to be infested with worms and other insects; but for lopping of pollards, the spring is preferable for all soft woods.

Great attention has lately been paid to the planting of this useful timber tree in different parts of the kingdom. According to the transactions of the Society of Arts, near Great Finborough in Suffolk, Mr. Wollaston has planted twenty acres; and at Buttsfield near Durham, Mr. White has covered thirty-five acres; in Kent a still larger extent of land has been planted by Mr. Day of Frindsbury; and at Buscot, near Farringdon, Berkshire, Edward Loveden Loveden, esquire, is said to have planted thirty-three thousand on seven acres and nine perches; in Staffordshire, six thousand have been set by Mr. Sneyd of Belmont; and in Westmoreland, the bishop of Landaff has planted eleven acres with twenty thousand. In Scotland likewise, something has been done in the cultivation of ash timber; in Cromarty, forty-two thousand have been planted by Mr. Ross; and fifty-seven thousand by the earl of Fife, in the county of Murray.

The ashes resulting from the combustion of this kind of wood, are found to contain good pot-ash in a larger proportion than most other kinds of green wood.

ASH, *Bitter*. See QUASSIA AMARA.

ASH-*Weed*. See ÆGOPodium.

ASHA, in *Geography*, a town of Germany, in the archduchy of Austria, four miles north of Effending.

ASHAJA-TUSLA. See SOLI.

ASHAN, in *Scripture Geography*, a city in the tribe of Judah (Joshua xv. 42.): but, perhaps, afterwards surrendered to Simeon. (Josh. xix. 7.) According to Eusebius, Beth-Ashan was 16 miles west from Jerusalem.

ASHAU, in *Geography*, a river of Germany, in the circle of Lower Saxony, which runs into the Lechte, near Zell.

ASHBOURN, a town of England, in the county of Derby, on the east side of the river Dove; its weekly market is on Saturday; distant north-north-west 139 miles from London. N. lat. 53°. W. long. 1° 35'.

ASHBURNHAM, formerly *Dorchester-Canada*, a town of America, in Worcester County, in Massachusetts, 30 miles north of Worcester, and 54 from Boston, was incorporated in 1765, and contains 951 inhabitants. In this township is a white sand, which is thought to be fit for making fine glass.

ASHBURTON, an ancient borough town of England, in the county of Devon, which sends two members to parliament; it lies in a valley, with hills to the north and south. It is one of the four stannary towns of Devonshire; and has in its neighbourhood mines of tin and copper. It has two weekly markets, one on Tuesday, chiefly for woollen yarns, for the accommodation of the serge manufacture which is carried on in the town; and one on Saturday, for provisions. This town gives the title of baron to the family of Dunning. It is distant west-south-west from Exeter 19 miles, and 19½ west from London. N. lat. 50° 30'. W. long. 3° 10'.

ASHBY, a township of America, in Middlesex county, Massachusetts, fifty miles north-west from Boston; containing 751 inhabitants.

ASHBY *de la Zouch*, a town of England, in the county of Leicester, near the borders of Derbyshire; the principal trade of the town depends upon the making of malt; its market is on Saturday. The decayed castle, which was formerly the property of the family of de la Zouch, now belongs to the earl of Huntingdon. It is distant 17 miles north-west from Leicester, and 114½ north from London. N. lat. 52° 40'. W. long. 1° 20'.

ASHCUTNEY, or ASACUTNEY, a mountain of America, in Vermont, situate partly in the townships of Wind-river and Weathersfield, and opposite Claremont, on Sugar-river, in the state of New Hampshire. It is 2031 feet above the sea, and 1732 feet above high water in Connecticut river, which runs by its eastern side.

ASHDOD, in *Ancient Geography*. See AZOTUS.

ASHDOTH-PISGAH, a city in the tribe of Reuben, so called from אִשְׁדֹּת, *well-watered places*, and situated in the fertile plains at the foot of mount Pisgah, or at the springs of Pisgah; whence its name.

ASHENAGUR, a province of India, corresponding with the country of the Affacani, in which Alexander warred, on the west of the Indus, situate at or near the conflux of the Penje-korch and Sewad rivers, and two marches from Bijore. The present Sewad is part of the ancient province Ashenagur. Rennell's *Memoirs*, p. 150.

ASHER, the son of Jacob, by Zilpah, gave denomination to one of the twelve tribes which was settled on the north-west of the province of Lower Galilee, in a very fertile country producing abundance of corn, and wine, and oil, of the best kinds, with Phœnicia west, mount Libanus north, mount Carmel and the tribe of Issachar south, and Zebulun and Naphtali east. It contained some considerable cities near the sea, but no sea-port of any note. This tribe never possessed the whole extent of district assigned to it, which was to reach to Libanus, Syria, and Phœnicia.

ASHER, a city of Palestine between Scythopolis and Shechem.—Also, according to Eusebius, a large town between Azoth and Ascalon.

ASHES, in *Chemistry*. This is a term of general import, which is applied to the pulverulent residue left after the combustion of any substance whatever. In this sense, the combustion of metallic bodies has been said to yield *metallic ashes*, but to these the terms *calx* and *oxyd* have been substituted; and it is only vegetable and animal matters that are now said to afford ashes after burning.

To consume vegetable or animal substance to ashes, the free access of air is requisite, more particularly with the latter.

Vegetable Ashes. When a vegetable is set on fire, a vast quantity of aqueous vapour first escapes, together with the component parts of most of the other vegetable principles, such as the native juices, the acids, the sugar, the oil, &c. which latter either burn with flame or are driven off in a dense smoke. The more solid carbonaceous part requires a longer continuance of heat, and a free access of air for its complete combustion; but when this is effected, a certain portion of white or grey ashes remain behind, consisting of the fixed saline, the earthy, and the metallic ingredients. In general, it is found (as would be expected) that the watery, succulent, and herbaceous plants, yield a less quantity of ashes than the hard and woody parts of vegetables; but there are numerous exceptions to this rule, as the hardness of texture is more determined by the quantity of carbonaceous matter. A very violent heat either melts the ashes into a *slag* or *scoria*, or dissipates their saline ingredient, and leaves only the earthy and metallic; so that a certain management of the fire is requisite in order to procure the greatest possible quantity of ashes from vegetable matter.

From the saline ingredient are procured those very important articles in chemistry and manufacture, the *fixed alkalis*, both vegetable and mineral; the former distinguished according to its species and purity by the terms *wood ashes*, *pearl-ash*, *pot-ash of commerce*, *salt of tartar*, or *salt of worm-wood*; the latter by the terms *natron*, *barilla*, *kelp*, and *soda*.

As the combustion of vegetables, when carried on in the large way, is always directed to the object of procuring the alkali salt, and as this subject includes a variety of interesting observations, and the particulars of the analysis of ashes, we shall refer the whole of this article to those above mentioned, and especially to that of *CALSONAR of Potash and of Soda*.

We may add, however, that though vegetable ashes are composed of fixed earths and alkalis combined with acids, and of some metallic oxyds, especially those of iron and manganese, almost every possible variety of combination and proportional quantity of ingredients is to be met with, according to the nature of the plant, the composition of the soil, the season of the year, climate, and the like. In general, chemical analysis has detected the following substances in vegetable ashes; silex, magnesia, lime, pot-ash, soda; the sulphuric, carbonic, phosphoric, and muriatic acids; and the oxyds of iron and manganese. The most usual states of combination of these ingredients are, the sulphates of pot-ash, soda, lime, and magnesia; the muriate and carbonates of the same, and the phosphat of lime. It is still a question, which of the saline ingredients represent the actual state of the vegetable juices, and which of them are formed by the process of combustion; the acid of the carbonats may with great probability be supposed to arise from the latter cause.

When the saline part of vegetable ashes has been separated by lixiviation, the light earth that remains, probably still mixed with a portion of sulphat of lime, is sometimes employed, after being well washed, for the formation of the large *CUPELS* used in the *refining of silver*.

The ancient alchemists paid considerable attention to the ashes of different plants; and some of the Rosicrucian school of deceived and deceiving impostors, pretended to be able, by a species of *palingenesis* or re-production, to exhibit in the ashes of a plant a complete miniature representation of the gradual growth and maturity of the individual vegetable.

Animal Ashes. A very few words will be requisite on this subject taken separately. Animal matter is much more difficult of complete combustion than vegetable; the volatile part of each is driven off by heat without much difficulty, but the coal of animal substance is of very difficult incineration, often requiring a very long continued and violent fire. This is probably owing in part to the greater quantity of oxyd of iron which, uniting with the carbonaceous matter by the assistance of heat, forms a *carburet of iron* that burns with extreme difficulty. The saline and earthy parts almost peculiar to animal ashes are the phosphat of soda, phosphat of ammonia, and phosphat of lime, and often the carbonats of soda and lime. The proportion of earthy salt in bones, horns, and the harder parts of animals, is generally full one half the weight of the substance when fresh from the body: in *bone* it is almost entirely phosphat of lime, mixed however with a small portion of sulphat and carbonat of lime; in *shell* the earthy part is principally carbonat of lime.

For further particulars concerning animal ashes we must refer the reader to the individual articles of animal matter; such as *BLOOD, BONE, HARTSHORN, SHELL*, and to the above-mentioned earthy and alkaline salts.

The only animal ashes employed to any extent in the arts are the lixiviated ashes from bones, which when mixed up in water, and cast in proper moulds, form the *CUPELS* that are employed in *ASSAYING and REFINING of gold and silver*. The finer and whiter ash of calcined horn is employed to a small extent in medicine, under the term *cornu cervi calcinatum*, or *calcined hartshorn*.

Ashes, in Agriculture, the earthy or other particles of combustible substances after they have been burnt in the fire. The beneficial effects of such matters, as manures, may probably, in a great measure, arise from the portion of alkaline saline matter which they contain, which by its action on, and combination with the materials that are present in soils, may render them more soluble and proper for the nutrition of plants. Considerable utility may also be derived from their operating mechanically, and in that way lessening the tenacity and stiffness of the heavier kinds of soils, and likewise by their absorbent powers in lands of the more moist kind. Ashes are of different sorts, as *bleacher's ashes, coal ashes, peat ashes, pot ashes, soapers' ashes, turf ashes, wood ashes*.

The first sort consists principally of the hard undissolved parts of pot-ash, kelp, weed-*a.*, and barilla. Laid on land alone, they are too stimulating; they ought therefore, perhaps, never to be used but in union with earth, or earth and dung. It is said, however, they answer well with blood, garbage, and putrid animal substances. They are generally laid upon fallows for wheat. The greatest advantage derived from them is upon clays or deep loams. Upon rusty grounds, or coarse wet meadows, they will be found particularly useful, in destroying the coarse plants that infest them.

The second sort, or coal ashes, probably from their containing a portion of calcareous matter, are found to be highly beneficial on stiff and sour lands; for which purpose they are successfully used in the neighbourhood of many great cities, where coal is much burnt for fuel. They also open the texture of clayey grounds, and correct their tenacity, and other bad qualities. The gardeners and farmers about London know their value, and make a very profitable use of them; particularly in bringing into order those grounds which have been dug up for brick-earth. Mr. Bradley long ago, indeed, blamed the people of Staffordshire, and the countries adjoining, where there are coal-pits, for not improving their heavy grounds around them, by manuring them with coal ashes, which might be easily burnt out of the waste coals of such pits; and suggests "that wherever there are plenty of coal-pits, there can be no want of good profitable land." Mortimer held the same opinion, esteeming sea-coal ashes as the best manure of any for cold lands, as well as the most lasting and fittest to kill worms and slugs. And Worley looked upon them as an excellent compost, when mixed with horse-dung; remarking, that they have great effects in removing moss and rushes in moist grounds. Ashes of this kind are employed in different proportions, in different places, according to the particular circumstances of the crop, and the land on which they are applied. It is observed by Mr. Farey, in the *Annals of Agriculture*, that about Dunstable they are used at the rate of from fifty to sixty bushels to the statute acre, for a complete dressing; and that they succeed, well sown on clover, in March or April, on dry chalky lands. They have also much effect on sward-land, when applied during the winter or spring; but they are never used on wheat. It is likewise further remarked by the same writer, that in very dry seasons they do little service, except on cold swards, which they invariably improve; and that on light land they require rain, after being sown or spread over the land, in order to promote their operation.

The ashes formed from peat, are found, from long experience, to be a very good manure. The author of *Modern Agriculture* remarks, that in many parts of the kingdom peat-earth cut and dried in the course of the summer, is the only fuel; and that the peat dug from the mosses that are so firm as to bear cattle to tread on them, is the best
both

both for fuel, and afterwards for manure. The ashes of the fward, or what is pared from the surface of heaths and commons by the cottagers in many parts, as about Bedford, are, he says, of little value, when compared to those above mentioned. It is probable that Berkshire is the only district of Great Britain, where peat ashes, without the mixture of any other substance, are at present generally used as manure. The ashes of peat, dug from extensive meadows in that county, have been proved, by the experience of sixty or seventy years, to be a most excellent manure, when used as a top dressing on almost all kinds of crops; as oats, wheat, barley, turnips, clover, sainfoin, meadows, pastures, &c. The quantity generally used is about twenty bushels, more or less, as the condition of the land seems to require; and the price about three-pence or four-pence a bushel. To such an extent is this mode of manuring carried on in that county, that the proprietors often receive two or three hundred pounds the acre for the liberty of cutting and carrying off peat to the depth of five or six feet. It would be absurd to suppose, says he, that the peat ashes of Berkshire are superior, as manure, to those in every other part of the island; and as their effects in that country, when applied to the soil, have been conspicuous for a great number of years, it is certainly a circumstance meriting the attention of those who reside where peat is the only fuel, to ascertain whether peat ashes in such districts do not possess all the fertilizing qualities of those in Berkshire. The experiment is easily made; all that is necessary being to keep the ashes dry, and under cover during winter; and to sprinkle them with the hand over the crops in spring, at the rate that has been just mentioned.

Lord Dundonald, in his Treatise on the Connection of Agriculture with Chemistry, however, remarks, that the ashes procured from peat in the neighbourhood of Reading, in Berkshire, seem to possess a fertilizing power infinitely greater than ashes obtained from most other peat. They certainly, he believes, contain no alkaline salts; and in an hasty analysis made some years since, no saline matter, says he, is recollected to have been got from them, but a small proportion of Epfom salt. Had these ashes, however, been analysed with more care, and when newly made, they probably would, he thinks, have been found to contain a *hepar of lime*, a salt which is soluble in water; whilst gypsum, to which it reverts on exposure to the air, is insoluble. To this *hepar*, therefore, says he, may the fertilizing power of these ashes most probably be attributed. And the writer of the Survey of the County of Middlesex suggests, that as the hills on each side of the meadows which produce the Newbury peat ashes, consist of chalk, easily dissolvable by heavy rains, which washes it off the ridges, down the furrows, ditches, and streamlets, to the low grounds, where, mixing with the floods, it is floated over the meadows, and deposited with the peat; consequently the peat of that district differs from that of most other, by the quantity of chalk which it contains, and that when dug, dried, and burnt, the fire reduces the chalk to lime, and the rest to ashes. Hence Newbury ashes are a mixture of lime and vegetable ashes; and it is very probable, he thinks, that any common peat-ashes, or the ashes of rough grass land, of turf, heath, furze, ling, wood, &c. produced by the operation of paring and burning, being mixed with chalk-lime in due proportion, would be equally fertilizing as those noted ashes. It has indeed been long since observed by Miller, that these ashes are greatly bettered by being mixed with lime before they are put on the land. These ashes are produced from land that is black and crumbly at top, under which lies the peat to the depth of several feet. They do not burn the peat in the field by choice, because the peat

is burnt for ashes, when it cannot be dried for sale; and then it is burnt in large heaps, with a smothering fire, as is likewise the superficial black earth, or moory soil, together with the refuse of the peat: the ashes of these are laid up in round or long heaps, rising at top like the ridge of a house, in order to throw off the rain and keep them dry till they are sold. Sometimes they are laid under dry sheds or in houses to save them from wet, which they cannot be wholly protected from by laying them up in ridges exposed to the weather, into which the rain penetrates for some inches deep; but these ashes are never so good manure as those that are kept dry. Near the surface of the peat earth there is sometimes a bed of whitish earth called *maurn*, which is a composition of earth and very small shells of the periwinkle kind; this is also burnt to ashes for manure, and the quantity of it in some places is so great, that the ashes are of a whitish colour, while those from the peat or moorish earth are reddish. The white are esteemed to be as good manure as the red; and being a kind of shell-marl, would make good manure without being burnt; as indeed they rarely are thoroughly, though they seldom lay them upon land till they have passed the fire, or are mixed with the ashes of the peat-earth. The ashes of the peat sold for fuel, and burnt in chimnies, are much stronger manure than the ashes burnt in the field; and if care be taken to keep them dry, are sold for nearly double the sum of the field ashes. Mr. Farcy states, in the Annals of Agriculture, that he has found field ashes to improve the chalky soils about Dunstable; but on the wet lands, or cold fwards, and hot sandy lands, they did little good. They may be employed on the same kinds of crops, and in the same way as coal ashes, and also on the wheat crops about April. But Mr. Middleton says, that he has tried the Newbury peat-ashes on wheat, tares, feeds, and meadows, in various quantities to the acre, without producing any sensible effect. In Norfolk, ashes are not in estimation as manure; even those of the hearth are in some degree neglected. But the meadows and fens abound with peat-bogs, which in some places would be considered as inestimable sources of manure; and the peat-earth in such meadows, when burnt, would no doubt afford an ample supply of ashes. In many places, much advantage has been supposed to arise from the practice of mixing lime with peat-ashes before they are applied to the ground.

The refuse, or ashes, remaining after the burning of different green vegetable matters from which the alkaline salt called pot-ash has been extracted, is a kind of ashes which has been found of great service to most sorts of land; but as they have been in a great measure deprived of their saline property, it is necessary to lay them on much thicker than any other sort of ashes. Mr. Bradley asserts that a bushel and a half of these may be used in the room of a bushel of fresh ashes; and that they should always be mixed with some other light ingredient which may be used in any quantity when laid on very stiff land; but if the land be not over stiff, they may be laid on it with less mixture. As in places far removed from the means of improvement, a substitute for common manures, that is of easy carriage, and can be had at a moderate expence, must be valuable, pot-ash may be employed; for, from experiments that have been made, it appears that two hundred pounds of it are sufficient for an acre of strong land. For lighter soils much less is required, if laid on by itself; on these, however, a compost of this and train or refuse oil incorporated with mould, will be the best way of employing it. Upon strong clays and deep loams however, it ought always to be applied by itself. When the expence of carriage is considered, this will often be found a cheaper manure than lime; and in one respect it

is superior, for the union of pot-ash with all the different acids forms a neutral salt which is in some degree useful in vegetation; whereas when lime meets with vitriolic acid, it is almost entirely lost to the purposes of agriculture. A considerable part of what is used in manufactures (glass excepted) may be useful as a manure, after the purposes of the different manufactures have been served; particularly in bleaching, the alkali of which will be found improved in consequence of the mucilage or oil which it has imbibed from the cloth or other matters.

The soapers' ashes are a composition of wood ashes and lime, remaining after the soap-makers have drawn off their lye. These are in general a very valuable manure; but there is great difference in the quality and effects of them. Those from wood ashes are the weakest sort, as, wood ashes being very light and spongy, their salts are soon dissolved and extracted by the lye; so that there remains but a very slight portion of salt in the ashes. But when the soap-boilers make use of kelp instead of wood ashes, the kelp, from its being of a harder nature than wood-ashes, is not so easily separated and dissolved by the lye; consequently, much more of the saline matter remains in the ashes. The soap-boilers also make use of another kind of potash called barilla, which is imported from Spain and other places in large lumps, and which is much harder than common pot-ash, and though they break this sort very small, and sometimes screen or sift it, much more salt remains than when pot-ash is employed; so that the ashes from barilla are for the most part stronger than any other; and if the same quantity of them were laid upon land as is commonly the case with wood ashes, they would burn and destroy the crop. Farmers should therefore use soap-boilers' ashes with caution, till they know their qualities and strength. Wood ashes and pot ashes are used in various places for making soap; but in and near London, very little of any thing but barilla is employed. The ashes from the barilla are a strong rich manure, and sold at five shillings per cart-load. They are not now however so good as they were formerly, the soap-makers having found means to extract more of their salt from them; as they also take the salt from the lye which was formerly rather superior to the ashes as a manure, and to be had for nothing, being all thrown away as useless. This excellent manure was first used by the Flemings with great success. Two loads of these ashes are sufficient for an acre of arable land. They should be laid on the ground when the weather is inclined to be moist, in order that the rain may more easily dissolve and wash them in. As soapers' ashes principally consist of lime, which is used by soap-makers to deprive the alkaline salts of their fixed air, the addition of lime to the ashes is unnecessary. They are used to most advantage when made into composts with earth and well-fermented dung in the proportion of two loads of dung to one of earth; the ashes being then added in the quantity of one load to ten of this mixture, turning and incorporating the whole completely. The quantity necessary for strong clays or deep loams is ten cart loads to an acre. If the dung has been well fermented, perhaps the most profitable way of using this compost may be as a top-dressing harrowed in with the grain, taking care, however, that the caustic quality of the ashes be properly blunted by a sufficient mixture of dung and earth, or rich earth only. These ashes, when beat small, may be made into a rich compost with ruse oil and earth, and used as a top-dressing for young crops. They will destroy slugs and vermin of every description, and are therefore highly valuable on lands where the early wheat is injured by the worm. Laid upon grass lands in the end of autumn, this manure, it is said, produces a deep

verdure during the winter, and an early vigorous vegetation in the spring; it is therefore particularly calculated for cold wet pasture lands.

In respect to turf ashes, produced by burning turf or the paring of the surface of heathy, moorish, and other lands, their utility as a manure, perhaps, chiefly depends upon the proportion of alkaline saline matter which they contain, and which is produced by the burning of the fresh vegetable substances of turf, and the combination of vital air or oxygen, with the clayey part of the soil during the process of combustion, as well as by the mechanical action of such substances on the tenacious earthy matters of the soils. According to the Rev. Mr. Comber, the ashes in the moors of Yorkshire, are carried out daily, or once in two or three days to the dunghill; and the farmer takes the opportunity of his first leisure towards the end of the year, to carry them out to his meadow lands on which he lays them thicker or thinner as he has more or less land which he apprehends to want them, and more or less of them. The first rains wash them in, and the next summer never fails to shew their good effects. It would however be probably a much better practice to apply them to the land in the early spring when the weather is rather wet, and not to leave them to be washed away by the heavy rains and land-floods during the winter months. They would also be much more efficacious if kept in sheds, or other suitable places, instead of being carried out to the dung-heap; where the rains must dissolve and carry away their most nutrient properties; as these ashes are much finer or more pulverized than those of coal, they may insinuate themselves more into the soil, but they are probably not so lasting in their effects. Of the truth of this a remarkable instance is mentioned.—A field, whereof the soil was a poor gravel, that had a crop of the broad or red clover growing upon it, was dressed, one side of it with peat ashes, and the other side with turf ashes. The farmer laid upon this field all the ashes he had of these two sorts, and the middle of the field had no dressing. The clover in the middle part not dressed was a very poor crop, the plants being short, yellow, and stunted; the side dressed with turf ashes was much better than the middle; the plants being taller, of a better colour, and promised to be double the crop of the undressed part; but that side dressed with peat ashes produced a crop that appeared to be as much superior to the part dressed with the turf ashes, as this last was superior to the middle that had no dressing at all. The ashes were sown upon the clover by hand, and the improvement made upon the clover was so great, that the cast of the sower's hand was extremely plain next to the middle, and appeared like an indenture; and the vigour of the plants there was so much greater than the undressed plants, that the extent of the peat ashes might be plainly distinguished almost to an inch. This observation was however made in the beginning of summer, before the clover had arrived to its full growth. See **PARING**, and **BURNING**.

Ashes produced from wood and most green vegetable products contain a considerable quantity of fixed alkaline salt blended with the earthy particles; but none or very little can be produced by the combustion of dead or decayed vegetable matters. It is from the ashes of the former kinds of vegetable matter that the alkaline salts called potash and pearl-ashes are commonly extracted. It seems also probable, from the observations of the earl of Dundonald, that the effects produced upon land by the application of the ashes of fresh vegetable products, arise from the vegetable alkaline salt which they contain, which, by its action on what he terms the *oxydated* or inert mould or earth of the soil, renders it soluble, and more suitable for the nutrition of plants.

plants. As the saline matters contained in these substances are liable to be lixiviated and carried away by moisture, they should always be kept dry and free from water, either by means of sheds or other conveniences. It has been long ago observed by Mortimer, that one load of dry ashes will go as far as two not kept so; but though rain-water diminishes their salts, so the moistening them with chamber-ley or soap-suds will add greatly to their strength. Two loads of these ashes will manure an acre of land, better than six loads of those that are exposed to the rain, and that are not ordered so, which is the common allowance for an acre, though some lands require more, and some less. That the ashes of any sort of vegetables are very advantageous to land, is what is experienced in most parts of England, by the improvement that is made by burning of furze, and stubble, straw, heath, furze, sedge, bean-stalks, &c. Mr. Young, in the first volume of the *Annals of Agriculture*, approves of charcoal-ashes, in preference to powdered charcoal itself. And wood ashes mixed with mud (he says) are superior to ashes alone, and four times better than mud alone, as a manure. In the second volume of the same useful work, he adds, that wood ashes appear to be a most powerful manure. In a neighbourhood abounding with vitriolic acid (he says), they more than neutralize that salt; they furnish, besides, the food of plants. In neutralizing it, the fixed vegetable alkali they contain forms with the acid a vitriolated tartar, which is beneficial to vegetation. From the alkaline saline matter contained in ashes, and its known operation on earthy substances, they may probably be used to great advantage in combination with good mould or earthy materials, and dung, in the proportion of one load of ashes to ten of the compost; and thus may be applied to tillage-lands as well as those under grass, in their simple state; but in the former they would seem to be the most proper, when conjoined with other matters, such as have been mentioned above. They may, when employed in the unmixed way, be sown upon the surface, and harrowed in with the crop to which they are used. But in whatever way they are made use of, they should be spread out as equally as possible on the land. Most grass-lands are improved by their application, but more especially those that are wet, and given to the production of wild sorrel, rushes, or other coarse plants of the same kind. When used in the way of compost on tillage-lands, they are generally laid on at the rate of about ten or twelve loads to the acre, but on pasture or grass-lands, the quantity applied varies very considerably, as from one hundred to one hundred and sixty bushels. These substances have been found highly useful, when sown on the green wheat and clover crops in the spring, and also when harrowed in with turnip seeds, or sown over the young plants when they first appear, as by this practice the ravages of the fly are said to be greatly lessened in many cases. See MANURE.

ASHES, *Volcanic*. See VOLCANO.

ASHFIELD, in *Geography*, a township of America, in Hampshire county, Massachusetts, about 15 miles north-west of Northampton, and 117 west from Boston; containing 1459 inhabitants.

ASHFORD, a town of England, in the county of Kent, seated on the river Stour. It has a monthly market for cattle on the first Tuesday, and a weekly market on Saturday for corn &c. It is distant 45 miles E.S.E. from London. N. lat. $51^{\circ} 15'$. E. long. $0^{\circ} 45'$.

ASHFORD, a township of America, in Windham county, Connecticut, incorporated in 1710; distant about 38 miles north-east from Hartford, and 76 south-west from Boston.

ASHFORD, *New*, a township of America, in Berkshire

county, Massachusetts, 155 miles west from Boston; containing 460 inhabitants.

ASHKENAZ, in *Ancient Geography and History*, one of the sons of Gomer, is supposed to have settled near Armenia, in the eastern part of Asia Minor; or towards the north-west of that continent; for it is said, that with reference to his name, there was in Bithynia the Ascanian lake, a river called Ascanius, and a bay of the same name; and in lesser Phrygia there was a city called Ascania, with isles called the Ascanian islands: and it is further observed, that besides Ascanius, the son of Æneas. Homer mentions a king of that period who was at the siege of Troy; and as a proof that the Ashkenaz, mentioned by Jeremiah, were people of these parts, it is shewn from Xenophon, that Hytaspes having conquered Phrygia, that lies on the Hellespont, brought thence many of the horses and soldiers which Cyrus carried with him to the siege of Babylon. Moreover, the Pontus Euxinus, or Axinus as the Greeks first called it, is supposed to be a corruption for the sea of Ashkenaz.

ASHKOKO, in *Zoology*, a very singular kind of quadruped, described by modern naturalists under the names of Syrian hyrax, hyrax syriacus, and bristly cavy: for a full and accurate description of this species we are however indebted to that indefatigable and learned traveller, Mr. Bruce, he observed it in several parts of Abyssinia, and gives us the following account of it in the Appendix to his Travels.

"This curious animal," says Mr. Bruce, "is found in Ethiopia, in the caverns of the rocks, or under the great stones in the mountain of the sun, behind the queen's palace at Koscam. It is also frequent in the deep caverns in the rocks in many other parts of Abyssinia. It does not burrow or make holes as the rat and rabbit; nature having interdicted him this practice by furnishing him with feet, the toes of which are perfectly round, and of a soft, pulpy, tender substance; the fleshy parts of the toes project beyond the nails, which are rather broad than sharp, much similar to a man's nail ill grown, and these appear rather given him for the defence of his soft toes than for any active use in digging, to which they are by no means adapted.

"His hind foot is long and narrow, divided with two deep wrinkles or clefts in the middle drawn across the centre, on each side of which the flesh rises with considerable protuberancy, and it is terminated by three claws; the middle one is the longest. The fore-foot has four toes; three disposed in the same proportion as the hind foot; the fourth, the largest of the whole, is placed lower on the side of the foot, so that the top of it arrives no farther than the bottom of the top of the toe next to it. The sole of the foot is divided in the centre by deep clefts like the other, and this cleft reaches down to the heel, which it nearly divides. The whole of the fore-foot is very thick, fleshy, and soft, and of a deep black colour, altogether void of hair, though the back or upper part of it is thick-covered, like the rest of the body, down to where the toes divide, there the hair ends, so that these long toes very much resemble the fingers of a man.

"In the place of holes, it seems to delight in less close or more airy places, in the mouths of caves, or clefts in the rock, or where one projecting, and being open before, affords a long retreat under it, without fear that this can ever be removed by the strength or operations of man. The ashkoko are gregarious, and frequently several dozens of them sit upon the great stones at the mouths of caves, and warm themselves in the sun, or even come out and enjoy the freshness of the summer evening. They do not stand upright upon their feet, but seem to steal along as in

fear, their belly being nearly close to the ground, advancing a few steps at a time, and then pausing. They have something very mild, feeble, and timid in their deportment, are gentle, and easily tamed; though when roughly handled at the first, they bite very feverly.

This animal is found plentifully on mount Libanus: I have seen them also among the rocks at the Pharan promontorium, or cape Mahomet, which divides the Euxine from the Heroopolitic gulf, or gulf of Suez. In all places they seem to be the same; if there is any difference, it is in favour of the size and fatness which those in the mountain of the fun seem to enjoy above the others. What is his food I cannot determine with any degree of certainty: when in my possession he ate bread and milk, and seemed to be rather a moderate than a voracious feeder. I suppose he lives on grain, fruit, and roots. He seemed too timid and backward in his own nature to feed upon living food, or catch it by hunting.

The total length of this animal, as he sits, from the point of his nose to the extremity of his body, is seventeen inches and a quarter: the length of his snout, from the extremity of the nose to the occiput, is three inches and three eighths; his upper jaw is longer than his under; his nose stretches half an inch beyond his chin. The aperture of the mouth, when he keeps it close, in profile, is little more than an inch. The circumference of his snout around both his jaws is three inches and three eighths; and round his head just above his ears, eight inches and five eighths; the circumference of his neck is eight inches and a half, and its length one inch and a half. He seems more willing to turn his body altogether, than his neck alone. The circumference of his body, measured behind his fore-legs, is nine inches and three quarters; and that of his body, where greatest, eleven inches and three eighths; the length of his fore-leg and toe is three inches and a half; the length of his hind thigh is three inches and one eighth, and the length of his hind leg to the toe, taken together, is two feet two inches; the length of the fore-foot is one inch and three eighths; the length of the middle toe six lines, and its breadth six lines also. The distance between the point of the nose and the first corner of the eye is one inch and five eighths; and the length of his eye from one angle to the other four lines. The difference from the fore angle of his eye to the root of his ear is one inch and three lines; and the opening of his eye two lines and a half. His upper lip is covered with a pencil of strong hairs for mustachoes; the length of which is three inches and five eighths, and those of his eye-brows are two inches and two eighths. He has no tail, and gives at first sight the idea of a rat rather than of any other creature. His colour is a grey mixed with a reddish brown, perfectly like the wild or warren rabbit. His belly is white from the point of the lower jaw to where his tail would begin if he had one. All over his body he has scattered hairs, strong, and polished like his mustachoes; these are for the most part two inches and a quarter in length: his ears are round, not pointed; he makes no noise that ever I heard; but certainly chews the cud. [Dr. Shaw observes, that this particular of the ashkoko seems very doubtful, and may probably be owing to the peculiar motions of the mouth resembling those of the hare, which has also been supposed by some to ruminat. Gen. Zool.] To discover this was the principal reason of my keeping him alive: those with whom he is acquainted he follows with great assiduity. The arrival of any living creature, even of a bird, makes him seek for a hiding-place; and I shut him up in a cage with a small chicken, after wanting to feed him a whole day; the next morning the

chicken was unhurt, though the ashkoko came to me with great signs of having fasted with hunger. I likewise made a second experiment, by inclosing two smaller birds with him for the space of several weeks; neither were these hurt, though both of them fed without impediment of the meat that was thrown into his cage; and the smallest of these, a titmouse, seemed to be advancing in a sort of familiarity with him, though I never saw it venture to perch upon him, yet it would eat frequently, and at the same time, of the food upon which the ashkoko was feeding; and in this consisted chiefly the familiarity I speak of, for the ashkoko himself never shewed any alteration of behaviour upon the presence of the bird, but treated it with a kind of absolute indifference. The cage indeed was large, and the birds having a perch to sit upon in the upper part of it, they did not annoy one another.

In Amhara, this animal is called ashkoko, which, I apprehend, is derived from the singularity of those long herinaceous hairs, which, like small thorns, grow about his back, and which, in Amhara, are called ashok. In Arabia and Syria, he is called Israel's sheep, or Gannim Israel, for what reason I know not, unless it is chiefly from his frequenting the rocks of Horeb and Sinai, where the children of Israel made their forty years peregrination; perhaps this name obtains only among the Arabians. I apprehend he is known by that of Saphan in the Hebrew, and is the animal erroneously called by our translators cuniculus, the rabbit or coney." Bruce Append.

M. Schreber, who names this animal *hyrax syriacus*, gives it this specific character: *H. plantis tridactylis, unguibus omnibus subæqualibus.* (Feet tridactyle, with all the claws nearly equal.) To this Dr. Shaw, in his Zoology, adds, that it is rufous-grey, and white beneath. Gmelin also has *hyrax syriacus, pedibus unguiculatis.* See *HYRAX SYRIACUS.*

ASHLAR, a term used among *Builders*, by which they mean common or free stones, as they come out of the quarry, and of different lengths and thickneses.

ASHLEP, in *Agriculture*, a term sometimes applied to soapers' ashes or wash. See *Soapers' ASHES.*

ASHLERING, among *Builders*, signifies quartering, to lath to, in garrets, about 2½, or 3 feet high, perpendicular to the floor, up to the underlide of the rafters.

ASHLEY, in *Geography*, a river of North America, which runs into the sea on the south-west side of Charlestown, in South Carolina.

ASHMOLE, ELIAS, in *Biography*, an eminent antiquarian of the 17th century, was born at Litchfield in 1617; and at the age of sixteen was received into the family of his kinsman James Paget, esq. a baron of the exchequer, where he studied the law and other branches of knowledge. Having married in 1638, he settled in London as an attorney; but on the commencement of the civil war, his wife being dead, he entered into the king's service, and was employed in the department of the Ordnance, first at Oxford, and afterwards at Worcester. At Oxford he became a student of Brazen-nose college, and directed his attention to mathematics, natural philosophy, and astronomy. From the study of the latter important and useful science he deviated to that of astrology, to which he seems to have been much addicted. In 1646, he was admitted into the society of free and accepted masons, and his election into this society was considered by him as a distinguishing era of his life. His valuable collections very much contributed to the illustration of its history in this kingdom. Upon the surrender of Worcester to the parliament in this year, he withdrew first to Cheshire, and afterwards came to London, where he formed

intimate acquaintance with the astrologers of that period, Moore, Lilly, and Booker. In 1647, he retired to Englefield in Berkshire, and applied to the study of botany. Here he became acquainted with a rich widow, whom he married in 1649, and then removed with her to London, where his house was a place of resort for all the proficients in the curious and occult sciences. Having acquired from an adept in Berkshire a taste for alchemy, he published, under a feigned name, a treatise by the famous Dr. Dee, and another by an anonymous author, on this subject; and with great labour and expence he made a collection of the MS. works of English chemists, which he published in 1652, under the title of "Theatrum Chymicum Britannicum," in 4to. Having brought to a favourable termination some legal disputes occasioned by his wealthy marriage, he devoted himself with singular assiduity to the study of antiquity and the perusal of records; and relinquishing hermetic philosophy with a preface to a treatise on the philosophers' stone, which he edited, he began to make collections for the work which conducted much more to his literary reputation than any of his astrological and alchemical pursuits, and this was his "History of the Order of the Garter." As he was fond of the study of botany, he chose for the place of his residence the house of John Tradescant, a scientific gardener of Lambeth; and became possessor of the collection of rarities that had been made by Tradescant and his father, and which was conveyed to Mr. Ashmole by a deed of gift in 1659. On the restoration, Ashmole was particularly noticed, on account both of his loyalty and learning, by the king, who appointed him Windsor herald, and committed to him the description of the royal medals. He was also made a commissioner, and afterwards comptroller of the excise; he was called to the bar in the Middle Temple, admitted a fellow of the Royal Society that had been recently established; presented, by the university of Oxford, with the degree of doctor of physic; and promoted to other offices, both honourable and lucrative. Upon the death of his second wife, he married the daughter of his friend Sir W. Dagdale. In 1672, he presented to the king his book "On the Order of the Garter," intitled "The Institutions, Laws, and Ceremonies of the Most Noble Order of the Garter, collected and digested into one body;" and printed at London in folio, in 1672. In 1679, he resigned his office of Windsor herald, and declined accepting that of garter king at Arms, on two vacancies which occurred. His valuable library, which he had been thirty-three years in collecting, and also his cabinet consisting of nine thousand coins, and many curious antiquities, were destroyed by a fire, which happened in the chambers adjoining his own in the Middle Temple; but his MSS. and gold medals were preserved at Lambeth. When the university of Oxford had finished an edifice for a museum, in 1683, Mr. Ashmole sent thither his Tradescantian collection of rarities, with the additions which he had made to it; and he afterwards added to this donation, his books and MSS. Thus commenced the "Museum Ashmoleanum," now subsisting at Oxford. Mr. Ashmole, having attained the 76th year of his age, died in 1692, and was buried in the church of Great Lambeth. Some few of his numerous MSS. chiefly on antiquities, have been published since his death; and also "A Diary of his Life" written by himself. His rank in literature and philosophy may be estimated by the brief account that has now been given of his researches and pursuits. Whilst a sober judgment will hesitate in admitting the extravagant panegyric of the "Biographia Britannica," which records him as "one of the greatest men in the last century," he will be allowed to have possessed, in a high degree, industry, perseverance, curiosity, and

exactness; and "Anthony Wood," says one of his biographers (see Aikin's Gen. Biog.), "in his quaint language, perhaps not ill characterised him, as—the greatest virtuoso or curioist that was ever known or read of, in England, before his time." Biog. Brit.

ASHMOT, in *Geography*, the principal harbour in Isle Madame, which is dependant on cape Breton.

ASHMOUNEIN, probably, says Bruce (Trav. vol. i. p. 91.), the ancient Latopolis, a large town of Egypt, which gives name to the province. See ACHMOUNAIN.

ASHMUN-TANAH, a town of Egypt, on a canal, between the Nile and the lake of Tennis, twelve miles east of Mansora, and twenty fourth of Damietta.

A-SHORE, in *Nautical Language*, a term signifying on the shore, as opposed to A-BOARD. It also means A-GROUND.

ASH-PIT, is the lower part of any air-furnace, which serves to receive the ashes of the fuel as it is consumed, and in general to supply the air necessary for the combustion. See FURNACE.

ASHUELOT, or ASHWILLET, in *Geography*, a small river of America, having many branches, whose most remote source is at the north end of the Sunapee mountains, in New Hampshire. It runs south-westerly through part of Cheshire county; below Winchester, its course is west by north, and it discharges itself into Connecticut river at Hinsdale.

ASHUR, in *Ancient Geography and History*, the second son of Shem, occupied at the dispersion the country called after his name, and by the Greeks Assyria, at present Kurdistan, or the country of the Kurds. Pezron supposes that he was driven out of Shinaar by Nimrod, the grandson of Ham; but however this be, it seems to have been Ashur, (Gen x. 11.), and not Nimrod, who went out of Shinaar into Assyria, and built Nineveh, and other cities; and thus Perizonius maintains, that the text ought to be understood. See ASSYRIA.

ASH WEDNESDAY, the first day of Lent, supposed to have been so called from a custom in the church of sprinkling ashes that day on the heads of penitents then admitted to penance.

ASHWELL, GEORGE, in *Biography*, an episcopalian divine, was born in London in 1612, and educated at Wadham college, Oxford. He was rector of Hanwell in Oxfordshire for thirty-five years, and distinguished as a zealous advocate for the doctrine and worship of the church of England, in defence of which he wrote several treatises; "Fides Apostolica," or "A Discourse on the authors and authority of the Apostles' Creed," with "A double Appendix on the Athanasian and Nicene Creeds," printed at Oxford, in 8vo. in 1653; "Gestus Eucharisticus," or "The Gestures to be used at the receiving of the Sacrament," 8vo. Oxford, 1663; "De Socino et Socinianismo;" "De Ecclesia Romana;" 4to. Oxford, 1688; and an English translation of Pococke's Latin translation of an Arabic work, intitled, "Philosophus Autodidactus," or "The self-taught philosopher, Hai Ebn Yokdan," by Tophail. Biog. Brit.

ASIA, in *Geography*, one of the four grand divisions of the earth, and the second in order, though the first inhabited. It is separated from Europe by the Mediterranean, the Archipelago, the Euxine, the Palus Meotides or sea of Azof, the Don, and the Dvina; from Africa by the Red sea and the isthmus of Suez. On the other sides it is surrounded by the Great South sea. It does not join to America. Its principal parts are, Arabia, Asiatic Turkey, Persia, India, Tartary, Asiatic Russia, China, Japan, the

kingdom of Ava, that of Siam, the island of Ceylon, and the Souda islands, whereof the chief are Sumatra, Borneo, Java, Celebes, the Moluccas, the Philippines, the Maldives. Asia, according to Mr. Pinkerton, extends, in length, from the Hellepont to what is called the East cape; that is, from about the twenty-sixth degree of longitude east from London, into the other hemisphere to near 190 degrees of east longitude, or 170 degrees west from London; being no less than 164 degrees, or (taking the degree at a medial latitude) more than 6500 geographical miles. From the southern cape of Malacca, to the Severovostoknoi-nofs the north-eastern cape, now called the cape of Taimura, which braves the ice of the arctic ocean, the breadth extends from about the second degree of northern latitude, to about the seventy-seventh, or nearly 4500 geographical miles. If, for the sake of a rude and merely comparative calculation, one-sixth part be added for the difference between the latitude and geographical mile, the length of Asia in British miles would be about 7583, and the breadth 5250.—Under their proper heads, will be found the names of the places it contains, and such general accounts of them as the limits to which we are confined on this subject will allow.

For ascertaining the real length of the continent of Asia, there was no guide as to its southern and eastern part, even beyond the Ganges, except from the accounts that were obtained from the time that the navigations began in the sixteenth century, and their disagreements with the arbitrary alterations that had been made. A long period elapsed before it was possible to settle the position of that portion of Asia, still susceptible of much correction, notwithstanding the observations of the Jesuits at Pekin, the most accurate of any extant. We shall content ourselves then with relating the result of the latest observations of the academy of sciences at St. Peterburg, of the latitude and longitude of the following places in the north of Asia.

	Lat.	Long from Ferro,	from Greenwich
Bocheretzk, - -	52° 55'	174° 13'	156° 38'
Harbour of St. Peter and Paul, }	- 35 1	176 10	158 36
Eastern extremity of Siberia, }	- 66 0	200 0	282 25

Unalaska, by the general map of Russia, lies in 58° of latitude from Ferro, 223° of longitude; and from Greenwich, 205° 25'. The same place, according to the chart of Krenitzin and Levashev, is in 53° 30' latitude, longitude from Ferro 205° 30', from Greenwich 187° 55'; the longitude from Ferro to Greenwich being computed at 17° 34' 45".

If the ancients had so slight a knowledge of the southern countries of Asia on the other side the Ganges, we ought not to be surpris'd if what they have been able to hand down to us concerning the hyperborean regions, coasts, and seas, or the northern extremities, should be considerably more so; and it must have been merely by chance that Pliny obtained some slight knowledge of cape Tabin and of the island Tazzata; as we have learnt a few uncertain notices about those vast lakes towards the west of America, from savages taken prisoners, and others, and from vague report, with which we are obliged to be satisfied for want of better information. It was impossible to acquire any more authentic, except by means of the Russians, with whom, till the seventeenth century, we were scarcely any more acquainted than with the savage inmates of those northern coasts. Nay, had it not been for the Russian, Anika Stroganof, who formed speculations for profiting by the lucrative commerce which the Samoyedes carried on at

Mosco, in peltries brought from countries beyond them, Siberia, properly so called, would have remained a great while longer unknown to the Russians themselves. Thus, as a thirst for riches had been the chief motive that excited the Spaniards to the discovery of America, and attracted the attention of other maritime nations to that quarter, so the same greediness of gain occasioned the discovery and conquest of northern Asia, a country till then unknown to the Europeans. The first foundation of this conquest was laid by the celebrated Yermak Timofeiyef, at the head of a band of adventurers, less civilised, though not so inhuman, as the conquerors of America. By the accession of this vast territory, now known by the name of Siberia, the Russians have acquired an extent of empire, never before attained by any other people. (Tooke's View of the Russian empire, vol. i. p. 303.) It was however owing to Anika Stroganof and his comrades, that this conquest was undertaken, who also shewed the way to subjugate, by degrees, farther distant nations. The Russians themselves became known to the Europeans, through the voyages undertaken by the latter. The English and Dutch obtained some intimation of them while in quest of a north-east passage; they learnt of the Samoyedes that the little sea froze over in winter, but the great sea was never frozen; that they went thither to fish between the mouths of the Pisida and the Yenisey; that opposite to the east and north point of Nova Zemla, was another, making a great salient angle, from which the coast afterwards declined towards the east and south-east, nearly to the hot countries. Here we see to what a small matter was confined the knowledge at that time obtained of the southern part of Asia, and the only materials from which they could lay down their charts. They were puzzled how to reconcile these statements, and the more, as the coast between the Pisida and the easternmost point of its cape was unknown to them. Some knowledge of it by land had indeed been obtained; and even the coasts of the sea to the westward of it, as far as its mouth, are filled with simovies, or winter-huts, consequently peopled; but those situate beyond that little river were so indistinctly known to them, that they thought it best to mark them down in an indeterminate manner.

They reasoned thus: cape Tabin must form a *finis terræ*, the extremity of Asia towards the north. There is a sea that washes all those shores; and we are assured there is another that divides Asia from America; these two seas therefore must join, and at that place form an angle, which will prove to be this Tabin; having an island to the westward which they laid down as lying at the mouth of a river. This notion, notwithstanding the numerous discoveries that might have destroyed it, has always subsisted, under one form or another, to the very times in which we live. Some, building on the report of the Samoyedes, marked the coast from the cape to the Taimura, as declining gradually towards the south-east. Others, willing to reconcile one with the other, laid down this declension only to the Lena, at its mouth, having got intelligence of some islands there; accordingly they carried the coast north-eastwards, for the sake of preserving this Tabin. On learning that the Russians and others regarded Svetoi-nofs as the most advanced promontory, they gave its name, or Promontorium Sacrum, to the pretended Tabin. Afterwards, being informed that this Svetoi-nofs lay to the east of the Lena, they marked it accordingly, and hence were more firmly persuaded, that the isles at the mouth of that river were those of Tazzata; while, on the other hand, they persisted in the idea of a cape *finis terræ*, which they left subsisting under the names of Tabin (which we shall continue

to use while speaking of it in this sense), Svetoi-nofs, Caput Sacrum, Tshukchi-nofs, Tshalakikoi-nofs, &c.

Strahleberg notices this cape in a striking manner; and the navigators of the seventeenth century, likewise, even so early as Linschotten and his contemporaries, were persuaded that it was no other than that prominent angle towards the Taimura: indeed it is the most advanced cape of all that coast, lying beyond the $77\frac{1}{2}^{\circ}$ or in 78° , and therefore the finis terræ towards the north. But Strahleberg at the same time points out the isle of Tazzata, which he proves to be Novaya Zemla, since the ancient Scythians and their successors began with the northern nations of Europe, by the river Taas, whence they denominate the great gulf to which we give the name of Oby, the gulf of Taas, and from which Novaya Zemla, situate over against it, was called Tazzata. This is so natural, and can be the less doubted of, as that island has always been reputed as lying to the west of cape Tabin, near the mouth of a river. Whence Strahleberg concludes, that those geographers who mark it more to the east are greatly mistaken, "huc usquam Tazzata insula a Plinio ponitur."

After the conquest of Siberia, some Russians fell upon the same reflections as Anika Stroganof and his companions had done concerning the wealth that might be drawn from these oriental parts by the articles of peltry, on going direct to obtain them, either by the chase or by commerce; several companies were accordingly formed of people who were then, and are still known by the name of Promyschleniye.

They considered that the method of making the greatest profit possible would be by going to sea coastwise, and trafficking with these unknown tribes, who being ignorant of the value of their peltries, would give them for a low price. In this they were not deceived: and, notwithstanding the great risk they ran, as their vessels were small and crazy; as they were no less unskillful in the art of constructing than in managing them; as in not venturing far from shore, they were in jeopardy every moment of foundering among the ice; yet the thirst of lucre was too strong to prevent them from being deterred from their projects; and the government was well satisfied with them, as they furnished it with the means of rendering all these people tributary.

They began their courses from Yakutsk about the year 1636: proceeding in this manner step by step, they every year almost discovered some new river, some new cape, the Yena, the Indigirka, the Alasea, the Kovyma. No sooner were they come to the last of these rivers, than their curiosity was excited to know what other streams might be beyond it, in the two-fold view of rendering the nations bordering on them tributary to the empire, and of prosecuting the expected capture of fables for their own emolument. The first voyage from the river Kovyma was undertaken in 1646, by a free company of these Promyschleni, under the conduct of a certain Isaac Ignatief, a native of Meseu. They found the sea full of ice: between the ice, however, and the main land was an open passage, along which they proceeded twice 24 hours; when, coming to an inlet between the rocks and the shore, they ran into it. These 48 hours make seven degrees and a half, and the bay they entered lies in 72° deg. Here they met with people of the Tshuktshi nation, with whom they began to trade in the manner customary with uncivilized people; spreading their commodities on the shore, of which the Tshuktshi took what they pleased, and deposited in their place walrus-teeth, and articles made of that species of ivory. None of the mariners would venture on shore to the Tshuktshi,

particularly as they had nobody on board who could serve as interpreter. Contenting themselves therefore with having made this first discovery, they returned to the river Kovyma.

The accounts brought home by these people of the walrus-teeth, induced some other Promyschleni some years afterwards to undertake a second voyage. To this end Fedot Alexeyef, a native of Kolmogor, associated himself with a Mosco merchant of the Gostiinna fotna, a vassal of Alexey Ustof, and was immediately considered as the chief of the enterprise. He thought it, however, expedient to ask of the commandant at Kovyma, one of his kozaks to look after the concerns of the crown during the voyage, who appointed one Simeon Ivanof sin Deshnef, to attend him, with proper instructions. Four kotshes, a species of barks, sailed at the same time in June 1647, from the river Kovyma. Some loose informations having been obtained of a river Anadir, or as it was then pronounced, Anandir, the borders of which were inhabited by numerous tribes of strange people, it was calculated that this river must fall into the Frozen ocean; one of the objects therefore of the present voyage was to discover its mouth. However, in this, as well as all the rest, they completely failed; the sea, even in summer, being too full of ice to permit them a free navigation.

Nevertheless, the passion for discoveries for augmenting the revenues of the crown and the wealth of private individuals was so great, that no thoughts were entertained of giving them up. Indeed the number of adventurers seemed rather to increase, both among the Kozaks and the Promyschleni, so that the following year seven kotshes were fitted out in the same design; what became of four of these vessels the accounts received make no mention. Of the three others, Simeon Deshnef and Gerafin Ankudinof were commanders on the part of the Kozaks, and Fedot Alexeyef the principal of the Promyschleni. Previous to their departure a quarrel broke out between the two former, arising from the jealousy of Deshnef, that Ankudinof should share in the honour as well as in the profits to accrue from the future discoveries. The crew of each vessel might consist of about thirty persons; at least that was the number of Ankudinof's people.

It is to be lamented that the accounts of Deshnef, the original whereof Mr. Müller was lucky enough to find among the archives of Yakutsk, should say so little, and even nothing at all concerning the fate of four of those kotshes; nothing of what happened to him and his companions on board the other three till they came to the Great Cape; nothing about the ice, because, doubtless, says Mr. Müller, there was none; and as Deshnef remarks in another place, the sea is not every year navigable.

The relation begins at this cape. His words are: "This cape is entirely different from that which projects near the river Tshukotsha, westward from the Kovyma. It is situate between the north and north-east, forming a semicircle towards the Anadyr. On the Russian or western side, the Tshuktshy have raised by the side of a river a number of whalebones in the form of a tower (according to other reports they are the tusks of the walrus). Opposite to the promontory (it is not mentioned on which side) are two islands, whereon were seen people of the nation of Tshuktshy, distinguished by wearing pieces of the teeth of the walrus inserted in their upper lip. It is possible, with a very good wind, to stretch from the promontory as far as the river Anadyr in three times 24 hours; and it would require no longer time to do it by land, as the Anadyr discharges itself into a bay." On this promontory it was
that.

that Ankudinof's kofch perished; the people however were saved, and put on board the other two kofches. Shortly afterwards these were separated, and never again got sight of each other. Deshnef, after being driven about by wind and weather till October, suffered shipwreck, as far as can be collected from circumstances, considerably to the south of the river Anadyr, some where about the river Olutora. What became of Fedot Alexeief and his ship's company we do not know.

Deshnef, with his followers, five and twenty in number, now set out in search of the Anadyr, which they did not discover till after they had wandered about, for want of a guide, the tedious space of ten weeks. The region where they came up to the Anadyr was not far from its mouth, a country entirely void of inhabitants, and destitute of forests; circumstances that naturally threw them into the extremity of distress, as perceiving no means of obtaining subsistence. Wild animals were not to be expected, as they usually haunt the woods; and they had no implements for fishing. In this perplexity, twelve of the company went up the course of the river; but after a tedious journey of twenty days, still finding no traces of mankind, they turned about to regain the station where Deshnef and the rest were waiting for them; which, however, on account of hunger and fatigue, only a few of them reached.

After undergoing incredible hardships, Deshnef, in the summer of 1649, with the small remains of his people, went up the Anadyr by water, till he came to a people called Anauli; and there he founded the Anadyrskoi ostrog, which was followed by other buildings. Deshnef observed a great sand-bank lying at the mouth of the Anadyr, advancing on the northern side far into the sea, the resort of a vast number of morshes and other amphibious animals. This circumstance was too flattering to be neglected. Accordingly, he began to fell timber, in 1653, for the construction of a kofche to be employed in conveying the tribute to Yakutsk by sea; but was obliged to desist from his purpose from the want of other materials, and because he learnt that the sea about Tshukotkoi-nofs was not every year equally free from ice.

In 1654, he made another expedition to the korga, or sand-bank, for the purpose of collecting morsh-teeth. He now associated with him a Kozak named Yutko Seliverstof, who had accompanied Mikhaila Stadikin on his voyage of discovery in the Frozen Ocean, and was sent from Yakutsk to collect these teeth for the benefit of the crown. In his instructions mention is made of a river Shendon, falling into the bay at Penzhinsk, as well as of the Anadyr; and he was ordered to levy a tribute on the inhabitants dwelling about both these rivers; as what Deshnef had been doing was not as yet known at Yakutsk. On this occasion new discontents arose. Seliverstof arrogated to himself the discovery of the korga, as having failed to that place with Stadikin, in 1649. Deshnef however proved that he had not even reached the great Tshukotki-nofs, which he affirmed to be formed of nothing but bare rocks, as was but too well known to him, since Ankudinof's vessel had been wrecked upon them. He farther alleged, that this was by no means the first promontory that appeared under the appellation of Svatoi-nofs. The two islands lying opposite the Tshukotki-nofs, belonging to the tooth-lipped people before mentioned, being the peculiar marks of it. That Deshnef alone, and neither Stadikin nor Seliverstof, had seen these people; and concluded by insisting that the korga at the mouth of the Anadyr was at a great distance from them.

Deshnef, while surveying the sea-coast, learnt of the

Koriaks the fate of the two Ankudinofs, Fedot and Gerolim, as well as of Fedot Alexeief.

In 1659, other expeditions were again undertaken; but, from the foregoing impediments, though they set sail in July, they suffered so much damage from the floating ice between the eastern mouths of the Lena and Svatoi-nofs, that they were deterred from such voyages for a long time; and it was not till the reign of Peter the Great that these enterprises were resumed. It is well known that his comprehensive mind conceived only vast ideas and grand projects; that being principally desirous to establish an extensive commerce by means of navigation, he began by opening to himself the navigation of the Baltic by the foundation of St. Petersburg; Archangel already existed on the shore of the White Sea; he thought himself secure in the navigation of the Euxine by the possession of Azof, and that of the Caspian by Astrakhan, which he succeeded in bringing to effect. He now conceived that it might not be impossible for him to participate in the lucrative commerce of the Indies, of Japan, of China, and of America, by establishing factories at the extremity of Asia, in the proximity of those countries. The Dutch East India company declining to attempt the discovery of the north-east passage, the czar adopted the project, as well as that of subjecting the countries adjacent to the objects of his commerce, beginning by Kamtschatka, of which some obscure information had been obtained.

Thither, in 1696, he sent Vladimir Atlafsof, stationed as commandant of the Kozaks at Anadyrskoi-ostrog, a settlement that had been retained ever since its first erection by Deshnef, as before related, who was naturally supposed to have acquired an extensive knowledge of all the neighbouring countries. He accordingly dispatched sixteen Kozaks of Yakutsk, to render the Koriaks on the river Opuka tributary; Morosko, their chief, acquitted himself well of his commission, and even took a Kamtschadale ostrog. Atlafsof, profiting by this advantage, put himself at the head of sixty Kozaks, and as many Yukagurs, and led them to the river Kamtschatka, and the surrounding districts. In his juridical declaration, he relates, among other things, before he continues the recital of his progress to Kamtschatka; that, between the Kovyma and Anadyr is a *double cape*, which some have called Shalatskoi cape and Anadyrskoi cape. Of the latter he affirms, that it can never be doubled in vessels of the ordinary construction, because on the western or northern side are always vast pieces of floating ice (stationary and solid in winter); and that the other side of the sea of the Anadyrskoi cape is at all times free from ice. That, though he himself was not personally at the height of these capes, yet he learnt from the Tshuktshi, who dwelt about the mouth of the Anadyr, that over against this cape is a large island, inhabited by people who come to them in winter over the ice, and bring them bad fables.

To avoid prolixity, we omit the remainder of his account, only observing, that Mr. Müller seems rather to depart from his usual candour in regard to this narrative, which he acknowledges to be really Atlafsof's, but suggests that it does not exactly tally with a letter of his in 1700, nor with his juridical deposition in 1701. In order to have given validity to his doubts, he should have communicated these pieces among the great number with which he has enriched his valuable collection. This he has not done. And since the czar, who was an excellent judge of mankind, was so well satisfied with him, that he made him colonel of the Kozaks at Yakutsk, this circumstance ought to have its proper weight with us.

Parties were repeatedly sent against the Tshuktshi, with-
out

out being able to subdue them. In 1711, the Yakutsk-Kozak Peter Iln sin Popof, the promyshlennik Yezoi Vassilief sin Toldin, and the newly baptized Ivan Vassilief sin Terefshkin, made a vigorous attempt to compel those who dwell on the other side of the bay, and of the cape or nos, to pay the tribute; which they as strenuously refused. They, however, obtained from them a great number of particulars concerning the situation of the surrounding countries; and, among others, that opposite, whether to the Kovyma or to the Anadyr they could not sufficiently comprehend, is situate a spacious island, to which the Tshuktshi give the name of *the great land*, the inhabitants whereof pierce their cheeks, and pass large pieces of teeth through the orifice; not having the same language with the Tshuktshi, who have been at war with them from time immemorial. Popof saw ten of them, who were prisoners to the Tshuktshi; and he remarked that these pieces were those of the walrus. He learnt that in summer they pass over to this island in baidars in one day, and in winter likewise in one day in sledges on the ice.

On the promontory or land of this cape no other animals than wolves and foxes are seen, since there are no forests; whereas on the other land are all sorts of animals that furnish the finer sorts of furs. The inhabitants keep numerous herds of rein-deer. The country produces cedars, firs, pines, larches, and other trees. Popof supposed that the number of the Tshuktshi at the cape might amount to two thousand men, and that of the islanders to triple that sum; that, from the Anadyrskoi-ostrog they go by land to the nos, along the rock Matkol, which runs out from a great gulf.

At the time of which we are speaking, there being yet no implements for navigation at Okhotsk, and the use of the compass not being known there till the year 1714, by the express command of the great czar Peter I., the governor prince Gagarin supplied both these defects. Probably the governor at first imagined that the purposes of discovery might be effected without these helps; for the first order relating to the discovery of a passage by sea to Kamtschatka, dated the 17th of February 1713, directed to the voivode Yelshin, contains not a word about the construction of vessels, nor of people expert in the art of navigation: accordingly, nothing farther appears than that the dvoranin Ivan Sorokanof, who was charged with the business at Yakutsk, after arriving with twelve kozaks at Okhotsk in the autumn of that year, committed a great many blunders, and was brought back to Yakutsk in custody. It was now found necessary, that the governor should immediately send some able seamen and ship-carpenters. By these, who arrived at Yakutsk the 23d of May 1714, and were sent off to Okhotsk the 3d of July, under the command of a Kozak named Kofinas Sokolof, with about twenty Kozaks, the long-wished-for discovery was made.

One of the failors, by birth a Dutelman, a native of Hoorn, (Strahlenberg calls him a Swedish corporal, who had formerly been a ship-carpenter. But Busch himself says, that he had served in various places many years as a sailor, and at last in the Swedish cavalry, and so came to be taken prisoner at Vyborg, in the year 1706,) named Henry Busch, was still living at Yakutsk in 1736, when Mr. Müller made some stay there; and, in answer to his inquiries, learnt of him the following particulars. After they were come to Okhotsk, the carpenters built a vessel of the same kind with the Russian loddies, in which they used formerly to go from Archangel to Meseen, Pustozero and Nova Zemlia. These labours occupied the whole of the year 1715. The vessel was very stout and substantial. It was eight fathom and a half in

length, and in breadth three fathom. When loaded, it drew three feet and a half of water. All things necessary for the voyage being ready, the first expedition was undertaken in June 1716. They coasted north-eastwards, as far as the region of the river Oka. It was intended to pursue the same course farther; but a contrary wind drove the vessel, as it were against the will of the navigators, across the sea to Kamtschatka. What they first desired, as they afterwards were informed, was a promontory, starting northwards from the mouth of the river Tigil. The coast seemed steep and rocky, therefore they would not venture on shore, destitute as they were of any pilot or guide. Proceeding, however, to keep the sea, a contrary wind arose, which drove the vessel back upon the Okhotskian shore. The wind afterwards coming favourable, the navigators tacked about, and came exactly back to the Tigil, where they now cast anchor. Some of the people went on shore in search of human beings, but found only empty huts. The Kamtschadales had perceived the vessel approaching, and had fled for fear into the forests and mountains. Our mariners therefore again set sail, passed the Tigil, and in the space of a day reached the stream Chariufosca, having two small islands lying in its vicinity. The former, being the largest, is at the distance of five versts from the main land; the other, consisting only of barren rocks, a little farther. Leaving the Chariufosca, they stood out to sea the whole night, and the next morning found themselves in with the land at the river Isha. Here they sent some of the crew on shore; who, finding however neither people nor habitations, presently returned. Continuing to sail along the coast, they came up with the river Krutogorova, into which they would have run, but missed the inlet; luckily, however, a bay opening to the south of the river being found convenient, in it they dropped their anchor. A detachment of them, while exploring the country, met with a Kamtschadale girl picking up edible roots in the fields. She directed them to some huts, where just at that time a party of Kozaks had put up for the purpose of collecting the tribute. These, on being sent to, came and served them as guides and interpreters. The vessel was brought to the mouth of the river Kompakova, which they found a good birth to moor in for the winter. Here they had not been many days when a whale was thrown ashore by the sea: in the body of the fish was sticking a harpoon of European manufacture, marked with Roman letters. If I could have furnished, continues Mr. Müller, that the sailor who related to me this fact, had known of the like accident that happened to the shipwrecked Dutchmen on the coast of Korea, in 1653, (Witsen, ed. 2. p. 45. Voyage au Nord, tom. ix. p. 308.) I might have been led to suspect, that he perhaps was amusing me with a tale that had no other foundation than what he borrowed from the former. This, however, was not the case. For he was a completely illiterate man, could neither read nor write, and scarcely knew that there was such a place as Korea in the world; consequently the fact is only the more confirmed by two examples. The commander Sokolof, during the winter, made a journey to Nishnei Kamtschatskoi ostrog, whence he returned to the ship in spring, and at the beginning of May 1717, put again to sea. The sea, however, was so full of ice, that on the fourth day from their departure they were completely jammed in between some fields of it, where they were obliged to remain fixed upwards of six weeks, before they could proceed on the voyage. In the mean time they were in great want of provisions. Happily they regained the Okhotskian shore, between the river Oka and Taniskoi ostrog, where they remained at anchor a few days; and about the middle of July returned to Okhotsk. From

this time a navigation has been uninterruptedly kept up between Okhotk and Kamtschatka.

While all this was transacting, governor prince Gagarin, in the year 1716, dispatched colonel Jacob Ageef in Yeltshin, formerly voivode at Yakutsk, with a considerable party of officers and people, to the same regions, with orders to make diligent inquiries concerning Kamtschatka, and chiefly such as related to the object in question. Kofsensky mentions, that ships from Japan came to the sixth of the Kurilli islands, Shokoki, for ores or minerals, which they carried back to their island. This, however, seems to be not quite correct, as differing widely from all the other accounts, which say, that the Japanese (probably when driven about by adverse winds and storms) used never to proceed farther than Matmai. Nor had any subsequent information confirmed what he advances. This therefore was one of the principal matters into which the colonel was intrusted by the governor to inquire; he was likewise to proceed from Tshuktikoi-nofs to the opposite islands, and thence to the main land. By his instructions also he was to gain accurate information about the islands of Shantari; to attempt to settle a regular traffic with the Japanese, and whatever else he could collect in consequence of his own observations; nothing, however, of importance ensued from it. The governor had given the colonel, a Swedish lieutenant named Ambion Molyn, who was to construct the vessels proper for the several enterprises at Okhotk. This man pretended that there was no timber to be found at that place fit for the purpose. (See also Strahlenberg, p. 17.) Disputes arose now between the colonel and the voivode of Yakutsk, Ivan Vasilief in Rakitin, which likewise probably threw great impediments in the way of this expedition; and the disgrace of prince Gagarin happening soon after, the whole business came to nothing. The only benefit accruing from it was a voyage set on foot by Yeltshin, in the year 1718, to the Shantary islands, and performed by the sin boyarskoi Prokofey Philkeief. This person was still living when Mr. Müller was at Yakutsk, and from whom he learnt the following particulars of his voyage.

Philkeief was provided with able seamen, the better to ensure success: when they were out at sea, these men declared to him that they were resolved to visit not only the Shantary, but all the other islands lying in those seas, as far as the Kurilli; which done, they would winter on the largest of the Shantary islands, which by way of eminence is denominated Shantar. This not being agreeable to Philkeief, he caused himself, with a couple of Kozaks, to be put on shore at the mouth of the river Tugur. The rest accomplished their design, passed the winter on the isle of Shantar, and had a rich capture of fables. Having negligently, however, left a fire they had been using, the flames caught the trees, so that the whole forest of the island was in a blaze, by which they also lost their fables. The next summer they returned to the continent, where, intending to fish along the coast between the Tugur and the Amoor, the greater part of them were slain by the Giliaks. They computed the isle of Shantar to be from south to north about twenty versts, and three or four versts in breadth, without any mountain upon it. How then were these islands to be seen from the mouth of the river Ud? This therefore seems to confirm Philkeief's assertion, that they are situate in the proximity of the Tugur, and that it requires eight days to pass from the Ud to the Tugur, in lodkas or small craft. If we admit the situation of the coasts to be as they appear upon the maps, namely, as stretching directly south from Okhotk to the Amoor, then the difficulty is much increased; because in that case there must be

several promontories projecting so far as to conceal these islands from the view. But various reasons may be found for believing that the coast from Okhotk to the river Ud runs south-westwards, and from the Ud to the Amoor south-eastwards. If so, as it is highly probable it will hereafter be found, then the Shantarian islands may lie in such a manner as to follow one another in succession northwards from the river Tugur. There may be more of them than we imagine, since the number of them is by no means ascertained. In that case, the nearest may unquestionably be discerned from the river Ud.

In 1718, a tribe of Tshuktshis came voluntarily to surrender themselves at the Anadirskoi ostrog, declaring that they inhabited the promontory between the Anadyr and the Kovyma: that they were in number about 3500 men; that this promontory was covered with rocks and mountains, but that the flat country consisted of turf-land; that opposite to the cape was seen an isle of moderate dimensions, the inhabitants whereof bore a resemblance to the Tshuktshis, but spoke a different language; that from the point they could go over to the isle in half a day; that beyond it was a large continent which might be seen from the island in fair weather; that its inhabitants likewise resembled the Tshuktshis, had a different dialect, numerous forests, &c. (giving an exact description of the great island mentioned above); that with their baidars, or boats, by coasting the promontory, they could make the voyage from the bottom of the bay of Anadyr, to the extreme point of the promontory, in three weeks, and often in less time.

Peter the Great, desirous of obtaining a more accurate knowledge of these parts and passages; and unable to induce the Dutch East India Company to take up the matter, resolved himself to prosecute the design with vigour. Accordingly, in 1727, he sent two geodesists, or geometers, to Kamtschatka. Of what they executed or discovered nothing ever came to the ears of the public. It is only known, that on their return, the tzar gave them a very gracious reception; whence it may be presumed, that they acquitted themselves of their trust to his satisfaction.

In short, the tzar being resolved to satisfy his curiosity by causing these latitudes to be explored, and above all to be certified whether Asia was contiguous to America on the north-eastern side, towards Tshuktshinofs, since on the north side it undoubtedly was not; he made choice of Vitus Beering, an expert Danish mariner, for that purpose, to whom he joined lieutenants Spangberg and Tshirikof. Peter had this business so much at heart, that though confined to his bed by the disease that put an end to his life, he conversed with Beering, and even drew up with his own hand a set of instructions for his guidance, which paper was delivered to him five days after the demise of that great monarch.

He set sail the 14th of July 1728, from the river of Kamtschatka, and steered north-eastwards, following the land so as seldom to lose sight of it. Of this he drew a chart so accurate as to be still the best extant.

The 8th of August, being in lat. 64° 30'. a baidar having eight men on board, came up to his vessel. These proved to be Tshuktshis, who told him that the coast was covered with the dwellings of their people, and gave him to understand that not far off the land trended towards the west; they also pointed out an isle at no great distance, which Beering came up with on the 10th of August, and gave it the name of Saint Lawrence.

On the 15th of the same month, in 67° 18'. lat. perceiving that as the Tshuktshis had said, the coast bent towards the west, and no longer to the north, it is said that he drew this

this false consequence, that he had reached the extremity of the north-east of Asia; that the coast thenceforward taking a western direction, it was impossible there could be a junction of Asia with America; and that he had fulfilled his commission. Mr. Müller adds, that he was mistaken, since he was only then at Serdzekamen, whence the coast indeed turns to the west, forming a large gulf; but that it afterwards returns to the north and north-east as far as the great Tshuktshi-nofs. On his passage back, the 20th of August, forty Tshuktshi approached his ship in four baidars, and informed him that their countrymen frequently went to the Kovyra by land, with merchandises, but never by water.

Afanasy Sheftakof, colonel of the Yakutskoi Kozaks, having made several proposals to the senate to render the obstinate Tshuktshi tributary, it will be necessary to say something of his expedition as being of some consequence to the history of navigation. Sheftakof was resolved to reduce not only the Tshuktshi, but likewise the Koriaks who dwell on the Siberian coast of the Penhinskian sea, and likewise inhabit both shores of the northern part of Kamtschatka, and were frequently in a state of rebellion, to obedience. He purposed to visit the country lying opposite to Tshukotkoi-nofs, and subject the inhabitants to the Russian authority. It was part of his plan likewise to make an attempt to discover the pretended land in the Frozen ocean; and, lastly, before his return, to explore the Shantarian and Kurilly islands. The eloquence, with which he accompanied the delivery of his project, gained him universal approbation, and high and low became interested in the success of his enterprise, all conceiving it extremely probable that great public benefit might accrue from it. Accordingly he was appointed commander of a particular expedition. The admiralty of St. Petersburg gave him a pilot named Jacob Hens, with an assistant Ivan Fedorof, a geodesist Michael Gvosdef, a mineralogist named Herdehol, and ten sailors. At Ekatarinenburg, he was supplied with field-pieces and mortars, with all proper appurtenances. At Tobolsk, a captain of the Siberian regiment of dragoons, Dmitri Pavluzki, was ordered to join him, with four hundred Kozaks, under their united command; and they were farther empowered to increase their strength from all the garrisons, ostrogs, and simovies, in the territory of Yakutsk, wherever they should come, at their discretion.

These preparatives being made, Sheftakof set out from St. Petersburg for Siberia in the month of June 1727. At Tobolsk he tarried till the 28th of November, passed the winter in the upper regions of the Lena, and reached Yakutsk in the summer of 1728. Here a violent quarrel arose between Sheftakof and Pavluzki, which probably occasioned them to part, though they prosecuted their several purposes to the same end. Sheftakof, in 1729, repaired to Okhotsk, and there took to his use the vessels with which captain Beerling had lately returned from Kamtschatka. Having dispatched his kinsman the sin boyarskoi Ivan Sheftakof, on the first of September, in one of them, the Gabriel, to go to the river Ud and thence to Kamtschatka, for the purpose of examining and describing all the islands he might meet with on that voyage; he sailed in the other vessel, the Fortuna, for Taviskoi ostrog, but had the misfortune to suffer shipwreck, and to see the greater part of his people perish in the billows, with great difficulty saving himself and four other persons from sharing their fate. The 30th of September, he sent from Taviskoi ostrog a kozak, Ivan Ollasief, in company with an elder of the Koriaks, forwards along the coast, with orders to proceed to the river Penhina, and by kind words and fair promises to persuade the

refractory Koriaks dwelling in that tract, to submit to the Russian government. He himself followed, at the commencement of December, with the rest of his men, took up Ollasief by the way, and arrived within two days journey from the Penhina, where he fell in with a prodigious host of Tshuktshi on their march to make war upon the Koriaks. Though the number of Sheftakof's followers, Russians, Okhotskian Tunguses, Lamutes, and Koriaks, all together consisted of not more than 150 men, yet he did not hesitate to risk a battle with the Tshuktshi. This, however, had an unfortunate issue: Sheftakof was struck by an arrow from the enemy, which deprived him of life, and those who escaped falling with him, were entirely put to flight. This happened the 14th of March 1730, near the stream Yegatsh, which falls into the Penhinskian gulf between the rivers Paren and Penhina.

Three days prior to this disastrous event, Sheftakof had sent an order to Taviskoi ostrog, directing the Kozak Trypho Krupishief to proceed in one of the vessels to Bolsheretzkoï ostrog, from thence doubling the southern point of Kamtschatka, to sail on towards Nishnei Kamtschatkoi ostrog, to continue his voyage in the same ship to the river Anadyr, and invite the inhabitants of the vast tract of country lying opposite to pay tribute to Russia. In this dispatch he recommended Krupishief to take with him the geodesist Gvosdef, in case he were inclined to go, and to treat him with all possible kindness. Concerning what came of it no accounts are extant. Only thus much is known, observes Mr. Müller, that the geodesist Gvosdef was actually, in the year 1730, between the 65th and 66th degrees of latitude, at a short distance from the country of the Tshuktshy, on an unknown shore situate over against the said country; that he even found people there, with whom, however, he was unable to converse for want of an interpreter.

During these transactions, the sin boyarskoi Ivan Sheftakof was sailing on board the Gabriel to Kamtschatka, and on the 19th of September 1729, arrived at Bolsheretzkoï. For though his instructions were to proceed first to the river Ud, he was prevented from doing so by violent adverse storms. The following summer, however, he made the voyage to the Ud, touched at Udskoï ostrog, where he found people who had been sent thither by colonel Sheftakof, and had built a vessel; but that not being fit for his purpose, he returned to Kamtschatka, having seen both on his passage outwards, and on his way back, several islands, and at last made again the port of Okhotsk.

While Sheftakof was on his passage back to Okhotsk, Jacob Hens the pilot, received a dispatch from captain Pavluzki, who had come directly from Yakutsk, by the common inland road, to Nishney Kovymiskoi Simovie, or ostrog, informing him that he had heard, by way of Anadyrskoi ostrog, of the death of the Kozak colonel Sheftakof: but that this would cause no impediment to the progress of the expedition: at the same time ordering the pilot Hens to go, with one of the vessels which captain Beerling had left at Okhotsk, round by Kamtschatka to Anadyrsk, whither likewise captain Pavluzki would precede without delay. In pursuance of this order, Hens went on board the Gabriel, and sailed for Kamtschatka. On the 20th of July 1731, he arrived at the mouth of the river Kamtschatka, intending to pursue his voyage to the Anadyr, when a report was brought to him, that the same day a rebellious crew of Kamtschadales were come to Nishney Kamtschatkoi ostrog, where after murdering most of the Russians, they had set fire to the dwellings of the inhabitants. The few remaining Russians took refuge on board the vessel, and Hens sent a party of his people on shore to reduce the Kamtschadales

to obedience; in which they succeeded; but the event effectually stopped the navigation of the river Anadyr.

In the mean time, captain Pavluzky had arrived, the 3d of September 1730, at Anadyrskoi ostrog. From that place in the ensuing summer he marched on an expedition against the refractory Tihuktshi. Pavluzky opened his campaign the twelfth of March 1731, his force consisting of 215 Russians, 160 Koriaks, and 60 Yukagirs. He took the road across the sources of the rivers Uboina, Behi, and Tscherna, which fall into the Anadyr, advancing directly north towards the Frozen ocean, and leaving the head of the Anadyr to the left. Of the other rivers which he crossed nothing is known, as there was nobody to inform him of them, or tell their names. After a course of two months, in which they could not proceed above ten versts a day, and that only by resting at times, Pavluzky came to the Frozen ocean, at a place where a considerable river disembogues into it, but the name of which he could not learn. He now proceeded fourteen days eastward along the coast, mostly over the ice, without observing any mouths of rivers, as they were oftentimes obliged to keep out on the ice at a distance from land. At length they perceived a great troop of Tihuktshi advancing towards them, apparently intending to come to an engagement with them. Pavluzki, by an interpreter, summoned them to surrender to Russia; which, on their peremptorily refusing to obey, he immediately attacked them, and had the good fortune to give them a total defeat. This happened on the 7th of June.

After resting one week, Pavluzky continued his march, and at the latter end of June came to two rivers that discharge themselves into the Frozen ocean, at the distance of a day's journey asunder. On the bank of the latter of these rivers, on the 30th of June, a second battle was fought, which terminated as happily as the former.

They now lay still for three days, then proceeded to Tihukotskoi-nofs, resolving to go right across it to the Anadyrskian sea, when a third time they saw advancing towards them a numerous army of Tihuktshi, collected together from both coasts. Here on the fourteenth of July was fought the third battle, in which the slaughter on the enemy's side, was greater than the advantage on that of the Russians; as, notwithstanding their defeat, the Tihuktshi would hearken to no terms of submission or tribute. Among the spoil were found many articles that had belonged to the Kozak colonel Sheflakof, and were lost in the engagement that happened near the stream Yegath. That affair therefore was thus amply revenged; especially as in all the three battles, not more than three Russians, one Yukagir, and five Koriaks, were left on the field. It was affirmed, that among the killed of the enemy in the last encounter, one was found who had a hole in the upper lip on each side of the mouth, in which pieces of the walrus tooth were inserted.

Pavluzky now marched triumphantly across Tihukotskoi-nofs, in which he had to climb over the summits of huge mountains, and at the end of ten days happily reached the other coast. Here he sent off some of his people by water in baidars; but remained himself, with the greater part of his followers on shore, and kept along the coast, which there stretches south-eastward, so that every evening he received reports from the baidars. On the seventh day they came up to the mouth of a river, and twelve days after, to that of another, from which, at the distance of about ten versts, a point of land runs far out into the sea, which at first is mountainous, but terminates in a plain extending as far as the eye can see. This point is probably the same that obliged captain Beering to put back. One of the mountains is by the inhabitants of Anadyrskoi ostrog called Serdzekamen.

Pavluzki hence turned in land, and returned to Anadyrsk the twenty-first of October, by the same way that he went out.

Mr. Muller speaks of the ardent zeal which M. Kerilof, at that time secretary of the senate, manifested for the success of these discoveries in 1732.

Having related what information has been obtained from the Russians, and particularly from the indefatigable Mr. Müllers, we shall now proceed to deliver, as briefly as possible, what we gather from other authors, more ancient.

Pere Avril was informed by a vaivode, that the people dwelling about the Kovyma frequently went to the shores of the Frozen ocean to pursue the walrus, for the sake of their tooth. M. Witfen, justly celebrated for his persevering diligence, from about 1670 to 1692, in the discovery of these unknown countries, says, that "the great projecting point, which he calls cape Tabin, extends near to America; that about fifty or three-score men, coming from the Lena, a little before 1692, put out to sea in the Frozen ocean; and, having turned to the right, came to the point against which the fields of ice driving from the north strike with their whole force, &c. It was therefore not possible for them to double this cape, nor to perceive its extremity from the mountains of the north-east of that point of Asia, which is not extremely wide in that place: they remarked that the sea was free from ice on the other side, that is, the southern; whence it may be inferred that the land of that point extends so far to the north-east, that the floating ice, coming down from the north, cannot pass on the southern side."

M. Buache, from whom this passage is taken (Consider. Geograph. p. 105, 106.) corroborates and illustrates the account thus: "The first pieces of ice (he says) coming from the north, stop at the island between the cape and America, and on the shallows which connect it to the two continents; these large flakes, accumulating on one another, form a sort of bridge; and it is only then, that the others which afterwards come down from the north, are unable to pass to the south, &c. On this point (continues M. Witfen) are found men who wear little bones and pieces of bone inserted in their cheeks, and seem to have a strong affinity with the North Americans."

Kaempfer, in 1683, sparing no pains that might any way lead to the knowledge of the northern regions, was informed by several persons, that the Greater Tartary was joined by an isthmus, composed of lofty mountains, to a neighbouring continent, which they supposed to be America. He was shewn the first maps of the Russian empire, laid down some years before, without degrees of longitude. On them appeared several considerable capes on the eastern shores of Siberia; one of them, too large for being comprised within the border of the map, which was cut in wood, was abruptly shortened by it. This is the point spoken of by M. Witfen; but at that time, it is said to have been thought more near to Russia than it really is.

Hbrandt Ides, from informations carefully taken in 1693 and 1694, speaks of Kamtschatka, as of a town, which, with the surrounding country, was inhabited by the Nuxi and Kœliki (Tihuktshi and Koriaks); says, that the cape of ice is a tongue of land projecting into the sea, where it is intersected by several arms of water, which form gulfs and isles above Kamtschatka; the sea has an entrance frequented by the fishermen; here are the towns Anadyrskoi and Sabatska (on the map, and according to others Sabatsia), inhabited by the two nations above-mentioned. The inhabitants of Yakutik go to cape St. abatsia, Anadyr, Kamtschatka, &c. in quest of the narval.

The Swedish officer, who was a prisoner in Siberia from

1709 to 1721, contending against the opinion of those who imagined that Asia was contiguous to America, positively asserts that the Russian vessels, coasting along the main land, ordinarily pass the Svatoï-nofs, in order to trade with the Kamtschadales on the shore of the Eastern ocean, about the fiftieth degree of latitude: but for this purpose they are obliged to pass between the main land, and a great island lying to the north-east of Svatoï nofs, and that this isle is the north-west of America. Strahlenberg mentions nothing farther in his work than the facts already related, excepting that the Yukagirs are a people settled near the Frozen ocean, between the mouth of the Lena and cape Tabin. It has been found, that in the part of the continent of America of which some knowledge has been obtained, opposite the cape, there is a large river, wafting down its current numbers of great trees, &c.

From all these, and various other documents and data, M. Engel endeavours to establish some important facts; such as, that the position of this pretended cape Tabin owes its origin to the desire of fixing that of Pliny spoken of above; and this motive having subsisted till within a few years past, or at least the idea of a *finis terræ* towards the north-east, it has been preserved, and some cape or other was to be found for that purpose. That the largest of all, that which extends farthest into the sea; and the most formidable, according to all accounts, is the double cape, called Serdzekamen, or heart of stone, north of the Anadyr, which may in some years, at least, without difficulty be doubled; since it is not owing to its proximity to the pole, but to the occasional conjunction of vast bodies of ice, that renders it at such times impracticable.

M. Gmelin says: "There are even traces of a man, who in a small boat, not much bigger than a fisherman's canoe, doubled the Shalaginskoy cape, and made the voyage from the Kovyma to Kamtschatka." It may be asked, adds M. Engel, whether I am so credulous as to believe it? No: if I should grant what he means by that cape; since this man must have sailed, according to the arbitrary distances laid down in the charts, five or six hundred leagues. But if according to my system, we banish cape Tabin into its proper nonentity, diminish the extent of the coasts, approximate the rivers, especially the Kovyma (for the supposed declension of the coast, and the greater proximity of the Indigirka and the Kovyma, are confirmed by various arguments); by doubling the Serdzekamen, as the sole and real cape Shalaginskoy, then it would be by no means impossible, in one of those years, when, as M. Müller allows, there are no masses of ice in its environs.

The authorities whereon M. Müller and the Russian geographers fix the longitude of the eastern extremity of Asia beyond the two hundredth degree from the first meridian of Ferro, or $180^{\circ} 6' 15''$ from Paris, are derived from the observations of Jupiter's satellites, taken by Krassilnikof, at Kamtschatka and in several parts of Siberia; as also from the expeditions, both by land and sea, of the Russians towards Tihukotskoi-nofs.

M. Engel disputes the accuracy of these observations, and deducts no less than twenty-nine degrees from the longitude of Kamtschatka as stated by the Russians. M. de Vaugondy, however, sees no sufficient reasons for so extraordinary a subtraction; and contents himself with curtailing the continent of Asia of no more than eleven degrees of longitude. M. Buache dissents from the opinions both of Engel and Vaugondy; defending the system of the Russian geographers on the authority of tables drawn up by M. Maraldi.

It is certain that Krassilnikof compared his statements with correspondent observations made at Petersburg, and the

results were; on comparing an observation of an eclipse of the first satellite of Jupiter, taken at Okhotsk, Jan. 17, 1743, with an observation of an eclipse of the same satellite taken at Petersburg, Jan. 15, of the same year, the difference of longitude between Petersburg and Okhotsk appeared to be 7 hours, 31 minutes, 29 seconds; from a comparison of two subsequent similar observations, the difference of longitude was found to be 7 hours, 31 minutes, 34 seconds; the proportional mean whereof, rejecting the half second, is 7 hours, 31 minutes, 31 seconds, the true difference between the meridians of Petersburg and Okhotsk according to these observations. Adding the longitudinal difference between Petersburg and Paris, which is 1 hour, 52 minutes, 25 seconds, we get the longitude of Okhotsk from Paris, 7 hours, 23 minutes, 56 seconds, differing only 26 seconds from the result of M. Maraldi. (See Nov. Comm. Petropol. tom. iii. p. 470.) So likewise the longitude of Bolsheretsk, from correspondent observations taken there and at St. Petersburg, appears to be 10 hours, 20 minutes, 22 seconds, differing from Maraldi about 2 minutes, 5 seconds. (Id. ib. p. 469.) But the longitude of the haven of Peterpavlovsky, calculated in like manner by correspondent observations, disagrees with the longitude as computed by Maraldi no more than 20 seconds. (Ibid.) Besides, the results deduced from correspondent observations of the eclipses of Jupiter's satellites taken at Bolsheretsk, and at the haven of Peter and Paul, by Krassilnikof, and at Pekin by the jesuit missionaries, evince by their near agreement the care and attention with which the observations must have been conducted; whence there is great reason to suppose, that the suspicions of inaccuracy imputed to Krassilnikof are destitute of any just foundation. (Observ. Astron. ecel. Sat. Jovis, &c. Nov. Comm. Petropol. tom. iii. p. 452, & seq. Observ. Astron. Pekini factæ. Aut. Hallerstein. Curante Max. Hell. Vindibonæ, 1768.)

For supporting, however, in some sort, these suspicions, M. Vaugondy pretends, that the time-pieces and other instruments used by Krassilnikof at Kamtschatka, were greatly damaged by the length of the journey; and that the person who was sent to repair them was not expert in his business. But this opinion seems to have been too hastily adopted; for, though Krassilnikof does indeed allow that his time-piece sometimes stopt, and that too when he wanted to ascertain the true time of the observation; and farther admits, that consequently the observations taken by him under these disadvantages, when he was unable to correct them by former or subsequent observations of the sun or stars, are not to be relied on, and which he has therefore distinguished by an asterisk; there are nevertheless many others not liable to any objections of this nature; and the observations alluded to above fall under this description. (See Nov. Comment. Petrop. tom. iii. p. 444.) However, the testimony of the late professor Müller, who was in those parts with Krassilnikof, as to the sufficiency of the instruments entirely removes that objection.

The best way of trying the accuracy of the Russian geographers in settling the longitude of Kamtschatka, will be by comparing it with that of Yakutsk, which has been clearly established by a variety of observations taken at different times and by different persons. If therefore any error be in placing Kamtschatka so far to the east, it is in the longitude between Yakutsk and Bolsheretsk.

Now, Krassilnikof, on his return from Kamtschatka, observed at Yakutsk several eclipses of Jupiter's satellites, from which it appears, on comparing them with calculations of the same eclipses made by M. Wargentin for the meridian of Paris, that the mean of the result is 8 hours, 29 minutes, 5 seconds. The observations of M. Isenief, taken at Ya-

kutsk in 1769, whither he had been sent to observe the transit of Venus, received the sanction of the imperial academy of sciences. (Nov. Comment. Acad. Petrop. tom. xiv. pars iii. p. 268—321.) The longitude given by him to Yakutsk is 8 hours, 29 minutes, 34 seconds, a sufficiently accurate agreement with the longitude resulting from the observations of Krassnikof.

The longitude therefore of Yakutsk from Paris being 8 hours, 29 minutes, 5 seconds, or $127^{\circ} 16' 0''$; and of Bolsheretsk 12 hours, 17 minutes, 11 seconds, or $152^{\circ} 19' 15''$, the longitudinal difference of these two places, from astronomical observations, is 1 hour, 48 minutes, 8 seconds, or $27^{\circ} 3' 0''$. The latitude of Bolsheretsk is $52^{\circ} 55' 3''$, and that of Yakutsk $62^{\circ} 1' 50''$; then the difference of their longitude being from the foregoing statement $27^{\circ} 3' 0''$, the direct distance between the places measured on a great circle of the earth will appear by trigonometry to be $16^{\circ} 57'$, or about 1773 versts, reckoning $10\frac{1}{2}$ versts to a degree. This distance consists partly of sea and partly of land; and a constant intercourse is kept up between the two places, by means of Okhotk, which stands in the intermediate space. The distance by sea from Bolsheretsk to Okhotk is estimated by nautical reckonings to be 1254 versts, and the distance by land from Okhotk to Yakutsk is 927, making together 2181 versts. The direct distance deduced by trigonometry, supposing the difference of longitude between Bolsheretsk and Yakutsk to be $27^{\circ} 3'$, is 1773, falling short of 2181 by 408; a difference naturally to be expected, on considering that neither journeys by land, nor voyages by sea, are ever performed precisely on a great circle of the globe, which is the shortest line between any two places.

Such being the agreement between the distance thus estimated, and that deduced by calculation, admitting the difference of longitude between Yakutsk and Bolsheretsk to be $27^{\circ} 3'$, it seems highly improbable that there should be an error of many degrees in the astronomical determination.

Since then the longitude between Ferro and St. Petersburg is confessedly 48° ; that between St. Petersburg and Yakutsk $99^{\circ} 21'$; and, as the distance in longitude between Yakutsk and Bolsheretsk cannot be materially less than $27^{\circ} 3'$: it follows, that the longitude of Bolsheretsk from Ferro cannot be much short of $174^{\circ} 24'$. How then are we to find room for so considerable an error as 29 degrees, which, according to M. Engel, or even of 11° , which, according to M. Vaugondy, is chargeable on the Russian geographers in determining the longitude of Kamtschatka?

From the isle of Ferro the longitude of

Yakutsk is	-	-	$147^{\circ} 0' 0''$
Okhotk	-	-	$160 7 0$
Bolsheretsk	-	-	$174 13 0$
Peter and Paul	-	-	$176 10 0$

As no astronomical observations have been made farther to the east than the haven of Peter and Paul, it is impossible to ascertain with precision the longitude of the north-eastern promontory of Asia. It is nevertheless apparent, from Beering's and Synd's coasting voyages towards Tshukotskoi-nofs, as well as from other expeditions to those parts by land and sea, that the coast of Asia, in lat. 64° , stretches at least $23^{\circ} 2' 30''$ from port Peter and Paul, or to about 200° longitude from the isle of Ferro. But the accuracy of Krassnikof's observations at the harbour of Peter and Paul has since been confirmed by captain Cook, who places that harbour in lat. $53^{\circ} 1'$, longit. $158^{\circ} 36'$, east from Greenwich; Krassnikof stating it to lie in lat. $53^{\circ} 0' 38''$, long. $176^{\circ} 10'$, from Ferro, or $158^{\circ} 35'$, from Greenwich. The difference therefore is only twenty-two seconds in the latitude,

and one minute in the longitude. Consequently, the assertion of Vaugondy, that the Russians had advanced the peninsula of Kamtschatka eleven degrees too much to the east; and of Engel, who supposes that error to be no less than twenty-nine degrees, is manifestly refuted; and the accuracy of the astronomical observations made by the Russian geographers is now incontrovertibly ascertained.

The next point of land observed by our English navigators, was that promontory, by Beering called Tshukotskoi-nofs, a name adopted by captain Cook, but which is sometimes denominated Anadyrskoi-nofs, from its situation on the bay of the river Anadyr. The application of the term Tshukotskoi-nofs to this promontory, may perhaps occasion some confusion to future navigators and geographers, as that denomination has been usually given, and ought therefore to be appropriated to the eastern extremity of Asia, the east cape of Cook.

From Anadyrskoi-nofs, laid down by the English in lat. $64^{\circ} 15'$, under the appellation of Tshukotskoi-nofs, to cape Serdzekamen, in lat. 67° , the utmost extent of Beering's navigation to the north, captain Cook does justice to the memory of Beering, by observing, that "he has here delineated the coast very well, and fixed the latitude and longitude of the places better than could be expected from the methods he had to go by." (Cook's Voyage, vol. ii. p. 474.)

Within this track our great navigator has corrected the errors of the Russian charts, and ascertained the position of the real Tshukotskoi-nofs, which Müller had erroneously conjectured to lie above the 70th degree of latitude. He gives the name of East-cape to this great promontory of the Tshuktsihi, proves it to be the most eastern extremity of Asia, and fixes its latitude in $66^{\circ} 6'$, and longit. $190^{\circ} 22'$; incontrovertibly shewing, that the Russians were not wrong in asserting that the north-eastern extremity of Asia stretched beyond the 200th degree of longitude from the isle of Ferro, or 182° from Greenwich.

That remarkable expedition of Deshnef, in which, according to professor Müller, he failed from the mouth of the Kovyma, wreathed Tshukotskoi-nofs, or East-cape, and was shipwrecked in the sea of Kamtschatka, was not only the earliest, but the most important of the Russian enterprises in these latitudes; as it first ascertained the separation of the two continents.

Deshnef's description of the north-eastern cape agrees in several material circumstances with that of the same promontory given by captain Cook. According to Deshnef, it "consists entirely of rocks." Cook says, that "it shews a steep rocky cliff next the sea; and at the very point are some rocks like spires. The land about this promontory is composed of hills and vallies; the former terminate at the sea in steep rocky points, and the latter in low shores. The hills seemed to be naked rock." (Voyage, vol. ii. p. 472.)

Deshnef adds, that, on the coast near the promontory, the natives had reared a "pile resembling a tower, with the bones of whales." Cook likewise noticed these piles as very common on the coast of the Tshuktsihi. "Over the dwelling stands a kind of sentry-box, composed of the large bones of large fish;" and again, "near the dwellings were erected staves of bones, such as before described." (Ib. p. 451. 472.) Cook also coincides with Deshnef in placing two islands directly opposite to the promontory; and captain King confirms another assertion of the Russian navigator, that the passage from the same promontory to the mouth of the Anadyr, may with a fair wind be performed in seventy-two hours. (Id. vol. iii. p. 264.)

It has been objected to Deshnef's narrative, that Cook and Clerke were in two successive years prevented by the ice from pushing forward into the Frozen ocean; but in reply to this it should be observed, that Deshnef failed in a small vessel, more easily worked than the English ships; and that the year in which he passed round is represented as more than usually free from ice. The season also in which Deshnef doubled the great Siberian promontory, probably was more favourable to navigation in the Frozen sea, than the time of year adopted by the English. For, though he failed on the first of July, or June 20, O. S. yet he appears not to have arrived in the eastern ocean till towards the end of September. Shortly after Anskudinof's shipwreck on Tshukotskoi nofs, Deshnef mentions that he landed on the first of October, or September 20, O. S., and skirmished with the Tshuktsi. Consequently, from the length of the interval between the day of his departure from the mouth of the Kovyra to his entrance on the Eastern ocean, it may reasonably be inferred that he was waiting for an opportunity of getting through the ice, which he at length effected. Whereas Cook quitted that dreary region on the 29th of August; and Clerke so early as the month of July. The middle and the latter end of September are generally esteemed the most proper periods for navigating the Frozen ocean.

The sole aim of Deshnef being to fail from the Kovyra to the Anadyr, it was not incompatible with his plan to continue on the coast, and to persevere in expecting a favourable occasion for effectuating his purpose, without exposing himself to those difficulties and dangers which seamen from more distant quarters must necessarily experience. Whereas the grand design of the English navigators being to ascertain the practicability of a north-eastern passage, and having incontrovertibly determined that important question in the negative, they accomplished the primary object of their expedition. They could not therefore, consistently with their views and instructions, by delaying their departure from those frozen regions, expose themselves to the hazard of being hemmed in by the ice, merely for the sake of evincing the possibility of getting round to the Kovyra.

These circumstances seem to prove that Deshnef actually performed this voyage; yet as he neither made any astronomical observations, nor traced a chart of the coast, his expedition, though it decided the long controversy concerning the separation of the two continents, contributed, however, nothing towards an accurate knowledge of the north-eastern extremity of Asia, for which we are indebted to capt. Cook alone. (See Cox's Russian Discoveries.)

In the year 1785, capt. Billings, an Englishman in the Russian service, was sent by Catharine II. on a voyage of discovery into these parts; and the results of his observations are found to agree with those of captain Cook, placing the easternmost extremity of Asia in lat. 66° 6', and ascertaining its longitude at 190° 22' from Greenwich.

The population of Asia, says Mr. Pinkerton, is by all authors allowed to be wholly primitive and original; if we except that of the Tshuktsi, who by the Russian travellers and Mr. Tooke are supposed to have passed from the opposite coast of America. A few colonies have migrated from Russia to the northern parts, as far as the sea of Kamtschatka; and well-known European settlements are in Hindostan and the isles to the south-east; but the first serious attempt to colonize what is deemed a part of Asia, was the recent settlement at Port Jackson. With these and other trifling exceptions, Asia presents a prodigious original population, as may be judged from the following table,

which will be found more clear than any prolix disquisition on the subject.

LINNÆAN TABLE OF THE NATIONS AND LANGUAGES
IN ASIA.

Of the three several appellatives, the first denotes *ordo*, the second *genus*, the third *species*.

1. Assyrians.—Assyrians, Arabians, Egyptians.—Chaldee, Hebrew, &c.

2. Scythians.—Persians, Scythians intra and extra Imaum, &c. Armenians.—(The Parti and Zend are cognate with the Gothic, Greek, Latin, according to sir William Jones. Indian Dissert. vol. i. p. 206. The Pehlavi is Assyrian or Chaldaic. Id. 187, 188, 206.)

3. Sarmats.—Medes and Parthians.—Georgians and Circassians.

4. Seres and Indi.—Hindoos, northern and southern, &c.

5. Sinae.—Chinese and Japanese.—These have a Tataric form and face; they are probably highly-civilized Tatars, Mongoles or Mandshurs.

Barbaric Nations from north to south, and according to the degrees of barbarism.

6. Samoyedes, Ostiaks, Yurals, &c.

7. Yakutes.—Yukagirs. (Expelled Tatars, according to Tooke and Lesseps.)

8. Koriaks.—Tshuktsi. (From the opposite coast of America. Tooke's Russia. The Yukagirs are a tribe of the Yakutes, around Yakutsk, and both are expelled Tatars. Tooke's View, ii. 80. Lesseps, ii. 312.)

9. Kamtschatkians.—Kurillians.—(These resemble the Japanese.)

10. Mandshures or Tunguses.—Lamutes.—(Ruling people in China.)

11. Mongoles.—Kalmuks.—Soongares, Tungutes, Burats, &c.

12. Tatars or Huns.—Turks, Khafares, Uzcs, and Siberians.—Nogays, Bashkirs, Kirghiskaizaki or Kirghise Kaizaks, Teleutes.

After the destruction of Attila's swarms, and the effects of unfortunate inroads, the Huns became subject to the Mongoles, who under Zingis or Chingis Khan, Timur, &c. constituted the supreme nation in Asia.—The great share of population which Europe has received from Asia will appear from the following brief statement.

Primitive Inhabitants.

1. Celts.—Irish, Welch, Armorican.—Erse, Manks, Cornish.

2. Fins (chief god *Tammala*).—Finlanders, Ethonians, Laplanders, Hungarians, Permans or Birmanians, Livonians, Votiaks and Cheremisses, Vogules and Ostiaks.

Colonies from Asia.

3. Scythians or Goths (*Odin*).—Icelanders, Norwegians, Swedes, Danes, Germans, English.—Swiss, Fritic, Flemish, Dutch.

4. Sarmats or Slavons (*Perune*).—Poles, Russians, Kaizaks.—Heruli, Vendi, Lettes.

The inhabitants of France, Italy, and Spain, are also of Asiatic origin; and speak corrupted Roman, which, like the Greek, is a polished dialect of the Gothic, according to sir William Jones, and other able antiquaries. The Heruli, Vendes, and Lettes, used mixed and imperfect dialects of the Slavonic.

Besides these numerous original nations, the Malays and Asiatic islanders constitute another large and distinct class of mankind, with a peculiar speech, in the south of the extensive continent of Asia.

It appears that not above one quarter of Asia was known to the ancients; and this knowledge was little increased till Marco Polo, whose travels became well known in Europe in the fourteenth century, established a memorable epoch in geography, by passing to China, and disclosing the extent of that country, the islands of Japan, and a faint intelligence of other regions, illustrated and confirmed by recent accounts. The wide conquests of the famous Tchingis-khan, commonly called Zingis, in the beginning of the thirteenth century, first opened the discovery of the distant parts of Asia; the Mongoles, whose sovereign he was, being situated to the east of the Huns, who had before diffused terror over Europe. The primitive seat of the Mongoles was in the mountains which give source to the river Onon; and at a short distance to the south-west was Kara-kum, the first capital of the Mongole empire. The victories of Zingis extended from Cathay, or the northern part of China, to the river Indus; and his successors prosecuted them over Russia, while they made incursions as far as Hungary and Germany. The power of the Mongoles, thus widely diffused, naturally excited an attention, never stimulated by a number of petty barbaric tribes; and at the same time facilitated the progress of the traveller, who, as in Africa at present, had been formerly impeded by the enmities of diminutive potentates. By force of arms the Mongoles also first opened the obscure recesses of Siberia. Sheibani khan, in the year 1242, led a horde of fifteen thousand families into those northern regions; and his descendants reigned in the Toboltkoy above three centuries, till the Russian conquest. (Gibbon, xi. 424.) Two European travellers, Carpini and Rubruquis, being commissioned to inspect the power and resources of the new empire of the Mongoles, the latter found at Kara-kum a Persian goldsmith employed in the service of the khan: and by Carpini's relation it appears, that from their brethren in Siberia, the Mongoles had received some intelligence concerning the Samoyedes.

Thus the discovery of Asia, which had lain nearly dormant since the time of Ptolemy, began to revive in the thirteenth century. Yet after the publication of Marco Polo's travels, little was done for two centuries; and the authenticity of his accounts even began to be questioned. From the map of the world by Andrea Bianco, the Venetian, 1446, it sufficiently appears that the discoveries of Polo had, even in his native country, been rather diminished than increased. (See Formalconi, *raggia sulla nautica antica de Veneziani*, Ven. 1783, 8vo.) See also the description of Asia by pope Pius II. who appears not even to have seen the travels of Polo. One man indeed of great mental powers, was impressed with their veracity, and in consequence accomplished a memorable enterprise. This was Christoval Colon, or as we call him, Christopher Columbus; who, led by the relation of Polo, conceived, that as Asia extended so far to the east, its shores might be reached by a short navigation from the western extremity of Europe. In this erroneous idea, when that great man discovered the islands now called the West Indies, he thought that he had arrived at the Zipango of Polo, or Japan; and thus the name of India was absurdly bestowed on those new regions.

After the discovery of America and the cape of Good Hope, the maritime parts and islands of Asia were successively discovered. Yet the recent voyages of the Russian navigators, of our immortal Cook, and of the unfortunate La Peyrouse, evince that much remained to be done. Concerning the interior of Siberia, scarcely any solid information was had till Peter the Great, after the battle of Pultava, sent many Swedish prisoners into that region; and

Strahlemberg, one of the officers, published an account of Siberia; which though extremely inaccurate and defective, opened the way to farther intelligence. The knowledge thus obtained was greatly improved and augmented by the well-known journeys of Pallas and the other academicians. Our acquaintance with Asia is still however far from being perfect, especially in regard to Daouria and other regions near the confines of the Russian and Chinese empires; not to mention central Asia in general, Thibet and some more southern tracts; nor had even the geography of Hindostan been treated with tolerable accuracy, till major Rennell published his excellent map and memoir.

The religions of Asia are various; and the climate admits of every variety, from the equator to the Arctic sea.

Though Asia cannot vie with Europe in the advantages of inland seas, yet, in addition to a share of the Mediterranean, it possesses the Red sea (the Arabian sea), and the gulf of Persia, the bays of Bengal and Naukin, with other gulfs, which diversify the coasts much more than those of Africa or America, and have doubtless contributed greatly to the civilization of this celebrated quarter of the globe.

The Red sea, or the Arabian gulf of antiquity, constitutes the grand natural division between Asia and Africa; but its advantages have been chiefly felt by the latter, which is entirely destitute of other inland seas; Egypt and Abyssinia, two of the most civilized countries in that division, having derived great benefits from that famous gulf, which, from the straits of Babelmandel to Suez, extends about 21° or 1470 British miles; terminating, not in two equal branches, as delineated in old maps, but in an extensive western branch, while the eastern ascends little beyond the parallel of mount Sinai.

The Persian gulf is another noted inland sea, about half the length of the former, being the grand receptacle of those celebrated rivers the Euphrates and the Tigris.

The other gulfs do not afford such strong features of what are properly termed inland seas. But the vast extent of Asia contains seas totally detached, and of a different description from any that occur in Europe or other quarters of the world. Such is the Euxine, and likewise the Caspian, which extends about ten degrees, or 700 miles in length, and from 100 to 200 in breadth. Strabo and Pliny idly supposed this sea to be a gulf, extending from the northern ocean: though Herodotus, many centuries before, had delivered juster notions of it. The Caspian, however, seems, at some remote period, to have spread farther to the north, where the deserts are still sandy and saline, and present the same shells that are found in the Caspian; yet that chain of mountains which branches from the west of the Urals to the north of Orenburg, and reaches to the Volga, must in all ages have restricted the northern bounds of the Caspian. To the east, this remarkable sea, in the opinion of most geographers, extended, in times not very distant, to the Aral. This sea, or lake Aral, a hundred miles eastward of the Caspian, is about 200 miles in length, and about 70 miles in breadth; receiving the river anciently called Iaxartes, more recently the Sirr or Sihon, and the river Gihon, the Oxus of antiquity; both streams of considerable course, flowing from the mountains Belur Tag or Imaus. The Aral sea being surrounded with sandy deserts, has been little explored; but it is salt like the Caspian, having many small saline lakes in its vicinity.

Another remarkable detached sea is the Baikal in Siberia, or Asiatic Russia, extending from about the fifty-first to the fifty-fifth degree of north latitude, being about 350 British miles in length, though its greatest breadth is not above 35. The water is fresh and pellucid, yet of a green or sea tinge, commonly

commonly frozen in the latter end of December, and clear of ice in May.

Passing by the other Asiatic seas of inferior note, a few observations may be offered on the remarkable strait that divides Asia from America. This strait, which, as we have already seen, was discovered by Bering, and afterwards by Cook, is about thirteen leagues or near forty miles in breadth. Bering actually passed this strait in 1728, probably in the usual fogs of the climate, without discovering land to the east; but our great navigator gave the name of that Danish adventurer to these straits, when he afterwards explored them with his usual accuracy. On the Asiatic shore is the East-cape; and on the American that called Prince of Wales. The depth of water in the strait is from twelve to thirty fathoms. To the north of these straits the Asiatic shore tends rapidly to the west, while the American proceeds nearly in a northern direction, till, at the distance of about four or five degrees, the continents are joined by solid and impenetrable bonds of ice.

In the Asiatic seas are numerous shoals or sand-banks; but few of them have been described as conducive to human industry.

The chief rivers of Asia are the Kianku and Hoang Ho, the Lena, the Yenisey, and the Obi, streams which rival in the length of their course any others on the globe. Next in consequence are the Amoor, and the Makaung of Laos, if the course be rightly delineated, the Sampoo or Burram-pooter, and the Ganges; compared with all which the Euphrates and Indus are but moderate streams.

The Asiatic mountains are reputed not to equal the European in height. The Uralian chain forms one of the boundaries of Europe; and the Altaian ridge may be classed among the most extensive of the globe, reaching from about the seventieth to the hundred and fortieth degree of longitude east from London, or about 5000 miles, thus rivalling in length the Andes of South America. But, as chains of mountains rarely receive uniform appellations, except from nations highly civilized, the Altaian chain, beyond the sources of the Yenisey, is called the mountains of Sayansk; and from the south of the sea Baikal, the Yablonnoy mountains, branches whereof extend even to the country of the Tihuktshi, or extreme boundaries of Asia. The chain of Alak may perhaps be regarded as a part of the Altaian, branching to the south; while the Taurus, now known by various names in different countries, was by the ancients considered as a range of great length, reaching from cape Keli-doni, on the west of the gulf of Satalia, through Armenia, even to India: this last chain, however, has not impressed modern travellers with the same idea of its extent. To the south of the Altaian range extends the elevated desert Goby or Shamo, running in a parallel direction from east to west; and the high region of Thibet may be included in this central prominence of Asia. Other considerable ranges of mountains are Bogdo, Khangay, Belur, those of Thibet, the eastern and western Gaults of Hindostan, and the Caucasian chain between the Euxine and the Caspian.

The Asiatic governments are almost universally despotic; and the very idea of a commonwealth seems utterly unknown to that quarter of the world. The mild systems are perhaps those found in Arabia. (See Pinkerton's *Modern Geography*, vol. ii.)

ASIA, *Proper*, in *Ancient Geography*. Much perplexity has arisen among authors by the diverse acceptations of the term Asia; so as to render it extremely difficult for their readers to know what region was distinctly understood by that appellation; nor is it easy to reconcile the apparent inconsistency between the sacred and profane writers as to the provinces

comprised under this denomination. The ancient geographers divided the vast continent that was known to the Greeks and Romans under the word Asia, first into the Greater and Lesser Asia. The Lesser, commonly termed Asia Minor, comprehended a great number of provinces; but that which included Phrygia, Mysia, Caria, and Lydia, was denominated Asia Proper, or Asia properly so called. Cicero (*Orat. pro Flacco.*), enumerating the regions contained in Asia Proper, makes no mention of Æolis or Iolia, though undoubtedly a district of it, as being comprehended partly in Lydia and partly in Mysia. Lydia, beside the inland country commonly known by that name, contained also Ionia, lying on the sea side, between the rivers Hermus and Mæander; and Æolis, extending from Hermus to the river Caicus (*Ptol. lib. v. cap. 2.*), or to the promontory Lectum (*Strabo, lib. xiii. p. 393.*), the ancient boundary between Troas and the sea-coast of the greater Mysia. Accordingly, Asia Proper comprehended Phrygia, Mysia, Lydia, Caria, Æolia, and Ionia. This tract was bounded, according to Ptolemy, on the north by Bithynia and Pontus, extending from Galatia to Propontis; on the east by Galatia, Pamphilia, and Lycia; on the south by part of Lycia and the Rhodian sea; on the west by the Hælicpont, by the Ægean, Scærian, and Myrtoan seas. It lies between the thirty-fifth and forty-first degree of north latitude, and extends in longitude from 55° to 62°.

As Asia Proper is but a part of Asia Minor, so the Lydian Asia is only a part of Asia Proper. Asia, in this acceptation, comprehends Lydia, Æolia, and Ionia; and is that Asia whereof mention is made in the Acts, and the Apocalypse. Aristotle tells us that Smyrna was at first possessed by the Lydians (*Aristot. lib. de poetica apud Plutarch in lib. de vita & poeti Homerii*); and Scylax Coryandensis reckons it among the cities of Lydia, as also Ephesus, Sardis, Philadelphia, and Thyatira, are reckoned by Ptolemy among the cities of Lydia, as is Laodicea by Stephanus. (*Steph. de Urbib.*)

That in ancient times Lydia was called Mæonia, and the Lydians Mæonians, is manifest from Herodotus, Diodorus Siculus, Dionysius Afer, Strabo, Pliny, Stephanus, and others; and that Mæonia was called Asia, is no less plain from Callinius, who flourished before Archilochus, from Demetrius Scepius, contemporary with Crates, and Aristarchus the grammarian, from Euripides, Suidas, the great etymologist, &c.; nay, that Lydia was formerly called Asia is expressly affirmed by the ancient scholiast of Apollonius Rhodius. From whence Lydia borrowed the name of Asia is altogether uncertain; some deriving it from a city of Lydia, seated on mount Timolus; others from one Añas, king of Lydia, who according to the Lydians, communicated his name to the whole continent. But, be that as it may, it is certain that Lydia has a better claim to the name of Asia than any other part of that continent.

ASIA, in *Modern Geography*, falls into the following divisions: Tartary, China, India, Persia, Turkey in Asia. Tartary is divided into Chinese, Independent, and Russian; Chinese Tartary contains the country of the Mandshu, and that of the Mongole Tartars; Independent Tartary contains the dominions of the khan of the Cælets or Kalnuks, Turkestan, the country of the Ubec Tartars, the Daghestan, Circassia, and the tribes inhabiting mount Caucasus; Russian Tartary contains the governments of Astrakhan and Kazan, and Siberia. China is divided into the northern provinces of Pecheli or Pekin, Changh, Xensi, Houan Canton, from east to west, and the southern provinces of Na-kin, Chekian, Kiangh, Fokien, Huquang, Quanton, Quingh, Queicheu, Yunnan, Suchuen, from east to west. India is divided

divided into the states of the Great Mogul, comprising the kingdoms of Delli, Agra, Guzarate, Bengal; the peninsula of India beyond the Ganges, comprising the kingdoms of Visapoor, Goleonda, to the north; Bishnagar, Malabar, in the middle towards the south; the peninsula of India within the Ganges, comprising the kingdoms of Pegu, Tonkeen, Cochinchina; Siam, containing Martaban, Siam, Malacca, from north to south. Persia is divided into the northern provinces of Shirvan, Kilan, Khorazan, from west to east; the middle provinces of Erakatzum, Sablutan, Suzilan, from west to east; the southern provinces of Khufistan, Fars, Kirman, Makran, from west to east. Turkey in Asia is divided into Natolia or Anatolia, comprising the provinces of Natolia Proper, Amasia, from north-west to east; Karanania, Adaduly, from south-west to east. Syria, comprehending the provinces of Syria Proper, Phœnicia, Palestine, from north to south. Arabia, containing the provinces of Beriana or Arabia Deserta, Baraab or Arabia Petrea, Hyaman or Arabia Felix, comprising Hagia, Theama, Hadramut, Seceer, Oman, Bahrain, Yuhama, from north to south; the provinces of the Euphrates, viz. Diarbek, containing Diarbek Proper, Erzerum, Yeraek, from north to south; Turcomania, containing Turcomania Proper, the Kurdistan, from west to east; Georgia, containing Mingrelia, Gurgistan, from west to east. The isles of Japan; Japan, the isle of Xicoco or Tocoefi, Bongo, &c., the isle of Nippon, &c., from north-east to south-west. The Philippine islands; Luzon or Luceonia, among which is Manilla, Tandare, Mindanas, &c., from north to south. The Molucca islands; Ternate, the isle of Gilolo, Celebes, isle of Geram, Amboyna, &c., from west to east. The Ladrones; Guan, Tinian, Pagon, &c., from south to north. The Sonda isles; Bornico, Sumatra, under the equator, Java, &c. south of the two former. The Maldive islands, the principal whereof is Male. The number of these is very considerable, but all of them are small. The island of Ceylon, in which are seven kingdoms, the most considerable being that of Candi.

ASIA, in *Ancient Geography*, the name of an island of Ethiopia. Steph. Byz.—A port of the Jews and Phœnicians, on the Red sea. Eusebius.—A lake of Asia, near the Caister. Virgil. *Æn.* l. vii. v. 700.—A town of Asia Minor, in Lydia, situate near mount Tmolus. Suidas.—A burgh or town of Asia, in Sufiana. Ptolemy.—A mountain of Peloponnesus, in Laconia. Pausanias.

ASIA, *Proconsular*, so called because it was governed by a proconsul, comprehended, according to Augustus's distribution of the provinces of the Roman empire, Lydia, Ionia, Caria, Mysia, Phrygia, and the proconsular Hellepont. In the time of Constantine the Great, the proconsular Asia was much abridged, and a distinction was introduced between this and the Asiatic diocese; the former being governed by the proconsul of Asia, and the latter by the vicarius or lieutenant of Asia. The proconsular Asia seems, by the description given of it by Eunapius (in Vit. Maxim.), to have been much the same with the Lydian Asia, which comprehended Lydia, Æolis, and Ionia, and which is the Asia mentioned in Acts, ch. xvi., and including the seven churches of the book of Revelations, ch. ii. and iii. This Lydian Asia was only a part of Asia Proper, or Asia properly so called, which according to Cicero (in Orat. pro Flacco) consisted of four regions, viz. Phrygia, Mysia, Caria, and Lydia. In the reign of Theodosius the elder, who succeeded Valens, the consular Hellepont was taken from the vicarius of Asia, and added to the proconsular Asia; but under Arcadius, the proconsular Asia was abridged of all the inland part of Lydia. However, the southern part of Lydia, lying between the Meander, and Caister, and the

maritime provinces from Ephesus to Aflos, and the promontory Lectann, were left to the proconsular Asia.

ASIA, in *Geography*, an island on the coast of Peru, situate at the distance of seven leagues from Canette on the south-east, and Chilca on the north-west. It is a white island under the shore, about half a league in circuit. S. lat. 13° 6'.

ASIA, in *Mythology*, was one of the nymphs called Oceanides; and according to Diodorus, the wife of Jæpetus.

ASIARCHA, in *Antiquity*, the superintendent of the sacred games in Asia. Montfaucon. Pal. Grec. lib. ii. c. 6. p. 161.

The asiarcha differed from the *Galatarcha*, *Syriarcha*, &c. Some will have the asiarchs to have been persons of rank, chosen in the way of honour, to procure the celebration of the solemn games at their own expence.

As the asiarchs united the magistracy and priesthood, they were entrusted with the care of the temples and sacred edifices; and the expence of the office being considerable, they were selected from persons of great wealth and reputation. In the election of these officers, assemblies were convened in all the towns of Asia at the commencement of the Asiatic year, or about the autumnal equinox. From each of these a deputy was sent to the general assembly of the nation; and of ten persons who were returned to the proconsul, he appointed one to the office of asiarch. The attributes of the asiarch were a crown of gold, with a toga ornamented with gold and purple. This officer existed for some time under the Christian emperors, although they had abolished the sacred games and temples. To these officers there is a reference in Acts, xix. 31. And as they were persons of opulence and dignity, they acted with civility and kindness towards the apostle Paul, in sending a message from the theatre to apprise him of the temper of the people, and to dissuade him from coming thither.

ASIANO, in *Geography*, a town of Italy, in the principality of Piedmont and lordship of Verceili, four miles south of Verceili.

ASIANTE, a country of Africa, eastward of the Gold Coast, situated about N. lat. 5° 35'. and the same longitude with London.

ASIATIC, in a general sense, denotes any person or thing that bears relation to Asia.

ASIATIC, in *Biography*, is a surname given to L. Scipio, the brother of Scipio Africanus, after his defeat of Antiochus king of Syria.

ASIATIC diocese, in *Geography*, a part of Asia, which comprehended eight provinces that were governed by the vicarius, or lieutenant of Asia, viz. Lydia, Caria, Phrygia Salutaris, Phrygia Pacatiana, Pamphylia, Lyeia, Lycaonia, and Pisidia. Sometimes it is taken in a more strict sense, as distinct from the proconsular Asia, and the provinces under the jurisdiction of the proconsul; and sometimes in a more extensive sense, as comprehending also the proconsular Asia.

ASIATIC Society, in the *History of Literary Establishments*. See SOCIETY.

ASIATIC Style, in *Rhetoric*. See STYLE.

ASIATICA, in *Entomology*, a species of CHRYSOMELA, found in Siberia. The form is oval; colour brassy-green, very glossy; wing-cases blue. Fabr. Spec. Inf. Gmel. &c.

ASIATICA, an Asiatic species of BLATTA, described by Professor Pallas, It. 3. p. 263. It is of a grey colour, and oblong form; the wings and wing-cases are longer than the body, and narrow or pointed at the end. Gmel. &c.

ASIATICA, a species of SPHEX, found in the island of Antigua,

Antigna. The abdomen is black, with a yellow lunar mark on the first segment. Fabricius, &c.

ASIATICA, in *Ornithology*, a bird of the MYCTERIA genus, or Jabiru. This is of a large size, white colour, with a black band through the eyes; lower part of the back, quill, and tail feathers black. Ind. Orn. The bill of this bird is dusky, and the legs pale red. It is a native of the East Indies, and feeds on snails.

ASIATICA, a species of **EMBERIZA**, found in the East Indies, where it is called **GAUR**. We know very little of this bird; it is of a small size, being about four inches and a half in length. Bill pale rose colour: head, neck, back, breast, and belly cinereous, palest beneath; wings and tail brown with paler edges; legs pale blue. Lath. In the Ind. Orn. it is described specifically as being of a cinereous colour; wings and tail brown.

ASIATICA, a species of **COLUMBA**, that inhabits India. The colour is greenish ash; head ash; under side of the body white, and a spot of the same on the wings; quill feathers black with a white exterior margin. The length of this bird is eleven inches; bill bluish at the base, and white towards the tip; tail greenish ash, dusky at the end; legs bluish; claws black. It is called the Indian pigeon. Lath. Ind. Orn.

ASIATICA, a species of **CERTHIA**, or creeper, that inhabits India. It is about four inches in length, and briefly described as being of a deep blue, with brown wings; black bill, and legs of the same colour. Lath. Ind. Orn.

ASIATICUS, a new species of **FALCO**, described by Dr. Latham in the Supplement to his Synopsis of Birds. The length is twenty-one inches; and though smaller, it resembles the common buzzard. The bill is bluish black; breast cream colour, dashed down the shafts with dusky black; belly, thighs, and vent white; quills grey, barred with black; on the secondaries a bar of the same. In his Ind. Orn. this bird is thus specifically described: legs half-downy and yellow; body brown above, beneath white; breast streaked, tail-feathers silvery grey, with five obsolete bands on the exterior ones. Inhabits China, and is called in England the Asiatic falcon.

ASIATICUS, a species of **CAPRIMULGUS**, described by Dr. Latham, Sup. Gen. Syn. under the name of *Bombay Goat-sucker*. It is pale ash colour clouded with black, and ferruginous breast fasciated with ash-colour; a blackish streak on the crown of the head, a pale one on each side of the jaw, and a pale spot on the throat; length eight inches and a half. Inhabits India. In addition to the foregoing specific character, it may be observed that the plumage of this bird is an elegant intermixture of ash colour and brown; and that between the legs it is of a pale rufous; quills dusky, barred with rufous; four of the greater quills have a spot of white on the inner web; tail marked in the same manner as the quills, except the two middle ones, which are mottled like the back, and the two outer ones have the ends white for about an inch; the middle toe is greatly pectinated.

ASIATICUS, a species of **TROGON**, in Latham's Ind. Orn. unnoticed by Gmelin. It is green; forehead, crown, and back of the neck red; throat blue, with a red spot; quill and tail feathers black. The length of this bird is nine inches; the red on the forehead is bounded by a white line, and on the crown and neck is bounded below by a white line, and on the sides by a black one; legs green. Inhabits India.

ASIDÆANS. See **CHASIDÆANS**.

ASIGRAMMA, in *Ancient Geography*, a town of India, seated on the Ganges. Ptolemy.

ASIGRUM, in *Botany*. See **HYPERICUM**.

ASII, in *Ancient Geography*, a tribe or horde of Scythian Nomades, who came from the country beyond the Jaxartes, and deprived the Greeks of Bactria. Strabo, l. xi. p. 779.

ASILIFORMIS, in *Entomology*, a species of **SPHINX**, the wings of which are deeply scalloped and dented; anterior ones cinereous, with a dark band and black dot upon it; posterior pair red, with a black margin. Inhabits India. Fabricius.

ASILIFORMIS, a species of **MUSCA** (*Syrphus* Fabr.) that inhabits Germany. The thorax is hairy and yellowish; abdomen black; first and second segment whitish. Fabricius, Gmelin, &c.

ASILUS, a genus of dipterous insects in the Linnæan system, the character of which is that the mouth is furnished with a horny, projecting, straight, bivalve, sucking trunk that is gibbous at the base; and the antennæ filiform. These are the wasp flies of some writers; they prey chiefly on insects, but are very troublesome to cattle.

The species described by Gmelin are numerous; viz. *grossus*, *maurus*, *algius*, *barbarus*, *ciabroniformis*, *ephippium*, *atlans*, *fasciatus*, *barbatus*, *gibbosus*, *ater*, *diadema*, *calidus*, *flavus*, *violaceus*, *gylvus*, *punctatus*, *marginatus*, *plumbeus*, *eyanensis*, *teutonius*, *germanicus*, *rufipes*, *maculatus*, *marginellus*, *annulatus*, *stylatus*, *cingulatus*, *nigripes*, *brunneus*, *forcipatus*, *tipuloides*, *cinctus*, *lineatus*, *cyaneus*, *celandicus*, *morio*, *lufitanicus*, *conopioides*, *linearis*, *culiciformis*, *villosus*, *pubescens*, *striatus*, *albifrons*, *æstivus*, *nigerrimus*, and *podagricus*; which see respectively. *Algius* has the body entirely brown, and inhabits Africa. Fab. & Gmel. *Atlans* is a native of North America, is cinereous, and has the three last segments of the abdomen white. Linn. Gmel. *Æstivus* inhabits Europe; the colour is cinereous, with three black lines on the thorax; legs black; flanks testaceous. Schrank. Scopoli describes a variety in which the legs are entirely black.

ASILUS, a species of **ONISCUS**, that inhabits the European ocean. The abdomen is covered with two scales; and the tail is semioval. Linn. Fn. Suec. Fabr. &c. This is *pediculus marinus* of Rondel.

ASINARA, in *Geography*, a small island in the Mediterranean near the north-west coast of Sardinia, about ten leagues in circumference, is fertile and populous. The mountains abound with wild boars, deer, buffaloes, and falcons. N. lat. 41° 5'. E. long. 8° 30'.

ASINARIA, in *Antiquity*, feasts of the Syracusans, instituted in commemoration of the victory gained by them over Nicias and Demosthenes, the Athenian generals, near the river Asinarius, now *Falunera*, from which they took their name.

ASINARI, in *Ecclesiastical History*, an appellation given by way of reproach to the Christians, as well as Jews, from a mistaken opinion, among heathens, that they worshipped an ass. The appellation was originally given to the Jews, and only became applied to the Christians: the Jews were charged with keeping a golden ass's head in the sanctuary of the temple, to which on certain occasions they paid adoration; in memory of a herd of asses, which, in their passing through the wilderness, shewed Moses the way, under a distressing want of water, to a spring. Tacit. Hist. lib. v.

Some had even the impiety to represent Christ with an ass's ears, and one foot hooped, holding a book, with the inscription *Deus Christianorum asinus*. Crinit. de Honest. Discipl. lib. i. c. 9. See **ASINUS**.

ASINATA, in *Entomology*, a species of **PHALÆNA** (*Geometra*),

(*G. onefra*), about the size of *PHALÆNA charophyllata*, or chimney-sweeper moth of the English Auricians. It inhabits Austria. The wings are greenish, ash colour, and without spots. Fabricius, *Gmelin. Olf.*: This is *PHALÆNA griseata* of Wien. Schmettler.

ASINDA, in *Antiqui Geography*, a town of India, on this side of the Ganges. Ptolemy.

ASINDO, or ASSIZO, a town of Spain, in Bética, seated on a mountain, nearly east of Gadis.

ASINDUM, a town of Spain, in the country of the Turdetani.

ASINE, a town of Greece, in the Argolide, situate upon the Argolic gulf, north-west of Hermione, and south-west of Epidaurus.—A town of Messenia, south-west of Messene, founded by the Asinaans after they had been driven from their former city in the Argolide by the Argives.—A town of the island of Cyprus.—A town of Asia, in Cilicia. Steph. Byz.

ASINELLA, in *Geography*, a river of Italy, in the kingdom of Naples, which runs into the Adriatic near Penae, in the Abruzzo citra.

ASINI, in *Entomology*, a species of *PEDICULUS* that infests the ass. The head is pointed and obtuse; abdomen ovate and striated with brown. Fabricius, Redi, &c.

ASINIUS LAPIS, a name given by some writers of the middle ages to a stone said to be found in those places frequented by the wild ass. See BIZOAR.

ASINUS *Pollin*, in *Biography*. See POLLIO.

ASINUS, or ASS, in *Zoology*, a quadruped of the HORSE kind, or genus *EQUUS* in the Linnæan system of animals; a native originally of the mountainous deserts of Tartary, of Arabia, Persia, and some other southern parts of the Asiatic continent, and Africa; and at present very generally domesticated throughout most civilized countries.

In point of size, of strength, and beauty, the varieties of this species, like other domestic animals, have undergone many changes, and differ considerably from each other. Those of the eastern parts of the world, who continue to enjoy the advantages of a climate entirely congenial with their nature, are still observed to possess nearly all that activity, that energetic spirit and beauty of appearance which characterize this animal in a state of independent wildness; they present a race of beings in almost every respect the very reverse of those abject creatures, their degenerate offspring, which we are daily accustomed to see employed in the meanest acts of servitude in the northern parts of Europe. But although the shades of degradation are so much more strongly marked in the latter kinds, than in the rest, all may be definitively traced to a few distinct varieties, and these again to the single species, the primeval stock from which they were at first derived.

The character of the ass, as Linnæus defines it, consists in having the tail bristly at the extremity, and a black cross over the shoulders. To this his editor Gmelin adds, that the hoofs are solid; and that the black cross on the shoulders is peculiar to the male. According to Buffon *Quadr.* it is an *Equus* with long flouching ears, and short mane.

Gmelin divides the species *Assus* into four varieties, viz. *Assus silvestris*, *domesticus*, *muscus*, and *hinus*. The first is the wild ass, onager of Pliney and other ancient writers; onagrus, onager, five assus silvestris of Geiner; equus (onager) variabilis longis juba brevi pelle tuberculis pennis scabra of Brisson; Feline savage of Mammol. Af. and wilder ass of Pallas.—The domestic, or second variety, varying much in different countries, is not a singular well known in Europe by the several names of *Assus*, &c. Eng.

Pans and *Panasse*, Evén. *Assus miccio*, *f. miccia*, Ital. *Assus barriro*, *f. barriro*, Span. *Assus barriro*, *f. assus barriro*, Port. *Sifet*, Germ. *Eesel*, Dat. *Assus*, Swed. *Assus*, *esjel*, Danish.—*Mulus*, or mule, the third variety, it is almost unnecessary to remark is the hybrid offspring of the male ass with a mare; and *hinus*, the hinny, a similar hybrid product of the male horse with the female ass, and strictly speaking ought not to be deemed varieties of the species *assus*, but rather monsters, as being out of the course of nature.

Wild asses were perfectly well known to the ancients; they are faithfully described by Pliney and Oppian; and among the sacred writings are frequent allusions to them. They uniformly attracted the notice of travellers in Asia and Africa; and professor Pallas in particular has treated on them with his accustomed accuracy. The appearance both of the wild and tame asses in those parts of the world is altogether striking. "It was with difficulty," says Adanson, when speaking of the asses of Senegal, "that I could recognize this animal, so different did it appear from those of Europe; the hair was fine, and of a bright mouse colour; and the black list that crosses the back and shoulders had a good effect. These were the asses brought by the Moors from the interior of the country." From the best authorities it appears, that in a natural state, the ass has a soft woolly mane; a forehead greatly arched; and ears long, erect, and pointed, particulars in which it differs most obviously from the domesticated kind, which has the ears flouching, and the forehead flattish. The former stands also higher on its limbs, and the legs are more slender in proportion. The colour of the hair is white or silvery grey; the upper part of the face, the sides of the neck, and body, inclining to a straw colour; and the hind part of the thighs the same; the fore-part divided from the flank by a white line, which extends quite round from the rump to the tail: the belly and legs are also white; along the very top of the back, from the mane quite to the tail, runs a stripe of bushy waved hairs of a coffee-colour, broadest above the hind part, and growing narrower towards the tail; another of the same colour crosses it at the shoulders, and forming a similar mark to that by which the tame ass is distinguished. This is peculiar to the male, and is bounded on each side by a line of white. Its winter coat is very fine, soft, and silky, much undulated, and not unlike that of the camel; greasy to the touch, and the flaxen colour more vivid than in the summer. In its summer dress there are certain shaded rays that mark the sides of the neck, pointing downwards. These animals inhabit the dry and mountainous parts of the deserts of Great Tartary, but not higher than lat. 48°. They are migratory, and arrive in vast troops to feed during the summer, in the tracts to the east and north of lake Aral. About autumn they collect in herds of hundreds, and even thousands, and direct their course towards the north of India to enjoy a warm retreat during winter. But they more usually retire to Persia, where they are found in the mountains of Casbia, and where part of them remain during the whole year. According to Babago, they penetrate even into the southern parts of India to the mountains of Malabar and Goleon. The Kirgises and Arabs hunt them, or take them in snares for the sake of their flesh. At first when the animal is killed, the meat is hot and unfavoury; but if kept two days after it is boiled, it becomes excellent. The flesh of wild asses, it is well known, was esteemed an article of food among the ancient Romans.

The wild ass feeds chiefly on the most saline or bitter plants of the desert, as the kalis, atriplex, chenopodium, &c. and also prefers the saltiest and most brackish water to that which is fresh. Of this the hunters are aware, and usually station

station themselves near the ponds to which they resort to drink. Their manners greatly resemble those of the wild horse. They assemble in troops under the conduct of a leader, or sentinel; and are extremely shy and vigilant. They will however stop in the midst of their course, and even suffer the approach of man at that instant, and then dart off with the utmost rapidity. They have been at all times celebrated for their swiftness. Their voice resembles that of the common ass, but is shriller.

The Persians catch these animals alive for the sake of domesticating them, or improving the breed of tame asses: they sink for this purpose, pits of a convenient size and depth, which they half fill with plants, both as a temptation to the creature, and to break its fall. The breed of asses in such high esteem in the east, is produced by crossing the tame kind with the ass reclaimed from a state of wildness. These animals were anciently found in the Holy Land, Syria, Arabia Deserta, Mesopotamia, Phrygia, and Lycania; but they rarely occur in those parts at this time; and seem to be almost entirely confined to Tartary, some parts of India, and Africa.

It is said that neither asses nor horses were found in America, although the climate of South America is perfectly adapted for them. These which the Spaniards transported from Europe, and left in various parts of the New Continent have greatly multiplied, and are found in troops in a state of nature at this period.

The excellencies and defects of the common or domestic ass, have amply engaged the lively pens of several descriptive writers on the history of animals; and of none with more happy effect than those of the eloquent Buffon, and the ingenious abbé la Pluche: of the latter we shall speak hereafter: the former after entering minutely into a comparison between the horse and the ass, and endeavouring to prove that the two species are distinct (a fact which cannot well be doubted), concludes in a style of language so beautiful, so animated, and well calculated to enforce the tenor of his preceding arguments, that we cannot refrain inserting some few extracts from it.

“The ass is then an ass,” says Buffon, “and not a horse degenerated, a horse with a naked tail. The ass is neither a stranger, an intruder, nor a bastard; he has, like other animals, his family, his species, and his rank; his blood is pure and untainted, and although his race is less noble, yet it is equally good, equally ancient, with that of the horse. Why then is there so much contempt for an animal so good, so patient, so steady, and so useful? do men despise, even among animals, those which serve them best, and at the smallest expence? We educate the horse, take care of, instruct, and exercise him, whilst the ass is abandoned to the power of the lowest servant, or the tricks of children; so that instead of improving, he must lose by his education, and if he had not a fund of good qualities, he would certainly lose them by the manner in which he is treated. He is the sport of the rustics, who beat him with staves, abuse him, overload him, and work him beyond his strength. We do not consider that the ass would be in himself, and, with respect to us, the most beautiful, best formed, and most distinguished of animals, if there were no horses in the world; he, however, holds the second, instead of the first rank, and it is from that only that he appears to be of no value. It is comparison alone degrades him; we look at, and give our opinions, not of himself, but comparatively with the horse. We forget that he is an ass, that he has all the qualities of his nature, all the gifts attached to his species, and only think of the figure and qualities of the horse, which are wanting in him, and which he ought not to have.

“He is naturally as humble, patient, and quiet, as the horse is proud, ardent, and impetuous; he suffers with constancy, and perhaps with courage, chastisement and blows; he is moderate both as to the quantity and quality of his food; he is contented with the hardest and most disagreeable herbs, which the horse, or other animals, will leave with disdain; he is very delicate with respect to his water, for he will drink none but the clearest, and from rivulets which he is acquainted with; he drinks as moderately as he eats, and does not put his nose in the water through fear, as some say, of the shadow of his ears: as care is not taken to comb him, he frequently rolls on the grass, thistles, and in the dust; without regarding his road, he lies down and rolls as often as he can, and seemingly to reproach his master for the little care he takes of him, for he never wallows in the mud or in the water; he even fears to wet his feet, and will turn out of his road to avoid it; his legs are also drier and cleaner than those of the horse; he is susceptible of education, and some have been seen sufficiently disciplined for a public show.”

“When young, they are sprightly, handsome, light, and even graceful; but they soon lose those qualities, either from age or bad treatment, and become slow, stubborn, and headstrong. The ass is ardent in nothing but love; or rather when under the influence of that passion, he is so furious that nothing can restrain him: he has been known to exhaust himself by excessive indulgence, and die some moments afterwards. As he loves with a kind of madness, he has also the strongest attachment to his progeny. Pliny assures us, that when they separate the mother from her young, she will go through fire to recover it. The ass is also strongly attached to his master, notwithstanding he is usually ill-treated; he will scent him at a distance, and distinguish him from all other men. He also knows the places where he has lived, and the ways which he has frequented. His eyes are good, and his smell acute, especially with regard to females; his ears are also excellent, which has contributed to his being numbered among timid animals, who it is pretended have all long ears, and the hearing extremely delicate. When he is overloaded, he shews it by lowering his head, and bending down his ears: when greatly abused, he opens his mouth, and draws back his lips in a most disagreeable manner, which gives him an air of derision and scorn. If his eyes are covered, he remains motionless; and when he is laid down, and his head so fixed, that one eye rests on the ground, and the other being covered with a piece of wood, he will remain in that situation without endeavouring to get up. He walks, trots, and gallops like the horse, but all his motions are smaller and much slower. He can however run with tolerable swiftness, but he can hold it only for a small space, and whatever pace he uses, if hard pressed, he is soon fatigued.”

“The horse neighs, but the ass brays; which he does by a long, disagreeable, and discordant cry, by alternative discords of sharps and flats. He seldom cries but when he is pressed by love or appetite. The she-ass has her voice clearer and more shrill.” Buff.

“I confess” says the abbé la Plache “that the ass is not master of very shining qualities; but then he enjoys those which are very solid. If we resort to other animals for distinguished services, this at least furnishes us with such as are most necessary. His voice is not altogether melodious, nor his air majestic, nor his manners very lively; but then a fine voice has very little merit with people of solidity. With him the want of a noble air hath its compensation in a mild and modest countenance; and instead of the boisterous and irregular qualities of the horse,

which are frequently more incommodious than agreeable, the behaviour of the afs is entirely fimple and unaffected; no fupercilious and felf-fufficient air. He marches with an uniform pace, and though he is not extraordinarily fwift, he purfues his journey for a long time, and without intermiffion. He finishes his work in f Silence, ferves you with a fteady perseverance, and difcovers no oftentation in his proceedings, which is certainly a confiderable accomplifhment in a domeftic. His meats require no preparation, for he is perfectly well contented with the firft thistle that prefents itfelf in his way. He does not pretend that any thing is due to him, and never appears fqueamifh or difatisfied: he thankfully accepts whatever is offered him: he hath an elegant relifh for the beft things, and very civilly contents himfelf with the moft indifferent. If he happens to be forgotten, or is fattered a little too far from his fodder, he intreats his matter, in the moft pathetic language he can utter, to be fo good as to fupply his neceffities. It is very juft that he fhould live, and he employs all his rhetoric with that view. When he has finished his expoftulations, he patiently waits the arrival of a little bran, or a few withered leaves; and the moment he difpatches his meal, he returns to his bufinefs, and marches on, without a murmur or reply. His occupations have a tinge of the meanness of thofe who fet him to work; but the judgments that are formed, both of the afs and his matter, are equally partial. The employments of a judge, a man of confequence, and an officer of the revenue, have an important air, and their habit impofes on the fpectators: on the contrary, the labour of the peafant has a mean and contemptible appearance, becaufe his drefs is poor, and his condition defpifed. But we really make a falfe estimate of thefe particulars. It is the labour of the peafant which is moft valuable, and alone truly neceffary. Of what importance is it to us when a manager of the revenue glitters from head to foot with gold; we have no advantage from his labours. I confefs, judges and advocates are, in fome meafure, neceffary; but they are made fo by our folly and mifbehaviour; for they would be no longer wanted, could we conduct ourfelves in a rational manner. But, on the other hand, we could on no account, and in no feafon or condition of life, be without the peafant and the artizan. Thefe people may be confidered as the fouls and ftrength of the community, and the fupport of our life. It is from them we are constantly deriving fome accommodations for our wants. Our houfes, our habits, our furniture, and our fuffenance, rife out of their labours. Now what would become of your vine-dreffers, gardeners, mafons, and the generality of country people, that is to fay of two thirds of all mankind, if they were deftitute of either men or horfes to convey the commodities and materials they employ and manufacture? The afs is perpetually at their fervice: he carries fruit, herbs, coal, wood, bricks, tiles, plafter, lime, and ftraw. The moft abject offices are his ordinary lot, and it is a fingular advantage to this multitude of workmen, as well as ourfelves, to find a gentle, ftrong, and indefatigable animal, who, without either expence or pride, replenifhes our cities and villages with all forts of commodities. A fhort comparifon will complete the illuftration of his fervices, and in fome meafure raife them out of their obfcurity. The horfe very much refembles thofe nations who are fond of glitter and hurry; who are perpetually finging and dancing, and extremely ftudious to fet off their exterior, and mix gaiety in all their actions. They are admirable on fome diftinguifhed and decifive occasions; but their fire frequently degenerates into romantic enthufiafm; they fall into wild transports; they exhauft themfelves, and lofe the moft favourable conjunctures for want of

management and moderation. The afs, on the contrary, refembles thofe people who are naturally heavy and pacific, whole underftandings and capacity are limited to husbandry or commerce, and who proceed in the fame track without difcompofture, and complete, with a pofitive air, whatever they have once undertaken."

Of all animals that are covered with hair, it is believed the afs is the leaft fubject to vermin; and the authors of the Encyclopædia Britannica have even ventured to fay, that it is never troubled with lice. This opinion is altogether erroneous, and the more unaccountable, fince a flight acquaintance with the entomological writings of Redi, of Linnæus, Fabricius, and feveral others, might have convinced them that it is not only infefted with lice, but even with a fpecies peculiar to itfelf, and for that very reafon named *afini*, or louse of the afs. *Pediculus afini*, Red. Exp. 21. *Pediculus afini*, Linn. *Pediculus afini*, capite porrecto obtufo abdomine ovato fufco ftriato, Fabr. &c. The fkin of the afs is extremely hard and very elastic, and is ufed for various purpofes; fuch as to cover drums, make fhoes, or parchment. It is of the fkin of this animal that the orientals make the fagri, or, as we call it, fhagreen.

At two years and a half old, the firft middle incifive teeth fall out, and the others on each fide foon follow; they are renewed at the fame time, and in the fame order as thofe of the horfe. The age of the afs is alfo known by his teeth in the fame manner. From the age of two years and a half the afs is capable of procreating its kind, and the female ftill earlier. The females are in heat in May and June, which, when pregnant, foon goes off. In the tenth month, milk is found in her dugs, and she brings forth in the twelfth, and very rarely has more than one foal. Seven days after she is capable of again receiving the male. At the end of five or fix months the foal may be weaned; and it is even neceffary, if the mother be again pregnant. The ftallion afs fhould be chofen from the largeft and ftrongeft of his fpecies; he muft at leaft be three years old, but fhould not exceed ten; his legs fhould be long, his body plump, head long and light, eyes brisk, noftrils and cheft large, neck long, loins flefhy, ribs broad, rump flat, tail fhort, hair fhining, foft to the touch, and of a deep grey.

The afs, like the horfe, is three or four years in growing, and lives alfo like him twenty-five or thirty years; it is faid the female lives longer than the male; but perhaps this happens from their being often pregnant, and at thofe times having fome care taken of them, inftead of which the males are constantly worn out with fatigue and blows. They fleep lefs than the horfe, and do not lie down to fleep, except when they are exceedingly tired. The male afs alfo lafts much longer than the ftallion; the older he is, the more ardent he appears; and, in general, the health of this animal is much better than that of the horfe; he is lefs delicate, and not nearly fo fubject to maladies.

There are among affes, as among horfes, different races, though they are much lefs known, becaufe they have not been taken the fame care of, or followed with the fame attention. Travellers inform us, that there are two forts of affes in Perfia, one of which, being flow and heavy, are ufed for burdens; and the other is kept like horfes for the faddle. The latter have fmooth hair, carry their head well, and are much quicker in their motion; but when they ride them they fit nearer the buttocks than when on horfeback. They are drefsed like horfes, and like them are taught to amble; and they cleave their noftrils to give them more room for breathing. According to Dr. Ruffel, there are two forts in Syria, one of which are like ours, and the other

very large, with remarkable long ears; but both kinds are employed for the purpose of carrying burdens.

The wild mule, the *hemionus* of Pallas, has no claim to consideration in this place. It constitutes a distinct species of *equus* from the species *asinus*, in Gmelin's arrangement, under the name assigned to it by Pallas; and will be noticed hereafter in the article HEMONIUS. The common mule, engendered between the male ass and mare, is much cultivated in Spain, and is little inferior in size to its female parent.

The ass was one of the unclean animals under the Jewish law, as it did not chew the cud; and it prohibited coupling an ass with an ox for draught: Lev. xi. 26. The Jews were accused by the Pagans of worshipping the head of an ass. See ASINARIUM. The author of this calumny seems to have been Appion the grammarian; for he affirmed (Josephus, contra Appion l. ii.) that the Jews kept the head of an ass in the sanctuary; and that it was discovered there when Antiochus Epiphanes took the temple, and entered into the most holy place. Suidas also says (in *Damocrito* and in *Juda*) that Damocritus, or Democritus, the historian, averred, that the Jews adored the head of an ass, made of gold, and sacrificed a man to it every three or every seven years, after having first cut him in pieces. Plutarch (Sympos. l. iv. c. 5.) and Tacitus (Hist. l. v.) seem to have been imposed upon by this slander. They believed that the Hebrews adored an ass, from gratitude for the discovery of a fountain by one of these animals, at a time when they were exceedingly fatigued and parched with thirst in the wilderness. The same absurd idolatrous worship was imputed by the heathens to the Christians. Thus Cæcilius (apud Minut.) says, "Audio Christianos turpissimæ pecudis asini caput consecratum inepta nescio quam persuasione venerari." To the same purpose Tertullian tells us (Apolog. c. 16.), that some enemies to the Christians exposed to public view a picture, representing a person with a book in his hand, dressed in a long robe, with ass's ears, and one foot like that of an ass, upon which was inscribed, "The God of the Christians has an ass's hoof." Learned Christians have attempted to investigate the origin of this calumny. The report of the Jews worshipping an ass might originally have been derived from Egypt; to this country it is traced by Tanaquil Faber, who deduces it from the temple in Egypt called Onion, derived, as it is supposed, from *Onos*, an ass. To this purpose it may be added, that the Alexandrians hated the Jews, and were much addicted to railery and defamation. And they might have been informed, that the temple Onion, at Heliopolis, was named from Onias, the high-priest of the Jews, who built it in the reign of Ptolemy Philometer and Cleopatra, A. M. 3854., ante Christ. 150. Joseph. l. xlii. c. 6. Bochart is of opinion (De Animal. Sacr. l. ii. c. 18.), that the error took its rise from a passage of scripture, "The mouth of the Lord hath spoken it," in the Hebrew פִּי-יְהוָה, *pi-Jehovah*, or *pi-Jeo*. Hence, as *pieo*, in the Egyptian language, signifies an ass, the Alexandrian Egyptians, hearing the Jews often pronouncing the word *pieo*, might believe that they called on their god, and thence infer that they adored an ass. Omitting other conjectures, we shall add, that M. Le Moine supposes, that the golden urn containing the manna, which was preserved in the sanctuary, was taken for the head of an ass, and that the omer, or affaron, of manna, might have been confounded with the Hebrew *hamor*, which signifies an ass. Calmet.

ASINUS *Piscis*, in *Ichthyology*, a name given by some old writers, to the common haddock. It was also called *onos*. Willughby, &c.

ASIO, in *Ornithology*, a species of STRIX or owl, described

by Linnæus, the body of which is brown above, and white beneath; and the wings marked with five white dots. This is *le petit due de la caroline* of Brisson, *little owl* of Catesby, *red owl* of Pen. Arct. Zool. and *red-eared owl* of Latham. Its native place is North America.

Catesby says it is about the size of a jackdaw. The bill and iris are of a saffron colour; tail brown; edge of the bastard wing whitish; on the quills a few white spots; legs covered to the toes with light brown feathers; toes brown; claws black. Buffon seemed to imagine this bird might be only a variety of the long-eared and American owls, both of which he deemed the same species.

ASIO, is also a name given by Aldrovandus to the Italian eared-owl, and synonymous with *otus*: *asio five otus*. Aldr. Ray applied the same name to the long-eared owl or horn-owl of Willughby and Albin, and *strix otus* of Linnæus.

ASIONGABER. See EZIONGABER.

ASIOTÆ, in *Ancient Geography*, a people of Asia, in Scythia, on this side of Imaüs. Ptolemy.

ASIREF, in *Geography*, a town of Persia, on the south of the Caspian sea, in the province of Taberitan, eleven leagues east of Ferabad.

ASISARATH, in *Ancient Geography*, a town of Africa, in Mauritania Cæsariensis, between the rivers Gulus and Ampfagus. Ptolemy.

ASISIA, a town of Liburnia, the *Assisa* or *Asseria* of Pliny, now in ruins. The traces of ancient magnificence discernible at Podgraje, the seat of *Assisa*, are numerous. Among the Liburnian cities which attended the congress or diet of Scardona, Pliny mentions the free *Asserians*, who created their own magistrates, and were governed by their own municipal laws, and who were of course more opulent and powerful than their neighbours. The walls of this city appear to have measured in circumference 5600 Roman feet, and to have been constructed with Dalmatian marble, some pieces of which are of large dimensions, and brought from a considerable distance.

ASISIUM, or *Assisium*, now *Assisi*, a town of Italy, in Umbria, was a Roman municipium, and situated to the east of Arna. Pliny mentions the *Assisians*. See *Assisi*.

ASITCHOU АСНАШНШ, in *Ornithology*, the name by which a species of grosbeak is known in Hudson's Bay; and which Dr. Latham supposes to be the white-winged cross-bill of his General Synopsis.

ASITIA, in *Medicine*, a loss of appetite, from *a*, privative, and *σιτος*, food. A symptom which occurs in numerous diseases.

ASIUS, in *Entomology*, a species of PAPILIO (*Ey. Tro.*) that inhabits South America. The wings are tailed, black, with a common white band; base and tip of the posterior pair beneath spotted with red. Fabricius.

ASKA, in *Geography*, a river of Japan.

ASKER, in *Zoology*, a name used in some parts of England for the water-bewt; or *eft*.

ASKER-MOKREM, in *Geography*, a town of Asia, on the eastern bank of the Tigris, in the Arabic Iraq; called also *Sermenai*.

ASKERSUND, a town of Sweden, in the province of Nericia, on the Weter sea, five miles from Orebro.

ASKEYTON, a market, and, till the union, borough town of the county of Limerick, in Ireland, seated on the small river Deel, near its junction with the Shannon; famous for its castle built by the earl of Desmond, and for one of the most beautiful and perfect abbeys in Ireland. Distance from Dublin 110½ miles. Long. 8° 54' W. Lat. 52° 34' 30' N.

ASKRIG,

ASKRIG, a town of England, in the north riding of Yorkshire, beautifully situated on the banks of the river Ure, at the upper extremity of Wensley dale. It has a weekly market on Thursday: distant 247 miles north from London.

ASLA, a river of Spain on the northern coast, which falls into a bay in the bay of Biscay, where it forms a good harbour, to the east of cape Pimas.

ASLANI, in *Commerce*, a name given to the Dutch dollar, current in most parts of the Levant. The word is also written corruptly, *affilani*. It is originally Turkish, and signifies a lion, which is the figure stamped on it. The Arabs taking the figure of a lion for a dog, called it *abyketh*. The asiani is silver, but of a base alloy, and oftentimes counterfeit. It is current for 115 or 120 aspers. See **ASPER**.

ASLAPATHI, in *Geography*, a town and district of Asia, in Armenia, near Næcklivan, on the banks of the Aras. It is inhabited by Armenians; and the women are said to be so beautiful, that the king of Persia supplies his seraglio from this place.

ASLING, or **JESSENITZ**, a town of Germany, in Carniola, sixteen miles S. S. W. of Clagenfurt. In this town, which is not far from the river Sau, is dug a fine marble; and near it are lead furnaces, and other works, in which considerable quantities of iron and steel are smelted.

ASMER, a small town of Hindostan, in the states of the Mogul, south-west of Agra, and in the extremity of the province of Bando, called also Asmer.

ASMEROEA, a mountain of Asia, in the country of the Seres, inhabited by a people called Asmerians, who are dispersed through the province of Cataja, a part of Tartary.—Also a town of Asia, in the same country, according to Ptolemy.

ASMODAI, in *Mythology*, the name given by the Jews to the prince of demons; and, according to R. Elias, the same with Samael.

ASMONEANS, in *Ancient History*, the name given to the **MACCABEES**, the descendants of Mattathias, who, according to Josephus, was the grandfather of Asmoneus; though others derive the appellation from mount Asamar, placed by Josephus in the midst of Galilee, near Sephoris; and others again consider it merely as a title of honour given to Mattathias and his descendants, alleging that *chusebmanim* signifies in Hebrew, *princes*. However this be, the family of the Asmoneans became very illustrious in the latter period of the Hebrew commonwealth, and possessed the supreme authority and the high-priesthood from the commencement of the government of Judas Maccabeus to Herod the Great, during a period of 129 years, or 126 years according to Josephus, who reckons from the time in which Judas was established in the government by his peace with Antiochus Eupator, three years after he first assumed it. It was the practice of the Asmonean princes to impose their religion upon all the countries which they conquered, leaving to the vanquished no other choice but either to become Jews, or else to have their dwellings demolished, and to seek new habitations.

ASMURA, or **ASMURNA**, in *Ancient Geography*, a town of Asia, in the interior of Hyrcania. N. lat. 39° 30'. Ptolemy.

ASNAH, in *Geography*. See **ESNÉ**.

ASNAUS, in *Ancient Geography*, a mountain of Europe, in Macedonia, between which and Oeropus was a valley, in which flowed the river Oëas.

ASNEN, in *Geography*, a lake of Sweden, in the pro-

vince of Smoland, about North lat. 56° 36'. East longitude 14 48'.

ASNID, a town of Asia, in the kingdom of Candahar, 23 leagues north of Balcan.

ASNIERES, a town of France, in the department of the Upper Vienne, and chief place of a canton in the district of Bellac, 10 miles north-west of Bellac.

ASO, a town of Japan, in the province of Simood-fuke.

ASODES, in *Medicine*, a term applied to fevers accompanied with anxiety and oppression about the stomach and precordia. It is derived from *ασος*, which, in its primary sense, means a loathing of food; but which is used by Hippocrates, and other ancient physicians, to denote great uneasiness and restlessness, whether with or without nausea. It is sometimes written *asfodes*.

ASOLA, in *Geography*, a town of Italy, in the territory of Brescia, on the river Chiese; which was formerly a fortified place, belonging to the republic of Venice.

ASOLO, a town of Italy, in the district of Treviso, situate on a mountain at the source of the river Musona; small, but well-peopled. N. lat. 45° 49'. E. long. 12° 2'.

ASONA, a river of Italy, in the marquisate of Ancona; which rises in the Apennines, on the frontiers of Umbria, and runs into the Adriatic sea, ten miles south-east of Fermo.

ASOPH. See **AZOF**.

ASOPIA, in *Ancient Geography*, a country of Peloponnesus, in Sicyonia. Strabo.

ASOPUS, a town of Laconia, in which was a temple of Minerva Cypriferis, south-east of Cypriffa. At the distance of twelve stadia was a temple of Æsculapius, surnamed *Philolans*, the friend of the people. The citadel is now standing, and called by the sailors *Cassel Rampano*.—Also, a river of Bœotia, which had its source in mount Citheron, north-west of Plataæ; and passing east by north of this city, discharged itself into that part of the sea which separated the isle of Eubœa from the continent over against Eretria, now called *Asope*.—Also, a river of Sicyonia which rose to the south-west, on the frontiers of Arcadia, near mount Cylene, ran east of Sicyone, and discharged itself into the gulf of Corinth.—Also, a river of Greece, in Thessaly, which had two sources in that part of mount Oeta that was contiguous to mount Pindus, and running eastward, emptied itself into the Maliac gulf, north of Thermopylæ.—Also, a river of Asia Minor, which watered the town of Laodicea upon the Lycus. Pliny.

ASOTUS, in *Ichthyology*, a species of **SILURUS** found in Asia. It has a single dorsal fin, and four cirri at the mouth, two on the upper and two on the lower jaw. The teeth of this kind are numerous; the dorsal fin is destitute of spinous rays; first ray of the pectoral fin is serrated; and the anal fin is long, and connected with the tail.

ASOUPAS, in *Geography*, a town of Persia, in the province of Farsistan, twenty-three leagues north of Schiras.

ASP, or **ASPIS**, in *Zoology*, a species of **COLUBER**, described by Linnæus, as having 146 plates on the belly, and 46 scales on the tail. Dr. Shaw has some doubt concerning the Linnæan aspis, but concludes it is the serpent described under the name of asp by the count de Cèpede, who informs us that it is a native of France, and particularly of the northern provinces of that country. The length is about three feet; the head rather large, and covered with small carinated scales; the scales of the body smaller, but of a similar structure. In the structure of its fangs it resembles the viper, and is said to be equally poisonous. M. Latreille

is not willing to allow this to be the real *Coluber aspis* of Linnæus.

In addition to the specific character of the coluber aspis (taken from the number of abdominal plates, and scales of the tail), Gmelin observes, that the nose is terminated by an erect wart; the body rufous, with figured streaks, which are alternately confluent, and the under side steel-blue dotted with yellow. Dr. Shaw calls his coluber aspis, the respectable viper, with roundish, alternate, dusky, dorsal spots, subconfluent towards the tail; and states the number of abdominal scuta to be 155, subcaudal scales 37.

The true asp of the ancients seems to be entirely unknown. It is very frequently mentioned by ancient writers, but in such a careless and indefinite manner that it is impossible to ascertain the species with precision. With the asp it is said the high-spirited princess Cleopatra effected her death, rather than submit herself as a captive to grace the triumphal entry of her conqueror Augustus into Rome. This trait of heroism in that distinguished character is contested. The indications of Cleopatra's having occasioned her death by means of an asp, were only two almost insensible punctures observed in her arm; and it is asserted by Plutarch, that it is unknown of what death she died.

Brown places the popular report of her death in this manner among his vulgar errors. Others are of a different opinion. Some have imagined it was the Egyptian viper, described by Hasselquist, which Cleopatra made use of on that occasion. Mr. Bruce is led to conclude, from various circumstances, that it might be the cerastes, *coluber cerastes* of Linnæus.

"I apprehend," says Mr. Bruce, in speaking of the cerastes, "this to be the asp which Cleopatra employed to procure her death. Alexandria plentifully supplied by water, must then have had fruits of all kinds in its gardens: the basket of figs must have come from thence, and the asp or cerastes that was hid in them, from the adjoining desert, where they are plenty to this day; for to the westward in Egypt, where the Nile overflows, there is no sort of serpents whatever that ever I saw, nor, as I have before said, is there any other of the mortal kind that I know in those parts of Africa adjoining to Egypt, except the cerastes. It should seem very natural for any one, who, from motives of distress, has resolved to put a period to his existence, especially women and weak persons, unaccustomed to handle arms, to seek the gentlest method to free themselves from the load of life now become insupportable."—"It is not to be doubted," adds Mr. Bruce still further, "but that a woman, high-spirited like Cleopatra, was also above the momentary differences in feeling; and had the way in which she died not been ordinary and usual, she certainly would not have applied herself to the invention of a new one. We are therefore to look upon her dying by the bite of the cerastes, as only following the manner of death which she had seen adopted by those who intended to die without torment. Galen, speaking of the asp in the great city of Alexandria, says, I have seen how speedily they (the aspies) occasioned death. Whenever any person is condemned to die, whom they wish to end quickly and without torment, they put the viper to his breast, and suffering him there to creep a little, the man is presently killed."

Lord Bacon makes the asp the least painful of all the instruments of death; he supposes its poison to have an affinity to opium, but to be less disagreeable in its operation; which does not so well agree with the description of the symptoms given by Dioscorides and others. Immediately after the bite, the sight becomes dim, a sensible tumour arises, and a moderate pain is felt in the stomach. Matthi-

olus adds, that the bite is followed by a stupor of the whole body, paleness, coldness of the forehead, continual yawning, nictitation of the eyelids, inclination of the neck, heaviness of the head, sinking into a profound sleep, and lastly convulsions. The bite of the asp is said by Aristotle to admit of no remedy. Pliny and Ægineta allow of no other cure, but to cut off the wounded part. Others recommend burning the part, with the internal use of hot alexipharmic medicines. The ancients had a plaster called *ασπιον*, made of this terrible animal, of great efficacy as a discutient of *strumæ* and other indurations, and used likewise against pains of the gout. The flesh and skin, or exuvia of the creature, had also their share in the ancient *Materia Medica*.

ASP, or *Aspen-Tree*, in *Botany*. See *POPULUS*.

ASPA, in *Ancient Geography*, a town of Asia, in Parthia, supposed to be *Ispahan*. Ptolemy.

ASPAPOTA, a town of the Scythians, on this side of Imaus. Ptolemy.

ASPACARÆ, a people of Asia, in Serica. Ptolemy.

ASPAGORA or ASPACORA, a country of Asia, in Serica.

ASPAH, in *Geography*, a town of Germany, in the archduchy of Austria, twelve miles east of Steyr.

ASPALATH, ASPALATHUM, in *Pharmacy*, the wood or root of a foreign tree, heavy, oleaginous, of a whitish and bitter to the taste, and of a strong smell, and purple colour.

It is brought from the Canary islands, in long crooked pieces full of knots, externally of a whitish colour, internally of deep yellow, with a reddish cast. Digested in rectified spirit, it gives out pretty readily the whole of its active matter, and tinges the menstruum of a reddish colour; infused in water, it gives out likewise great part of its smell and taste, together with a bright yellow colour; and distilled with water, it gives over slowly and with difficulty, a highly odoriferous essential oil, at first of a reddish colour, becoming reddish with age, and amounting, if the rhodium be good, to about an ounce from 50: the distilled water is likewise impregnated agreeably with the fragrance of the rhodium, and resembles that of damask roses. This oil is used as a perfume for scenting pomatums, &c. in this light only it is now generally regarded. Dr. Lewis, (*Mat. Med.*) observes that it promises to be applicable to more important purposes, and bids fair to prove a valuable cordial and corroborant.

The aspalath is otherwise called *lignum Rhodium*, or rosewood, and by some *Cyprus-wood*; the former on account of its sweet smell, or growth in the island of Rhodes; the latter from its being also found in the island of Cyprus. Though some will have aspalathum a different wood from the *lignum Rhodium*.

Aspalath was anciently in much repute, as an astringent, strengthener, and drier; but it is now much disused in internal practice.

ASPALATHIS, in *Ancient Geography*, an island of Asia Minor, on the coast of Lycia. Steph. Byz.

ASPALATHUS, in *Botany*, the name of a thorny shrub in Dioscorides, (from *α* and *σπαθος*, because the thorns were not easily drawn out of the wounds they made.) *Lin. gen.* 860. *Reich.* 931. *Schreb.* 1168. *Gærtn.* 1. 144. *Juss.* 353. *Class.* *dicotyledia decandria*. *Nat. Ord.* *papilionaceæ* or *leguminosæ*. *Gen. Char.* *Cal.* perianth one-leaved, five-cleft, divisions acuminate, equal, except that the upper is larger; *Cor.* papilionaceous, banner compressed, ascending, obovate, generally hirsute on the outside, obtuse, with a point; wings lunate, obtuse, spreading, shorter than the banner,

ner, keel bifid, conformable with the wings; *Stam.* filaments ten, united into a sheath, gaping longitudinally at the top, ascending, anthers oblong; *Pyl.* germ ovate; style simple, ascending, stigma sharp; *Leg.* legume ovate, awnless; *Seeds*, generally two, kidney-shaped.

Eil. Gen. Char. *Cal.* five-cleft, upper divisions largest; *Legume* ovate, awnless, with about two seeds.

Cl. This genus is singular in having several leaves from the same bud, in a shrubby plant.

Species, 1. *A. spinosa*, thorny aspalathus. Genistella, &c. Bryn. Cent. t. 25. Pluk. Phyt. t. 237. f. 6. "Leaves fasciated, linear, naked, surrounding a gummaceous spine." Flowers lateral, scarcely longer than the leaves; legume small, ovate at the base, triangular, upwards drawn to a point, compressed like a lens, containing two seeds, one compressed kidney-shaped, the other globular. 2. *A. verticillata*, warted A. "Leaves fasciated, filiform; buds warted, naked, tomentose." A shrub two feet high, with large buds or warts; leaves fleshy, smooth, sharpish, an inch long; flowers lateral, shorter than the leaves, subsessile; calyx pubescent; banner villose. 3. *A. capitata*, headed A. Pluk. Phyt. 307. f. 6. Seba Mus. 1. t. 23. f. 6. "Leaves fasciated, linear, sharp, flowers headed, bractes naked." Leaves pubescent; flowers covered with ferruginous down; segments of the calyx subulate; keel of the flower arched and the length of the banner. 4. *A. glomerata*, glomerate A. "Leaves fasciated, linear, sharp, villose bent inwards, flowers headed, divisions of the calyx ovate, corollas smooth." This differs from the third, in having its leaves bent inwards, the calyx ovate, and the corollas smooth. 5. *A. asproites*, hairy A. Pluk. Mant. 88. t. 413. f. 3. Seba Mus. 1. t. 24. f. 6. "Leaves fasciated, subulate, mucronate, smooth, stem villose, flowers scattered." This has the appearance of juniper; it branches very much, and the twigs are covered with hoary down, and loaded with a profusion of flowers. 6. *A. chenopodia*, gemita africana lutea, &c. Herm. Afr. 11. Chamelariæ. Bryn. cent. 23. t. 11. Seba Mus. 1. t. 23. f. 4. "Leaves fasciated, subulate, mucronate, rough with hairs, flowers headed, very hirsute." A shrub about three feet high, with slender branches terminated by the flowers, which are yellow, collected in woolly heads; the leaves are prickly like those of juniper. Cultivated in 1759, by Miller. 7. *A. albens*, white A. "Leaves fasciated, subulate, silky, spreading at top, bunches of flowers scattered." Shrubby, upright, and covered with brown bark, which is full of chinks; leaves in fives, sharp, spreading at the tip, of a silky whiteness; flowers terminating in bunches, tomentose, small of a silky white; calyx pubescent. Introduced here in 1774, by Mr. Masson. It flowers in July. 8. *A. thymifolia*, thyme-leaved A. Gen. minima, &c. Pluk. Mant. 88. t. 413. f. 1. "Leaves fasciated, subulate, unarmed, smooth, very short, flowers alternate." This is a very small shrub; the leaves are crowded together and shining, resembling those of thyme. 9. *A. ericifolia*, heath-leaved A. Gen. actb. non spinosa, &c. Pluk. Mant. 88. t. 413. f. 6. "Leaves fasciated, linear, unarmed, hirsute, flowers alternate, calyxes linear." A small shrub very much branched, pubescent, or extremely hirsute; leaves minute; flowers lateral, scarcely longer than the leaves; banner villose. 10. *A. nigra*, black A. "Leaves fasciated, linear, rather obtuse, flowers headed-spiked, pubescent." A branching shrub, three feet high; buds and twigs pubescent; leaves minute, and become black on drying; flowers terminating, pubescent, bractes in pairs, narrow. 11. *A. carnosula*, fleshy A. "Leaves fasciated, almost columnar obtuse, calyxes subpubescent, sharp, corollas smooth." About the height of the tenth species; branches naked, determinate; leaves subcylindric, fleshy,

bent in, smooth, four or seven together; flowers yellow, terminal, umbelled; calyx bell-shaped; bractes three, ovate, lanceolate. 12. *A. ciliaris*, "leaves fasciated, filiform, feabrous, flowers terminal sessile, banners pubescent." Stem shrubby, two feet high, branching determinately, somewhat hairy, with naked warts; leaves roundish, sharp, erect, rough beneath, and when young, ciliate; flowers three or five, with a yellow corolla, and an ash-coloured banner. 13. *A. gypsoides*, broom-like A. "Leaves fasciated, filiform, polished, calyxes subracemed, pendulous, which as well as the corollas are smooth." Shrubby, nine feet high, branching, with a reticulate bark, and white villose buds; leaves roundish, half an inch long; flowers three or four, terminal, pendulous; calyxes smooth, with short teeth; bractes two, minute; corollas yellow; style protruding. 14. *A. hystrix*, porcupine A. "Leaves fasciated, filiform, rigid, spiny, silky, flowers lateral, sessile, solitary, corollas villose." This shrub differs much from the other species by its leaves resembling silky white spines. 15. *A. galioides*. "Leaves fasciated, linear, polished; peduncles two-flowered, elongate, leafy at the end." Stem two feet high, decumbent, branching, smooth; warts of the buds small, remote, tomentose; leaves like those of Asparagus acute; teeth of the calyx the length of the corolla, which is smooth, yellow; legume ovate, lanceolate, smoothish. 16. *A. retroflexa*. "Leaves fasciated, subulate, smooth, very small; branches filiform, very spreading; flowers solitary, terminal." 17. *A. uniflora*, one-flowered A. Gen. Æthiop. glabra, &c. Pluk. Mant. 88. t. 414. f. 7. "Leaves fasciated, linear, unarmed, smooth; stipules sharp, permanent; flowers solitary, divisions of the calyxes boat-shaped." Branches alternate, crowded, tomentose; flowers one or two, terminal, pubescent, keel of the corolla tomentose. 18. *A. aranesia*, Gen. &c. Pluk. Mant. 88. t. 414. f. 4. Seba Thef. 1. p. 38. t. 23. f. 6. "Leaves fasciated, bristle-shaped, unarmed, hispid; flowers headed." Leaves hairy, beset with tubercles, and rough on both sides; banner hairy outwardly. 19. *A. asparagoides*. "Leaves fasciated, fetaceous, rather hairy; calyxes leaf-shaped, the length of the corolla, solitary." A shrub much branched, with small pubescent warts where the leaves fall off; leaves pointed, thinly scattered with hairs; flowers solitary, sessile. 20. *A. sericea*, silky A. "Leaves fasciated, lanceolate, silky; peduncles two-flowered, terminal, banner almost naked." This resembles the preceding, but the leaves are flat, and none of them in heads; flowers large, smooth. 21. *A. canescens*, hoary A. "Leaves fasciated, subulate, tomentose, silky; flowers lateral; banners pubescent." An erect, stiff, hoary shrub, with alternate branches; leaves sharpish; flowers sessile, at the sides of the branches; calyx bell-shaped, with subulate teeth, shorter than the body of it; bractes two, short, fetaceous; corolla yellow; banner hoary. 22. *A. heterophylla*, various-leaved A. "Leaves of the branches fasciated, of the branchlets ternate, linear, hairy, spikes terminal; calyx and corolla villose." Lower leaves in bunches, upper, ternate; spikes long, flowers yellow. This, and all the foregoing species, are natives of the cape of Good Hope. 23. *A. indica*, small-flowered A. Pluk. Alm. 225. t. 201. fig. 2. (called Lotus, &c.) "Leaves quinate, sessile; peduncles one-flowered." A slender shrub with alternate branches; leaves alternate; leaflets oblong, obtuse, bluntish, smooth, broader towards the end; peduncles axillary, much longer than the leaves, but shorter than the legumes; flowers of a pale red colour, and appear in May. A native of the East Indies, and in 1759, cultivated by Miller. 24. *A. cretica*, evergreen A. "Leaves trine, wedge-shaped, smooth, lateral ones shorter; stipules obsolete, flowers headed." About four feet high, with very flexible branches;

leaves many, small, narrow, oblong, fleshy, evergreen, reflex at the edge, with a hard point, sometimes eared at the base; peduncles axillary; flowers of a pleasant smell, in two rows, yellow, very small; legume small, yellowish, containing a single round compressed shining seed. A native of the Cape. 25. *A. quinquefolia*, five-leaved *A.* Pluk. Alm. 128. t. 273. f. 4. "Leaves in fives, sessile; peduncles spiked." The leaflets are lanceolate, petioled; a little hairy, mucronate; peduncles many times longer than the leaves, receme-spiked; corollas tomentose. A native of the Cape. 26. *A. trilobata*, three-toothed *A.* "Leaves trine lanceolate, smooth; stipules three-toothed mucronate, flowers headed." A native of the cape of Good Hope. 27. *A. pilosa*, hairy *A.* "Leaves in threes, linear villose; heads terminal, very hairy; corollas pubescent." Stems shrubby simple, a little hairy; leaves spreading, sessile, acute, subpubescent; head of flowers protected by bractes and calyxes, which have white hairs. A native of the Cape. 28. *A. anthylloides*. "Leaves trine lanceolate, equal subpubescent; stipules none, heads terminal." This shrub has a hirsute stem; the leaves are sessile, rather fleshy, the upper ones somewhat hairy; heads solitary, sessile, oblong; three bractes under each calyx. It has the appearance of a lotus or anthyllus. Cape. 29. *A. lasata*, loose leaved *A.* "Leaves tern linear, villose; flowers in bunches of five; calyxes woolly; stems prostrate round." Stem subherbaceous, decumbent, round, flexile, pubescent; branches alternate; leaves loose, on very short petioles; flowers terminal, sessile, no bractes; corolla smooth, yellow. Cape. 30. *A. argentea*, silvery *A.* Cytifus. &c. Pluk. Mant. 63. t. 345. f. 2. "Leaves trine linear silky; stipules simple mucronate; flowers scattered tomentose;" shrubby, four feet high; flowers sometimes in spikes, purple, downy. Cultivated by Miller in 1759. A native of the Cape. 31. *A. callosa*, callous *A.* Pluk. Mant. 63. t. 345. f. 4. "Leaves trine subulate equal; stipules roundish, callous; flowers spiked, smooth." An under-shrub, having the branches covered with round calluses, occasioned by the falling of leaves, which are sessile, with a callous base like those of juniper; spikes loose; bractes one-leaved; flowers yellow, smooth. Cape. 32. *A. orientalis*, Levant *A.* "Leaves ternate, lanceolate, pubescent; flowers in bunches of five; calyxes pubescent; stems erect, angular." Stems a foot high; leaves sessile, resembling those of flax; corollas yellow, the size of those of laburnum; stamens connate. Found in the Levant by Tournefort. 33. *A. mucronata*. "Leaves tern, polished, branches acuminate; flowers in racemes." Stem smooth; branches remote, tapering to a point; leaves lanceolate, on short petioles; racemes terminate, erect, on very short pedicels. Cape. 34. *A. pinnata*, pinnate-leaved *A.* "Leaves pinnate-quinate obovate; peduncles headed;" leaflets five, close, a little hairy, tomentose underneath, on short petioles; peduncle longer than the leaves; corollas rather tomentose. It resembles *A. quinquefolia*, n. 25. Cape. 35. *A. pedunculata*, small-leaved *A.* L'Herit. Ang. t. 26. "Leaves fascieled, subulate, smooth; peduncles filiform, twice the length of the leaf." Found at the Cape by Masson, and introduced into the Kew garden in 1775. It flowers in June. 36. *A. canalicans*, fair *A.* "Leaves trine and fascieled, filiform, silky; flowers sublateral, banners naked." This was also found at the Cape by Masson and introduced in 1774. 37. *A. arborea*, tree *A.* Lour. Cochin. 431. "Leaves pinnate-quinate; racemes terminating." This is a middle-sized tree with a straight trunk, and weak reclining branches; leaves smooth, entire, sessile; flowers white, small, banner-obcordate, broadish, ascending; wings oblong, equal to the banner; stamens allconnate.

Propagation and Culture. Few of these shrubs have hitherto been cultivated in Europe. They are to be propagated by seeds which must be obtained from the country where they grow spontaneously, and should be sown in pots filled with light earth as soon as they arrive: if this happen in the autumn, the pots should be plunged into an old tan-bed whose heat is spent, where they may remain till spring, when they should be removed into a temperate hot-bed, which will bring up the plants. But when the seeds arrive in the spring, the pots in which the seeds are sown should be then plunged into a moderate hot-bed; and in warm weather the glasses must be shaded during the middle of the day, and the plants frequently refreshed with water. Those seeds that are sown in the spring, seldom grow the same year; therefore, in the autumn, the pots should be put into an old tan-bed as above directed, and the following spring put into a hot-bed. When the plants become strong enough to remove, they should each be planted in a separate small pot filled with light earth and plunged into a moderate hot-bed to promote their rooting again, and as soon as they are established in the pots, they should gradually be enured to the open air, into which they are to be removed in the summer, and remain in a sheltered situation till autumn, when they must be placed in the green-house, allowing them very little water during the winter. See Martyn's Miller's Dict.

ASPALATHUS. See ROBINIA and SPARTIUM.

ASPALATHUS *Ebenus*. See AMERIMNUM.

ASPALAX, in *Zoology*, an animal mentioned by Aristotle, as being blind. The Romans and some moderns translating the term *aspalax*, mole, and knowing that this animal is not blind, have thought themselves warranted in denying the assertion of Aristotle. Olivier, however, has not long since brought from the Levant an animal actually blind, with its skin not so much as pierced in the place of the eyes. This animal lives under ground, and has all the characters ascribed by Aristotle to the aspalax. It is known to Zoologists under the name of *mus typhlus*, and *xemni*.

ASPALAX, a species of *Mus*, called by Pennant and later English naturalists the Daurian rat; Laxmann names it *Mus myaspalax*; and Pallas, Schreber, Gmelin, &c. specifically describe it as having a short tail, uneared or wedged foreteeth, no ears, and claws of the forefeet elongated. It is a native of the Altaie mountains, and of the country beyond the lake Baikal; like other subterranean or ground rats, it burrows with its snout and feet, raises numerous hillocks of earth in its progress, and feeds on bulbous roots. In respect of size, it varies considerably, being from five to eight inches and a half or more in length.

Dr. Shaw observes that this species in form and manners of life agrees with the *mus typhlus*, or blind rat; but is in general of a smaller size and of a yellowish ash colour, and in some specimens a whitish line or longitudinal streak appears on the top of the head; the upper foreteeth are naked, but the lower are covered with a moveable lip; there is no appearance of external ears, and the eyes are extremely small and deeply seated; the head is flat and blunt; the body short and somewhat depressed; the limbs very strong, especially the fore-legs, the feet of which are large, naked, and well adapted for burrowing into the ground, having five toes, the three middle of which are furnished with long and strong slightly curved claws; the hind feet are also naked, and have five toes with small claws; the tail is very short. Gen. Zool.

ASPALUCA, in *Ancient Geography*, a valley of the Pyrenées, now the valley of *Aspe*, in which was the Gabarus, or Gave.

ASPANEUS, a forest of Asia Minor, in the Troas, being a part of the forest of Ida. Strabo.

ASPANG, in *Geography*, a town of Germany, in the archduchy of Austria, seventeen miles south of Ebenfurth.

ASPARAGI, in *Entomology*, a species of *CHRYSOMELA* (Linn.), with a red thorax marked with two dots of black; wing-cases yellow, with a cruciform mark, and four spots of black. Geoffroy calls it le criocère porte croix de Pasperge; it is attelabus asparagi of Scopoli; lema asparagi of Fab. Ent. Syll. Supp.; cryptocephalus asparagi of Gmelin; and auchenia asparagi of Marsh. Ent. Brit. This mischievous intruder into the kitchen garden, is but too well known by its depredations in the larva state upon the beds of asparagus; it is a little grub of a blackish-brown colour, that feeds exclusively on these plants; and if neglected, will in the course of a few days leave nothing but the naked stalks of the asparagus remaining in those beds where they can once take up their residence. Donov. Brit. Inf. &c.

ASPARAGUS, in *Botany* (*Ἀσπαραγός*, a young shoot, before its leaves unfold). Lin. g. 424. Schreb. 573. Gærtn. 16. Juss. 41. Class. *hexandria monogynia*. Nat. Ord. *farnentaceæ*. Gen. Char. *Cal.* none. *Cor.* petals six, cohering by the claws, oblong, erected into a tube, three alternately interior, permanent. *Stam.* filaments six, filiform, inserted into the petals, erect, shorter than the corolla; anthers roundish. *Pist.* germ. turbinate, three-cornered; style very short; stigma, a prominent point. *Pst.* berry globular, umbilicated with a point, three-celled. *Seed.* two, round, angular on the inside, smooth. *Off.* According to Dr. Smith, there are three stigmata; the flower appears as if it were monopetalous.

Eff. Gen. Char. *Cor.* six-parted, erect, equal. *Cal.* none; style very short; stigmas three; berry superior, three-celled; seeds two, externally convex. Smith.

Species, 1. *A. officinalis*, common asparagus or sperage, Hudf. 145. With. 340. Smith Brit. 369. Eng. Bot. 339. Flor. Dan. 805. "Stem herbaceous, round, erect, leaves setaceous; stipules uniform, subsolitary." It grows wild in maritime places in the south of England, abundantly on the pebbly beach opposite the ferry going from Weymouth to Portland island. A variety β . viz. *A. maritimus crassifloro folio*, (Dill in Ray's Synop.) has been found in Anglesea. Root perennial, creeping, with very long, thick, simple fibres; stem erect, occasionally procumbent, round, simple, and bearing alternate scales (or stipules without leaves blow) in the upper part, branching in a paniced alternate manner; leaves in tufts, very narrow, and bristly, but flexible; stipules solitary, membranous, triangular, acute, the upper ones ovate and jagged; flowers from the axillæ of the branches on capillary simple stalks, drooping, white, none of the segments inflexed, in some the stamens, in others the pistillum occasionally abortive; style deeply three-cleft; berry red. It flowers in August. The above is a description of the plant in its wild state in which its stems are usually about the size of a goose's quill, yet this is now well known to be the origin of our luxuriant garden asparagus, for the cultivation of which ample instructions are subjoined 2. *A. declinatus*, long-leaved A. "Stem unarmed, round; branches declined; leaves setaceous." This resembles the common sort, but it is higher, has more and much longer leaves; stipules solitary, lanceolate-subulate, with a membranaceous point at the base downwards; leaves seven or ten in a bunch, filiform, spreading. A native of the Cape. Introduced in 1787, by Mr. Masson. 3. *A. falcatus*, sickle-leaved A. Burm. Flor. Zeyl. 36. t. 13. f. 2. "Prickles solitary, reversed; branches round; leaves ensi-

form, falcated." A native of Ceylon. 4. *A. retrofractus*, arch-leaved A. "Prickles solitary, branches round, reflected, and retrofracted; leaves setaceous, fascieled." Its branches are round dichotomous, warted at the divisions with a minute nodding prickle. The stalks are shrubby, crooked, irregular, eight or ten feet high; leaves long, narrow, in clusters like those of the larch. A native of the Cape. Cultivated by Miller in 1759. The leaves preserve their verdure all the year. 5. *A. atbiopicus*. "Prickles solitary, reversed; branches angulate; leaves lanceolate-linear." This is nearly allied to *A. falcatus*, but the leaves are smaller, and about seven in a bunch. The stipules put forth a reversed spine. A native of the Cape. 6. *A. asiaticus*, slender-stalked A. "Prickles solitary; stem erect; branches filiform; leaves fascieled, setaceous." It sends up many weak shoots in clusters, and armed with sharp spines at the sides and ends of the shoots; leaves in small clusters, and continuing green all the year. 7. *A. albus*, white A. "Prickles solitary; branches angular, flexuose; leaves fascieled, triquetrous, awnless, deciduous." Stems shrubby, covered with white bark, armed with thorns, three or four feet high, furnished with many branches, bearing short narrow leaves. These continue green all the winter, if screened from the frost. A native of Spain and Portugal; cultivated here in 1640. 8. *A. acutifolius*, acute-leaved A. "Stem unarmed, angular, shrubby; leaves needle-shaped, rather rigid, perennial, mucronate, equal." It has white, crooked, shrubby stalks, four or five feet high, without spines; leaves like those of larch, but short, and end in prickles. It resembles *A. aphyllus*, from which it differs in usually having seven leaves together, which are much smaller. A native of Spain and the Levant. Cultivated by Miller in 1739. 9. *A. horridus*, thorny A. "Leafless, shrubby, pentagonal; prickles four-cornered, compressed, striated." The spines are about the length of the finger. A native of Spain. 10. *A. aphyllus*, prickly A. "Stem unarmed, angular, shrubby; leaves subulate, striated, unequal, diverging. Stems weak, irregular, furnished with stiff, short spines instead of leaves; flowers small, of an herbaceous colour; berries very large, and black when ripe. A native of the south of Europe. Cultivated here in 1640. 11. *A. capensis*, cape A. "Spines in fours; branches aggregate, round; leaves setaceous." Pluk. Alm. t. 78. f. 3. Root tuberous; stems fruticose, filiform, flexuose; branchlets from the axillæ of the spines, filiform, loose, unarmed, deciduous; leaflets setaceous, acute, short. A native of the Cape. Cultivated in the royal garden Hampton-court, in 1691. 12. *A. farnentofus*, linear-leaved A. "Leaves solitary, linear-lanceolate; stem flexuose; prickles recurved." It rises five or six feet high; and its shoots are so closely beset with short crooked spines that it is difficult to touch the branches. The roots, which are long and fusiform, are eaten with broth or milk by the inhabitants of Ceylon, who are very fond of them. Cultivated in 1714, by the dukes of Beaufort. 13. *A. verticillaris*, whorl-leaved A. "Leaves verticillate." Found by Tournefort in the Levant.

ASPARAGUS, in *Gardening*, comprehends one of the most valuable esculent vegetables of the kitchen garden; it has erect, herbaceous stalks, three or four feet in height, and very fine bristly leaves; it is a perennial fibrous rooted vegetable, the roots being of many years duration, but the tops or stalks annual. The plants being raised from seed, after having acquired a period of three or four years growth, produce proper sized asparagus, of which the same roots furnish an annual supply for many years, continuing to rise in perfection for six or eight weeks in the summer season,

the shoots afterwards run up to stalks and flowers, and perfect feeds in autumn.

But besides the crop raised in the summer season, it may also be obtained in perfection during the winter, and early in the spring, by the aid of hot-beds, in the manner explained below.

Propagation of the Plants. It is observed by the authors of the *Universal Gardener*, that the propagation of this plant is by seed only, which may be easily obtained from seed-shops. It should be sown in February, or any time in March, in a four feet wide bed of rich earth, either broad cast on the surface, and directly raked in, or in drills longways six inches asunder, the ground being afterwards raked. In six weeks or thereabouts, the plants will generally appear; they should be kept clean from weeds all the summer, and in winter a little short stable litter spread on the ground to defend the crowns of the roots from frosts; and in the spring following they will be fit for transplanting where they are finally to remain, and in two or three years afterwards, as has been just observed, they will produce asparagus fit to gather.

Asparagus is always three years at least from the time of sowing the seed before the plants obtain strength enough to produce shoots of due size for the table; that is, one year in the seed-bed, and two after being transplanted, though it is sometimes three or four years after planting before they produce good full-sized shoots. But the same bed or plantation will continue producing good asparagus ten or twelve years, and even endure fifteen or twenty years; however, at that age the shoots are generally small, and the whole annual produce inconsiderable; a new plantation should therefore be made every eight, ten, or twelve years, as may be judged necessary. When new plantations of asparagus are required to be raised in the quickest manner for use, it should be done by purchasing ready-raised year-old plants of the nurserymen or kitchen gardeners, as in this way a year may be gained.

The best season of the year to make a plantation of these plants is in March, in common light ground, or at the latest, the first or second week in April; but in cold moist soils, from about the twentieth of March to the fifteenth of April.

In regard to soil and situation, the plants succeed tolerably well in any that is light and mellow, and that is sufficiently rich; but it is eligible to allow them a spot that is rich and light in one of the open quarters of the garden, that is exposed to the free air and full sun, as this is of much importance. Dung must be added six or eight inches thick at least; the ground is then to be trenched one or two spits deep, as may be necessary, burying the dung regularly in each trench, observing that where the trench is but one spade depth, the dung be buried well in the bottom; but if two spades depth, betwixt the first and second spit, or about ten or twelve inches below the surface. Where the trenching is performed in winter, or any considerable time before the planting season, it is proper to throw the ground into ridges to meliorate and improve by the weather into better preparation for planting, as well as for the benefit of the young plants. When the time of planting arrives, it is to be levelled down, which will be a further improvement. See *TRENCHING* and *RIDGING of Ground*.

The space of ground necessary to plant for private use is generally from about four or five to twenty rods, according to the extent of the family; and the proper quantity of plants to a rod, exclusive of the alleys, is about 260; one year old plants are to be preferred to such as are older, as those of that age will establish themselves sooner and more effectually than older roots. The plants at the time

of being put into the beds, consisting usually of only roots, are at the proper time to be taken up from the seed-bed with a dung-fork as entire as possible, and the strongest sorted out for use, but not trimmed, only such parts as are broken or bruised being cut off.

In planting, they are to be placed in rows a foot asunder, and formed into beds, each bed to consist of four rows ranging lengthways of them, and planted in drills, or in small narrow trenches, as explained below, allowing three feet and a half interval between every four rows, two feet of which to be afterwards allotted for an alley between the beds, and the rest to be annexed to the beds, which, as well as the alleys, must be regularly laid out in their proper dimensions, four feet and an half for the beds, and two feet for each alley between bed and bed. Or they may be at first marked out and formed into beds and alleys regularly and of their respective dimensions; the beds four feet and a half, and the alleys trodden out between the different beds two feet wide; then four spaces a foot asunder marked out for four rows lengthways of each bed, the two outside rows of each nine inches from the edge; stretch a line tight along the length of the bed in the first outside row, and with the spade held in an erect position, the back being towards the line, cut out a small neat trench along close to the line about six inches deep, forming the side next the line upright, turning out the earth evenly to lie close along the edge of the trench, ready to earth in the roots as planted; this being done, proceed to planting the row, placing the plants in the trench close against the upright side ten or twelve inches asunder, with the crowns upright about two inches below the surface, spreading the roots both ways, and drawing a little earth up to those of each plant as they are put in, just so as to fix them in their places till the whole of the row is planted; then directly rake the excavated earth into the trench over the roots and crowns of the plants evenly; which done, move the line a foot further for the next row, and cut out another trench as above, and plant it in the same manner, directly earthing over the plants as in the first row; and thus proceeding regularly with the rest till the whole is completed. Having finished the planting in either of the above methods, the bed and alleys may either be lined out now regularly, or deferred until the winter and spring dressing, though where the beds, &c. are formed previous to the planting, it may be eligible to line them neatly in their proper dimensions as soon as planted, making the edges of the beds full and straight, and the alleys level and even. In the other method, either forming the beds and alleys now or afterwards, as hinted above; observing that of the wide intervals of three feet and an half between the beds, two feet only are to be allowed for alleys, the other eighteen inches must be added to the beds, which will make each bed four feet and a half wide, nine inches on each side wider than the outside rows; and noting that in either method, if the beds, &c. are formed as soon as planted, the alleys at this time are only to be trodden out gently the proper width, without casting out any of the earth upon the beds, so as to stand in the alleys, and lightly to rake the bed even, drawing off any large stones and lumpy clods, so as to leave a smooth surface.

In performing the above, if you have occasion to make the most of every part of the ground, a thin crop of onions may be sown the first year on the same plat as soon as the asparagus is planted; but in this case, sow the seed moderately thin, raking it in regularly with a light and even hand, so as not to displace any of the asparagus plants.

The asparagus being planted in this manner, it requires the following culture.—The shoots moistly appear above ground

ground the beginning of May, commonly not much bigger than brans; all such must be permitted to run wholly to stalk. During summer, they must be kept clean from weeds by small hoeing or hand weeding them three or four times in the course of that season; and if there be a crop of onions, thin them in the usual way, cutting out all such as grow immediately close about the asparagus plants. In October, when the asparagus stalks decay, cut them down, and clear off all weeds from the beds into the alleys, and then dig the alleys two feet wide, burying the weeds therein, and spread some of the earth over the beds. See *Winter Dressing*.

This is all that is necessary to be done until March, at which time the beds should be deeply hoed and raked smooth, permitting all the shoots to run as in the first summer; and in October, cut down the decayed haulm as before, and land up the beds: in the spring following, being the second after planting, slightly fork-dig the beds, and rake them level. See *Spring Dressing*. In this spring, as the shoots rise of some tolerable substance, begin the first gathering of the largest plants in the first fortnight, but do not practise any general gathering till the third year. See *Gathering Produce*.

Winter Dressing, or landing up the Beds.—From about the middle of October to the latter end of November, is the time to give the asparagus beds their winter dressing. This consists in cutting down the decayed stalks of the plants annually at the above time, and clearing the bed from weeds, digging the alleys, and spreading some of the earth upon the top of the beds, which is called landing up the beds. It is done in the following manner.—The decayed stalks, or haulm, are cut down with a knife close or within an inch or two of the ground; then with a sharp hoe cut up all weeds, drawing them off at the same time into the alleys to be buried; after this, proceed to line out the alleys, stretching the line along the edges of the beds about nine inches from each outward row of plants, the stakes that are to be placed at the corners of the beds, or otherwise the stumps of the stalks, will be a guide; then with a spade chop the ground along by the direction of the line, by which you will form each bed four feet wide, and the alleys two feet. The alleys are then to be dug one spade deep, and a good portion of the earth spread over each bed two or three inches thick. As you proceed in digging, let the weeds drawn off the beds be trimmed into the bottom, and buried a due depth, observing to land the beds all a regular thickness, so as to make them about six or eight inches higher than the level of the alleys, forming the edge of each bed full and straight. This work must be repeated every autumn. It may be supposed by some that in annual landing of the beds, they may in several years be considerably raised; but by the spring forking and raking, together with the repeated hoeings and clearing off weeds in summer and at the time of preparing for landing up in autumn, a considerable part of the earth is annually drawn off again into the alleys.

After thus performing the winter dressing of the beds, a row or two of cabbage plants may be planted in each alley, as a place of shelter during winter, by which they will be forwarded for early spring coleworts; or a row of mazayan dwarf or other beans may be planted in November or December in the warmest side of each alley, for an early crop; or occasionally, where ground is scarce, some of the bed might be occupied during winter by planting a crop of cabbage lettuce on it for spring use, which being all gathered, or transplanted into other places, by the beginning of April, are supposed to do little harm. It must, however, be done with great care, and such crops not suf-

fered to remain long, otherwise they may injure the asparagus plants in a high degree.

Spring Dressing the Beds.—The spring dressing consists in fork digging the beds annually at that season to a moderate depth, to loosen the soil, that the buds may freely advance and swell to their due size. The season for performing this work is any time in March, but not later than the first or second week in April, because many of the buds will then be formed, and, in forward seasons, begin to advance in growth.

This work is mostly performed with a short flat three-pronged fork. In the first spring dressing after planting, it is proper to loosen the surface only with a hoe, two or three inches deep, and then rake the beds smooth. But the general spring dressing is to be annually performed by fork-digging all such beds as have been planted more than one year, three or four inches deep, with the asparagus fork; being careful to loosen all the earth as deep as the surface of the roots, having regard however not to wound the crowns of them; and afterwards all the beds should be neatly raked, to break clods, clear off stones, and form a level smooth surface, drawing off all rough earth, &c. into the alleys, which afterwards also rake up in a neat order.

Manuring the Beds.—These should be enriched with an addition of good rotten dung, once every two or three years at farthest, the benefit of which will be evident in the quantity, as well as the size and quality of the produce; and the season of applying this manure is at the time of winter dressing or landing up the beds. The dung for this purpose should be perfectly well rotted, as the dung of old cucumber and melon beds, or any other of similar quality, which should be applied after the stalks and weeds are cleared off; spread two or three inches thick over the surface of each bed, and a double portion in the alleys; the beds being then slightly fork-dugged to bury it; after this, dig the alleys in the usual way, and spread a portion of the earth evenly over the beds. In this way, the winter rains may wash the enriching quality of the manure into the beds and the roots, from the vegetation of the spring.

Gathering Produce.—As asparagus plants sometimes, in very rich ground, afford tolerable large buds the second year, here and there, one of the largest that happens to appear the first week or fortnight may be cut, afterwards permitting the whole to run to stalk; but in the third year, a more general gathering may be practised, and continue a month or six weeks; and in the fourth year the general produce will rise in its utmost perfection. Then, and every succeeding year, gather all the buds arising from every plant during the season of cutting. The proper size of the asparagus for use, is when the shoots are about two or three inches above the surface of the earth, while the heads remain compact and plump. The principal season of cutting them, is from the latter end of April, or beginning of May, according to the forwardness of the season, till the middle or latter end of June. They might, however, be obtained a month or two longer in the season, by continuing to cut all the buds, according as they attain proper size; but this would be a very wrong practice, as the roots would thereby continue sending up a fresh supply, till they in a manner exhaust their vegetable food, as would be apparent by the inconsiderableness of the future crop, and short duration of the plants. The principal gatherings should therefore be terminated generally towards the latter end of June, especially as by that time there will be plenty of young peas to be used as a substitute in its place at table.

In cutting the asparagus for use, it is necessary to be furnished with a strait narrow-pointed knife, the blade six or eight inches long, toothed on the edge like a saw, which is

to be slipped down close to each separate bud, in order to cut it off slanting, three or four inches within the ground; being careful not to injure any of the younger buds rising in succession, as there are generally several from the same root, advancing in different stages of growth.

Forcing Asparagus.—As asparagus is frequently required in winter, and early in spring, another method must be practised for obtaining it in these seasons. This is by means of planting the roots in substantial hot-beds, covered with frames and glasses. When it is intended to have a constant succession of asparagus during the winter and spring, a new hot-bed must be made, and planted with fresh plants every three or four weeks. As these roots when forced in hot-beds do not continue to yield any tolerable produce longer than that period of time, when they will in a manner be quite exhausted, and are not fit for that or any other purpose afterwards; therefore, for this purpose, a fresh quantity of plants must be in readiness for every new hot-bed. These are raised in the natural ground to a proper age: they must be three or four years old, the plants being raised from seed, as directed for the natural ground asparagus, and when they are one year old, transplanted into beds of rich earth, as directed also for the natural plantations, in rows a foot asunder; but they need not to be more than nine inches distant in each row, forming them in beds of six rows in each, with only two feet alleys, just to go in to clean off weeds, &c. as the beds need not be landed up in winter, as in the natural asparagus; but when the plants have had two summers' growth, they will, in good ground, be fit for forcing, though they are in greater perfection if permitted to stand three years. During the time they remain in the natural ground, none, or very few, buds should be gathered, the whole being permitted to run to stalk each summer. It is also necessary, when intended to force asparagus annually, that some seed should be sown every spring, and a due quantity of plants transplanted as before directed, so as to have three different pieces of ground always employed at the same time with plants for the above purpose; that is one piece with seedlings in the seed-beds, the other two with transplanted plants, one to be of a year's growth before the other; by which practice, after the three first years, an annual succession of plants fit for forcing may be procured. But where it is inconvenient to wait the raising of the plants in this manner, they may be furnished by most of the kitchen gardeners in the neighbourhood of great towns, where when raised to proper growth for this purpose, they commonly sell by measurement of the ground they grow upon, generally from six to ten shillings per rod, according to the age and size of the plants, and salubrity of the crop.

Mr. Nicol, in his *Forcing Gardener*, observes, that plants for this use should not be older than seven or eight years, nor younger than four years, and that they should be covered with litter or straw, in order to have access to them during frosts. The necessary quantity of plants for hot-beds is (he says) considerable, since about as many as grow upon three rods of ground, are requisite for a bed intended for a common three-light garden frame. The common allowance of the London gardeners is about one rod to a light; for the plants are to be placed as close as they can possibly stand to one another, to the amount of five, six, or seven hundred, or more according to their size, in a three-light frame, otherwise a bed would not supply a quantity adequate to the expense and trouble necessary in the culture of these plants in hot-beds; for, from a bed of the above dimensions, we commonly expect about three hundred large buds or ware, besides sprew, weekly, and in the whole, about eight or nine hundred good asparagus, and near as many small ones, in three weeks, in which period of time, the roots will have

exhausted their strength, and produce very little more. Therefore, in raising or procuring plants for the above purpose, the quantity must be proportioned to the number of lights you intend working, and the succession of asparagus required. The season for beginning the above work, is according to the time the asparagus is required for use; as for instance, if you would have good asparagus at Christmas, it is proper to make the hot-bed in the first or second week in November, and so on in proportion to any other time in winter or spring it is desired to have it fit to gather. The rule is this: if a constant succession is required from about Christmas till the time when the natural asparagus come in, a new hot-bed should be made every three weeks or a month from the beginning of November until that of March: but some begin about the latter end of September, in order to obtain asparagus about the second week in November. The proper materials for this sort of hot-bed are, according to the authors of the *Dictionary of Gardening*, a sufficient quantity of horse stable dung, fresh and full of heat; for one or more three light frames, two feet and an half or a yard high; also some to line the sides of the bed, when the heat declines, a quantity of good kitchen garden earth, and one or two three light garden frames to place over the beds, and some large garden mats to cover occasionally in nights and bad weather; the dung being previously prepared as directed under the article HOT-BED. The best situations for the hot-beds are some of the warmest and most sheltered compartments of the kitchen garden, or the melon or cucumber ground if there be room; though the London gardeners, when they make a considerable extent of asparagus hot-beds, often form them in or near some of the large quarters of the kitchen ground, where the soil is rich and light, for the convenience of having plenty of good proper earth at hand for earthing the beds, banking up the outside plants, and moulding at top, &c. The exposure should be open to the full southern sun, and well defended from the northerly winds. The beds may be made either wholly on level ground, or occasionally in a shallow trench, four or five feet wide and six or eight inches deep, or if intended to make them in any of the quarters of the kitchen ground, a trench might be formed as above, in which to make the beds for the sake of the earth being laid ready for earthing the beds and plants, and to save the trouble of bringing it from a distance, especially for beds of considerable length; but otherwise they may be made, as has been just seen, entirely on even ground in the most convenient situations. As to the general dimensions of the beds, they must be in proportion to the width and length of the intended frames, or rather a little wider and longer, to allow from three or four to five or six inches clear on each side and end, whereon to bank up some earth against the outside roots, &c. and they should be about a yard high, earthed at top about six inches thick for the reception of the plants, before the frames are put on, keeping them within the compass of them upright and as close as they can stand, as directed below. The clear space of a few inches on each outside end is, as suggested above, to receive a small bank of earth against the outside roots, both to defend them from the weather, and for the support of the frame; the latter of which, on account of the first violent heat, is not put on till some time after planting the roots: these, as soon as planted and banked up on the outides, are earthed over the crowns of the plants an inch deep, which should be increased to five or six when the buds appear through the first earthing, at which time as the heat of the bed will be moderate, the frame and glasses should be placed on. See *General Culture*.

The author of the Scotch Forcing Gardener, however, suggests, that the forcing of asparagus in flued pits, is by far the most eligible method, as such pits may answer several other purposes; besides the grais is of a much better colour and higher flavour than that produced on a dung hot-bed. Such a pit as is represented at fig. 1. in *Plate 1.* (GARDENING), will completely answer the intentions of the cultivator. As it frequently occurs in large families, where much company is kept, that this esculent is wanted in a hurry, the conveniency of a pit will be found to be a great relief in this respect; as it is much easier (by aid of flues) to forward or protract the growth of the plants here, than in a common hot-bed; on the one hand, if the plants are advancing too rapidly, you are, it is observed, under the necessity of cooling the bed in a certain degree; and on the other, if they are not advancing so fast as you could wish, you are under the necessity of applying linings, which is attended with trouble and loss of time. The author says, that a pit twenty-five or thirty feet long, and six wide, and which one fire can perfectly command, is sufficient to force asparagus to serve a large family from November to May, in a constant and regular succession; after which it may be advantageously employed in raising a late crop of melons or cucumbers, or in striking young pine-apple plants, &c. The trifling consumption of fuel, even where it is most valuable, ought not, he thinks, to deter any who require asparagus, French beans, sallada, &c. at an early season, from building so useful a compartment in the forcing garden. If, continues he, a scrupulous attention is paid to the design in general, particularly to the construction of the fire-places and flues, it will give more satisfaction to the gardener than any other hot-bed whatever, and in the end be a saving to the proprietor. In the construction of this kind of pit, as is shewn by the plate, the first course of the flue runs along the front, the bottom of which is about the ground level, and as the outer wall of the flue is only a brick in bed, it is obvious that early cellery, carrots, lettuces, radishes, cauliflowers, &c. &c. sown on a well-prepared border about two feet broad, immediately adjoining the breast of the pit, would reap infinite advantage from the flue. At the time of any operation within the pit, a board or plank, supported by bricks, &c. would defend the border from injury. The pit is about four feet in the back and three in the front, deeper than the bottom of the flues; which great depth is made on the presumption that it may be frequently used for pine-apple plants; but where it is used for asparagus alone, half the depth would be sufficient. It is immaterial whether the pit is entirely filled with tan or not; the author frequently used three-fourths of stable dung, prepared in the same manner as for a hot-bed, with equal success; but has always found that dung is worse to manage than the tan, as it is more liable to heat violently; besides, from the nature of the building, there is not a possibility of drawing off the rank heat, as in a hot-bed; for which reason, if dung is to be used, it ought to be sweated in a more careful manner. It is added, that a very small degree of bottom heat is sufficient for the purpose; and that if the pit has been previously employed with young pines, it will require no preparation whatever for asparagus roots, excepting to level and put a few inches of very rotten tan upon the surface. But if melons were the last thing the pit produced, it will be necessary to stir up the bed about two feet deep, and add a little new tan or dung; then level the surface with old rotten tan, as before. In either case the surface should be levelled in a sloping manner to the sun, about six inches above the bottom of the flues, allowing so much for the tan settling; the roots are then to be placed in and covered, as directed for the common hot-bed. If the pits

are from twenty to thirty feet long, one half will be sufficient for a time; and, to keep a constant succession, the other half may be filled in about fifteen or twenty days, which will begin to come up before the first is all used; after which, once a month or six weeks, according to the size of the pit and consumption of the family, may be sufficient, till it be fit for cutting in the open ground. It is recommended that no fires be made if the thermometer stands as high as forty-eight to fifty degrees; but, if necessary, covered with mats at night; also to admit plenty of air through the day, if the weather will permit. When it is necessary to make fires, it should be done with caution; a small one made in the evening will serve the whole night, and it will be unnecessary to make any in the morning, unless it be a great storm. He has, however, sometimes found it convenient to make a small fire in the morning, that he might have it in his power to admit air, and at the same time keep up a proper degree of heat. It is added, that warmth will here be required in a more plentiful degree than recommended for hot-beds; but due observation of the state of the tan and the health of the buds should always determine the warmth that may be necessary. In filling the first end of the pit a second time with fresh roots, it will be unnecessary to stir up the tan, &c. and perhaps it may be so even at the third filling; but by keeping a thermometer plunged in the bed, or watch-sticks, you will be best enabled to judge: at all events, there will be no necessity for adding fresh materials, as he has always found that trunching the bed to the depth of two feet or so has answered the purpose for the whole season. If dung or oak leaves are used, the bed should be turfed; and at least a foot of very rotten tan or light mould laid on before the roots are placed in. This precaution is unnecessary, he says, when tan alone is used; in which case, however, not more than an eighth part of new tan ought to be trenched in.

Method of making the Beds, planting the Roots, and Culture. When the first method is followed in the situation and exposure above described, it is advised by the authors of the *Universal Gardener*, to mark out the place of the hot-bed, of the proper width and length proportionably to that of the intended frame or frames, whether one, two, or more; and if a trench is intended, to dig out the cavity, only one moderate spit deep, and the width as above; then wheel in the dung, and with it form the bed of the proper width and length, either on level ground or in a trench, as just directed, raising it regularly of the same dimensions, about a yard high, especially in winter; but for the final spring beds, two feet and a half depth of dung may be sufficient, working the whole upright and firm in the usual manner.

Mr. Nicol, however, recommends that a sufficient quantity of stable dung be shaken up to heat and sweeten, and that after it has lain six or eight days, it be turned over and shaken well up again, in which state it may lie four or five days more; by which time it will be ready for building the bed; this must be done in the common way, to the height of four feet in the back and three in front, and about a foot larger than the frame all round; it is then to be well levelled, the whole covered with squares of turf, cut so as to join again exactly, which are to be laid the green side down, and smoothed well with the back of the spade; then place the frame thereon, which should be thirty inches deep in the back, and twenty in front, in which dry well-reduced old tan should be laid to the thickness of six or eight inches; which also level, and gently smooth with the spade. Where old tan cannot be procured, he advises a light sandy earth, with a fourth part of good vegetable mould. The bed will begin to heat in twenty-four hours, and must then have air admitted to pass off any steam that may arise, which

will however in general be inconsiderable; the only reason of turfing the surface is to prevent the steam, which, if carefully done, will have the desired effect. Yet, it sometimes happens, that there will be a little, especially if the dung did not undergo a proper fermentation; but until the grafs begin to appear, it is of no great consequence if there is a little steam in the frame, nor provided there is not much steam, whether it has any air admitted or not. But, from the moment the buds begin to peep through, the greatest attention must be paid to prevent steam, which is sure to give the grafs a disagreeable flavour and bad colour. In order to prevent the grafs from drawing up weak, a large portion of air must be admitted every day, if the weather be not stormy; and a little air should be let in at night: while the bed has a rank heat in it, Fahrenheit's thermometer should not stand above 50° at any time, unless in sunshine, and then not above 60° . By the above rule, it will easily be seen, whether matting at night is necessary, and to what extent, but it must be attended to, till it entirely disappears.

When the beds are formed in the first method, they are advised in the Dictionary of Gardening to be directly earthed at top for the reception of the plants, with finely broken earth six inches thick, to the full width and length of the beds, the surface being raked level and smooth. Then immediately proceed to place the roots, for no time must be lost in asparagus hot-beds, in waiting for the temperature of the heat; previously to planting the roots, mark out on the surface of the beds the exact width and length of the frames, so as to have a clear space on each outside of a few inches width, to receive the banking of earth against the outside roots, &c. as before mentioned; then begin at one end, and raise a small ridge of earth cross-ways upon the surface, five or six inches high, against which lay the first row of roots, then having the roots which are not to be trimmed, place the first course close against the above ridge, and entirely upon the surface of the bed, with the crowns upright, and as close to one another as you can possibly place them, either wholly upon the top of the earth, or only draw a little to the lower ends of the roots, or insert the ends a little into the earth, though they are often planted without either drawing any earth about the fibres, or inserting them there; and when one course or row is thus placed, lay another against these in the same manner; and so proceed, laying them one against another, every way as you can possibly crowd them, from one end of the bed to another, being careful to place all the crowns of such an equal height, that the whole may form as it were a level surface, keeping the whole rather within the measure of the frame, for they will unavoidably swell out a little on each side. If more frames than one are intended for the same bed, then, at the termination of the length of each frame, raise a cross ridge of earth, as at first, about six inches in height; so proceed laying the roots as before; and when all the roots are thus placed the whole length of the bed, directly bank up some earth on each side and end as above hinted, against the outside roots, raising it an inch higher than the crowns; then cover the crowns all over evenly with finely broken light earth an inch deep, which finishes the work until the buds appear; for the roots must not till then be earthed deeper, nor the frame and glasses placed upon the beds till the violent heat has subsided, because they would confine the burning steam, and occasion the bed to heat too vehemently to the destruction of the plants.

In forming the above beds, they sometimes, where necessary to the saving of dung, are only made the exact width of the frame, so as to secure the outside roots; but

for the support of the frame, raise a bank of earth quite from the ground, six inches broad at bottom, drawing it in gradually to the top, banking it close against the sides of the beds; and that of the outside roots, raising it an inch higher than the crowns at bottom of them, so earthing them all over the top an inch deep as before observed; which method of banking quite from the ground may also prove effectual in preserving the temperature of the bed, by defending the dung from driving rains, snow, and piercing winds. As soon as the beds are made and planted in either of the above methods, in order to judge of the temperature of the heat, it is proper to thrust some sharp-pointed sticks, two feet long, down betwixt the roots into the dung of the bed, and by drawing these up daily, and feeling the lower part, you will be able to judge of the degree of heat, whether too violent or weak, which is to be regulated accordingly.

The beds being made and planted, the roots will soon after send forth fresh fibres into the earth, and even in time into the very dung, and the buds of the asparagus begin to appear in a fortnight or three weeks; but till that period, as the heat will probably be very strong, the bed is to remain unframed and uncovered, except being occasionally defended at top; or at least, if the frames are placed on the beds, the glasses not fully put on, only using them occasionally if very inclement weather should happen at that time, just to protect the bed and crowns of the plants from excessive wet or rigorous frost; or the bed may be occasionally defended with long litter or garden mats from violent rains, snow, and severe frosty weather; observing, however, to use only occasional covering just to preserve the heat of the bed and the crowns of the plants till the buds begin to appear, and the heat becomes quite moderate, as at this period too much covering would increase the heat to a violent degree, and scorch or steam-scald the roots, which, in strong beds, must be particularly guarded against. The temperature of heat must therefore be every day examined by the trying-stick; and if it is found so vehement that you judge the roots are in danger of scorching, the remedy is to bore with a large rake-handle, &c. the sides of the bed quite through in several places, both in the dung, and betwixt the top of the dung and the earth, that the rank steam and burning quality may evaporate at the holes; at the same time the free air may have access, and in two or three days the bed will be reduced to a moderate temperature. On the other hand, if it should likewise be observed, that if the bed in a week or two after being made does not heat kindly, or seems rather to decline, it may be proper to lay dry or warm stable-litter round the sides and over the top, which will forward and revive the heat more effectually. When the asparagus begin to appear, they are then to have their final earthing of four or five inches depth of additional mould all over the crowns of the roots, and the frame and glasses put on. At this period prepare some light, rich, finely-broken earth, sufficient to mould them the above depth; at the same time in order to secure the outsides of the said final earthing, it is proper to form a sort of wreathing or empalement round the top of the edges of the bed four or five inches high, which is done either with a thick straw-baud, or by raising the outside banking an additional four or five inches; either of which, as just observed, is necessary not only to secure the sides and ends of the said final top covering of earth, but also to support the frames when finally placed on the beds.

The beds being now finally earthed and framed, and the heat become moderate, the glasses or lights are to be kept constantly upon the frames, which in the night should be covered

ered with mats, or dry long litter, but must be uncovered every day, except in uncommonly severe weather; for it is of importance, when the asparagus shoot begins to advance, to admit as much light and sun as possible, to promote a green colour in the tops of the buds; and as to the admission of fresh air, if the heat is moderate, the glasses need only be shoved a little open in fine days, especially if you require the plants to be drawn up quick; but by admitting a large portion of air, the buds rise slower, and will acquire a larger size and greener colour; on which consideration you may sometimes, in the spring-made beds, take the glasses entirely off a few hours in fine mild dry days, particularly when the heat of the bed is considerable at the first appearance of the buds after the bed is framed.

This is also the proper period to examine the temperature of heat in the beds. When they have been made about three weeks, if but small beds, the heat will probably begin to decline considerably, which should be renewed by a lining of hot dung applied to the sides; this is not to be omitted, particularly when the buds begin to appear through the last covering of earth, if there seem occasion for it; though beds of more considerable length seldom require lining till after the first breaking, or gathering of the buds, then adding good linings, they will maintain the beds in the due temperature from fifteen to eighteen days longer, which is generally as long as the roots continue yielding any tolerable produce. Mr. Nicol has however remarked, that he has seldom found it necessary to line asparagus beds; yet that sometimes in a storm it may be requisite. This, when necessary, should therefore be done with caution; and never more than one side of the beds at a time. Let the dung for this purpose, says he, be prepared in the same manner as for a bed at first; then cut, with a sharp spade or dung knife, the part you intend to line, perpendicularly by the side of the frame; reject the tan and turf, and use the rest along with the new dung, unless very much wasted; from twenty-four to thirty inches will be a sufficient breadth for the lining; raising it to about six inches above the bottom of the frame, and observing to tread it well towards the old dung, giving it a considerable slope on the outside, which naturally makes it lean that way. If the lining should raise too great a heat in the bed, or cause a steam, draw it off as directed above; and when it has done subsiding, let it be turfed in the same way as the bed was. In respect to water, he says, he has frequently produced a whole crop of asparagus without either earth or water. This, however, is not always the case, nor is it desirable; as if a little water is not required the dung must be in too moist a state, and consequently too much noxious vapour must have attended the whole process. It will be advisable however, he says, from the little sun there is, to be sparing in the use of that element at this season of the year.

The asparagus is mostly in a situation to be cut about five or six weeks after the planting of the beds, or when the plants are advanced five or six inches above the surface of the earth with which the beds are covered. In gathering the shoots in hot-beds, it is the best method to break them off as close to the bottom as possible, by thrusting the fingers and thumbs down into the beds.

ASPARAGUS *Draco*. See DRACENA.

ASPARAGUS *Scandens*. See MEDIOLA.

ASPARAGUS was also used, by the ancient Greeks, to express not only the young shoots of the plant of that name, but any other young sprouts of an eatable plant. The sprouts of the several kinds of cabbage were particularly expressed by this word, or sometimes by the compound term *cramb-asparagus*.

ASPARN, in *Geography*, a town of Germany, in the arch-duchy of Austria, ten miles south-east of Laab.

ASPASIA, in *Biography*, a native of Miletus, and daughter of one Axiochus, was one of the most celebrated ladies of antiquity, for her beauty, talents, and dissolute life. Theocritus says, that she kept an house of ill fame at Megara, and after her removal to Athens, she pursued the profession of a courtesan, and of a procurer. She was as much distinguished, however, by her mental accomplishments, as by the attractions of her person, and the infamy of her conduct. In eloquence she surpassed her contemporaries; and her conversation was so pleasing and instructive, that persons of the first distinction, male and female, resorted to her house, as to a school of rhetoric and science; and she numbered even Socrates among her hearers and admirers. Such were her attainments in philosophy and politics, as well as the graces of her person, that she captivated Pericles, the great Athenian statesman; so that after an illegitimate connection with her, he divorced his own wife, and married Aspasia. By her extensive knowledge, irrefragable elocution, and intriguing genius, she for some time directed and influenced the administration of Athens. Accordingly, to her have been imputed the war against Samos, and also that with Megara. At length Aspasia was criminally prosecuted by Hermippus the comedian, on the two charges of impiety, and of enticing women to her house for the gratification of Pericles; and it required all the tears and entreaties of Pericles to save her. After his death, she formed a connection with a person of low condition; and by her interest and influence advanced him to the first offices of the state. Plut. in vit. Pericl. Athen. lib. xiii. p. 560. Cicero in Brut. Bayle, art. Pericles.

ASPASIA was also the name given by Cyrus to a young woman of exquisite beauty, whose original name was *Milto*, and who was the daughter of Hermotimus of Phocæa, a person of mean circumstances. Having been taken captive by the commander of Cyrus, brother of Artaxerxes Mnemon, he sent her to his master, whom she so much captivated by her modesty and reserve, as well as by her personal charms, that he treated her more like a wife than a concubine. Cyrus made her the partner of his counsels, and the companion of his expeditions; and such was her moderation, that she used her influence merely in making the fortune of her father, without aiming at any wealth and splendour on her own account. Her respectful attention to Parysatis secured her favour; and her magnificence was only displayed in her offerings to Venus, whom she considered as the patroness of her fortunes. When Cyrus lost his life in an engagement with his brother, she was equally favoured by him, into whose hands she fell, as by her former master. Plutarch and Justin relate, that when Darius, son of Artaxerxes, was declared his successor, and according to the customary privilege allowed him, asked of his father this Aspasia; the fair female being permitted to make her election, preferred the son. Upon which Artaxerxes took her out of his son's possession, and made her priestess of Diana, thus obliging her to perpetual continence; but the artifice occasioned the rebellion of Darius. The story, however, is attended with some circumstances which weaken its credibility. Bayle, art. Cyrus.

ASPASIA. Etius has preserved some fragments of the works of this female physician, and commends some of her compositions. She pretended to be acquainted with the use of certain drugs that were efficacious in procuring abortion, and even in preventing women from conceiving. These, however, were only to be administered, she said, to women who were incapable (from distortion, or some natural defect,

we suppose) of bearing living children, or of undergoing the pains of labour, without manifest danger of their lives. There have never been wanting persons professing to be able to procure abortion, with perfect safety to the women; but either these have been the vain boasts of impudent pretenders, or the art has been long lost, no drug or composition now known possessing such powers. See the article ABORTION in this work. It is not known who this Aspasia was, or in what age she lived. Le Clerc Hist. de Med.

ASPASIA, in *Entomology*, a species of PAPHIO, in the family *Heliconius*. It inhabits Tranquebar: the wings are black, with transparent streaks and spots; and the posterior ones yellow at the base. Fabricius, &c.

ASPASIA, among *Ancient Physicians*, a constrictive medicine for the *pubenda muliebri*. It consisted only of wool, moistened with an infusion of unripe galls. Castell. Lex. Med.

ASPASIÆ, in *Ancient Geography*, a people of Asia, placed by Polybius between the Oxus and the Tanais; probably the same with the *Aspasairæ* of Strabo, and the *Aspassi* of Ptolemy.

ASPASTICUM, in *Ecclesiastical Writers*, a place or apartment adjoining to the ancient churches, wherein the bishop and presbyters sat, to receive the salutations of the persons who came to visit them, desire their blessing, or consult them on business.

This is also called *aspaticum*, *diaconicum*, *receptorium*, *metatorium*, or *vesitorium*, and *saluatorium*; in English, *greeting-house*.

ASPATHEIS, in *Ancient Geography*, a town of India, on this side of the Ganges. Ptolemy.

ASPE, in *Geography*, a town of Spain, in Valencia, situated on the Eida, four leagues west of Alicant.

ASPE, a valley of Berne, in Switzerland, between the Pyrenees and the town of Oleron. The river of Oleron passes through this valley, and is called the *Gave of Alpe*.

ASPE Viejo, a town of Spain, in Valencia, three leagues and a half west of Alicant.

ASPECT, in *Astronomy*, is used for the situation of the stars, or planets, in respect of each other; or, in *Astrology*, it denotes a certain configuration, and mutual relation between the planets, arising from their situations in the zodiac, whereby their powers are supposed to be mutually either increased or diminished, as they happen to agree or disagree in their active or passive qualities. Though such configurations may be varied and combined a thousand ways, yet only a few of them are considered. Hence Wolfius more accurately defines aspect to be the meeting of luminous rays emitted from two planets to the earth, either situate in the same right line, or including an angle which is one or more aliquot parts of four right angles.

The doctrine of aspects was introduced by the astrologers as the foundation of their predictions. Hence, Kepler defines aspect an angle formed by the rays of two planets meeting on the earth, able to excite some natural power or influence.

The ancients reckoned five aspects, viz. *conjunction*, when the planets are in the same sign and degree, or have the same longitude, denoted by the character \odot ; *opposition*, where they are in opposite points of the circle, or at the distance from one another of 180 degrees, expressed by \odot ; *trine*, when they are distant one-third of the circle, or 120 degrees, denoted by Δ ; *quadrate*, or *quartile*, when they are distant $\frac{1}{4}$ th of the circle, or 90 degrees, marked by \square ; and *sextile*, when their distance is the sixth part of a circle, or 60 degrees, denoted by \ast .

Conjunction, and opposition, are the two extremes of the aspects; the first being the beginning, and the second the highest or ultimate term.

The aspects are divided, with regard to their supposed influences, into *benign*, *malign*, and *indifferent*.

The quadrate aspect and opposition are reputed malign, or unfriendly; trine and sextile, benign or friendly; and conjunction, an indifferent aspect.

To the five ancient aspects, the modern writers have added several more: as *decile*, containing the tenth part of a circle; *tridecile*, three-tenths; *quintile*, a fifth part of the circle; and *biquintile*, four-tenths, or two fifths.—Kepler adds others, as he tells us, from meteorological observations; as the *semi-sextile*, containing the twelfth part of the circle; and *quincunx*, containing five-twelfth.—Lastly, to the astrological physicians we owe, *orbis*, containing one-eighth; and *triseptile*, containing three-eighths.

The angle intercepted between two planets in the aspect of conjunction is 0; in the semi-sextile aspect, 30°; in decile, 36°; in octile, 45°; in sextile, 60°; in quintile, 72°; in quartile, 90°; in tridecile, 108°; in trine, 120°; in tri-ocile, 135°; in biquintile, 144°; in quincunx, 150°; in opposition, 180°.

These angles, or intervals, are reckoned on the secondary circles, or according to the longitudes of the planets; so that the aspects are the same, whether a planet be in the ecliptic, or out of it.

The aspects are also divided into *partile* and *platic*.

ASPECTS, *Partile*, are when the planets are just so many degrees distant, as is above expressed. These alone are the proper aspects.

ASPECTS, *Platic*, are when the planets do not regard each other from these very degrees; but the one exceeds as much as the other falls short.—So that the one does not cast its rays immediately on the body of the other, but only on its orb or sphere of light.

ASPECT, *Double*, is used in painting, where a single figure is so contrived, as to represent two or more different objects, either by changing the position of the eye, or by means of angular glasses.—Instances hereof, see under the articles ANAMORPHOSIS, CATOPTIC, CISTULA, and MIRROR.

ASPECT, in *Gardening*, is used for what we otherwise call *exposure*.

ASPECT, in *Military Language*, is applied to a country and to an army thus: a country is said to have a *military aspect*, when its general situation presents appropriate obstacles or facilities for an army's acting on the offensive or defensive. An army is said to hold a *menacing aspect*, when by advanced movements or positions it gives the opposing army reason for apprehending offensive operations. An army is said to have an *imposing aspect*, when it appears stronger than it really is; and this aspect is assumed for the purpose of deceiving an enemy, and serves as a kind of feint in war.

ASPEN-TREE, in *Planting*, a species of the poplar, having small roundish leaves with an angular indenture, and smooth surfaces on both sides. According to Marshall the leaves of this tree stand upon long, flat, slender footstalks, which render them liable to be shaken by the least wind; whence it has been called the trembling poplar or aspen-tree. This tree will grow on most kinds of soil, but may be cultivated to the greatest advantage on such as are inclined to be moist, without having much stagnant surface water. In such situations, they will sometimes grow to a considerable size. They may be raised in the same way and with equal facility as the common poplar. The wood of the aspen-tree is light, porous, and open; consequently of little value as timber.

timber. From its lightness, it might however probably be used to advantage for the purpose of common field-gates, hurdles, and other similar uses. In Mr. Marshall's treatise on Planting, it is represented as wholly unfit for being set in such grounds as are intended to be kept for pleasure, on account of the great number of suckers that are annually thrown up by it. See *POPULUS*.

ASPENDI, in *Ancient Geography*, a people of Pamphylia, who inhabited the town of Aspendus. They fortified their town in order to dispute the payment of the tribute which they had promised to Alexander; but he marched against them, and compelled them to submit; and afterwards doubled the tribute which he had at first demanded.

ASPENDUS, a town of Pamphylia, situate upon the Eurymedon, at the distance of 66 stadia from the sea, according to Strabo, who says that it was well-peopled, and that it had been founded by a colony from Argos. In M.D'Anville's map, it is placed between Perga and Sida.

ASPER, or *SPIRITUS ASPER*, in *Grammar*, denotes a character, or accent, in form of a c; placed over certain letters, in the Greek tongue, to shew they are to be strongly aspirated, and that the breath is here to supply the place of an h: as ἄσπ, *water*. The spiritus asper, or that mark which corresponds to the letter H, was undoubtedly in use among the ancient Greeks. Their H was at first a spiritus asper, and was taken from the Hebrew ח, and was retained in the same figure H in Latin. The Greek H was used in ancient monuments, instead of a spiritus asper, and the same letter stands for 100, because they wrote the word ἑκατόν, thus, HEKATON. Nevertheless, the ancient Grecians did not judge it necessary always to express this aspiration upon their monuments. Thus upon a medal of the Pyrians we find IEPAC. Hence it is very doubtful, whether this aspiration was in common use in the time of the apostles; and it becomes much more doubtful, when we consider, that the most ancient versions so frequently confound ἄσπ with ἄσπ, that both words seem to have been written without an aspiration. Marsh's *Michaelis*, vol. ii. p. 522. See *ASPIRATE*.

ASPER, or *ASPRE*, in *Commerce*, signifies a small Turkish silver coin, wherein most of the grand signior's revenues are paid.

The asper may be estimated at 6 deniers (one farthing).—The only impression it bears is that of the prince's name under whom it was struck.—The pay of the janizaries is only distributed every three months, and has a progressive increase from 3 aspers to 99; and 99 aspers are equivalent to 49½ sous, or about two-shillings and three farthings. But from an estimate made of the respective currency, the course of exchange reduces it to 39 sous 6 deniers (1s. 7d. 3); though this calculation is much above the intrinsic value of this coin.

ASPER, in *Conchology*, a species of *MUREX* described by Martin, (*Coch.* 4. t. 150.) The shell is plaited longitudinally, and ribbed transversely; spire rather prominent; aperture ovate; and the lip crenulated. This kind is reddish; whorls about five or six, and the ribs acute. Gmelin. In the *Gmelinian Systema Naturæ*, there is also another species of *MUREX* under the same name, which is a native of Guinea; the whorls of the spire are fuscated transversely, striated, and muricated; and the tail (or beak) ascending. The colour is milky white, with rows of brown dots; solid, with from twelve to fourteen furrows; aperture rather oval; and a single plait on the pillar lip. Gmelin.

The first species belongs to the section *Caudigeri*, cauda subulata clausa recta elongata, testa inermi (or murices, with subulate, straight, elongated, and closed beak, and

shell unarmed); and the second to *turriti subulati*, cauda brevissima (murices tapering, subulate, and furnished with a very short beak).

ASPER, a species of *TROCHUS*, figured by Chemnitz, the native place of which is unknown. The shell is obtuse; whorls round, with many rows of tubercles, fuscated and striated transversely; pillar-lip dentated; aperture lunated. This kind is of the middle size, cinereous, or testaceous; lip plaited and rugose within.

ASPER, in *Entomology*, a species of *CERAMBYX* (*Stenocorus* Fab.), a native of Italy, and figured by Sulzer. It is black, rough, thorax armed with two spines; wing-cases tuberculated in the middle. Sulzer, &c.

ASPER, a species of *SCARABÆUS* found in Europe; the head and thorax are grooved transversely; wing-cases striated. Fabricius, &c.

ASPER, a species of *CANCER* found on the British coasts. The thorax is heart-shaped, spinous; two spines on the proboscis; legs and arms spinous.

ASPER, in *Ichthyology*, a species of *PERCA*. It is fasciated with yellowish, and has thirteen rays in the second dorsal fin. Johnston, Ray, and others, call this asper pisciculus; and asper pisciculus, gobionis similis.

ASPERA ARTERIA, in *Anatomy*. See *ARTERIA Aspera*.

ASPERA, in *Conchology*, a species of *TELLINA*, about an inch and three quarters in length, and three inches in breadth. This shell is pointed at one end, yellowish within, and externally radiated, and rough, with transverse ribs. Gmelin. Country unknown.

ASPERANA, in *Entomology*, a species of *PHALÆNA* (*Tortrix*), found in the vicinity of Hamburg, and other parts of Europe. The anterior wings are white at the base, brown at the tip, and rough. This insect belongs to the *Tortrix* section in the Linnæan and Gmelinian arrangements; in that of Fabricius to the section *Pyralis*.

ASPERELLA, an European species of *PHALÆNA*, of the *Tinea* tribe. The anterior wings are whitish, emarginate at the tip, with two common black spots. This is *phalæna tinea alis albidis*; macula communi fusca, apicibus nigro punctatus retulis of Linn. Fn. Sv.

ASPEREN, in *Geography*, a small town of Holland in the country of Gorkum or Arkel, seated on the Linge, two leagues north-east from Gorkum, and five south from Utrecht.

ASPERGELLOUS, in *Botany*, the name given by Micheli to that genus of mosses called by Dillenius and others; *byffus*.

ASPERGILLUM, in *Antiquity*, a long brush made of horse-hair, fixed to a handle, wherewith the lustral water was sprinkled on the people, in lustrations and purifications. Horsley Brit. Rom. lib. ii. cap. 1.

This is also denominated *aspergile*, and *asperforium*. The ancients, instead of a brush, made use of branches of laurel and olive. It is also used in *Ecclesiastical Writers*, to denote the instrument in Romish churches, wherewith holy water is sprinkled.

ASPERIFOLIUS, in *Botany*, one of the divisions or classes of plants in the *Fragmenta Methodi Naturalis* of Linnæus; so denominated, because they are usually rough-leaved. According to Mr. Ray, these plants make a distinct genus, the characters of which are, that the leaves stand alternately, or without any certain order, on the stalks: the flowers are monopetalous, but they have the margin cut into five divisions, sometimes deep, sometimes shallow; and the upper spike or top of the plant is often curved back, something like a scorpion's tail.

In the place of each flower, there usually succeed four seeds; Mr. Ray supposes the cerinthe the only plant of this genus that hath less than four seeds at the base of each flower: this indeed hath but two.

To the class of herbe asperifoliae, referred in the Linnæan system to the monopetalous tetraspermous distinction, under the class of pentandria and order of monogynia, belong the pulmonaria, cynoglossum, borago, anchusa, echium, heliotropium, lithospermum, cerinthe, heliotropium, myosotis, symphytum, onofina, asperugo, lycopsis, porana, tournefortia, and messerschmidia.

They all possess the same general virtues, and are accounted glutinous and vulnerary.

ASPERITY, implies the inequality or roughness of the surface of any body; by which some parts of it are so much more prominent than the rest, as to hinder the hand, &c. from passing over it with ease and freedom.

Asperity, or roughness, stands opposed to smoothness, evenness, politure, &c.—From the asperity of the surfaces of contiguous bodies arises friction.

According to the relations of Vermausen, the blind man so famous for distinguishing colours by the touch, it should appear, that every colour has its particular degree and kind of asperity. He makes black the roughest, as it is the darkest of colours: but the others are not smoother in proportion as they are lighter; i. e. the roughest do not always reflect the least light: for, according to him, yellow is two degrees rougher than blue, and as much smoother than green. See COLOURS.

ASPERNATA, in *Entomology*, a species of PHALÆNA, of the *geometra* family, described by Linnæus. The wings are whitish; anterior margin subferruginous. Inhabits Europe. Mus. Lest. Gmel. &c.

ASPEROSA, in *Geography*, a town of European Turkey, which is a bishop's see, seated on the north-east of the Archipelago, and not far from the island of Tasso, opposite to the northern point of which is a cape of this name. N. lat. 40° 58'. E. long. 24° 20'.

ASPERRIMUS, in *Conchology*, a species of MUREX. The shell is brown, varied with yellow and white, and ribbed; whorls oblique, with a tuberculated margin; a brown band in the middle, and another of white; tail short, dilated, and ascending; length about two inches. Gmelin, &c.

ASPERSA, is a species of HELIX that inhabits Italy. The shell is subimperfurate, rather globose, pale yellow, with four rufous bands interrupted with white spots; lip white. Müll. Gmel. This kind is from an inch to an inch and a half in diameter; subrugose, with minute impressed dots; rarely white; whorls four, and the aperture elongated. The synonyms, quoted by Gmelin, are very doubtful, if not incorrect.

ASPERSA, in *Natural History*, a species of ASCIDIA, described by Müller, Zool. Dan. as a native of the Norway sea. This is rather compressed, and somewhat rough, white, bag spotted with red. Adheres to sea-weeds; is heart-shaped; skin pellucid, and smooth within; bag yellowish.

ASPERSED, in *Heraldry*, a term sometimes used instead of powdered or strewed.

ASPERSION, formed of the Latin *aspergere*, to sprinkle; of *ad*, to, and *spargo*, I scatter, the act of sprinkling with water, or some other fluid.

Some contend for baptism by *asperison*, others by *immersio*.

ASPERSKIRCH, in *Geography*, a town of Germany, in the archduchy of Austria, five miles to the south-east of Peyrbach.

ASPERSTORFF, a town of Germany, in the archduchy of Austria, two miles north-east of Sonneberg.

ASPERUGO, in *Botany* (ab asperitate), a rough-leaved plant. Lin. g. 189. Schreb. 249. Juss. 131. Class, *pentandria monogynia*. Nat. Ord. *asparifolia*. *Borraginæ* Juss. Gen. Char. *Cal.* perianth one-leaved, five-cleft, erect, with unequal toothlets, permanent. *Cor.* one-petalled, funnel-shaped; tube cylindrical, very short; border semiquinquefid, obtuse, small; throat closed with five convex, prominent, converging, little scales. *Stam.* filaments five, in the throat, very short; anthers oblongish, covered. *Pist.* germs four, compressed; style filiform, short; stigma obtuse. *Per.* none. *Calyx* very large, erect, compressed; lamellas flat-parallel, sinuate. *Seeds*, four, oblong, compressed, distant, by pairs.

Ess. Gen. Char. *Calyx* of the fruit compressed; lamellas flat-parallel, sinuate.

Species, 1. *A. procumbens*, procumbent asperugo, or German madwort. Hudf. 82. With. 231. Smith Brit. 220. Flor. Dan. 552. Eng. Bot. 661. "Calyx of the fruit flat." Root annual, small, attenuated; stems procumbent, angular, rough, leafy; leaves opposite, ascending, oblong, rough; flowers axillary, solitary, pedunculated, small, blue; calyx of the fruit large, compressed, close, reticulated, with a fetaceous margin, concealing the seeds. It grows among rubbish in roads, &c. flowering in April and May. Small wild bugloss, or horrage, great goose-grass, are also names under which it has been known, 2. *A. ægyptiaca*, Egyptian asperugo. Jacq. Hort. v. 3. t. 21. "Calyx of the fruit swelling." Root annual; stem eight inches high, with divaricating hispid branches; leaves broad-lanceolate, alternate, beset with rough hairs; flowers yellow, all directed the same way, on thick stalks. A native of Egypt, flowering from June till August.

Propagation and Culture. The second, or Egyptian species, may be raised from seeds sown in a temperate hot-bed. The plants will flower in the open air in summer, but they must be housed in winter.

ASPERULA, in *Botany* (a diminutive of *asper*, the seeds of the plant being roughish). Lin. g. 121. Schreb. 157. Juss. 196. Class, *tetrandria monogynia*. Nat. Order, *stellata*. *Rubiaceæ* Juss. Gen. Char. *Cal.* perianth superior, small, four-toothed. *Cor.* one-petalled, funnel-shaped; tube cylindrical, long; border four-parted; divisions oblong, obtuse, reflex. *Stam.* filaments four, at the top of the tube; anthers simple. *Pist.* germ twin, roundish, inferior; style filiform, bifid; stigmas headed. *Per.* two dry globular united berries. *Seeds*, solitary, roundish, large.

Ess. Gen. Char. *Cor.* one-petalled, funnel-shaped. *Seeds*, two, globular.

Species 1. *A. odorata*, sweet woodruff or woodroof. Hudf. 66. With. 185. Smith Brit. 172. Curt. Lond. f. 4. t. 15. Flor. Dan. 562. Eng. Bot. 755. "Leaves eight in a whorl, lanceolate; flowers fascicled, peduncled; fruit hispid." Root perennial, creeping; stems erect, simple, smooth; leaves seven, nine, but most commonly eight in every whorl, elliptic-lanceolate, rough at the edge; panicles terminal, trifid, or dichotomous; flowers white, sometimes sweet-scented, about four; fruit rough, with fetaceous hairs. When recent, the plant is inodorous; but on being dried, it is very fragrant like vernal grass. It grows in woods, flowering in May. 2. *A. arvensis*, blue woodroof; "leaves six in a whorl; flowers sessile, terminal, aggregate." Root annual, slender; stem a foot high, roughish, jointed, dichotomous; leaves linear-lanceolate, beneath whitish with hairs; a close umbel of sessile flowers terminates the stem and branches; flowers blue. A native of the south of Europe, flowering in July. It was introduced here, in 1772, by M. Richard.

Richard. 3. *A. lasius*, broad-leaved woodroof; "leaves four in a whorl, ovate-lanceolate; flowers in terminal bunches." Root perennial, woody; stems a foot high, branched; base hairy, nerved; peduncles one or two; bractes elate. A native of the mountains of Switzerland and Italy, flowering in June. It was cultivated by Miller in 1739. 4. *A. cretense*, thick-leaved woodroof; "leaves four in a whorl, oblong-lanceolate, revolute, bluntish, pubescent." Stem alternately branching; leaves the length of the internodes, the whorls on the branches more remote, and leaves narrower, unequal; flowers few, in upright terminal branches, pubescent on the outside. A native of Crete and the Levant, flowering in June. Introduced here by Mout. Thénin, in 1775. 5. *A. calabrica*, Calabrian woodroof, L'Herit. stirp. nov. 4. 65. t. 32. "Leaves four in a whorl, oblong, obtuse, imbric. odd and even." An undergrowth, a cubit high, decumbent, fetid. Leaves linear-lanceolate, one-nerved; there is a short sharp upright stipule between the leaves, half embracing the stem; flowers three or four, in terminating corymbs; bractes two-leaved, acute, spreading a little below the germs. A native of Syria. The fetid smell of this sufficiently distinguishes it from the other species. 6. *A. thoria*, narrow-leaved woodroof; "leaves linear, the lower six, the middle four, in a whorl; stem flaccid; flowers generally trifid." Stem branching, procumbent, three feet in length; leaves resembling those of wild thyme; peduncles from the axilla of the leaves, forming little umbels; flowers white; seeds smooth. The roots are used in Gothland for dyeing wool of a red colour. A native of Sweden, Germany, Switzerland, &c. Cultivated by Mr. James Gordon in 1764. 7. *A. pyrenaica*, Pyrenean woodroof; "leaves four in a whorl, lanceolate-linear; stem erect; flowers generally trifid." Root perennial; stems six or seven inches high; leaves keeled, acute, smooth; lower ones shorter, more obtuse, lanceolate; upper and floral leaves opposite, broader; flowers red. A native of the Pyrenæes, and about Basil. 8. *A. cynanchica*, spinney-wort, or small woodroof. Huff. 66. With. 186. Smith Brit. 173. Eng. Bot. 33. Rubicola vulg. &c. Ray Syn. 225. "Leaves four in a whorl, linear; the upper ones very unequal; flowers all quadrifid; fruit smooth." Root perennial, fibrous; lower leaves in fours, on the branches obovate; upper leaves linear, and those near the top very unequal, so that the intermediate pair seems diminished into stipules; umbels terminal; corollas of a flesh colour, marked with red lines, fragrant; fruit smooth. It grows in England on warm banks, affecting a calcareous soil. 9. *A. aristata*, awn-flowered woodroof; "leaves linear, rather fleshy; lower ones four in a whorl; flowers subternate." Stem upright; flowers pale, yellowish, placed parallel, divisions bluntly awned. A native of the south of Europe. 10. *A. leucata*, shining woodroof; *galium rotundifolium*, Jacq. And. t. 58. t. 94. "Leaves four in a whorl, elliptic, nerveless, smooth; peduncles divaricate, trichotomous; seeds roughish." Stems simple, smooth, spreading; leaves subspetioloid, obtuse; flowering branches horizontal, bifid; bractes two, small, lanceolate; flowers white, usually in threes. 11. *A. laxiflylla*, six-leaved woodroof, Allion Ped. t. 77. "Leaves six in a whorl, linear; flowers umbelled, terminal, subsessile." Root perennial; stems generally simple; leaves acuminate, flat, erect; umbels accompanied with ten or twelve leaves; corollas purple, white within; segments a little revolute; seeds oblong, compressed. It grows in the fissures of rocks near Tende.

Propagation and Culture. All these plants being perennial, except the second, may be increased by the roots as well as by the seeds. The first sort will prosper under the

shade of shrubs in wilderness quarters. The fifth must have the protection of a green-house, and does not continue many years; but may be increased both by seeds and cuttings. The eighth growing naturally in chalk, and most of the others being natives of rocks, must have a dry open situation. Martyn's Miller's Dict.

ASPERUM, in *Conchology*, a species of BUCCINUM, about an inch and an half in length. It is figured by Lister, but its *habitat* is unknown. The whorls of the spire are ribbed, and striated transversely; the first is gibbous, and the tail (or beak) rather prominent. Gmelin, &c.

ASPËT, in *Geography*, a town of France, in the department of the Upper Garonne, and chief place of a canton in the district of St. Gaudens; two leagues south-east of St. Gaudens.

ASPEYTLA, a town of Spain, in the province of Guipuzcoa, seven leagues from St. Seballian.

ASPHALITES, in *Anatomy*, the fifth vertebra of the loins. It is thus called, because conceived as the support of the whole spine of the loins; from the privative *α* and *σφαιλον*, *I supplant*.

ASPHALTITE LAKE, in *Geography*, a lake of Palestine, so called from the great quantity of bitumen, called *asphaltum*, which it produces. It has also been called the *Dead Sea*, from a supposition that no fishes will live in it, and that birds, which have attempted to fly over it, have been suffocated. From its situation, it has been denominated the *East Sea*; and distinguished by other appellations, as the *Salt Sea*, the *Sea of Sodom*, the *Sea of the Desert*, and the *Sea of the Plain*, by the sacred writings. Its origin has been ascribed to the submerision of the vale of Siddim, where once stood, according to common report, the three cities which perished, in the miraculous conflagration, with those of Sodom and Gomorah. These cities have, on account of their number, been called Pentapolis. Strabo, however, on the authority of an ancient and received tradition, reckoned thirteen of these cities, of which Sodom was the capital; and he adds, that they were overthrown by a violent earthquake occasioned by subterraneous fire, that threw up this great and sulphureous lake, in which all those cities were swallowed up. Josephus likewise assures us, that in the overthrow of Sodom, this vale became the lake Asphaltites. It has been said, that the ruins of these cities are still to be seen in clear weather; and we likewise read of apples that grew about it, fair without, but bitter to the taste and filled with ashes; which added to the deadly nature of its water and smoke, afforded another evidence of the divine indignation. Some of the circumstances that have been recited concerning this lake, and which have long obtained credit, have been contradicted by the testimony of more modern travellers. Although it was long thought that nothing would sink in the waters of this lake, and that no animal could live in it, yet Dr. Pococke assures us, that much as their specific gravity is augmented by the salt with which they are impregnated, several persons, and among others this writer himself, swam and dived in this lake, and birds have flown over it with safety. It is possible, indeed, that the specific gravity of the water of this lake may have been diminished since the experiments made by Vespasian, and recited by Piny (N. H. l. v. c. 15.), because great quantities of the bitumen have been collected and removed, and this lake has been supplied with copious streams of fresh water. Mr. Kirwan says (Analysis of Mineral Waters, p. 144.), that the heaviest water of which he has met with any account is that of this lake. Lavoisier found it 1.2403, and that it contained 44.4 per cent. of saline matter, of which 6.25 parts were common salt, and

38.15 were muriated lime and muriated magnesia. The Mem. Paris, 1778, p. 63. From these salts the water derives its bitter taste; and the bitumen which floats upon the surface of this lake, and which arises from its borders or its bottom, does not communicate to it any quality. As to the salt which it produces, the Arabs furnish themselves with large quantities by digging pits about the shore of the lake, filling them with water, and leaving them to be crystallized by the sun. As to the bitumen, which gave name to this lake, it is said to have thrown up great quantities of it, and that it is much used by the Egyptians and the inhabitants of other countries for the purpose of embalming dead bodies. Indeed Josephus assures us, that it ascended in masses as big as an ox without its head, and even of a larger size. Mr. Maundrell says (Journey, p. 84.), that there was no bitumen in the place where he happened to be; but that it is gathered near the mountains on both sides in great plenty. Pococke, however, (Travels, p. 56.), observed it to float on the surface of the water, and after windy weather to be found on the shore, where the Arabs gather it for the purpose of applying it to the same use with common pitch; and Dr. Shaw (Travels, p. 347.) informs us, that he was assured that the bitumen is raised at certain times from the bottom of the lake in large hemispheres, which, as soon as they touch the surface, and are acted upon by the external air, burst at once with great smoke and noise like the pulvis fulminans of the chemists, and disperse themselves into a thousand pieces. This, he adds, only happens near the shore; for in greater depths, the eruptions are supposed to discover themselves in such columns of smoke as are now and then observed to arise from the lake. This bitumen is described as resembling our black pitch, and not to be distinguished from it except by its sulphureous and fetid smell, occasioned either by friction or by setting it on fire. Some persons have confounded it with a blackish combustible stone thrown on the shore, and sometimes called "Moses's stone," which held in the flame of a candle, will soon burn, and emit a smoke and intolerable stench. Whilst its weight is much diminished, it retains its bulk, and becomes of a whitish colour. Dr. Pococke observes, that these stones are found about two or three leagues from the shore; and he supposes, that a stratum of this kind of stone under the lake is probably one part of the matter that feeds the subterraneous fire, and causes the ebullition of the bitumen.

Mr. Maundrell informs us, that he saw several birds flying about and over this sea without any visible harm; and he suspects that the tradition which reports, that no animals can live in these waters is false, as he observed among the pebbles on the shore two or three shells of fish resembling oyster shells, which were cast up by the waves. He surveyed the waters with attention, in order, if possible, to discern the ruins of the absorbed cities, but he failed in his attempts to discover them; he was told, however, by two aged persons, not destitute of understanding or probity, that they had once actually seen one of these ruins near the shore, and the waters being shallow, they went to it, and found there several pillars and other fragments of buildings. As for the apples of Sodom, Mr. Maundrell neither saw nor heard of any; nor was any tree to be seen near the lake from which such kind of fruit might be expected. A late traveller, Mr. Volney (Travels in Egypt and Syria, vol. i. p. 310.) says, that this lake contains neither animal nor vegetable life. No verdure is perceived on its banks, nor are fish to be found in its waters; but it is not true, adds this writer, that its exhalations are pestiferous so as to destroy birds flying over it. It is very common to see swallows skimming its surface, and dipping for the water necessary to build their

nests. The real cause which deprives it of vegetables and animals, is the extreme saltiness of the water, which very much exceeds that of the sea: the soil around it, impregnated with this salt, produce no plants, and the air itself, loaded with it by evaporation, and receiving the sulphureous and bituminous vapours, cannot be favourable to vegetation; and hence proceeds the deadly aspect which reigns around this lake. The origin of this mineral (says Mr. Volney) may be easily discovered: for on the south-west shore are mines of fossil salt, which are situated in the sides of the mountains extending along that border, and which have, for time immemorial, supplied the neighbouring Arabs, and even the city of Jerusalem. On this shore are also found fragments of sulphur and bitumen, which the Arabs convert into a trifling article of commerce. There is also found a sort of stone, which, with friction, emits a noxious smell, burns like bitumen, receives a polish like white alabaster, and is used for the paving of court yards. At intervals there may be also seen unshapen blocks, which prejudice has mistaken for mutilated statues, and which pass with ignorant and superstitious pilgrims for monuments of the adventure of Lot's wife. Mr. Maundrell was informed that on the west side of the sea is a small promontory, near which stood the monument of Lot's metamorphosed wife, part of which, as he was told, is visible at this day. But he had neither faith enough in the report of his informers, nor sufficient leisure for examining the truth of this fabulous relation. One remarkable property of this lake remains to be mentioned; and this is, that though it receives the Jordan, the brooks of Jabok, Kihon, Arnon, and other springs, which rush down from the adjacent mountains, yet it never overflows; this circumstance has led some naturalists to imagine that there is a subterraneous communication between this lake and the Mediterranean, or the Red Sea. But no gulf of this kind has been discovered; nor, indeed, is it necessary to recur to any hypothesis of this kind; since it has been demonstrated by accurate calculations, that evaporation is more than sufficient to carry off the waters with which the lake is supplied. This evaporation is, in fact, very considerable, and frequently becomes sensible to the eye by the fogs with which the lake is covered at the rising of the sun, and which are afterwards dispersed by the heat. This lake is inclosed on the east and west by very high mountains; on the north it is bounded by the plain of Jericho, on which side it receives the waters of Jordan; on the south it is open and extends beyond the reach of the eye. Josephus (Antiq. l. viii. c. 2. De Bell. l. iv. c. 14.) assigns this lake the length of 580 furlongs, from the mouth of Jordan, to the town of Segor or Zohar on the opposite shore, or about twenty-two leagues; and a breadth of about 150 furlongs, or five leagues; but Mr. Maundrell (ubi supra, p. 84.) says, that it is twenty-four leagues long, and six or seven broad.

ASPHALTUM, in *Mineralogy*, denotes a kind of bituminous stone, found near the ancient Babylon, and lately in the province of Neuchâtel; which, mixed with other matters, make an excellent cement, incorruptible by air, and impervious by water; this was supposed to be the mortar so much celebrated among the ancients, where with the walls of Babylon, and the temple of Jerusalem were cemented.

It yields an oil which defends itself from water, worms, &c. much better than the ordinary composition: and which is also of good service for the cleaning and healing of ulcers, &c. See *Mineral Prince*.

ASPIAX, in *Arctic Geography*, a nation of the isle of Cyprus. Steph Byz.

ASPHODELUS, in *Botany*, *Asphodel* or *king's-sparrow*. Lin. Gen. 421. Scrob. 519. Gartn. 7. Juss. 57. Clafs. hexandria monogynia. Nat. Ord. coronaria. *Asphodelus* Juss. Gen.

Gen. Char. *Cal.* none; *corolla* one-petalled, six-parted; divisions lanceolate, flat, spreading; nectary, six very small valves, converging into a globe, inserted into the base of the corolla. *Stern.* filaments six, tubulate, inserted into the valves of the nectary, bowed; alternately shorter; anthers oblong, incumbent, rising. *Pist.* germ roundish within the nectary; style tubulate, in the same situation with the stamens; stigma truncate. *Per.* capsule globular, fleshy, three-lobed, three-celled. *Seeds*, several, triangular, gibbous on one side.

Ess. Gen. Char. *Cor.* six-parted; nectary six valves covering the germ.

Species. 1. *A. luteus*; yellow asphodel, or king's-spear, Jacq. Hort. 1. 32. t. 77. "Stem leafy, leaves three-sided, striated." Root composed of fleshy long thick tubers; stalks round, simple, about three feet high, and wholly covered with long triangular boat-shaped leaves. The upper part of the stalk is crowned with yellow star-shaped flowers, which open in succession, about the beginning of June. Peduncles one-flowered, arising from the axillæ of the bractæ, which are membranaceous, small, whitish. The corolla has a sweet smell, and is so deeply divided as not to seem monopetalous, and the divisions or petals are alternately narrower. It is a native of Sicily. 2. *A. ramosus*; branched asphodel. Villar's Dauph. 2. 265. Murray in Com. Gott. 1776. 37. t. 7. β . *A. albus*. Mill. Dict. n. 3. "Stem naked, leaves ensiform, keeled, smooth." Root composed of many tubers and fibres; leaves long, flexible, sharp at the edges, growing in irregular clusters from the crown of the root; stalks three feet high, sending off naked branches, from the upper part of which arise many star-shaped flowers, which are white, with a longitudinal purple line along the outside of each segment. A native of the south of Europe. 3. *A. fistulosus*; onion-leaved asphodel. Gært. Fruct. 1. 68. Gouan. Hort. 174. "Stem naked, leaves stiff, tubulate, striated, subulose;" annual; roots consist of many fleshy yellow fibres; leaves in a large cluster from the crown of the root, convex on their under side, flat above and hollow. Flower stalks rise immediately from the root, and grow to the height of two feet, dividing towards the top into three or four branches, which are adorned with white starry flowers, having purple lines on the outside; these come out in July and August, and their seeds ripen in October. A native of the south of France, Spain, and the island of Crete. Scopoli has described and figured another species, which he named *asphodelius liburnicus*; it has yellow pendulous flowers, streaked with five brownish lines, and has saffron-coloured filaments. It was found in Istria by Mygind. See Flor. Carn. n. 411. t. 12. The three former species were cultivated by Gerard in 1596.

Propagation and Culture. The first species multiplies very fast by roots, and will soon overspread a large border, if suffered to remain undisturbed. The second does not increase very rapidly by roots, nor should it be often transplanted, for that will weaken it; therefore the best way is to propagate it by seeds. These asphodels are pretty ornaments in a garden, and requiring very little trouble to cultivate, are rendered more acceptable. They may be propagated by seeds which should be sown soon after they are ripe, on a warm border of light fresh earth: in the spring the plants will appear, when they are to be carefully cleared from weeds, and in dry weather frequently watered, by which means the plants will be in a proper state to be transplanted the Michaelmas following. A bed must then be prepared in the flower nursery of fresh earth, into which you should plant the roots, at about six inches distance, and so deep that the top of the roots may be three or four inches under the surface of the bed; and some old tan or dung spread over the bed to keep out the frost. In this bed they are to

remain one year, by which time the roots having acquired strength enough to produce flowers the following year, they should in autumn, when their leaves are decayed, be carefully taken up and transplanted into the flower garden, observing to place them in the middle of the borders among other hardy kinds of flowers, where being properly intermixed, they will make an agreeable variety, and continue a long time in flower. The third sort is an annual, and can only be propagated by seeds which should be sown in autumn, and not removed till they have put out four or five leaves, when they are to be transplanted into the places where they are to remain. If the seeds of this plant are permitted to scatter, they will come up without care, and those which are not removed will be the strongest, and produce a greater number of flowers. See Martyn's Miller's Dict.

ASPHYXIA, in *Medicine*, a term which, in its literal sense, signifies a want of pulsation, being derived from a privative, and $\sigma\phi\upsilon\chi\iota\varsigma$, *pulsus*. It is used to denote apparent death. Such suspensions of the vital actions are referred by Cullen to apoplexy and syncope; but in the system of Sauvages they constitute a distinct genus, under the above name. The last-mentioned nosologist has been too minute in his subdivision of this, as well as of many other diseases. The following appear to us to be the only legitimate species; viz. *A. submersorum*, apparent death from DROWNING; which see. *A. suspensorum*, apparent death from HANGING; which see. *A. congelatorum*, apparent death from exposure to extreme cold. This we shall notice here, as the most convenient place. In the northern latitudes, frequent instances occur, during the winter season, of persons being frozen to death. Before this event takes place, they are seized with a general numbness, and an irresistible propensity to sleep, followed by stupor, and insensibility. In this apparently lifeless state they lie for several hours, more or less, according to the intensity of the cold, and the previous condition of the body. They are, however, yet recoverable by proper treatment; which consists in taking off the person's clothes, and rubbing the body all over with snow, or dashing cold water upon it. The friction should be continued for many hours, until signs of life appear; when the patient should be wiped dry, and put into a cold bed, in a room without fire: he should have but few clothes upon him at first. When the power of swallowing is restored, a small quantity of white wine and water (two parts of water to one of wine) should be given in a tepid state; but on no account any spirituous liquors, such as brandy, rum, &c. Afterwards he may have tea, with a large proportion of milk, increasing the quantity of nourishment gradually. He should avoid a heated room for a day or two, as well as all strong drinks and seasoned food; otherwise a fever, or dangerous local inflammations, will be excited. Travellers or others who are about to be exposed to extreme degrees of cold, should be cautioned against the use of spirituous liquors, and every effort should be exerted by their companions to prevent them from falling asleep. For the treatment of partial injuries from cold, see the article FROST-BITTEN. *A. a carbone* (*A. carbonica*, as we would term it), suffocation from the fumes of charcoal, from the gas thrown out by fermenting liquors, &c. (*i. e.* suffocation from the carbonic acid gas.) See SUFFOCATION. *A. a mephitite* (*A. azotica*), suffocation from foul air or azotic gas. See SUFFOCATION. *A. neophytorum*, apparent death of new-born infants. See MIDWIFERY.

ASPIA, in *Ancient Geography*, a river of Italy, in Picenum, north-east of Auxinum.

ASPIC, Fr. in *Artillery*, a piece of ordnance, weighing 4250 lb, and carrying a 12 lb shot.

ASPIC, in *Botany*, a plant which grows in plenty in Languedoc, in Provence, and especially on the mountain of St. Baume, in France. It is a kind of lavender, nearly like what grows in our gardens; both with regard to the figure and colour of its leaves and flowers. The botanists call it *male lavender*, *lavendula mas*, or *spica nardi*, *pseudo nardus*, &c.

ASPIC, *Oil of*. See *Oil of SPIKE*.

ASPIDO, in *Geography*, a river of Italy, in the marquise of Ancona: it rises near Polverigo, and runs into the Musona, a little above its mouth in the Adriatic sea.

ASPIDOPHORE, in *Ichthyology*, the name of a new genus of fishes in Lacépède's arrangement. This genus is composed of the two species of **COTTUS**, in the Linnæan system called *catapiræus* and *japonicus*, the former of which M. Lacépède names *l'aspidophore armé*, and the latter *l'aspidophore lisza*. See **COTTUS**.

ASPII, in *Ancient Geography*, a powerful people of India, whom Alexander defeated in a pitched battle near the river Euaspla. He had previously crossed this river, as well as the Choe; and after the battle he passed through the territory of the Guræi, and crossed the river Guraus, supposed by major Rennell to be the Kameh or Cabul river. This ingenious geographer conjectures, that the nations of the Aspîi, Thyraî, and Arasaci were inferior divisions of the modern Cabul, and situated between the rivers of Ghizni and Cabul, at the height of Irjab and Dukkah. Mem. p. 172.

ASPING, in *Zoology*, a name given by the inhabitants of Smoland to a venomous small snake, not more than six inches long, found in Oiseries and Willow-holts, the bite of which is frequently fatal, and which is much dreaded by the Smolanders. It is the **COLUBER CHERSEA** of Linnæus, with 150 abdominal scuta, and 34 subcaudal scales.

ASPIRAN, in *Geography*, a town of France, in the department of Herault, and chief place of a canton in the district of Lodeve, two leagues north of Pezenas.

ASPIRATE, **ASPIRATIO**, in *Grammar*, a character used to denote an aspiration.

The aspirate, by the Greeks called *spiritus asper*, and marked over their vowels, seems to be of a very different nature from the letters; but is nevertheless a true letter, as well as the rest, and a real consonant.—By letters we do not mean the characters of the alphabet, which are changeable according to the languages and the people, and among the same people, according to time and custom; and even according to the fancy of particular persons. Thus, some, for instance, write the aspirates, or letters aspirated: which by others are omitted; though both the one and the other pronounce alike; as in *uomo*, *uomini*, an Italian word frequently written *uomo*, *usmini*. But by letters we mean articulate sounds, marked by them, and formed by the organs of speech, viz. the throat, mouth, tongue, palate, teeth, &c.

These sounds are of two kinds, the one *simple*, and the other *compound*, or modified. *Simple* sounds are those pronounced by a single motion of the organ, such are the vowels. *Compound* sounds are those same simple sounds modified by a motion of the organ, superadded to the motion necessary to pronounce the simple sound; of which kind are the consonants.

Now an aspirate is an effect or consequence of a motion made by some of the organs of speech; and therefore it must either be a vowel or a consonant. The former it cannot be, as not being a simple sound, or a sound that may be pronounced by itself. It must therefore be a modificative, or consonant; and in effect it has all the properties of one.

For, 1st, It results from a motion of the organ, which of itself produces no sound. Thus the *spiritus* of the Greeks, our *h* aspirate, as well as that of the French, and other people, has no more sound of itself, than *b*, *c*, *d*, &c. and the same thing may be observed of the *alph*, *beth*, and *cap*, of the Eastern languages.

2dly, On the contrary, our *h*, the *spiritus* of the Greeks, and the other aspirates just mentioned, are pronounced with all the vowels, in the same manner as consonants are. They modify those vowels, and are effects of a motion of the organ superadded to the motion necessary to form the vowel. Thus, to pronounce *ba*, two motions of the organ are required as well as for *ba*, or *ca*, &c. one for *a*, which itself is a sound; the other for *h*, which yields no sound, no more than *b*; but adds something to *a* which modifies it, and makes that *ba* is not mere *a*, nor *ba*, nor *ca*, &c. And this must hold still more sensibly in the stronger aspirates, as those of the oriental tongues ה, ה', ה", ה", ה", ה", ה", &c. in all which there are evidently two motions, the one to express the vowel, and the other to modify it: now this being the nature and essence of a consonant, it follows, that let them be denoted in what manner they will, whether as our *h*, as the orientals do, i. e. by proper characters in the course of the words themselves; or, as the Greeks do some of theirs, by a sign of aspiration placed over the vowel, it matters not. The aspirate is no less a consonant in *αἴμα*, than in *χαίμα*; in *ἔω*, than in *χέω*; in *ἄν* than in *χῶν*; and so of others.

The third and last reason urged by some, is, that the Eastern languages, which, according to them, do not express the vowels, do yet express the aspirates. This kind of argument seems, however, to be grounded on a mistake; since it is more than probable, that the *h*, *h'*, *h''*, *h'''* of those languages, should be ranked among the vowels, and were so used.

Add, that the aspirate is frequently changed into a consonant, and expressed by a consonant. Thus of *ix* is made *fox*; of *ἔπια*, *septem*; of *ἑσπερος*, *vesperus*, &c. of the Hebrew *יין*, *vinum*, and thence *vinum*, &c. Nay even in the same language, Hesiod, speaking of Hercules's buckler, uses *ἦρην* for *ἄρην*; making no difference between a *h* and an aspirate.

Hence it follows, that aspirates are real consonants; and that we ought not to exclude the *h* in our language, out of the number of letters.

Other grammarians contend, that the *h* is founded only by a strong emission of the breath, without any conformation of the organs of speech, and consequently is no letter. See **H**.

ASPIRATION, the act of aspirating, i. e. of pronouncing any syllable, or word, strongly; with a good deal of breath, and vehemence.

This we do, for instance, in those words which have the letter *h* before them; as *harangue*, *hook*, *Holland*, *hero*, &c. whereas the like syllables are founded much softer and easier without the *h*; as in *ear*, *eat*, &c. See **H**.

ASPII, in *Ancient Geography*, a town of Spain, north-west of Ilieis and very near it on the same river.—Also, a town of Africa Propria, in 33° 20' N. lat. according to Ptolemy.—Another town of the same country, about 30° 20' N. lat. according to Ptolemy. Strabo places it in the Greater Syrtis, and says it is the best port of that coast.—Also, a hill or territory of Africa, in the promontory of Taphitis, according to Strabo. Also, a town of the Carthaginians, called *Clypea*. M. d'Anville thinks this to be the same with the former; but Ptolemy distinguishes them.—Also, an island of Asia, upon the coast of Asia Minor, between Tenedos and Teos. It was called, according to Strabo, Arconnesus.—Also, a promontory of Ethiopia, near Egypt.—An island in the vicinity

vicinity of the Cyclades.—Alfo, a town of Asia, in Macedonia, founded by Philip, the father of Pericles. Steph. Byz.

ASPITIRA, a town of Asia, in the country of the Sina. Ptolemy.—Alfo, a river of Asia in the same country.

ASPIS, in *Icthyology*, a species of *CYPRINUS*, that inhabits the fresh water streams in most of the northern parts of Europe. Linnæus in his Fauna Suecica, describes it specifically as having fifteen rays in the anal fin, and the lower jaw longer than the upper one, and recurved. It grows to the weight of twelve pounds; is blackish above, and bluish-white on the sides; feeds on vegetables, worms, and little fish; spawns in March; flesh white, soft, fat, and well tasted. This is *Cyprinus rapax ovatus subcompressus carulifcus*, &c. of Lestk.; *leucifcus argenteus*, &c. Klein; and rappe of Gein.

ASPLEDON, in *Ancient Geography*, a town of Bœotia, north-east of Orchomenus, from which it was separated by the small river Melis.

ASPLENIUM, in *Botany*, spleenwort (said to be derived from α and $\sigma\pi\eta\eta$, because it was supposed to dry upon the spleen). Lin. g. 1178. Schreb. 1631. *Lingua cervina*, *trichomanes* Tournef. Class, *cryptogamia filices*. Generic Char. Fructifications disposed in right lines along the under disk of the frond.

* *Frond simple.*

Species, 1. *A. rhizophyllum*, root-leaved spleenwort. Phyllitis Pluk. Alm. 154. t. 105. f. 3. Morr. Hist. 3. 557. 14. f. 14. t. 1. f. 14. "Fronds cordate-ensiform undivided, top filiform, rooting." Root fibrous; fronds triangular acuminate, point long linear; at the base hollowed, cared, on long footstalks; fructifications irregularly dispersed over the whole disk of the leaf in oblong spots; the ends of the fronds bent down to the ground, and there striking root. A native of North America. Introduced here by Mr. Bartram in 1764. 2. *A. hemionitis*, mule's-tongue spleenwort. Lour. Coch. 677. "Fronds simple, cordate-lanceolate, five-lobed, entire; sipes smooth and even." It rises about six inches in height, and nearly resembles N° 3. (hart's-tongue), but the longitudinal diameter of the frond scarcely exceeds the transverse one; the sipes are slender and in tufts; the lobes of the fronds are sublinear, unequal; fructifications in oblique lines. A native of the south of Europe. Introduced here in 1779. 3. *A. scolopendrium*, hart's-tongue spleenwort, Hudf. 452. With. 3. 51. Lightf. 665. Curt. Lond. 1. 67. Bolton Fil. 18. t. 11. Woodv. Med. Bot. f. 272. The varieties are β . *phyllitis crispa*. Bauh. Hist. 7. P. f. *Lingua cervina maxima*, undulato folio auriculato per basim. Pluk. phyt. 2. *Lingua cervina*, multifido folio. Bauh. pin. 2. P. f. *Lingua cervina minor crispa*, fol. multifido, ramosa, Pluk. phyt. "Fronds simple, cordate-lingulate, quite entire; sipes hirsute." Root black, hard, scaly, furnished with numerous fibres; sipe and lower part of the mid-rib covered with chaffy scales; fronds from five inches to a foot long, and from an inch to two inches broad, lanceolate, rounded, and hollowed at the base, of a firm tough texture, and of a shining green on the upper side, and more or less waved at the edges; fructifications in parallel lines; these are at first covered with a pellucid involucre, which bursts when the capsules swell; they then appear globular and brown, and each is surrounded with a jointed elastic ring, by which the seeds when ripe are forced out of the capsule and dispersed to a considerable distance. It grows commonly on old walls, rocks, and in shady lanes. This plant, like some others of the same genus, was formerly used to strengthen the viscera, restrain hæmorrhages, and alvine fluxes, expel gravel, and

open obstructions of the liver and spleen; but its medicinal qualities are now little valued. It is one of those termed the five capillary herbs. 4. *A. nidus*, bird's-nest spleenwort; "fronds simple, lanceolate, quite entire, smooth." Leaves two feet long, broad, firm, thick, smooth, streaked; fructifications in parallel lines, extending one-third of the breadth of the leaf. It roots into the tops of trees; the leaves come out in a circle, and form a kind of umbel, in the middle of which birds make their nests. A native of Java and the Society Iles. 5. *A. ferratum*, ferrate-leaved spleenwort. Phyllitis, &c. Sloan. Jam. f. 72. n. 5. "Fronds simple, lanceolate, ferrate, tubefid." Root composed of brown fibres, which send forth eight or nine fronds about three inches long, gradually broader near the end, which is formed into a blunt point. A native of woods in the inland parts of Jamaica. 6. *A. plantaginicum*, plantain-leaved spleenwort, Brown Jam. 92. "Fronds simple, ovate-lanceolate, subternate, sipe quadrangular." The fronds rise from a thick fibrous root to the height of ten or twelve inches, with an even margin and a smooth sipe. A native of Jamaica. 7. *A. lanceum*, lance-leaved spleenwort. Thumb. Japon. 333. "Frond simple, elliptic, entire, smooth; sipe round, scaly." Stipe flexuose, decumbent; lines of fructifications near the edge of the leaf, which is lanceolate. A native of Jamaica. 8. *A. bifolium*, double-leaved spleenwort, lingua, cerv. &c. Plum. fil. 116. t. 133. "Fronds pinnate; leaflets lanceolate, subternate, connate." Fronds all double, or composed of two equal similar leaflets, united at the base by a common membrane; the common peduncle forks a very little above the base, and forms the mid rib. A native of South America.

** *Frond pinnatifid.*

9. *A. ceterach*, common spleenwort, Hudf. 452. Lightf. 661. Bolton Fil. 20. t. 12. "Fronds pinnatifid; lobes alternate, confluent, obtuse." Fronds many, from three to six inches long; lobes of the frond short, broad, roundish, entire, about twenty pairs in a frond. This grows in similar situations to those mentioned of *A. scolopendrium*. 10. *A. obtusifolium*, blunt-leaved spleenwort, adiantum alis latioribus, Pet. Fil. 117. t. 2. f. 4. "Fronds subpinnate; pinna obtuse, sinuate, decurrent, alternate." A native of South America.

*** *Frond pinnate.*

11. *A. nodosum*, knotted-stalked spleenwort. Brown Jam. 93. Lour. Coch. 678. Sloane Jam. 1. 85. t. 11. f. 1. "Fronds pinnate; pinnae opposite, lanceolate, entire." Above a foot and a half high, upright, smooth; pinnae long, striated; fructifications in oblique, straight, parallel lines. A native of the West Indies and Cochinchina. 12. *A. falcifolium*, willow-leaved spleenwort. Louchit, &c. Plum. Amer. 4. t. 6. Pet. Fil. 110. t. 3. f. 3. Sloane Jam. 1. 78. 24. "Fronds pinnate; pinnae sickle-lanceolate, crenate from the base upwards, angular." A foot high or more; pinnae alternate; middle pinna largest, ferrate at the edges. A native of Jamaica and the Antilles. 13. *A. trichomanes*, common maiden hair. Hudf. 452. With. 3. 52. Bolton 22. t. 13. Woodv. Med. Bot. 204. Eng. Bot. 576. "Fronds pinnate; pinnae roundish, crenate." Fronds about five or six inches long, lanceolate; sipe and rachis smooth, glossy, blackish, purple; pinnae fifteen or twenty pairs, the lowest most remote, of an irregular oval figure, largest below; feminal lines oblique to the mid-rib, three, four, or five in number. It grows in the crevices of rocks and walls, and in shady places among stones. The leaves have been used in disorders of the breast proceeding from an acrimony of the fluids, and also to promote the expectoration

expectoration of tough phlegm, and to open obstructions of the viscera. They are usually directed in infusion or decoction, with the addition of a little liquorice. A syrup prepared from them is common in our shops, both as made here and imported from abroad; this latter has an admixture of orange-flower water. A little of these syrups, mixed with water, makes a very pleasant draught. 14. *A. viride*, green spleenwort. Hudf. 453. With. 3. 52. Lightf. 663. Bolton Fil. 24. t. 14. Trich. colta viridi, &c. Rai Syn. 119. *β*. Trich. fol. eleganter incisus, Tournef. Insl. 539. t. 350. f. t. c. "Fronds pinnate; pinnae roundish, crenate, truncate at the base." Pinnae eighteen or twenty pairs; leaflets sometimes alternate, rhomboidal, or trapezium-shaped. It is found on rocks in mountainous situations in the north of England. 15. *A. cuneum*, ivory-stalked spleenwort. Ait. Fort. Kew. "Fronde pinnate; pinnae lanceolate, subfalcate, ferrate, eared at the base; stipe very glossy, simple." A native of North America. Cultivated by Dr. Fothergill in 1779. 16. *A. dentatum*, tooth-leaved spleenwort. Brown Jam. 93. 5. Plum. Fil. t. 101. Pet. t. 2. f. 15. "Fronds pinnate; pinnae wedge-shaped, obtuse, crenate, emarginate." A native of South America and the West Indies. We learn from Swartz, that the *A. pygmaeum* L. is nothing more than the young plant of this species. 17. *A. marinum*, sea spleenwort, or dwarf sea fern. Hudf. With. Lightf. Bolton, 26. t. 15. Eng. Bot. 392. "Fronde pinnate; pinnae obovate, ferrate, gibbous, above obtuse, wedged at the base." Fronds from three inches to a foot in length, but commonly five or six inches; stipes smooth, reddish, brown; pinnae usually about twelve pairs, nearly rhomboidal, sometimes lanceolate, sharply crenate; lines of fructification four or five on each side of the nerve in an oblique direction. It grows on rocks on the sea coast. 18. *A. cultrifolium*, sickle-leaved spleenwort. Plum. Fil. 45. t. 59. "Fronds pinnate; pinnae sickle-lanceolate, gash-ferrate, from the base downwards angular." A native of Martinico. 19. *A. rhizophorum*, Swartz. Obs. 399. Brown Jam. 92. Pluk. Alm. 9. t. 253-4. "Fronds pinnate, rooting at top; pinnae ovate, repand, somewhat eared; very small ones remote, entire." About ten or twelve inches in length, with the top bending to the ground; the old plant is bipinnate. A native of Jamaica. 20. *A. monanthemum*, one flowered spleenwort. Smith ic. ined. 3. 73. "Fronds pinnate, pinnae trapeziumed, obtuse, ferrate, behind entire; one line of fructifications." Fronds numerous, linear lanceolate, a foot high, often twisted; leaflets numerous, rather alternate, sessile; line of fructification single. The younger Linnæus has confounded this plant with *A. resectum*. A native of the Cape. 21. *A. ruta muraria*, wall-rue, tent-wort, white spleenwort. Hudf. 453. With. 3. 53. Bolt. Fil. 28. t. 16. Eng. Bot. 150. "Fronds alternately decomposed; leaflets wedge-shaped crenulate." Fronds three or four inches high, furnished at the end with two, or more commonly three alternate pinnae: they are short, broad, and somewhat of a rhomboidal figure; fructifications appear in two or three white dots on each side of the nerve. It grows on fissures of walls and rocks. 22. *A. alternifolium*, alternate-leaved spleenwort. Jacq. Misc. 2. 51. t. 5. f. 2. "Fronds simply pinnate; leaflets alternate, wedge-shaped, gashed above." Linnæus regarded this as a variety of the preceding species, from which it differs in having the stems more simple, black at the base, with one or two short divisions only, having three leaves lobed and two-lobed; the other leaves are solitary; in the lower part of the leaf are two or three lines of a longish form. A native of Switzerland and Austria. 23. *A. adiantum nigrum*, black maidenhair. Hudf. 454. With. Bolt. 30. "Fronds subtripinnate, leaflets alternate, pinnae

lanceolate, gash-ferrate." Fronds eight or nine inches high, their outline triangular; stipes glossy, black, or very dark red; pinnae alternately pinnate. It grows on fissures of rocks and old walls, and among stones and shady places. 24. *A. lanceolatum*, lanceolate spleenwort. Eng. Bot. 240. Hudf. 454. With. 3. 54. *A. trichomanes ramosum*. Lin. Sp. Plant. "Fronds doubly pinnate, lanceolate; pinnae obovate, crenate; root crowned with tufts of long narrow dark scales." Fronds in size and habit somewhat like *pol. fragile*; pinnae lanceolate, lobed above; pinnule and lobes obovate, veiny, sharply crenate or toothed. Found on the great rocks at Tunbridge, and in Fayal one of the Azores. by Forster. 25. *A. marginatum*, margined spleenwort. Pet. Fil. 108. t. 12. f. 2. Plum. 88. t. 106. "Fronds pinnate; pinnae opposite, cordate-lanceolate, submarginate, entire." A native of South America. 26. *A. squarrosum*, fealy-stiped spleenwort. Pet. Fil. 112. t. 5. f. 2. Plum. Fil. 86. t. 103. "Fronds pinnate; pinnae acuminate, gashed; stipe fealy." A native of South America. 27. *A. striatum*, striated spleenwort. Plum. Fil. 15. 16. t. 18, 19. "Fronds pinnate; pinnae pinnatifid, obtuse, crenate, the terminal one acuminate." A native of South America. 28. *A. crispum*, lacerated spleenwort. Brown. Jam. 94. Sloan. Jam. 1. 73. t. 33. f. 2. "Fronds pinnate; pinnae trapezoid-oblong, striated, entire, eared at the base." From fourteen to eighteen inches high; stipe black, simple; leaves pointed, and appearing as if torn at the margin. A native of Jamaica. 29. *A. japonicum*, Japanese spleenwort. Thunb. Jap. 334. "Fronds pinnate; pinnae acute, gash-pinnatifid, ferrate; stipe fealy." Stipe compressed, furrowed, fealy at bottom, two feet high; pinnae opposite, sessile, lanceolate. Lines of fructification approximating. A native of Japan. 30. *A. resectum*, half-leaved spleenwort. Smith ic. ined. 3. t. 72. "Fronds pinnate; pinnae trapezium-shaped, acuminate, gash-crenate." Fronde lanceolate, a foot high; leaflets numerous, alternate, subsessile, an inch long, entire at the base, and along the hinder edge, and appearing as if cut off at the nerve in front, and at the tip, unequally gash-crenate, veined; lines of fructification two or three. Found by Commerçon in the isle of Bourbon. 31. *A. bulbosum*, bulbous-rooted spleenwort. Lour. Coch. 678. "Fronds pinnate; pinnae lanceolate, slightly crenate; root bulbous." A foot high, diffused; stipes fleshy, thick, tubercled, reclining; leaflets smooth; fructification in oblique parallel lines. A native of the mountains of Cochinchina, where the roots are eaten.

The following eight species are from Swartz.

32. *A. proliferum*. Swartz Prodr. 129. Sloan. Jam. 1. 71. t. 26. f. 1. "Fronds subsessile, broad-lanceolate, the first leaves obovate, rooting at the end." Leaves two inches long, ending in a point, which bows down to the ground, takes root, and sends out other leaves; seeds in a round spot on each side of the midrib. A native of Jamaica. 33. *A. pumilum*. Swartz 129. *A. anthriscifolium*, Jacq. coll. "Fronde ternate, leaflets three-parted, gashed." Fronds about four inches high; leaflets elongate, triangular, acute, divided into round, blunt, lobes; fructification on the whole back of the frond. A native of Jamaica and Martinico. 34. *A. dimidiatum*. Swartz 129. "Fronds pinnate; pinnae trapezoid-oblong, acuminate, angular upwards, entire, and flat downwards. A native of Jamaica. 35. *A. fragrans*. Swartz 130. "Fronds subtripinnate, leaflets alternate, pinnae lanceolate, broadish, ferrate at the tip." 36. *A. grandiflorum*. Swartz 130. "Fronds pinnate; pinnae alternate, lanceolate, subserrate, at the base rectangular, lower ones rounded. 37. *A. diffusum*. Swartz 130. "Fronds pinnate; pinnae lanceolate, gash-ferrate, tailed at the tip. 38. *A. p. morifolium*.

Swartz 130. "Fronds tripartitid; pinnae somewhat wedge-shaped, pinnae croce, toothed at the tip. 39. *A. cicutarium*. Swartz 130. "Fronde tripartite, very smooth, the upper one bipinnatifid, leaflets lanceolate, entire." The six last species are natives of Jamaica.

The following species are from Forster, and are all Natives of New Zealand.

40. *A. flaccidum*. Forst. Flor. Austr. n. 425. "Fronde pinnate; leaflets alternate, remote, bipinnatifid, linear, stiff. 41. *A. lucidum*. Forst. n. 427. "Fronde pinnate; leaflets opposite, oblong-ovate, acuminate, ferrulate." 42. *A. polydromum*. Forst. n. 128. "Fronde pinnate; leaflets trapezoid, acuminate, acute, doubly-ferrate." 43. *A. obliquum*. Forst. n. 129. "Fronde pinnate; leaflets ovate; leaflets opposite, acuminate, ferrate, the outer margin shorter." 44. *A. obtusatum*. Forst. n. 130. "Fronde pinnate; leaflets opposite, oblong, obtuse, ferrate." 45. *A. tenerrimum*. Forst. n. 131. "Fronde pinnate; leaflets rhomb-oblong, obtuse, gash-ferrate." 46. *A. caudatum*. Forst. n. 132. "Fronde pinnate; leaflets bipinnatifid, linear, brittle-shaped at the tip, segments blunt, gash-ferrate at the tip, silipe rough with hairs." 47. *A. bulbiferum*. Forst. n. 133. "Fronde bipinnate; leaflets decurrent, oblong, obtuse, bipinnatifid; fructifications profliferous.

Propagation and Culture. Whoever is desirous of cultivating any of these ferns, must have walls or rocks or heaps of stones to set the hardy species in, or pots may be filled with loamy undug earth, or sand gravel and lime rubbish for that purpose, placing them in the shade. Hart's-tongue has been raised from seed; but all the sorts may be increased by parting the roots. Some of the foreign species must be placed under a common frame in winter; and it is evident that such as are natives of the West Indies and other hot climates, require the protection of a stove.

ASPLENIUM. See ACROSTICHUM, and MENISCIUM.

ASPOE, in *Geography*, a small island of Sweden, in the Baltic, two miles south-west of Casseron.

ASPONA, in *Ancient Geography*, a municipal town of Asia Minor, in Galatia, in the road from Ancyra to Cæsarea, according to Antonine's Itinerary.

ASPORENUM, a district of Asia Minor, near Pergamus; which, according to Strabo, was barren and stony, and in which was a temple dedicated to the mother of the gods, called Asporene.

ASPOTAGOEN MOUNTAIN, in *Geography*, a high land of America, that lies on the promontory which separates Mahone from Margaret's bay, on the coast of Nova Scotia. This land, which is seen at a distance, is that which is generally made by the ships bound from Europe and the West Indies to Halifax. Its summit is about 500 feet above the level of the sea.

ASPRA, a town of Italy, in the territory of the church, upon the river Aja, between Tivoli and Terni. It was formerly in the district of the Sabines, and called *Casperia*, and *Casperula*.

ASPREDO, in *Ichthyology*, a species of SILVUS that inhabits the rivers in America. This kind has a single dorsal fin, with five rays, and has eight cirri. Gmel. The back is carinated, and the tail forked. Klein names it *batra. lus*.

ASPRELLIA, in *Botany*. See LEERSIA.

ASPREMONT, in *Geography*, a town of France, in the department of the Meuse, and chief place of a canton in the district of St. Michel, four miles south-east of St. Michel.

ASPRES LES VAYNES, a town of France, in the department of the Higher Alps, and chief place of a canton in the district of Serres, fifteen miles west of Gap.

ASPRO, a river of European Turkey, which runs into the sea, twenty-eight miles west of Lepanto.

ASPRONISI, formerly *Automate*, a small island of the Archipelago, which, by some convulsion at a former period was separated from Thera, now Santorin. This separation is said to have happened 237 years before the Christian era. The coal of the gulf between these two islands, composed of these rocks, black, calcined, and towering upwards of 300 feet above the level of the sea, appears to be the edge of an enormous crater, the bottom of which has never been fathomed. Aspronisi is rent internally, and covered with pumice stone; whence it has obtained the name of the "White Island," which it now bears. Sonnini's Travels in Greece, &c. p. 188. Olivier's Travels in the Ottoman empire, p. 161.

ASPROPITI, a small town of European Turkey, in Livadia, upon the gulf of Lepanto.

ASPROPOTAMO, a river of the southern part of Greece, has its source in mount Mezzovo, and discharges itself into the Ionian sea.

ASPROSPIZIA, a town of European Turkey, ten miles S. S. W. of Livadia.

ASPUCA, in *Ancient Geography*, a town of Africa Propria. Ptolemy.

ASPUNGITANI, a people of Asia, near the Palus Mæotis. Strabo.

ASPURGIANI, a barbarous nation about the Bosphorus. Strabo.

ASS, *Afinus*, in *Zoology*. See ASINUS.

Ass's Milk. See MILK.

Ass Bay, in *Geography*, lies on the south coast of the island of Newfoundland.

Ass, *Cucumbr.* See MOMORDICA.

Ass, *Fest of the*, in *Ecclesiastical History*, a festival which was celebrated in several churches of France, during the dark ages, in commemoration of the Virgin Mary's flight into Egypt. On this occasion a young girl richly dressed, with a child in her arms, was set upon an ass richly caparisoned. The ass was led to the altar in solemn procession, and high mass was said with great pomp. The ass was taught to kneel at proper places; a hymn no less childish than impious was sung in his praise; and when the ceremony was ended, the priest, instead of the usual words with which he dismissed the people, brayed three times like an ass; and the people, instead of their usual response, "We bless the Lord," brayed three times in the same manner. This was an act of devotion performed by the ministers of religion, and by the authority of the church. However, as this practice did not prevail universally in the catholic church, its absurdity contributed at last to abolish it. Du-Cange, Vcc. Festum.

ASSA, in *Geography*, a town of European Turkey, in the island of Cephalonia, sixteen miles N. N. W. of Cephalonia.

ASSABA, in *Botany*, the name given by the people of Guinea to a shrub which they are very fond of for its medicinal virtue; they boil it in water, and rub it on a *bubo*, and it proves a cure. Phil. Trans. N^o 232.

ASSABENSIS, in *Ancient Geography*, an episcopal see of Africa, in Numidia.

ASSABET, in *Geography*, a river of America, which rises in Grafton, Worcester county, Massachusetts, and runs north-east into Merrimack river.

ASSACANI, or *ASSACENI*, in *Ancient Geography*, a people of India, who inhabited a country situated between Bazira, now Bijore, and Pencilæotis, corresponding to the present Puckhohi. The government of the country, when Alexander

Alexander

Alexander invaded it, was possessed by a woman, as Plutarch, Curtius, and Justin, agree: she was, as they say, the wife of Affacenus, and, according to the latter, her name was Cleophes. The Affaceni, when they were attacked by Alexander, had, according to Arrian, (l. iv. c. 24, 25.) 20,000 horse, 30,000 foot, and 30 elephants, ready to take the field. Their capital was Massaga, called by Curtius Mazaga, by Strabo Magofa, and by Diodorus Massaca, which Alexander took by assault, though he was wounded on the occasion, and repeatedly repulsed; and he then proceeded to summon Bazira, the capital of the next adjoining territory. After the capture of the rock Aornus, Alexander made a second expedition into the country of the Affaceni, in order to get possession of some elephants which were sent thither that they might not fall into his hands. These elephants were at last found in the pastures near the Indus, and sent off by land to the grand army. The country of the Affaceni, afterwards called *Ashenagur*, answers, says major Rennell, (Mém. p. 173.) to the present Sewad or Sowhad; or at least Sewad was one of the divisions of Ashenagur. See *ASHENAGUR*, and *SEWAD*.

ASSACH, or **ASSATH**, in *Antiquity*, a kind of purgation, anciently used in Wales, by the oaths of three hundred men. It was abrogated by 1 Hen. V. c. 6.

ASSAD, in *Zoology*, the name by which some Arabic writers call the lion.

ASSA-DULCIS. See *ASA-DULCIS*.

ASSAFA, **ASSAFENSIS**, in *Ancient Geography*, an episcopal see of Africa, in Mauritania Situfensis.

ASSA-FETIDA, or **ASA-FOLIDA**, in *Pharmacy*, *Teuffel's Dreck*, Germ. (Devil's Dung.)

This curious and valuable article of the *Materia Medica* is a gum resin procured from the root of a large umbelliferous plant, growing in the mountains of several provinces in Persia, and on the borders of the Persian gulf, and called in the language of the country *hingifch*. For the botanical description of this plant, see *FERULA Afa-Fetida*.

The assafetida is brought over in masses of various size and form, of a yellow brown, or bluish colour, interspersed with roundish pieces white in the inside, which are the assafetida in tears, and the purest.

The taste of this gum is bitterish, acrid or biting, and very permanent on the tongue; when chewed, it becomes plastic, and soon dissolves in the saliva into a white milky liquid. Assafetida is principally distinguished (as its name imports) by its excessively strong fœtid smell, somewhat resembling that of garlic; which is extremely diffusible and permanent. The odour, however, is not of a sickening or very oppressive quality, and so readily can the organs be accustomed to it, that this gum makes a favourite seasoning for food in many countries of the East.

By chemical analysis, assafetida is found to consist of an essential oil, a resin, and a gummy substance, so that it is with great propriety reckoned among the gum resins. Trommsdorf obtained about fifteen or sixteen grains of essential oil from an ounce of the gum, which in one experiment swam upon the water with which it was distilled, and in another partly sank to the bottom. The remaining gum yielded 108 grains of resin, and 292 grains of gum. The analyses of Neuman and Cartheuser exhibit the same ingredients, but in different proportions. Both spirit and water distilled off this gum resin are strongly impregnated with its ungrateful odour. If assafetida be digested with warm water, the liquor presently whitens, and by long standing the whole is reduced into a soft pulpy mass of a dirty yellow, owing to the solution of the gummy part. By trituration

with water, this gum is entirely dissolved into a milky liquor which remains uniformly turbid for a considerable time. It is partly soluble in expressed oil, but scarcely so in the essential oils.

The following curious and authentic account of the method of collecting the assafetida is given from ocular testimony by Kœmpfer, who visited the country in the year 1687. The plant which yields this valuable gum resin (and called in Persia *hingifch*) is found abundantly on the mountains around Heraat, the capital town of the province of Chorasan, and in the province of Laar, which extends from the river Caur to the town of Congo on the Persian gulph. Beyond this, on the Arabian side, the plant is said to lose much of its strong odour and acrid quality, so that goats browse upon it with great delight and advantage. The richer the soil, the more valuable is the gum. The principal harvest of this substance is made on the mountains around the small town of Disguum, in the province of Laar.

The root of the hingifch grows for many years increasing in size, till sooner or later it sends forth the flowering umbelliferous stem, after which, on the succeeding year, the whole plant perishes. The crop of gum therefore is procured from the root before the time of flowering. When the root is four years old, it is about the thickness of a man's arm, and of considerable length; it seldom yields any gum before this age, and the older it is, the greater is the quantity of product. The root is heavy, smooth externally, when growing in a rich soil; but scaly in a sandy soil. It is often found bifurcated or further divided at about a foot below the surface. The upper part, which rises above the soil, is thickly beset with short fibres standing up like hairs. The rind of the root is easily separable when fresh, the substance within is smooth and moist, consisting of a tough fibrous part, inclosing a pulpy cellular portion, full of an oily white juice, of a most intensely fœtid smell, which when exposed to the air becomes first clammy and yellow, and at last hardens into the gum assafetida. The intensity of the smell is the test of the goodness of the gum, and the odour of the fresh juice or recent gum is beyond all comparison more fœtid than that of the gum as it is received by us. Hence in the gathering season, the whole town of Disguum smells of it; a single ship is exclusively devoted to transporting the bulk of this commodity to the ports in the Persian gulf; and in carrying smaller parcels they are tied to the top of the mat to prevent their infecting every thing on board. In a short time, however, this intensity of smell goes off.

The whole gathering of the assafetida is performed by the inhabitants of Disguum in four different journeys to the mountains. The demand for the article in foreign countries being first ascertained to be sufficient to indemnify the trouble of collecting, the gatherers divide into companies of four or five each, and proceed to the mountains about the middle of April, when the leaves of the plant are turned yellow and decaying, a sign that the root is in a proper state to yield the juice. The first operation is to remove the soil for a hand's breadth from the plant, and to strip off the leaves and the hair-like fibres, leaving the root perfectly bare and smooth, which is again earthed round and covered with a bundle of its own or any other leaves at hand, to screen it from the sun. These bundles of leaves are confined by a large stone, lest the wind should blow them off; for without this precaution, the heat of the sun would destroy the roots in a day's time, and the juice would be spoiled. Each party of four or five men take to themselves about two thousand plants, and when several

myriads of roots are thus prepared, the whole company return home.

In about forty days, or towards the end of May, the parties return to the mountain, arriving there at day break. The implements which they employ are a sharp knife for cutting the root, a broad and flat iron scoop for scraping off the dried juice, a small pan fastened to the thigh for receiving the contents of the scoop, and a double basket suspended at each end of a pole which is slung across the shoulders in order to carry the whole crop when they return home. They now uncover the root, remove the earth to a little depth from the top, and with the knife they cut off a small transverse slice. The root, in which the juice that has been collecting for forty days, has been made to stagnate by the previous operation of stripping off the boughs, now bleeds copiously; and it is immediately again covered with the umbrella of leaves as before, taking care that these do not actually touch the surface of the root and rub off the juice. On the ensuing day it is sufficiently concreted to be scraped off, after which another very thin slice is cut off from the surface of the root, which bleeds afresh, and is allowed time to concreate as before. This process is performed on half the roots on alternate days, that the employment of the gatherers may be more uniformly divided. After this collection has been twice made from each root, a third slice is cut off, the root is covered with its umbrella, and the whole company leave the mountain bringing home their first harvest, which to each party of five or six men is about fifty pounds weight of assafœtida. This first gum is reckoned of rather inferior strength to the subsequent crop, and is called *Sjûir*.

In about ten days the company again return to the mountain, making their third excursion, and they find on the top of each cut root a quantity of very fine and pure assafœtida, which having had time to concreate very slowly, is esteemed the best and most powerful, and is called *Pispaas*, and sells at a much higher price than the *Sjûir*. This latter, however, appears chiefly to owe its inferiority to a quantity of earth with which the gatherers adulterate it while yet in a very soft and semifluid state, whereas the *Pispaas* being concreted into a hard gum is not liable to this abuse. After this latter is collected, two more successive incisions are made, the juice is scraped off as before, the root is again cut and covered over, and the company return home.

The fourth and last excursion is made after an interval only of three days, for the root, which is exhausted by so many repeated bleedings, is now on the point of perishing. The *Pispaas*, or first scraping, is again collected, and the root will bear about two or three more incisions, after which it is quite exhausted, and is left to die by the heat of the sun, which happens in a single day.

Each root of the four-year-old plants will bear ten or eleven successive cuttings, but the large roots of twenty years standing or upwards, such as are sometimes found in the less accessible parts of the mountains, will yield the gum much oftener, though not with such ease, so that the harvest from these is not finished till about the end of December.

It is not quite ascertained whether the ancients were acquainted with this gum resin. Some authors have supposed it to be the *Σάκκος*, or *Όπερ σακκος*, of Dioscorides and Hippocrates, and the *Laserpitium* of Pliny, but of this there is considerable doubt. It may be mentioned that the root of a plant abounding in a milky juice exactly similar to the assafœtida was sent by professor Pallas to Dr. Guthrie, and transmitted by the latter to Dr. Hope, who succeeded in cultivating it in the botanical garden of Edinburgh some years ago. The botanical character of this

plant, however, was so different from that given by Kœmpfer (whose accuracy is much to be depended on), as to make it probable that there may be more than one species of plants which yield this fetid gum.

The uses and virtues of assafœtida are very considerable. In many parts of Arabia and Persia it forms an important article of the *Materia Medica*, and is employed largely as a condiment for food. In its native country, the common people resort to it as a sovereign remedy for dropsy, flatulent and colicky pains in the bowels, and even as an external application to wounds. In the above disorders, its strongly stimulant and antispasmodic power renders it peculiarly valuable, but the factor which transpires from the bodies and evacuations of those that use it is so excessive, as to be almost intolerable even to the organs of the natives. The Banian Indians (who not using animal food, have always recourse to the strongest and most acrid condiments), employ assafœtida liberally in their cooking, and even rub their mouth with it before meals to stimulate their appetite. Another use common to this, as to all other stimulating and heating substances in the East, is to excite the venereal appetite.

With us, assafœtida is considered as a most powerful nerve, antispasmodic, carminative, and anthelmintic, though the potency of its odour, in which probably consists a large proportion of its medical virtue, prevents its use in a variety of cases in which it might prove highly beneficial. It is of the greatest service in hypochondriac affections, in which the state of the bowels is always torpid, and digestion liable to be deranged. For the true tympanites, a clyster of two drams of assafœtida dissolved in water, thrown up once or twice a day, is an excellent remedy. Dr. Millar has introduced the use of this gum with great effect against the spasmodic asthma, and the spasmodic state of hooping cough. The dose of the solution, even to children, should be large; and it is worthy of remark, that the disgust excited by so strongly fetid a remedy is much sooner surmounted than might at first be imagined, nor, when it is in the stomach, does it ever excite sickness. The flatulent colic attending hysterical affections is much relieved by this gum, exhibited either by the mouth or in glysters. On account of its heating quality, it should be avoided when general fever is present. The vermifuge property of this gum appears to be very considerable. Kœmpfer relates, that the leaves and stalk of the fresh plant in Persia, are laid in the channels through which the water runs for irrigating gardens, and that fruit-trees and plants are thus preserved from all kinds of vermin. Probably its penetrating odour much incommodes these animals; and it has long been known both in the East and in Europe as a very powerful anthelmintic, especially when combined with the stronger purgatives, or given in the form of glyster, and followed by them.

Hufeland has employed this gum internally as a very good remedy in venereal exostosis, and caries of the bone, after the constitution has received as much mercury as it will bear.

Assafœtida enters into some of the compound plasters for external application, and in this combination is reckoned to be stimulant and resolvent.

The pharmaceutical preparations of assafœtida in actual use, are the following:

Lac Assafœtida (P. Lond.); a milky solution of two drams of the gum in half a pint of water, formed by the assistance of trituration.

Tinctura Assafœtida (P. Lond.); made by adding two ounces of assafœtida to a pint of rectified spirit of wine. The same in the Edinburgh Pharmacopœia, but a quarter of a pint more of the spirit is used.

Rectified spirit is employed, for the dilute or proof spirit, though it dissolves more of the gum, makes a turbid solution; whereas the tincture with the former spirit is quite clear. It may be given in doses of from ten to sixty drops. The *tinctura Fuliginis* of the former Pharmacopœia, now disused, was made with wood foot, assafœtida, and proof spirit; but the foot is properly omitted, as it does not appear to add to the virtue of the medicine, and needlessly increases its nauseous odour.

Spiritus Ammoniac fatidus (P. Lond. and Ed.), prepared by distilling the spirit of ammonia with assafœtida, whereby it is strongly impregnated with the peculiar odour.

Pilula Galbani composita (P. Lond.), composed of several heating and gravolent gums, viz. galbanum, opopanax, myrrh, sagapnum, and assafœtida. The proportion of the latter is one-ninth of the whole.

Pilula Asse-fatida composita, formerly *Pilula gummosa* (P. Ed.), composed of assafœtida, myrrh, and galbanum, of each one ounce, and one drachm of oil of amber.

Emplastrum Asse-fatidæ, formerly *Emplastrum antihypericum* (P. Ed.), composed of litharge plaster and assafœtida, of each two parts, and of yellow wax, and strained galbanum, of each one part.

The smell of assafœtida, and along with it its peculiar virtues, are liable to be lost and injured by long and careless keeping, but a considerable latitude may be allowed in the dosing, without much danger of risk or injury to the patient. Kœmpferi Amenit. Exotica.—Murray Appar. Med.—Bergii Mat. Med.—Ph. Transact. vol. 75, &c.

ASSAI, in *Geography*, a town of Japan, in the province of Oomi or Omi.

ASSAI, in *Italian*, is an adverb of augmentation generally in the superlative degree, which is added to another musical term to increase its force: as *Presto assai*, *Allegro assai*, very quick; *Largo assai*, very slow.

ASSAILANT, one that assaults or sets upon another. See ASSAULT.

ASSAM, in *Geography*. See ASAM.

ASSAN, a town of Asia, in the province of Diarbekir, forty miles from Diarbek.

ASSANCALE, a strongly fortified town of Armenia, on the river Aras, surrounded with walls, and guarded by towers and a garrisoned citadel, in the road to Erzeron, and a short day's journey from it. It has hot-baths that are much frequented.

ASSANUS, in *Ancient Geography*, now *Ijër*, a river of Africa, in Mauritania Cæsariensis, which by its junction with other rivers formed the ancient *Siga*, or present *Tafna*.

ASSAPOORY, in *Natural History*, a name given by the people of the East Indies to a peculiar species of slate, which they used in medicine, reducing it to powder, and throwing this on burning coals, that the sick person may receive the fumes of it. It is principally used for children, when they are disordered by taking cold. The smell of it while burning is very offensive.

ASSAR, in *Geography*, a river of Abyssinia, which is the southern boundary of AROOSI, as Kelti is the northern. This is the largest river which Mr. Bruce saw, except the Nile; it was about 170 yards broad, and two feet deep, running over a bed of large stones, though generally through a flat country; its course is rapid, and after much rain it is scarcely passable, owing to the height of its source in the mountains of the Agows. Its course where Mr. B. forded it, was from south to north; but it soon turned to the north-east, and, after flowing five or six miles, joined the Nile. Below the ford is a cataract above twenty feet high, and

eighty broad. The whole river falls in an undivided sheet of water with incredible violence and noise; but below this cataract it becomes much narrower, till it loses itself in the Nile. Bruce's Trav. vol. iii. p. 562.

ASSARA, in *Ancient Geography*, a river of Africa in Mauritania Cæsariensis. Ptolemy.—Also, a place of Asia, in the department of Mesopotamia.—Also, a river of Asia, which discharged itself into the Mediterranean, in the gulf west of the great promontory. Ptolemy.

ASSARABACCA. See ASARABACCA.

ASSARACÆ, in *Ancient Geography*, a people of Africa, in the interior Libya, placed by Ptolemy east of mount Aranga.

ASSARIUM denotes a small copper coin, being a part or diminutive of the *as*.

The word is used by Suidas indifferently with *ασδολος*, and *νμισμας*, to denote a small piece of money; in which he is followed by Cujacius, who defines *ασσαριος*, by *minimus aris nummus*.

The assarium, or imperial *as*, was worth one half-penny English. This division of the *as* began to be called assarium as soon as its size was reduced to half an ounce, and it was then always struck on copper. Its size regularly corresponded to that of the dupondius, and declined till at the close of the reign of Gallienus, it became what is called small brass, and weighed only about the eighth part of an ounce. In the time of Dioclesian, it was about the twentieth part of an ounce; and in that of Justinian, it was the same with *λεπτα*, *lepta*, or the smallest coin excepting the *νομια*, *nommia*. The Greek assarian kept pace with the Roman. Pinkerton's Ess. on Medals, vol. i. p. 121.

We find mention of the assarian in the gospel of St. Matthew, chap. x. ver. 29.

ASSARLI, in *Geography*, a town of European Turkey, in the province of Romania, forty-four miles E. S. E. from Filippopoli.

ASSARON, an ancient Jewish measure of capacity, equal to the tenth part of the *ephah*. Exod. xvi. 16.

The assaron is the same with what is more frequently called omer, or gomer.

Josephus calls it *ασσαριον*; in the Hebrew it is also written *assarith*. Calmet and Arbuthnot.

ASSART, ASSARTUM, (derived either from *assartir* Fr. to make plain, or as Spelman supposes from *certum*, pulled up by the roots, for it is sometimes written *assart*), in *Larvo*, an offence committed in the forest, by pulling up by the roots, woods which serve as thickets and covert for the deer, and making them plain as arable land. This is the greatest trespass that can be committed in the forest, being more than a waste. For whereas waste of the forest is but the felling and cutting the coverts, which may grow again; assart is a total extirpation. What we call assartum, is elsewhere termed *disforeatio*.

ASSART was also used for a parcel of land assarted. See ESSART.

ASSART-rents were those formerly paid to the crown for forest-lands assarted. Stat. 22. Car. II. c. 6. See RENT.

ASSASI, in *Ichthyology*, a species of BALISTES that inhabits the Red Sea. The body is variegated with brown warts; and a triple row of black ones on the tail. Fork. Arab. Length about six inches, brown, belly white, vent black surrounded by a fulvous ring. The flesh of this kind is eatable but insipid.

ASSASSINS, in *Ancient Geography and History*, the name of a people of Phœnicia, who inhabited the mountains of Libanus, to the north-east of the city of Tyre, and who pretended to derive their origin from the family of Arsacidæ,

Arfacidæ, the founders of the Parthian empire. To a corruption of Arfacidæ into Assassins some have ascribed the etymology of the appellation by which they were distinguished; whilst others suppose it to have been formed from *Assifins*, in reference to the poniard, which was their customary weapon. It is said that they were a sect of Mahometans, who arose in the year 891, when Carmat, or Karnat, a pretended prophet in Arabia, drew after him many followers. He failed, and laboured with his hands, and prayed fifty times a day. He promised to re-establish the family of Ali, and to dethrone the caliphs. He released his disciples from the most troublesome observances of their religion, permitting them to drink wine and to eat any kind of food. By this indulgence, joined to the hopes of plunder, he collected a great army, and ravaged the dominions of the caliph. Thus Carmat had a series of successors, of whom the most famous was Abu-Thaher or ARUDHAHER. These Carmatians, or KARNATHIANS, being enfeebled, kept their religion concealed, mixed themselves with the Mahometans, and were dispersed over various parts of the east. About the year 1090, they were settled in Persia; where Hacen, or Al-Hafan their chief, receiving a threatening message from the sultan, commanded one of his subjects, in the presence of the messenger, to sling himself from the top of a tower, and another to kill himself, which they instantly performed. Upon which Hacen said to the messenger, "Tell your master that I have 70,000 men ready to do as much." In Persia and Syria, they were denominated *Ismaelians*; and among the hills to the south of the Caspian, these odious sectaries maintained their power for nearly two centuries. Their prince, or Imam, established his lieutenant to lead and govern the colony of mount Libanus, so famous and so formidable in the history of the crusades. They had acquired or founded ten castles in the hills above Tortosa, and possessed several cities about Tyre. As these enthusiasts had possessed themselves of the best part of Al Jebal, in the Persian Irak, under the conduct of Al Hafan Ebn Masbah, or Al Hafan Sabah, as he is sometimes called, the commencement of the dynasty of the Ismaelian princes is generally placed at this period, or the year of the Hegira 483, A. D. 1090. The style or title adopted by these princes was "Sheikh Al Jebal," that is, the prince of Al Jebal; or "the chief of the mountainous country;" the province of Al Jebal being such a country, and from this circumstance deriving its modern name, "Kuhistan or Chufistan;" the words "Sheikh al Jebal" may likewise be properly rendered "the senior, or old man of the mountain," and hence the chief or prince of the Assassins has obtained the appellation of "the old man of the mountain," amongst the writers of the history of the Holy Wars. Al Hafan Ebn Masbah and his descendants reigned in Al Jebal 171 years, till the whole race of them was destroyed by the Tartar Hulaku, or Holagou Khan, the grandson of Zingis, or Jenghis Khan, who abolished the caliphate by the reduction of Bagdad, in the year of the Hegira 656, A. D. 1258. Gibbon says that the Ismaelians of Syria were extirpated by the Mamelukes about the year 1280. Not a vestige is left of these enemies of mankind, whose daggers have been felt both in the east and the west, except the term *assassin*, which, in the most odious sense, has been adopted in the languages of Europe. With the fanaticism of the Koran, the Ismaelians had blended the Indian transmigration, and the visions of their own prophets; and it was their first duty to devote their souls and bodies in blind obedience to the vicar of God. Such was the ascendant which their prince had acquired over his deluded and fanatical subjects, that they paid the most implicit deference to his commands; esteemed assassination meritorious, when

sanctified by his mandate; courted danger, and even certain death, in the execution of his orders; and fancied, that when they sacrificed their lives for his sake, the highest joys of paradise were the infallible reward of their devoted obedience. It was the custom of this prince, when he imagined himself injured, to dispatch secretly some of his subjects against the aggressor, to charge them with the execution of his revenge, to instruct them in every art of disguising their purpose; and no precaution was sufficient to guard any man, however powerful, against the attempts of these subtle and determined ruffians. The greatest monarchs stood in awe of this prince of the assassins; and in 1192, Conrade, marquis of Montferrat, a zealous crusader, fell a sacrifice to his resentment. The prince determined to avenge the death of some of his people who had been murdered by the inhabitants of Tyre, then under the government of this nobleman, employed two of his subjects for the execution of his purpose. Those men insinuated themselves in disguise among Conrade's guards, and openly, in the streets of Sidon, wounded him mortally; and when they were seized and put to the most cruel tortures, they triumphed amidst their agonies, and rejoiced that they had been destined by heaven to suffer in a cause so just and meritorious. The prince of the Assassins himself avowed the action in a formal narrative which he sent to Europe. In 1173, a prince of the Assassins in Phœnicia, sent a deputy to the king of Jerusalem, declaring himself and his people inclined to receive the Christian religion; but the knights templars assassinated the deputy on his return home, and the king was unable to chastise or restrain them. In 1213, Louis of Bavaria was murdered by the Assassins. The favourers of these Assassins were condemned by the council of Lyons, under Innocent IV. in 1231. Hume's Hist. vol. ii. p. 18. Gibbon's Hist. vol. xi. p. 117. Jortin's Rem. on Eccl. Hist. vol. v. p. 237. Mod. Un. Hist. vol. iii. p. 60.

ASSASSINS, a denomination which distinguished a faction that sprung from the followers of Judas of Galilee, in the Jewish war that preceded and succeeded the destruction of Jerusalem. The head of this faction was Eleazar, the grandson of Judas the Gaulonite. For their fate at the siege of Massada, which terminated the Jewish war, see MASSADA. Of those who had previously escaped, some fled to Alexandria, where they were at first kindly received by their brethren; but as they excited sedition and tumult, they were delivered up to the Romans, and 600 of them put to death. An order was also issued for shutting up the Jewish temple at Alexandria, and the worship of it was discontinued. See GAULONITES, and ZEALOTS.

ASSASSIN, in *Laws*, a person who kills another with the advantage either of an inequality in the weapons, or by means of the situation of the place, or by attacking him at unawares. For the etymology of the term, see the preceding article.

There was a certain law of nations, an opinion received in all the republics of Greece and Italy, whereby he that assassinated an usurper of the supreme power, was declared a virtuous man. At Rome, especially after the expulsion of the kings, the law was formal and solemn, and instances of it admitted. The commonwealth armed the hand of any citizen, and created him magistrate for that moment. Confid. sur les Causes de la Grand. des Rom. chap. xi. p. 121.

ASSASSIN'S Bay, in *Geography*, lies on the south-east coast of New Zealand, in the south Pacific ocean.

ASSATION, formed of the Latin *assere*, to roast, the preparing or dressing foods, or medicaments, in their own juices, by an external heat, without addition of any foreign moisture. Assation, in respect of culinary matters, is more frequently

frequently called roasting; and in pharmacy, uſtion, or torrefaction.

ASSAULT, in the *Art of War*, ſignifies a general attack made by a beſieging army, to become maſters of an entrenched camp, poſt, or fortrefs. In the latter caſe it is particularly underſtood to take place without the advantage of any works to ſcreen the aſſailants from the fire of the garrifon.

Anciently, when tactics were yet in their infancy, and the art of beſieging places bore comparatively no proportion to that of defence, we rarely meet with inſtances of walled towns entered by aſſault. A cloſe blockade was generally the meſure reſorted to, and the garrifon were ſlowly diſtreſſed, and the patience of the beſiegers exhausted, by circumvallations ſupported for years. The ſieges of Azotus by the Egyptians, of Nineveh by the Medes and Babylonians, and of Babylon by Darius Hyſtaſpes, where treachery alone prevented a reſiſtance equally tedious with that of the two former places, are evidences of the almoſt inſuperable difficulties attending the reduction of ſtrong holds in earlier days.

The Greeks, previous to the æra of Alexander, had very imperfect notions of aſſaulting towns. The Carthaginians firſt demonſtrated the poſſibility of ſhortening ſieges by the ſummary expedient of reiterated and furious attacks. Thus they became maſters, in the fifth century B. C., of Himera and Selinus in Sicily; and, nearly two hundred years after, of Saguntum in Spain. The cruelties they executed againſt the unfortunate inhabitants were afterwards amply retaliated upon themſelves by the Romans.

That warlike nation was employed for ages in almoſt continual wars before they practiſed this method of attack. Surprize, not an open and vigorous aſſault, made them maſters of Veii. In the firſt Punic war, Lilybæum for years baffled their utmoſt efforts, though they had then united to their own ſyſtem of tactics, whatever was moſt new and valuable in that of the Greeks. The ſtorming of New Carthage by Scipio is one of the firſt and moſt memorable examples of a ſucceſſful aſſault in the Roman annals. To what perfection they afterwards carried this branch of military ſcience, the capture of Athens by Sylla, of Avaricum by Cæſar, and of Cremona and Rome itſelf by the armies of Veſpaſian, are melancholy witneſſes.

In the dark period of the decline of the empire, the barbarians who ſucceſſively invaded it only carried on their operations againſt fortified places by continued aſſaults, which were commonly ſucceſſful, nor were the ſuperior tactics of the Romans then capable of reſiſting their fury.

Alike impetuous and inextinguible, the Mogul deſtroyers, who, under Jengis Khan and his ſucceſſors, deſolated the faireſt regions of Aſia, mocked the ordinary rules of war. A place which had once reſul'd capitulation, never enjoyed a repetition of the offer. Aſſault ſucceeded to aſſault with aſtoniſhing rapidity; and no reſpite was allowed the devoted garrifon, till weakened beyond the power of further reſiſtance, they were involved, with the innocent inhabitants, and the place itſelf, in one common deſtruction.

With the Europeans of the middle ages, the ſcience of attack loſt much of its former ſuperiority; and the caſtle of a petty-baron frequently baffled the endeavours of the moſt powerful monarch.

The invention of gunpowder offered new advantages to the art of beſieging: but general aſſaults have become infinitely more dangerous againſt ramparts mounted with artillery. Even after the requiſite breach is made, it is abſolutely neceſſary to deſtroy the works whoſe fire, on either ſide, flank and protect the point of attack. Before therefore a ſtorm is attempted, the beſieging general ſhould

afertain that his troops are expoſed to no other fire than the garrifon are able to maintain from the front of the breach itſelf.

Owing to the fancied advantages a regular garrifon were ſuppoſed to poſſeſs behind good fortifications, the rules of war formerly required a governor to ſuſtain three aſſaults before he ſurrendered. But ſuch rigid notions have been by degrees diſregarded. Few commanders chuſe, by maintaining a fortrefs to the laſt extremity, to expoſe their troops to an uſeleſs ſlaughter, or the inhabitants to the murder and pillage inevitably the attendants of a ſtorm. At Glogaw, carried by the Pruſſians in 1741, and Bergen op Zoom, by the French in 1747, ſucceſs was more the effect of a coup de main than a regular aſſault.

The Turks, however, materially differ from us on this head. It is with them a maxim of religion, never to ſurrender to Chriſtians a place where they have once poſſeſſed a moſque. They, therefore, hold out to the laſt. Severe puniſhment has, indeed, attended this obſtinacy. Bender, Oekzakow, and Iſnael, are memorable for the undiſtinguiſhed ſlaughters exerciſed by Ruſſian ferocity, and have crowned with bloody laurels the names of Panin, of Potemkin, and of Suwarrow.

The capture of Warſaw, in 1794, is a freſh inſtance of the ſummary methods obſerved by the latter general in attacking towns, and of the lamentable conſequences of ineffectual reſiſtance to a barbarous and unforgiving enemy.

During the late war, an inceſſant cannonade and bombardment have been chiefly ſubſtituted by beſiegers to the ſyſtem of aſſault. Pavia indeed, with ſome ſmaller places in Italy, ſuffered, in 1796, all the horrors of a ſtorm, from the French army, under general Buonaparté. The year 1799 alſo furniſhes four remarkable inſtances: 1. The attack of Naples (January 22), by general Championet, to which the raſhneſs of the Lazzaroni madly expoſed themſelves; but memorable for the daring and deſperate, though unſucceſſful reſiſtance, maintained by them againſt regular troops. 2. The ſtorming of Jaffa by Buonaparté (Feb.), the garrifon of which place, 3,500 ſtrong, was nearly extirpated, preſents a ſtriking and frightful picture of Turkiſh obſtinacy. 3. That of Acre (May 8), where the French, after having penetrated within the town, were eventually repulſed with great loſs, is the more worthy of notice, from its having effectually checked the adventurous progreſs of Buonaparté on the ſide of Syria. 4. The aſſault of Zurich (Sept. 24) by the republican army of Helvetia, and which may with more propriety be denominated a battle, diſplays ſo much ingenuity in the complicated movements, directed by general Maſſena, all of which were inſeparably connected with the main point of attack, ſuch preciſion, firmneſs, and bravery in the execution, and ſuch importance in the conſequences, as to demand a ſeparate relation elſewhere. It will here be ſufficient to obſerve, that the Ruſſian camp before Zurich was forced, the town itſelf carried ſword in hand, and that this event gave ſo decided a ſuperiority to Maſſena, as to be immediately followed by a precipitate retreat of the allied forces from Switzerland.

Aſſailants, as ſuch, acquire a very conſiderable ſuperiority over thoſe they attack. This ſuperiority, ſays an excellent writer on tactics, may be derived from two cauſes; the firſt a phyſical one, viz. that air of boldneſs, peculiar to aſſailants, cannot but aſtoniſh and intimidate an enemy who ſees that no difficulty can ſtop them; the ſecond is, that the aſſailants can command as much time as they pleaſe, to take their meaſures for overcoming all obſtacles that can be thrown

in their way. Mante's Translation of Moizeyoy's Taſtics, vol. i. p. 186, &c.

ASSAULT, *Aſſultus*, or *Infultus*, in *Lex*, an offer or attempt to hurt the perſon of another.

Or, it is a violent injury offered to a man's perſon, of a larger extent than battery, becauſe it may be committed by only offering to give a blow, without touching him, as if one liſts up his cane, or his ſiſt, in a threatening manner, at another; or ſtrikes at him, but miſſes him; this is an aſſault deſcribed by Finch (l. 202.) to be "an unlawful ſetting upon one's perſon." But no words whatſoever, be they ever ſo provoking, can amount to an aſſault, notwithstanding many eminent opinions to the contrary. 1 Hawk. P. C. 62. § 1. Aſſault does not always imply a blow; for, in treſpaſs for aſſault and battery, a man may be found guilty of the aſſault, and excuſed of the battery. 1 Hawk. P. C. 263. But every battery includes an aſſault.

For an aſſault, the offender is ſubject both to an action at the ſuit of the party, in which he ſhall render damages; and alſo to an indictment at the ſuit of the king, in which he ſhall be fined according to the heinousneſs of the offence. 1 Hawk. 263.

The aſſaulting of a perſon with offensive weapons, with a deſign to rob (though no robbery enſues), is puniſhed with transportation for ſeven years. 7 Geo. II. c. 21. Aſſaulting in the ſtreet or highway, with intent to ſpoil people's cloaths, and to ſpoiling them, is felony and transportation, by 6 Geo. I. c. 23. ſec. 11. And the aſſault of a privy counſellor in the execution of his office, is felony without benefit of clergy, by 9 Ann. c. 16. Aſſaulting or threatening a counſellor at law, or attorney employed in a cauſe againſt a man, or a juror giving verdict againſt him, or an adverſary for ſuing him, &c. is puniſhable on an indictment, by fine and imprisonment, for the contempt. 1 Hawk. 58. There are other aſſaults to which peculiar puniſhments are annexed: thus, ſtat. 5 Hen. IV. c. 6, and 11 Hen. VI. c. 11. render aſſaults on members of parliament more than uſually penal, upon non-ſurrender on proclamation. Stat. 9 Edw. II. ſt. 1. c. 3. gives a double criminal proceſs againſt thoſe who aſſault clergymen, indictment for the temporal offence, and proceſs in the eccleſiaſtical court for the ſpiritual one. By ſtat. 5 Eliz. c. 4., ſervants aſſaulting their maſter, miſtreſs, or overſeer, may be impriſoned twelve months, on conviction before two juſtices. By ſtat. 9 Ann. c. 14. § 8. to aſſault, beat, or challenge another, on account of money won by gaming, incurs forfeiture of goods, and two years impriſonment. By ſtat. 9 Geo. I. c. 22. to aſſault another by wilfully ſhooting at him, is felony without clergy. By ſtat. 12 Geo. I. c. 34. aſſaulting a maſter woolcomber or weaver, &c. for not complying with the demands of workmen, is felony, and transportation for ſeven years. In many caſes a man may juſtify an aſſault: the defendant may juſtify "molliter manus impoſuit," in defence of his perſon or goods; or of his wife, father, mother, or maſter, or for the maintenance of juſtice. Braët. 9 E. 4. 35 H. VI. c. 51. There are alſo other caſes in which aſſault may be juſtified: as, of an officer reſiſted in arreſting a man by warrant, of a parent reaſonably chaſtiſing his child, or a maſter his ſervant, or a ſchoolmaſter his ſcholar, or a gaoler his priſoner, or even a huſband his wife for reaſonable and proper cauſe, &c. Hawk. P. C. 258.

ASSAY, ESSAY, or SAY, in *Metallurgy*, the proof or trial of the goodneſs, purity, value, &c. of metals, and metalline ſubſtances.

In ancient ſtatutes, this is called *touch*; and thoſe who had the care of it, *keepers of the touch*. Under Henry VI. divers cities were appointed to have *touch* for wrought ſilver

plate. 2 Hen. VI. c. 14. By this one might imagine they had no better method of aſſaying than the ſimple one, by the touch-ſtone; but the caſe is far otherwiſe. In the time of king Henry II. the biſhop of Salilbury, then treaſurer, conſidering that though the money paid into the king's exchequer for his crown-rents, did anſwer *numero & pondere*, it might nevertheleſs be mixed with copper or braſs; wherefore a conſtitution was made, called the *trial by combuſtion*; which differs little or nothing from the preſent method of aſſaying ſilver. See a deſcription of it in the Black Book in the Exchequer, written by Gervale of Tilbury, c. xxi. The trial is alſo there called *effigium*, and the officer who made it is named *fuſor*. Vid. Lownd. Eſſ. Amend. Silv. Coin. p. 5. & 155.

The method ſtill in uſe of *aſſaying* gold and ſilver, was firſt eſtabliſhed by an act of the Engliſh parliament, in 1354. Anderſon's Com. vol. i. p. 187.

ASSAY, or *Eſſay*, *Eſſayer* Fr. *Probiren* Germ. The term aſſay in its moſt extended ſignification, means a ſpecies of analyſis applied to metallic ores or alloys, the object of which is to aſcertain the quantity and proportion of only one of the ingredients of the maſs. Hence it differs from analyſis in general, as this takes notice of all the ingredients: thus, in the aſſay of copper ores, the ſole object is to know the proportion of pure metallic copper which a given weight of the ore can be made to yield; diſregarding all the other component parts, ſuch as the ſulphur, iron, ſilex, &c. or rather confounding them together under the general term impurities. The ſame mode of inquiry takes place in the aſſay of a mixture of gold, or gold and ſilver, with copper, lead, tin, or any other of the inferior metals, the whole attention being directed to the proportion of ſine, or of gold and ſilver contained in the alloy. For the various methods of conducting the aſſays, the reader is referred to the ſeveral metals; in all which articles the ſecond ſection is devoted to the aſſay and analyſis of the metal treated of. Gold and ſilver, from their ſuperior commercial value, from their being the univerſal mediums of exchange throughout the civilized world, and from their being the materials of the moſt coſtly and ſplendid utenſils, ornaments, and articles of furniture, have demanded and obtained a greater accuracy in their aſſay than any of the other metallic bodies. The method of conducting it has been the ſubject of various legiſlative regulations, has from time immemorial been entrusted to a diſtinct craft or profeſſion, and has more than any other proceſs engaged the attention of ſome of the moſt able and accurate chemiſts of the preſent as well as of former ages. For theſe reaſons, under the articles GOLD and SILVER, we ſhall enter at length into the conſideration of this important ſubject. It was at firſt our intention to have introduced in this place all the matter relative to the art of the aſſayer, but by ſuch an arrangement, much unneceſſary repetition would have been required of information that properly belongs to the articles ASSAY-BALANCE, CUPEL, CUPELLATION, COIN, *Aſſayer's FURNACE*, &c.

ASSAY-MASTER, an officer, under certain corporations, entrusted with the care of making true *touch*, or *aſſay*, of the gold and ſilver brought to him; and giving a juſt report of the goodneſs or badneſs thereof.

Such is the aſſay-maſter of the mint in the Tower, called alſo *aſſayer of the king*.

The aſſay-maſter of the goldſmiths' company is a ſort of aſſistant-warden, called alſo a *touch-warden*, appointed to ſurvey, aſſay, and mark all the ſilver-work, &c. committed to him.—There are alſo aſſay-maſters, appointed by ſtatute, at York, Exeter, Briſtol, Cheſter, Norwich, Newcaſtle,

and Birmingham, for *assaying* wrought plate. The assay-master is to retain eight grains of every pound troy of silver brought to him; four whereof are to be put in the *PIX*, or box of deal, to be re-*assayed* the next year; and the other four to be allowed him for his waste and spillings. 12 and 13 W. III. c. 4. 1 Ann. c. 9.

Note. The number of penny-weights set down in the assay-master's report, is to be accounted as *per pound*, or so much in every pound of twelve ounces troy. For every twenty penny-weight, or ounce troy, the silver is found by the assay to be worse than standard, or sterling, sixpence is to be deducted; because every ounce will cost so much to reduce it to standard goodness, or to change it for sterling.

In gold, for every carat it is set down to be worse than standard, you must account that in the ounce troy it is worse by so many times 3 s. 8 d. And for every grain it is set down worse, you must account it worse by so many times 11 d. in the ounce troy. And for every half grain 5 d. $\frac{1}{2}$; for so much it will cost to make it of standard goodness, &c. Touchstone of Gold and Silver Ware, &c. p. 41. &c.

ASSAY-Balance, a balance used in the operation of assaying. See *BALANCE*.

ASSAY of Weights and Measures, signifies the trial or examination of common weights and measures, by the *CLERK of the market*.

ASSE LE BERANGER, in *Geography*, a town of France, in the department of the Mayenne, and chief place of a canton in the district of Evron, one league from Evron.

ASSE la Boisve, a town of France, in the department of the Sarthe, and chief place of a canton in the district of Frenay le Viscomte, eight miles S.S.W. of Alençon.

ASSECOMA, in *Ancient Geography*, a place of Spain, between *Pria* and *Brevis*. Itin. Anton.

ASSETATOR, in *Entomology*, a species of *ICHNEUMON* that inhabits Europe. It is black; abdomen falcated, with three rufous spots on each side; posterior flanks clavate and black. Fabricius.

ASSED-ABAD, in *Geography*, a small town of Persia, towards *Amadan*.

ASSELEN, a town of Germany, in the circle of Westphalia, nine miles S. E. of *Paderborn*.

ASSELO, a town of Persia, in the province of *Farsistan*, on the north coast of the Persian gulf, 47 leagues south of *Sehiras*.

ASSELYN, JOHN, in *Biography*, a painter, was born in Holland about the year 1610, and after receiving his education under *Isaiah Vanden-Velde*, a battle-painter, at the Hague, travelled into France and Italy. He studied at Rome, and particularly imitated the manner of *Bambochio*. His hands and fingers were crooked, and from this circumstance he was denominated by the Flemish students "Krabbate." After improving his time during his residence at Rome, he passed through Lyons on his return, and there married the daughter of a merchant at Antwerp, whom he brought with him to Amsterdam in 1645. His countrymen received him with applause, and from him the Dutch painters first acquired the idea of imitating the natural manner of colouring landscape, for which *Claude Lorrain* has been so much admired; and abandoning the sombre style, with the prevalent blue and green tints of *Paul Bril* and *Brangel*. *Affelyn* was in great reputation at Amsterdam, and his paintings, consisting of history pieces, battles, and landscapes exhibiting antiquities, and also men and animals, were purchased at a high price; they were distinguished by their correctness and admirable brilliancy of colouring; and a set of 24 of his landscapes and

ruins has been engraved by *Perelle*. *Affelyn* died at Amsterdam in 1650. *D'Argenville*, *Vies des Peintres*. Gen. Biog.

ASSEM, or *GREAT ARDRAH*, in *Geography*, a town of Africa, on the Slave coast, the capital of the kingdom of *Ardrah*. It was formerly the residence of the kings of *Ardrah*, and five or six leagues in circuit. The streets are very wide, and each house surrounded by its own rampart, as a security against fire. The walls are of mud, but high and thick, and also compact as if they were formed of stone and lime. The gates are defended by deep ditches in the inside, which are crossed by draw-bridges, and near each gate is a guard-room for the convenience of the officers and soldiers. The river *Euphrates* compasses one half of the city. The buildings are of clay, covered with straw, and the streets are kept in good order. The people are numerous, and the women are richly dressed. In the conquest of the kingdom of *Ardrah* by the king of *Dahomay*, in 1724, this city suffered very much. It is situated 16 leagues from the sea, and to the north-east of *Little Ardrah*.

ASSEMBLAGE, the joining, or uniting, of several things together; or, the things themselves so joined or united. The assemblage of two bones for motion, is called *ARTICULATION*. Carpenters and joiners have various kinds and forms of assemblage; as, with mortises and tenons, with dove-tails, &c. See *DOVE-TAIL*, *MORTISE*, &c. The Europeans admire the *CARPENTRY* of some Indians, where the assemblage is made without either nails or pins. *Herrera*.

ASSEMBLAGE is also used in a more general sense, for a collection of several things, so disposed together, as that the whole has an agreeable effect. It is with discourse as with bodies, which owe their chief excellency to the just assemblage and proportion of their members.

ASSEMBLY, formed of *adfinulare*; compounded of *ad*, to, and *finul*, together; a meeting of several persons in the same place, and with the same common design. Assemblies of the clergy are called convocations, synods, and councils of the clergy; though that annual one of the kirk of Scotland retains the name general assembly, &c. The assemblies of judges, &c. are called *courts*, &c.—The assemblies of the Roman people were called *comitia*.—The assembly of a preacher, &c. is his audience.—The academies have their assemblies, or days of assembly.

Under the Gothic governments, the supreme legislative power was lodged in an assembly of the states of the kingdom, held annually for the like purposes as our parliament. See *PARLIAMENT*.

ASSEMBLY, General, in *Ecclesiastical History*, is an assembly possessing the highest authority in the church of Scotland, and consisting of a certain number of ministers and ruling elders delegated from each presbytery, and of commissioners from the universities and royal boroughs. A presbytery, composed of fewer than 12 parishes, sends two ministers and one ruling elder to this assembly; if it contain between 12 and 18 ministers, it sends three of these, and one ruling elder; if it contain between 18 and 24 ministers, it sends four ministers and two ruling elders; and of 24 ministers, when the presbytery consists of so many, it sends five with two ruling elders. Every royal borough deposes one ruling elder, and Edinburgh two; and their election must be attested by the kirk-session of their respective boroughs. Every university sends one commissioner from its own body. The commissioners are chosen annually six weeks before the meeting of the assembly; and the ruling elders are often men of the first eminence in the kingdom for rank and

talents. In this assembly, which meets once a year, the king prelates by his commissioner, who is always a nobleman; but he has no voice in their deliberations. Appeals are brought from all the other ecclesiastical courts in Scotland to the general assembly; and in questions purely religious, no appeal lies from its determinations. The first general assembly of the church of Scotland was held in the year 1560; but it bore, says Dr. Robertson (Hist. Scotl. vol. i. p. 251.) all the marks of an infant and unformed society. The members were few, and of no considerable rank; and and, of course, a convention so feeble and irregular, could possess no great authority; and conscious of their own weakness, the members put an end to their debates, without venturing upon any decision of much importance. By degrees, however, it acquired dignity, authority, and permanence.

ASSEMBLY, *General*, of the Jewish Rabbis. See AGUDA.

ASSEMBLY of *Divines*, is the name given to an association of ministers and others, summoned by an ordinance of parliament, in the year 1643, to meet at Westminster, "for settling the government and liturgy of the church of England, and for vindicating and clearing the said church from false aspersions and interpretations." This assembly consisted of 121 divines, and 30 laymen, "celebrated in their party," says Mr. Hume, "for piety and learning." The several parties in this assembly were composed of Presbyterians, Erastians, and Independents. By their advice, alterations were made in the thirty-nine articles, the first fifteen of which employed their committee for ten weeks; and these alterations chiefly respected the doctrinal articles, and were designed to render their sense more express and determinate in favour of Calvinism. It was of still greater importance, that they utterly abolished the liturgy, and, in its stead, established a new directory for worship, by which, suitably to the spirit of the puritans, the utmost liberty, both in praying and preaching, was indulged to the public teachers. They also agreed in introducing and enforcing the solemn league and covenant, by which episcopacy was abjured; and a national engagement, attended with every circumstance that could render a promise sacred and obligatory, was entered into with the Scots, never to suffer its re-admission. All these measures, says Mr. Hume, shewed little spirit of accommodation in the parliament; and the king's commissioners were not surprised to find the establishment of presbytery, and the directory positively demanded, together with the subscription of the covenant, both by the king and kingdom. This assembly subsisted till Feb. 22. 1648, about three weeks after the king's death, having sat five years, six months, and twenty-two days, in which they had 1163 sessions. They were afterwards changed into a committee for the examination of such ministers as presented themselves for ordination or induction into livings, and met once a week, till March 25, 1652; when the long parliament being turned out of the house by Oliver Cromwell, they broke up without any formal dissolution. The works of the assembly, besides some letters to foreign churches, and occasional admonitions, were, 1. "Their humble advice to the parliament, for ordination of ministers, and settling the presbyterian government." 2. "A directory for public worship." 3. "A confession of faith." 4. "A larger and shorter catechism." 5. "A review of some of the thirty-nine articles." "When posterity," says Mr. Neal, "shall impartially review this assembly of divines, and consider the times in which they lived, they will have a just veneration for their memory; for though their sentiments in divinity were in many instances too narrow and contracted, yet, with all their faults, amongst

which their persecuting zeal for religion was not the least, they were certainly men of real piety and virtue, who meant well, and had the interest of religion at heart; and most of them possessed as much learning as any of their contemporaries: the names of Lightfoot, Selden, Gataker, Greenhill, Arminius, Wallis, bishop Reynolds, Wallis, &c. will always meet with esteem from the learned world; and had they not grasped at coercive power or jurisdiction over the consciences of men, their characters would have been unblemished." Lord Clarendon (vol. i. p. 530.) allows, "that about twenty of them were revered and worthy persons; and episcopal in their judgments; but as to the remainder, they were but pretenders to divinity; some were infamous in their lives and conversations; and most of them of very mean parts and learning, if not of scandalous ignorance, and of no other reputation than of malice to the church of England." Mr. Euclard confesses, that his lordship has, perhaps with too much severity, said, that some of these divines were infamous in their lives and characters; but Mr. Baxter, who knew most of them, says, "they were men of eminent learning, godliness, ministerial abilities, and fidelity; and being not worthy to be one of them myself," says he, "I may more fully speak the truth, which I know, even in the face of malice and envy, than as far as I am able to judge by the information of history, and by any other evidences, the Christian world, since the days of the apostles, had never a synod of more excellent divines than this synod, and the synod of Dort." "The *divine right*," says Mr. Neal, "of the presbyterian government, first threw them into heats, and then divided them; engaging them first with the parliament, and then with the Independents and Erastians. Their opposing a toleration, raised them a great many enemies, and caused a secession in their own body; for after they had carried the question of "divine right," the Independents and Erastians deserted them, after which they found it very difficult to muster as many as would make a house. Had the parliament dissolved them at this juncture, they had separated with honour; but they dwindled by degrees, and the business of the church was translated to the provincial assemblies. Hume's Hist. vol. vii. p. 32. Neal's Hist. Pur. vol. ii. p. 35, &c. p. 335. 4to.

ASSEMBLIES of the *campus Martii*, or *Marii*, of the field of *Mars*, or *Mary*; see FIELD of *Mars*, &c.—Rebellious assembly; see REBELLIOUS.—Unlawful assembly; see UNLAWFUL.

ASSEMBLY is particularly used in the *beau-monde*, for a stated and general meeting of the polite persons of both sexes, for the sake of conversation, dancing, and play.

ASSEMBLY is also used in the *Military Art*, for the second beat of the drum, being that before the march. On hearing this, the soldiers strike their tents, roll them up, and then stand to their arms.—The third beating is called the *march*, as the first is called the *general*.

ASSEMOM, AZMOM, or JESHOM, in *Ancient Geography*, a city in the wilderness of Moab, south of the tribe of Judah, 1 Sam. xxiii. 25. Josh. xv. 4. Also, an encampment of Israel in the desert. Azmon was the nearest city to Egypt, south. Numb. xxxiii. 29. xxxiv. 4, 5.

ASSENA, in *Geography*. See ESNE.

ASSENEDE, a town of Flanders, one mile south-west of Sa. de Ghent.

ASSENEPOWALS, a lake of America, westward of Chittimaux lake, through which its waters run into Albany river, in New South Wales.

ASSENHEIM, a town of Germany, in the circle of the Upper Rhine, and county of Solms Rodelheim, at the conflux

conflux of the Wetter and Nidda, eleven miles north-east of Frankfort on the Mayne. N. lat. 50° 11'. E. long. 8° 50'.

ASSENS, a sea-port town of Denmark, situate on the west coast of the island of Funen, with a good harbour on the Little Belt, chiefly inhabited by fishermen. The passage from hence, across the Little Belt, to Arroa sound, in the duchy of Sleswick, is nine miles. N. lat. 55° 21'. E. long. 9° 54'.

ASSENSU, *fnæ*, *Capituli*, in *Law*. See *SINE*, &c.

ASSENSU *Regio*. See *REGIO*.

ASSENSU *Patris*, *Dower ex*. See *DOWER*.

ASSENT, *ASSENSUS*, an agreement or acquiescence of the mind to something proposed or affirmed.—Thus, to assent to any proposition, is to allow it to be true, or to perceive its truth.

Assent is distinguished, like faith, into *implicit*, or *blind*; and *explicit*, or *seeing*, &c.—Others distinguish it into *actual* and *habitual*.

ASSENT, *actual*, is a determination of the mind, arising from the perception of the truth of any proposition.

ASSENT, *habitual*, consists in certain habits of believing or acquiescing, induced in the mind by repeated acts.

To this belongs faith, which is an assent arising from the authority of the person who speaks.—Such also is opinion, which is defined an assent of the mind, *cum formidine oppositi*, &c.

Father Malebranche lays it down as an axiom, or principle of method, never to allow any thing for truth, from which we can forbear our assent without some secret reproach of our own reason.

Mr. Hume, in his *Treatise of Human Nature* (vol. i. p. 172, &c.), has given us a new theory of assent or belief in general; a theory, which suits very well with his hypothesis of ideas, and seems to be a natural consequence of it, and which at the same time reconciles all the belief that we find in human nature to perfect scepticism. According to this writer, “an opinion or belief may be most accurately defined, a lively idea related to or associated with a present impression.” Upon this notion of belief a great part of his theory is formed; and hence he deduces what he calls his hypothesis, “that belief is more properly an act of the sensitive than of the cogitative part of our natures.” Dr. Reid has justly observed, in his examination of this theory (*Ess. on the Intellectual Powers of Man*, p. 353.), that the belief of a proposition is an operation of the mind, of which every man is conscious, and what it is he understands perfectly, though, on account of its simplicity, he cannot give a logical definition of it. If he compares it with the strength or vivacity of his ideas, or with any modification of ideas, they are so far from appearing to be one and the same, that they have not the least similitude. That a strong belief and a weak belief differ only in degree, we may easily comprehend; but that belief and no belief should differ only in degree, no man can admit who understands what he speaks; for this in reality is to say, that something and nothing differ only in degree, or that nothing is a degree of something. Every proposition that may be the object of belief, has a contrary proposition that may be the object of a contrary belief. The ideas of both, according to Mr. Hume, are the same, and differ only in degrees of vivacity: that is, contraries differ only in degree; and so pleasure may be a degree of pain, and hatred a degree of love. Such are the absurdities that follow from this doctrine; but it is needless to trace them, as none of them can be more absurd than the doctrine itself. Mr. Hume, in the third volume of his “*Treatise of Human Nature*,” sensible that

his theory of belief is very objectionable, seems in some measure to retract it; but he still appears to be of opinion, that belief is only a modification of the idea, though vivacity is not a proper term by which to express that modification. He therefore adopts some analogical phrases to explain that modification; such as “apprehending the idea more strongly, or taking faster hold of it.” But this is merely a change of terms which have no precise difference; and whatever modification of the idea he makes belief to be, whether in vivacity or in a stronger apprehension of it, the hypothesis, which makes perception, memory, and imagination to be different degrees of that modification, is chargeable with the same absurdities already mentioned. Dr. Hartley’s theory on this subject, though not very intelligibly expressed, is not very different from that of Mr. Hume; and it is liable to similar objections. “Assent and dissent,” says this writer (*Observations on Man*, p. 191. ed. 4to. 1791.), “whatever their precise and particular nature may be, must come under the notion of ideas, being only those very complex internal feelings, which adhere by association to such clusters of words as are called propositions in general, or affirmations and negations in particular.” Accordingly, he distinguishes assent, and of course its opposite, dissent, into two kinds, *rational* and *practical*. *Rational assent* to any proposition may be defined a readiness to affirm it to be true, proceeding from a close association of the ideas suggested by the proposition with the idea, or internal feeling, belonging to the word truth; or of the terms of the proposition with the word truth. *Rational dissent* is the opposite to this. This assent, he adds, might be called *verbal*; but as every person supposes himself always to have sufficient reason for such readiness to affirm or deny, he prefers the term *rational*. *Practical assent* is a readiness to act in such manner as the frequent vivid recurrence of the rational assent, disposes us to act; and *practical dissent* the contrary. *Practical assent* is therefore the natural and necessary consequence of rational, when sufficiently impressed. For his mode of investigating the causes of both kinds of assent, and of accounting for them on the principles of association, we must refer to his work *ubi supra*.

For a farther account of this subject, with regard to the reasons or principles upon which assent is founded, and the various measures and degrees of it, see *DEMONSTRATION*, *EVIDENCE*, *FAITH*, *JUDGMENT*, *KNOWLEDGE*, *PROBABILITY*, and *TESTIMONY*. See also *AXIOMS*, *MAXIMS*, and *PRINCIPLES*.

ASSENT *Royal*. See *ROYAL*.

ASSER, or ASSERIUS MENFVENSIS, in *Biography*, an English divine of the ninth century, was a native of St. David’s in Wales, where he assumed the monastic habit among the Benedictines. According to Dr. Cave, he was a relation, and Hearne says, nephew, to Asserius, archbishop of St. David’s. Having made a considerable progress in learning under John Scotus Erigena, he was invited to court by king Alfred, and amongst other preferments, obtained the bishopric of Sherburn. Dr. Cave informs us, that Alfred, by his advice, founded the university of Oxford; but the time of its establishment has been a subject of dispute. Asser wrote “*The Life of Alfred*,” first published by archbishop Parker in the old Saxon character in his edition of Wallingham’s History, printed at London, in folio, in 1574; and republished in a collection of English historians by Camden, at Frankfurt, in folio, in 1602; and again by Mr. Wife, at Oxford, in 8vo., in 1722. Nicholson, in his “*Historical Library*,” observes, that Alfred’s Life, by Asserius, reaches no farther than the 45th year of his age, coinciding by his computation with the

year of our Lord 893; and therefore the continuation to the king's death must have been supplied by later authors. This work has been ascribed by Hearn to the archbishop Asserius. Another work, under the title of "Asserius's Annals," has been ascribed to him, and was published by Dr. Gale in his "Decem Scriptores, &c." at Oxford, in 1691, folio; but it has been doubted whether the name of Asser has not been prefixed to an anonymous collection of unquestionable authenticity, though the real author was not certainly known. These "Annals," it has been alleged, extend to the year 914, whereas Asser died in 909, and there is no trace of any appendix to the work. Dr. Gale ascribes it to Asser, and his notion is favoured by its insinuating chiefly upon the fortunes of king Alfred. Asserius has the reputation of a faithful historian. Some other works have been ascribed to him; and some have said that he was the translator of "Boethius de Consolatione," and not king Alfred, commonly reputed as such. Asser died, according to Godwin and Hearn, in 883; but according to Du-Pin, Cave, Olearius, and Oudin, in 909. Cave's H. L. vol. ii. p. 66. Gen. Dict.

ASSERA, in *Geography*, a town of European Turkey, in Macedonia, upon the river Vera, near Salonichi.

ASSERAC, among the *Turks*. See ASSIS.

ASSERADOES, in *Geography*, a small island near the west coast of North America, at the mouth of the bay Realajo, in the province of Nicaragua.

ASSERIDA, in *Botany*, a name given by the people of Guinea to a kind of shrub, the leaves of which being chewed are a cure for the colic, to which that people are very subject. Phil. Trans. N^o 232.

ASSERIGO, in *Geography*, a town of Italy, in the kingdom of Naples and province of Abruzzo ultra, seven miles north-east of Aquila.

ASSERTION, in the *Language of the Schools*, a proposition which a person advances, and which he avows to be true, and is ready to maintain in public.

ASSES, ORDER OF, *Asinorum Ordo*, in *Ecclesiastical History*, a denomination given to the Mathurins or Trinitarians, because they were anciently obliged, in travelling, to ride on asses, not horses. This obligation was set aside by a new rule given the order by pope Clement, in 1267. Du-Cange.

ASSES, in *Geography*, a people of Africa, in Guinea, on the Gold Coast, in the interior part of the country, to the west of Rio de Volta.

ASSESSMENTS, in *Law*, denote taxes levied on the inhabitants of a parish or district for some special purpose, or on those of the country for the support of government. The term *assess* is derived by Johnson from the Italian *assettare*, to make an equilibrium or balance, and signifying to charge with a certain sum. In the beginning of the civil wars between Charles I. and his parliament, the latter having no other sufficient revenue to support themselves and their measures, introduced the practice of laying weekly and monthly assessments of a specific sum upon the several counties of the kingdom, to be levied by a pound rate on lands and personal estates; which were occasionally continued during the whole usurpation, sometimes at the rate of 120,000 l. a month, sometimes at inferior rates. After the restoration, the ancient method of granting subsidies, instead of such monthly assessments, was twice, and twice only, renewed; viz. in 1663, when four subsidies were granted by the temporality, and four by the clergy; and in 1670, when 800,000 l. was raised by way of subsidy, which was the last time of raising supplies in that way. For, the monthly assessments being now established by custom, being raised by commissioners named by parliament, and producing a more

certain revenue; from that time forwards we hear no more of subsidies, but occasional assessments were granted as the national emergencies required. These periodical assessments, the subsidies which preceded them, and the more ancient scutage, hyage, and talliage, were to all intents and purposes a land-tax; and the assessments were sometimes expressly so called. See LAND-TAX, and SUBSIDY.

ASSESSMENT, in a *Military Sense*, signifies a certain rate which is paid by the county-treasurer to the receiver-general of the land-tax, to indemnify any place for not having raised the militia; which sum is to be paid by the receiver-general into the exchequer. The sum to be assessed is four pounds for each man, where no annual certificate of the state of the militia has been transmitted to the clerk of the peace: if not paid before June yearly, it may be levied on the parish officers. Such assessment, where there is no county rate, is to be raised in the same manner with the poor's rate.

ASSESSOR, formed of *ad, to*, and *sedeo, I sit*, an inferior or subordinate officer of justice, chiefly appointed to assist the ordinary judge with his opinion and advice. In this sense, the masters in chancery are assessors of the lord chancellor. There are two kinds of assessors in the imperial chamber, *ordinary* and *extraordinary*.—The ordinary are now in number forty-one, whereof five are elected by the emperor, viz. three counts or barons, and two *jurisconsulti*, or civil lawyers. The electors appoint ten, the six circles eighteen, &c. They act in quality of counsellors of the chamber, and have salaries accordingly.

ASSESSOR is also used for a person who assesses or lays assessments of taxes and other public duties.

In this sense, assessors, among us, are inhabitants of a town or village elected by the community to assess or settle the taxes and other impositions of the year, to fix the proportion which each person is to bear, according to his estate, and to see the collection made. These are also called in our law *assjores*. By the stat. 16 & 17 Car. II. two inhabitants in every parish were made assessors for the royal aid.

ASSESUS, in *Ancient Geography*, a town of the Milesians, in which was a temple of Minerva Assesiculis, which was burned by the flames which were driven thither by the wind. Herodot. l. i. c. 19.

ASSETS (Fr. *assès*, i. e. *satis, enough*), in *Law*, signify goods enough to discharge that burden which is cast upon the executor or heir, in satisfying the debts and legacies of the testator or ancestor. Bro. tit. *Assets*. Assets are *real* or *personal*; where a man hath lands in fee-simple, and dies seized thereof, the lands which come to his heir are assets *real*; and where he dies possessed of any personal estate, the goods which come to the executor are assets *personal*. Assets are also divided into assets *per descent*, and assets *inter maines*: assets by descent is where a person is bound in an obligation, and dies seized of lands which descend to the heir, the land shall be assets, and the heir shall be charged as far as the land to him descended will extend: assets *inter maines* is when a man indebted makes executors, and leaves them sufficient to pay his debts and legacies; or where some commodity or profit ariseth to them in right of the testator, which are called assets in their hands. Terms de Ley, 56, 57.

As to assets by descent, it is to be observed, that by the common law, if the heir had sold or aliened the lands which were assets before the obligation of his ancestor was put in suit, he was to be discharged, and the debt was lost; but by stat. 3 W. & M. c. 14. made perpetual by 6 Will. III. c. 14. the heir is made liable to the value of the land by him sold, in action of debt brought against him by the obligee, who shall recover to the value of the said land, as if the debt was the proper debt of the heir; but the land which is sold or aliened.

aliened *bonâ fide* before the action brought, shall not be liable to execution upon a judgment recovered against the heir in any such action. And by stat. 29 Car. II. c. 3. § 10. lands of *copy* *que trust* shall be assets by descent; and by the same stat. § 12. estates *pur autre vie* shall be assets in the hands of the heir, if they come to him by reason of a special occupancy; and where there is no special occupant, they shall go to the executors and administrators of the party that had them by virtue of the grant, and shall be assets in their hands. When a man binds himself and his heirs in a bond, and dies leaving issue two sons, if the eldest son enters on the lands by descent as heir to the father, and die without issue; and then the youngest son enters, he shall be charged with assets as heir to the father. Dyer. 368. Lands which come to the heir by purchase shall not be assets. 1 Danv. Abr. 577. A reversion in an estate for life or years shall be assets, and a reversion expectant upon the determination of an estate for life is assets, and ought to be pleaded specially by the heir. An advowson is assets, but not a presentation to a church actually void, which may not be sold. Co. Lit. 374. Lands by descent in ancient demesne will be assets in debt; but a copyhold estate descending to an heir is not assets; nor is any right to an estate assets, without possession. Danv. 577. An annuity is no assets, for it is only a *chose in action*. Equity of redemption of an estate mortgaged, and a term for years to attend the inheritance, are assets.

Leases are assets to pay debts, notwithstanding the assent of the executor to the devise of them. 1 Lill. Abr. 99. Assets in the hands of one executor, are assets in the hands of others; and if an executor hath goods of the testator in any part of the world, he shall be charged in respect of them. 6. Rep. 47. In actions against executors, the jury must find the value of the assets; for the plaintiff shall recover only according to the value of the assets found. 1 Rol. Rep. 58. A special judgment against assets only shall have relation to, and bind the lands from the time of filing the original writ or bill. Carth. Rep. 245.

ASSEVERATION, an earnest affirmation, or avouching.

ASSHETON, WILLIAM, in *Biography*, an English episcopalian divine, was born at Middleton in Lancashire, in 1641, and educated at Brazen-nose college in the university of Oxford. Distinguished by his application and proficiency in various parts of learning, he became a fellow of that college in 1663, and in 1673 was honoured with the degree of doctor in divinity. Besides other preferments to which he was advanced, he was presented to the rectory of Beckenham in Kent, in 1676. He was conscientiously and zealously attached to the church in which he officiated, and faithful and exemplary in the discharge of the duties of his profession. Whilst he was an upright and able advocate for the established religion, he was no less assiduous in inculcating, from the pews as well as from the pulpit, the indispensable obligations of morality and practical religion. In the present age, however, his "Treatise against Toleration," and his "Possibility of Apparitions," written in defence of them, will not be regarded as evidences of the liberality of his spirit, and the soundness of his judgment. The former, under the title of "Toleration disapproved and condemned, &c." was published at Oxford, in 1670, 4to.; and his book intitled, "Cases of Scandal and Persecution, &c." to the same purpose, was published at London, in 1674; and his "Possibility of Apparitions" was occasioned by the story of Mrs. Veale, who died at Dover, and was said to have appeared to her friend Mrs. Bargrave at Canterbury, and published in 1706. This story has been since prefixed to "Drelin-

court on Death." In 1685, Dr. Asheton, who was a strenuous advocate for monarchy, wrote "The Royal Apology," in defence of the doctrine of absolute submission to kings; and after the revolution, he wrote a piece in defence of king William and queen Mary, intitled, "A reasonable Vindication of their present Majesties," in which he declared to the public the reasons which induced him to swear allegiance to them. He also wrote several tracts against popery, and in vindication of the Trinity; and various pieces of a practical nature. Dr. Asheton claims peculiar commemoration and respect as the first projector of the scheme for providing a maintenance for clergymen's widows and others, by a jointure payable out of the mercers' company. To this scheme he devoted much attention, and after contending with many difficulties and discouragements, he had the pleasure of succeeding. An "Account of the Rise, Progress, and Advantages of the Proposals, &c." was printed in 1713. The plan, however, was not founded on a sufficient acquaintance with the doctrine of annuities; and the society of course failed in making good its proposals. Asheton having employed his time and talents in promoting the interests of truth, according to his views of it, and the cause of virtue and humanity, died at Beckenham, in 1711, in the 70th year of his age. Gen. Dict. Biog. Brit.

ASSIDEANS, or rather HASIDEANS, in *Antiquity*, a sect among the Jews; thus called from the Hebrew חסידים, *hasidim*, merciful, righteous. 1 Mac. ii. 42. vii. 16. Ecclesiasticus. xlv. 10.

Dr. Prideaux says (Comm. p. ii. book iii. vol. iii. p. 257.), that after the settling of the Jewish church in Judæa, on the return from the Babylonish captivity, there were two sorts of men among the members of it: the one contented themselves with the written law of Moses, and were called *Zadikim*, or the righteous; and the others superadded to the law the constitutions and traditions of the Elders, and other religious observances, which they voluntarily regarded by way of supererogation, and being considered as possessing a degree of holiness superior to that of the others, they were denominated *Chasideans*, or the pious. From the former were derived the sects of the Samaritans, Sadducees, and Karaites; and from the latter, the Pharisees, and Essenes. These Assideans, who were men of great valour as well as eminently zealous for the law, joined Mattathias and his company in the fastnesses of the mountains, as soon as Antiochus was returned to Antioch, and determined to fight with him for the law of their god and the liberties of their country.

ASSIDENT SIGN, *Signum Assidens*, in *Medicine*, a symptom which usually attends a disease, but not always. Thus a dry rough tongue, thirst, and watching, are *assident signs* in an ardent fever. In this sense, *assidents* differ from *pathognomonic*, which are inseparable from the disease.

ASSIDUUS, or ASSIDUUS, among the Romans, denoted a rich or wealthy person.

The word in this sense is derived from *as*, *assis*, q. d. a monied man.

Hence we meet with *assiduous* fureties, *assidui fidejussores*, answering to what the French now call city fureties or securities, *cautions bourgeoise*.

When Servius Tullius divided the Roman people into five classes, according as they were assessed or taxed to the public, the richer sort who contributed asses, were denominated *assidui*; and as these were the chief people of business, who attended all the public concerns: those who are diligent in attendances came to be denominated *assidui*.

ASSIDUI was also used for volunteers, or those who served in the army at their own expence.

ASSIENTO,

ASSIENTO, or ASIENZA, in matters of *Commerce*, a contract or convention between the king of Spain and other powers for furnishing the Spanish dominions in America with negro slaves.

The term is originally Spanish, and signifies a bargain: accordingly the first asiento was a treaty or contract made with the French Guinea company whereby they were put in possession of this privilege, in consideration of a certain duty which they were to pay to the king of Spain's farms, for every negro thus furnished.

The Spaniards, having almost destroyed the natural inhabitants of Spanish America, have in many years, and still are obliged to perform the work of their mines, and other laborious business, by negroes, of whom they could scarce ever obtain the number they have wanted: and it is certain, if they were fully supplied, they would get yearly above twice the silver perhaps they now do, or have done for many years past. It must be confessed, they have used variety of measures to obtain them. The Genoese undertook to supply them at a concerted price between them; for which end they formed a company called the asiento, who had their factors at Jamaica, Curacao, and Brasil; but by their ill management made nothing of this contract: nor did their successors the Portuguese. After them it fell into the hands of the French, who made so much of it, that they were enabled, by a computation made from the registers of Spain, to import into the French dominions, no less than 204,000,000 of pieces of eight. Yet they at length overglutted the market, and became sufferers towards the conclusion.

By the treaty of Utrecht, Philip V. being declared king of Spain by the allies, it was one of the articles of the peace between England and France, that the asiento contract should be transferred to the English. Accordingly a new instrument was signed in May 1713, to last thirty years; and the furnishing of negroes to Spanish America was committed to the South-sea Company, just then erected; though the first convention for this purpose was made in or about the year 1689.

In virtue whereof they were yearly to furnish 4800 negroes; for which they were to pay at the same rate as the French, with this condition, that during the first twenty-five years, only half the duty shall be paid for such as they shall import beyond the stated number.

The last article gives them a farther privilege not enjoyed by the French; which is, that the English asseentists shall be allowed, every year, to send to the Spanish America a ship of five hundred tons, loaden with the same commodities as the Spaniards usually carry thither; with a licence to sell the same concurrently with them, at the fairs of Porto Bello, Carthagena, and Vera Cruz. This additional article was supposed as advantageous to the company, as the whole contract besides; being granted contrary to the usual Spanish policy, which has ever solicitously preserved the commerce of their America to themselves.

Some new articles were afterwards added to the ancient asiento; as, that the English should send their register-ship yearly, even though the Spanish flota and galleons did not go; and that, for the first ten years, the said ship might be of 650 tons.

Finally, as the South-sea company had on the whole been losers by their trade, and at the time of the treaty of Aix-la-Chapelle, in 1748, they had only four years more of their asiento term remaining (the war between Spain and England having commenced in 1739, and interrupted the continuance of it), which Spain was determined not to renew, at least not on any promising terms; for these and other reasons, it

was concluded by the British court to instruct her minister at Madrid, to obtain the best equivalent that could be procured for the remaining short time of the company's asiento contract.

By the treaty of Madrid, concluded on the 5th of October 1750, it was agreed that his Britannic majesty should yield to his Catholic majesty his right to the enjoyment of the asiento of negroes, and of the annual ship, during the four years stipulated by the treaty of Aix-la-Chapelle; and in consideration of a compensation of 100,000 l. sterling to be paid by his Catholic majesty to the South-sea company within three months, his Britannic majesty agreed to surrender to him all that might be due to that company for balance of accounts, or in any manner arising from the said asiento: thus all claims, in consequence of this contract, were finally abolished, and a period was put to all the foreign commerce of the South-sea company.

In consequence of the asiento conveyed to Great Britain by Philip V., British factories were established at Carthagena, Panama, Vera Cruz, Buenos Ayres, and other Spanish settlements. The veil with which Spain had before this time covered the state and transactions of her colonies, was removed. The agents of a rival nation, residing in the towns of most extensive trade, and of chief resort, had the best opportunities of becoming acquainted with the interior condition of the American provinces, of observing their stated and occasional wants, and of knowing what commodities might be imported into them with the greatest advantage. In consequence of information so authentic and expeditious, the merchants of Jamaica, and other English colonies who traded to the Spanish main, were enabled to assort and proportion their cargoes so exactly to the demands of the merchants, that the contraband commerce was carried on with a facility, and to an extent, unknown in any former period. Besides, the agents of the British South-sea company, under cover of the importation which they were authorized to make by the ship annually sent to Porto Bello, poured in their commodities on the Spanish continent, without limitation or restraint. Instead of a ship of 500 tons as stipulated in the treaty, they usually employed one which exceeded 900 tons in burden. She was accompanied by two or three smaller vessels, which nerving in some neighbouring creek, supplied her clandestinely with fresh bales of goods, to replace such as were sold. The inspectors of the fair, and officers of the revenue gained by exorbitant presents, connived at the fraud. The company itself, however, sustained a considerable loss by the asiento trade; whilst many of its servants acquired immense fortunes. Thus, partly by the operations of the company, and partly by the activity of private interlopers, almost the whole trade of Spanish America was ingrossed by foreigners. The immense commerce of the galleons, formerly the pride of Spain, and the envy of other nations, sunk to nothing; and the squadron itself reduced from 15000 to 2000 tons served hardly any purpose, about the year 1737, but to fetch home the royal revenue arising from the fish, or silver. In order to prevent these encroachments, Spain stationed ships of force, under the appellation of "Guarda Costas," on the coasts of those provinces which were most frequented by interlopers. The captains of these guarda costas, by several unjustifiable acts of violence, precipitated Great Britain into a war with Spain; in consequence of which the latter obtained a final release from the asiento, as we have above related, and was left at liberty to regulate the commerce of her colonies, without being restrained by any engagement with a foreign power. Anderson's Commerce, vol. iii. p. 378. Robertson's Hist. Amer. vol. iii. p. 378, &c.

ASSIENTO, in *Geography*, a country of Africa, on the Gold Coast, bordered on the north by the unknown regions, on the east by Achem, and on the south by Akanni or Little Achan. Assiento is imperfectly known, as its inhabitants maintain little or no correspondence with the maritime negroes. It is said, however, to be rich in gold, which the Achinese sometimes bring to the coast. Its situation, near the source of Rio Sacro de Colla, is very advantageous for trade, if the natives were more disposed for commerce, and better acquainted with their own interest.

ASSIGN, *To*, in *Common Law*, hath various significations: one general, viz. to set over a right to another, or to appoint a deputy, &c.; another special, viz. to set forth or point out, as to assign error, assign false judgment, waste, &c. In assigning of error, it must be when the error is committed; in false judgment, wherein the judgment is unjust; in waste, wherein especially the waste is committed. Judges are also said to be assigned to take assises. Stat. 11. Hen. VI. c. 2.

ASSIGNABLE Magnitude, in *Geometry*, is used for any finite magnitude that can be expressed or denoted, and *Assignable Ratio*, for any expressible ratio.

ASSIGNEE, or **ASSIGN**, in *Law*, a person to whom a thing is appointed, or assigned by the act of the party, or the operation of law, to be occupied, paid, or done.

An assignee differs from a deputy in this, that the assignee possesses or enjoys a thing in his own right; and a deputy acts in right of another.

Assignee may be so either by deed or by law.

ASSIGNER by Deed is when a lessor of a term, &c. sells and assigns the same to another: the other is his assignee by deed.

ASSIGNEE by Law, is he whom the law so makes, without any appointment of the person. Thus, an executor is assignee by law to the testator, who dies possessed of a lease made to him and his assigns.

ASSIGNEES under a commission of bankruptcy, are persons to whom the bankrupt's estate is assigned, for the benefit of the creditors: they are chosen at one of the three meetings appointed by the commissioners, and published in the Gazette, by the major part in value of the creditors who shall then have proved their debts; but they may be originally appointed by the commissioners, and afterwards approved or rejected by the creditors: and no creditor shall be admitted to vote in the choice of assignees, whose debt does not amount to ten pounds. By virtue of the statutes 1 Jac. I. c. 15. 21 Jac. I. c. 19. all the personal estate and effects of the bankrupt are considered as veiled by the act of bankruptcy in the future assignees of his commissioners, whether they be goods in actual possession, or debts, contracts, and other choses in action; and when the assignees are chosen or approved by the creditors, the commissioners are to assign every thing over to them; and the property of every part of the estate is thereby as fully veiled in them, as it was in the bankrupt himself, and they have the same remedies to recover it. 12 Mod. 324.

The assignees may pursue any legal method of recovering the property veiled in them, by their own authority: but cannot commence a suit in equity, nor compound any debts owing to the bankrupt, nor refer any matters to arbitration, without the consent of the creditors, or a major part of them in value, obtained at a Gazette meeting.

The assignees must, after four, and within twelve months after the commission issued, give one and twenty days notice to the creditors of a meeting for a **DIVIDEND**; and within eighteen months, a second and final dividend shall be made, unless all the effects were exhausted by the first.

ASSIGNING. See **ASSIGN**.

ASSIGNMENT, the act of assigning or transferring the interest or property a man has in any thing; or of appointing or setting over a right to another. Assignments may be made of lands in fee, for life or years; or an annuity, rent-charge, judgment, statute, &c.: as to lands, they are usually of lease and estates for years: and an assignment differs from a lease only in this; that by a lease one grants an interest less than his own, reserving to himself a reversion: whereas in assignments he parts with the whole property, and the assignee stands to all intents and purposes in the place of the assignor.

No estate of freehold or term of years shall be assigned, but by deed in writing signed by the parties, except by operation of law. Stat. 29 Car. II. cap. 3. If lease for years assign all his term in his lease to another, he cannot reserve the rent in the assignment; for he hath no interest in the thing by reason of which the rent reserved should be paid; and where there is no reversion, there can be no distress: but debt may lie on it as on a contract. 1 Lill. Abr. 99. If the executor of a lessor assigns the term, debt will not lie against him for rent incurred after the assignment; because there is neither privity of contract nor estate between the lessor and executor; but if the lessee himself assign his lease, the privity of contract remains between him and the lessor, although the privity of estate is gone by the assignment, and he shall be charged during his life; but after his death, the privity of contract is likewise determined. 3 Rep. 14. 24. Although a lessee make an assignment even of his term, yet debt is against him by the lessor or his heir (not having accepted rent from the assignee); but where a lessee assigns his term, and the lessor his reversion, the privity is determined, and debt doth not lie for the reversioner against the first lessee. Moor 472. If an assignment is made by an assignee, the first assignee is not liable for the rent; for if he be accepted by the lessor, the admission of one assignee is the admission of twenty. Comp. Attorn. 491. Where a tenant for years assigns his estate, no consideration is necessary; for the tenant being subject to payment of rent, &c. is sufficient to veil an estate in the assignees; in other cases, some consideration must be paid. 1 Mod. 263. The words required in assignments are, *grant, assign, and set over*, which may amount to a grant, feoffment, lease, release, confirmation, &c. 1 Inst. 301. In these deeds the assignee is to covenant to save harmless from former grants, &c. that he is owner of the land, and has power to assign; that the assignee shall quietly enjoy, and to make further assurance; and the assignee covenants to pay the rent, and perform the covenants, &c.

The stat. 32 Hen. VIII. c. 34. gives the assignee of a reversion (after notice of such assignment), the same remedies against the particular tenant, by entry or action, for waste or other forfeitures, non-payment of rent, and non-performance of conditions, covenants, and agreements, as the assignee himself might have had; and makes him equally liable on the other hand, for acts agreed to be performed by the assignee, except in the case of warranty. A bond, being a chose in action, cannot be assigned over so as to enable the assignee to sue in his own name; and therefore, the form of assigning a chose in action is in the nature of a declaration of trust, and an agreement to permit the assignee to make use of the name of the assignor, in order to recover the possession. Accordingly, when in common acceptance a debt or bond is said to be assigned over, it must still be sued in the name of the original creditor; the person, to whom it is transferred, being rather an attorney than an assignee. But the king is an exception to this general rule;

for he might always either grant or receive a *chose* in action by assignment; and our courts of equity, considering that in a commercial country almost all personal property must necessarily lie in contract, will protect the assignment of a *chose* in action, as much as the law will that of a *chose* in possession. 3 P. Wms. 199. In equity, therefore, a bond is assignable for a valuable consideration paid, and the assignee alone becomes entitled to the money, so that if the obligor, after notice of the assignment, pays the money to the obligee, he will be compelled to pay it over again. 2 Vern. 295.

Several things are assignable by acts of parliament, which seem not to be assignable in their own nature; as promissory notes and bills of exchange, by stat. 3 & 4 Ann. c. 9.; bail-bonds by the sheriff, by 4 & 5 Ann. c. 16.; a judge's certificate for taking and prosecuting a felon to conviction, by 10 & 11 W. 3. c. 23.; and a bankrupt's effects, by the several statutes of bankruptcy.

The *assignment of dower* is the setting out of a woman's marriage-portion by the king. By the old law, grounded on the feudal exactions, a woman could not be endowed without a fine paid to the lord; neither could he marry again without his license; but she could contract herself, and so convey part of the feud, to the lord's enemy. Mirr. c. 1. § 3. This license the lords took care to be well paid for; and as it seems, would sometimes force the dowager to a second marriage, in order to gain the fine. But, to remedy these oppressions, it was provided, first by the charter of Henry I. and afterwards by Magna Charta (cap. 7.), that the widow should pay nothing for her marriage, nor be distrained to marry again, if she chose to live without a husband; but should not, however, marry against the consent of the lord: and farther, that nothing should be taken for assignment of the widow's dower, but that she should remain in her husband's capital mansion-house for forty days after his death, during which time, called the widow's "quarantine," her dower should be assigned. The particular lands to be held in dower, must be assigned by the heir of the husband, or his guardian; Co. Litt. 34, 35. not only for the sake of notoriety, but also to entitle the lord of the fee to demand his services of the heir, in respect of the lands so holden. For the heir by this entry becomes tenant thereof to the lord, and the widow is immediate tenant to the heir, by a kind of subinfeudation or under-tenancy, completed by this investiture or assignment; which tenure may still be created, notwithstanding the statute of *quia emptores*, because the heir parts not with the fee simple, but only with an estate for life. If the heir or his guardian do not assign her dower within the time of quarantine, or do assign it unfairly, she has her remedy at law, and the sheriff is appointed to assign it. Co. Litt. 34, 35. Or, if the heir, being under age, or his guardian assign more than she ought to have, it may be afterwards remedied by writ of *ADMEASUREMENT of dower*. Bl. Com. vol. ii. 135. &c. The assignment of the lands is for the life of the woman; and if lands are assigned to a woman for years, in recompence of dower, this is no bar of dower. 2 Danv. Abr. 168. When other land is assigned, that is no part of the lands in which the woman claims dower, that assignment will not be good or binding; and there must be certainty in that which is assigned; otherwise, though it be by agreement, it may be void. 4 Rep. 2. 1 Inst. 34. If a wife accept and enter upon less land than the third of the whole, on the sheriff's assignment, she is barred to demand more. Moor. 679. But if a wife is entitled to dower of the lands of her first husband, and her second husband accepts of this dower less than her third part, she may, after his death,

refuse the same, and have her full third part. Fitz. Dower, 121. By provision of law, the wife may take a third part of the husband's lands, and hold them discharged. 2 Danv. 672. The sheriff may also assign a rent out of the land in lieu of dower; and her acceptance of it will bar dower out of the same land, but not of other lands. 2 And. 31. Dyer, 31. 1 Nelson Abr. 680. None can assign dower but those who have a freehold, or against whom a writ of dower lies; and therefore a tenant by statute-merchant, statute-staple, or elegit, or lessee for years, cannot assign dower; for none of these have an estate large enough to answer the plaintiff's demand. Park. 403, 404. Co. Litt. 35. Bro. 63, 94. 1 Rol. Abr. 681. 6 Co. 57. If the heir within age assign to the wife more land in dower than she ought to have, he himself shall have a writ of admeasurement of dower at full age by the common law. F. N. B. 148, 332. Co. Litt. 39 a. 2 Inst. 367. 7 H. 11. c. 4. 13 Edw. 1. c. 7 & 8. If the heir within age, before the guardian enters, assigns too much in dower, the guardian shall have a writ of admeasurement, by stat. W. 11. c. 7. 2 Inst. 317. If a wife after assignment of dower improves the lands, so that they then become of greater value than the other two parts, no writ of admeasurement lies, &c. F. N. B. 149. 2 Inst. 368. 5 W. 12.

ASSIGNMENT, *Novel*. See *NOVEL*.

ASSIMILATION, compounded of *ad*, *to*, and *familis*, *like*, the act of *assimilating*; an act whereby a thing is rendered similar, and like to another.

ASSIMILATION, *ASSIMILATIO*, in *Physics*, is properly a motion whereby bodies convert other duly disposed bodies into a nature like, or homogeneous to their own. Instances of this assimilation we see in flame, which converts the oily or other particles of fuel into its own fiery and luminous nature. The like also appears in air, smoke, and spirits of all kinds.

The like we see in vegetables, where the watery juices imbibed from the earth, being farther prepared and digested in the vessels of the plant, become of a vegetable nature, and augment the wood, leaves, fruit, &c.

So also, in animal bodies, we see the food assimilated or changed into animal substance, by digestion, chylification, and the other operations necessary to nutrition.

ASSIMILATION, in *Rhetoric*. See *SIMILE*.

ASSIMILATOR, in *Entomology*, a species of *ICHNEUMON*, found in North America. The general colour is scarlet; anterior part of the thorax black; wings brown; base and band yellowish, with a sanguineous dot. Swederus Nov. Act. Stockh. &c.

ASSIMILIS, a species of *BRENTUS*, a native of New Zealand, and first described by Fabricius in his *Species Insectorum*, under the name of *Curculio assimilis*. It is of a cylindrical form, with the apex of the beak glabrous and black; and the wing-cases somewhat fasciated with ferruginous. Fab. Gmel. &c.—*Obs.* The snout is shorter than the body; antennæ black, brown at the tip; thorax black, and cuniculated; wing-cases pointed, and marked with four or five dots.

ASSIMILIS, a species of *GRYLLUS* (*Acheta* section). The wings are tailed, and longer than the wing-cases; abdomen with two styles, which are cleft at the end.

ASSIMILIS, a species of *SPHFX*, that inhabits Tranquebar. It is black; antennæ, tail, and legs rufous; wings blue, white at the base and tip. Fabr. Mant. Inf.

ASSIMILIS, a species of *ONISCUS*, found in the European seas. It is oval; the tail obtuse and unarmed; body cinereous. Fabricius. This is *afellus marinus vulgari brevier*

viore et latior of Ray; and it is conjectured is the same kind as Pallas calls *oniscus globator*.

ASSINILIS, a species of **ONISCUS**, called by Pallas *oniscus globator*; and by Ray *asellus marinus vulgari brevier et latior*. It inhabits the European seas; is oval, cinereous, with an obtuse, unarmed tail.

ASSINI, in *Geography*. See **ISSINI**.

ASSINIBOIN, or **RED RIVER**, sometimes called *Affiniboils*, and *Affiniboils*, a river in the north-west part of North America, which disembogues on the south-west side of the lake Winipic, in N. lat. $50^{\circ} 20'$. W. long. $96^{\circ} 30'$. It alternately receives the two denominations of Assiniboin and Red river, from its dividing at the distance of about thirty miles from the lake into two large branches. The eastern branch, called the Red river, runs in a southern direction to near the head waters of the Mississippi. On this river are two trading establishments. The country, on either side, is but partially supplied with wood, and consists of plains covered with herds of the buffalo and the elk, especially on the western side. On the eastern side are lakes and rivers, and the whole country is well wooded, level, and abounding with beaver, bears, moose-deer, fallow-deer, &c. &c. The inhabitants, who are of the Algonquin tribe, are not very numerous, and are considered as the natives of lake Superior. This country is also inhabited by the Nadowasis, who are the natural enemies of the former; and the head of the water being in the war-line, they are in a state of continual hostility. Although the Algonquins are equally brave, they are generally outnumbered by the others; and, therefore, if they venture out of the woods, which form their only protection, they will probably be soon extirpated. There is not, it is said, a finer country in the world, for the residence of uncivilised man, than that which occupies the space between this river and lake Superior. It abounds in every thing necessary to the wants and comfort of such people. Fish, venison, fowl, and wild rice, are very plentiful; and their subsistence demands that exercise which is essential to health and vigour. This country was formerly very populous; but the aggregate of its inhabitants does not now exceed 300 warriors; and the widows appear to be more numerous than the men. The racoon is a native of this country, but is seldom found to the northward of it.

The other branch of the river is called after the tribe of the Nadowasis, who are denominated Assiniboins, and who are the principal inhabitants of its environs. It runs from off the N. N. W., and in N. lat. $51^{\circ} 25'$, and W. long. $103^{\circ} 20'$, rises in the same mountains with the river DAUPHIN. The country between this and the Red river is almost a continual plain to the Mississippi. The soil is sand and gravel, with a slight mixture of earth, and produces a short grass. Trees are very rare, and insufficient, except in particular spots, for building houses, and supplying fire-wood for the trading establishments, of which there are four principal ones. Both these rivers are navigable for canoes to their sources, without a fall; though in some parts there are rapids, caused by occasional beds of limestone and gravel; but the bottom in general is sandy.

The *Affiniboins*, and some of the Fall, or big-bellied Indians, are the principal inhabitants of this country, and border on the river, occupying the central part of it; that next lake Winipic, and about its source, being the station of the Algonquins and Knisteneaux, who have made choice of it in preference to their own country. They do not exceed 500 families. They are not beaver-hunters, which accounts for their allowing the division just mentioned, as the lower and upper parts of this river have those animals, which are

not found in the intermediate district. They confine themselves to hunting the buffalo, and trapping wolves, which cover the country. What they do not want of the former, for raiment or food, they sometimes make into pemican, or pounded meat, while they melt the fat, and prepare the skins in their hair, for winter use. The wolves they never eat; but produce a tallow from their fat, and prepare their skins; all which they exchange for arms or ammunition, gum, tobacco, knives, and various baubles, with those who go to traffic in their country. These Nadowasis, or Assiniboins, called also *Store Indians*, who inhabit the plains on and about the source and banks of the Saskatchewan and Assiniboin rivers, are supposed to have migrated from the southward, being detached tribes from the Nadowasis, who inhabit the western side of the Mississippi, and lower part of the Missouri, and their progress is north-west. Mackenzie's *Voyages from Montreal*, &c. Introd. p. 62, &c. p. 407.

ASSINOIS, a nation of Indians, inhabiting the forests of Canada.

ASSIRATUM, in *Antiquity*, a bloody draught, where-with treaties were ratified. It was made of wine and blood, called by the ancient Romans, *affir*.

ASSIS, in *Physiology*, either denotes opium, or a powder made of hemp-seed, which being formed into holes about the bigness of chestnuts, is swallowed by the Egyptians, who are hereby intoxicated, and become ecstasie, and full of the most agreeable visions.

This is also called by the Turks *afferac*.

ASSISA, or **ASSISIA**. See the articles **ASSISE**, and **TALLIAGE**.

ASSISA, *cadere, to fall from the assise*, in *Law*, is to be non-suited. Fleta, l. iv. c. 15. Bracton, l. ii. c. 7.

ASSISA cadit in juratam, is where the thing in controversy is so doubtful, that it must necessarily be tried by a **JURY**. Fleta, l. iv. c. 15.

ASSISA capi in modum assise, is when the defendant pleads directly to the assise, without taking any exception to the count, declaration, or **WRIT**.

ASSISA continuanda, is a **WRIT** directed to the justices, to take an assise for the continuance of the cause, where certain records alleged cannot in time be procured by the party. Reg. Orig. 217.

ASSISA nocuanti, is an *assise of NUSANCE*. See the article.

ASSISA panis & cerevisie, denotes the power or privilege of assigning and adjusting the weight and measure of bread and beer.

ASSISE judicium, in *Law*, signifies a judgment of the court, given either against the plaintiff or defendant, for default.

ASSISA proroganda, is a **WRIT** directed to the justices of assise, for the stay of proceedings, on account of the king's business wherein the party is employed. Reg. Orig. 208.

ASSISE, or **ASSIZE**, *assisa*, in *Law*, a sitting of judges or justices, for the hearing or determining of causes. The word is French, *assise*, or *assis*, *seated*; formed of the Latin *assideo, to sit together*, which is compounded of *ad, to*, and *sedeo, I sit*.

Such is the etymology of the word *assise*, given by Sir Edward Coke; so that it signifies, originally, the jury who try the cause, and sit together for that purpose. By a figure, it is now made to signify the court or jurisdiction, which summons this jury together by a commission of assise, or "ad assisas capiendas;" whence the judicial assemblies held by the king's commission in every county, as well to take these writs of assise, as to try causes at "Nisi Prius," are termed in common speech, the *assises*.

ASSISE, *Clerk of.* See CLERK.

ASSISE, or ASSISES, was anciently used for certain extraordinary sittings of superior judges, in the inferior courts depending on their jurisdiction, to inquire whether the subaltern judges and officers did their duty; to receive the complaints preferred against them; and take cognizance of appeals from them. These are also called *mercatorial assises*.

ASSISE was also a court or assembly, composed of several great persons of the realm; held occasionally in the king's palace, for the final decision of all affairs of importance.

This is more usually called, among our writers, *placita mala publica*, or *curie generalis*. Yet there is some difference been *assises* and *placita*.—The viscounts or sheriffs, who originally were only lieutenants of the *comites*, or counts, and rendered justice in their place, held two kinds of courts, the one ordinary, held every day, and called *placitum*; the other extraordinary, called *assise*, or *placitum generale*; at which the count himself assisted, for the dispatch of the more weighty affairs. Hence the term assise came to be extended to all grand days of judgment, at which the trials and pleadings were to be solemn and extraordinary.

The modern constitution of assises is different from that above-mentioned.—Our assise may be defined a court, place, or time, where and when writs and processes, either civil or criminal, or both, are considered, dispatched, decided, &c. by judges and jury.

In this sense we have two kinds of assises; *general* and *special*.

ASSISES, or ASSIZES, *general*, are those held by the judges twice a year, in their several circuits.

The nature of the assises is explained by lord Bacon, who observes, that all the counties of the kingdom are divided into six circuits; to each of which two learned men, assigned by the king's commission, are sent twice a year, except London and Middlesex, where courts of *nisi prius* are holden in and after every term, before the chief or other judge of the several superior courts; and except the four northern counties, where the assises are holden only once a year. These are called JUSTICES, or *judges of assise*, and have several commissions by which they sit; viz.

1. A *commission of oyer and terminer*, directed to them, and many others of the best account in their respective circuits. In this commission, the judges of assise, or sergeants at law, are only of the *quorum*; so that without them there can be no proceeding. This commission, which is the largest they have, gives them power to transact matters relating to treasons, murders, felonies, and other misdemeanors. See OYER and Terminer.

2. The second is of *gaol-delivery*, which is only to the judges themselves, and the clerk of the assise associate.—By this commission, they have concern with every prisoner in gaol, for every offence whatsoever. See GAOL-Delivery.

3. The third is of *assise*, directed to themselves and the clerk of the assise, to take writs of possession, called also assises, in the several counties; that is, to take the verdict of a peculiar species of jury, called an *assise*, and summoned for the trial of landed disputes. These writs were formerly frequent; but now men's possessions are sooner recovered by ejectments, &c.

4. The fourth is to take the *nisi prius*, directed to the justices, and the clerks of assises; whence they are also called *justices of nisi prius*. See NISI PRIUS.

5. The fifth is a *commission of peace*, in every county of their circuit; and all the justices of the peace, having no lawful impediment, are bound to be present at the assises, to attend the judges.

The sheriff of every shire is also to attend in person, or by a sufficient deputy allowed by the judges, who may fine him if he fail.

These commissions are constantly accompanied by writs of association, in pursuance of the statutes 27 Edw. I. c. 4. 12 Edw. II. c. 3.; by which certain persons (usually the clerk of the assise and his subordinate officers) are directed to associate themselves with the justices and sergeants, and they are required to admit the said persons into their society, in order to take the assises, &c. that a sufficient supply of commissioners may never be wanting. But to prevent the delay of justice by the absence of any of them, there is also issued of course a writ of "*si non omnes*," directing, that if all cannot be present, any two of them (a justice or serjeant being one) may proceed to execute the commission.

There is a commission of the peace, oyer and terminer, and gaol-delivery of Newgate, held eight times in every year, for the city of London and county of Middlesex, at justice-hall in the Old Bailey, where the lord mayor is chief judge. In Wales there are but two circuits, North and South Wales; for each of which the king appoints two persons learned in the law to be judges. Stat. 18 Eliz. c. 8.

This excellent constitution of judges, circuits, and assises, was begun in the time of Henry II. though somewhat different from what it is now.

The *grand assise*, or trial by jury, instituted by Henry II. as an alternative instead of judicial combats, is particularly described by Glanvil, who was probably the adviser of the measure.

For this purpose a writ, *De magna assisa ligenda*, was directed to the sheriff, to return four knights, who were to elect twelve others to be joined with them: all these together formed the grand assise, ordained to try the matter of right.

The judges of assise came into use in the room of the ancient justices in eyre, *justitiarum in itinere*; who were regularly established, if not first appointed, by the parliament of Northampton, A. D. 1176, 22 Hen. II. with a delegated power from the king's great court; and they afterwards made their circuit round the kingdom once in seven years, for the purpose of trying causes. They were afterwards directed by Magna Charta, c. 12. to be sent into every county once a year. Blackstone's Com. vol. iii. See JUSTICES of Assise.

ASSISE *Special*, is a particular commission granted to certain persons, to take cognizance of some one or two causes, as a disseisin, or the like. This was very frequently practised among our ancestors. Bracton, lib. iii. c. 12.

ASSISE is also used for a writ directed to the sheriff, for the recovery of possession of things immoveable, whereof a man's self, or ancestors, have been disseised.

Lyttleton, and others, suppose these writs of assise, in which the sheriff is ordered to summon a jury or assise, to have given the denomination to the assises, or courts so called; and they assign several reasons of the name of the writ: as,

1. Because such writs settle the possession and right, in him that obtains by them. 2. Because originally they were executed at a certain time and place appointed; for by the Norman law, the time and place must be known forty days before the judges sit; and by our law there must be fifteen days preparation, except they be tried in the standing courts at Westminster. But it is more natural to suppose the writs denominated from the courts; and that they were called assises, because anciently tried at special courts of assises, set and appointed for that purpose. Though of latter days, these

these are dispatched at the general assises, along with the commission of oyer and terminer, &c.

This writ of assise is said to have been invented by Glanvil, chief justice to Henry II; and if so, it seems to owe its introduction to the parliament held at Northampton, in the twenty-second year of that prince's reign; when justices in oyer were appointed to go round the kingdom, in order to take these assises; and the assises themselves (particularly those of *mort d'ancestor* and *novel disseisin*) were clearly pointed out and described. As a writ of entry is a real action, which *disproves* the title of the tenant, by shewing the unlawful commencement of his possession, so an assise is a real action, which *proves* the title of the demandant, merely by shewing his or his ancestor's possession; and these two remedies are in all other respects so totally alike, that a judgment on recovery in one is a bar against the other; so that when a man's possession is once established by either of these possessory actions, it can never be disturbed by the same antagonist, in any other of them.

This remedy by writ of assise was called by stat. Westm. 2. 13 Edw. I. c. 24. *feoffinum remedium*, in comparison with that by a writ of entry; as it did not admit of many dilatory pleas and proceedings, to which other real actions are subject; and it is only applicable to two species of injury by ouster, viz. *abatement*, and a recent or *novel disseisin*.

ASSISE of *Mort d'Ancestor*, or death of one's ancestor, is a writ that lies when father or mother, brother or sister, uncle or aunt, nephew or niece, dies seised of lands, tenements, rents, &c. held in fee-simple; and after their death, a stranger abates. It is good as well against the abator, as any other in possession; but it lies not against brothers or sisters, &c. where there is privity of blood between the person prosecuting and them. Co. Litt. 242. It must also be brought within the time limited by the statute of limitations, in fifty years; or the right may be lost by negligence.

This writ directs the sheriff to summon a jury or assise, who shall view the land in question, and recognise whether such ancestor were seised thereof on the day of his death, and whether the demandant be the next heir; soon after which, the judges come down by the king's commission to take the recognition of assise; when, if these points are found in the affirmative, the law immediately transfers the possession from the tenant to the demandant. F. N. B. 195. Finch. L. 290. If the abatement happened on the death of one's grandfather or grandmother, then an assise of mort d'ancestor no longer lies, but a writ of "*avyle*," or "*de avo*;" if on the death of the great grandfather or great grandmother, then a writ of "*besayle*," or "*de proavo*;" but if it mounts one degree higher, to the "*trifayle*" or grandfather's grandfather; or if the abatement happened upon the death of any collateral relation, other than those before mentioned, the writ is called a writ of "*cofinage*," or "*de consanguineo*." Finch. L. 266, 267. And the same points shall be inquired of in all these actions "*ancestral*," as in an assise of mort d'ancestor, as they are of the same nature (stat. Westm. 2. 13 Edw. I. c. 20.); though they differ in this point of form, that these ancestral writs (like all other writs of "*præcipe*") expressly assert a title in the demandant (viz. the seisin of the ancestor at his death, and his own right of inheritance); the assise asserts nothing directly, but only prays an inquiry whether these points be so. 2 Inst. 399. There is also another ancestral writ, denominated a "*nuper obiit*," to establish an equal division of the land in question, where, on the death of an ancestor, who has several heirs, one enters, and holds the others out of possession. F. N. B. 197. Finch. L. 293. But a man is not allowed to have any of these

actions ancestral for an abatement consequent on the death of any collateral relation, beyond the fourth degree (Hale on F. N. B. 221.), though in the lineal ascent he may proceed *in infinitum*. It was always held to be law (Bracton. l. 4. c. 13. § 3. F. N. B. 196.), that where lands were devisable in a man's will by the custom of the place, there an assise of mort d'ancestor did not lie. For where lands were so devisable, the right of possession could never be determined by a process, which merely inquired concerning the seisin of the ancestor, and the heirship of the demandant. Hence it may be reasonable to conclude, that when the statute of wills, 32 Hen. VIII. c. 1. made all feoffee lands devisable, an assise of mort d'ancestor no longer could be brought of lands held in feoffee (1 Leon. 267.); and that now, since the statute 12 Car. II. c. 24. which converts all tenures, a few only excepted, into free and common feoffee, no assise of mort d'ancestor can be brought of any lands in the kingdom; but that, in case of abatements, recourse must be properly had to the writs of entry. Bl. Com. vol. iii. p. 187.

These writs, however, are now almost obsolete, being in a great measure superseded by the action of ejectment, which answers almost all the purposes of real actions, some very peculiar cases excepted.

ASSISE of *Novel Disseisin* is an action of the same nature with the "*assise of mort d'ancestor*," as in this the demandant's possession must be shewn. But in other points it is different, particularly as it recites a complaint by the demandant of the disseisin committed in terms of direct averment; whereupon the sheriff is commanded to reseise the land, and all the chattels thereon, and keep the same in his custody till the arrival of the justices of assise (which, in fact, hath been usually omitted); and in the mean time to summon a jury to view the premises, and make recognition of the assise before the justices. F. N. B. 177. At which time the tenant may plead either the general issues, "*nul tort*," "*nul disseisin*," or any special plea. And if, upon the general issue, the recognitors find an actual seisin in the demandant, and his subsequent disseisin by the present tenant, he shall have judgment to recover his seisin, and damages for the injury sustained.

This is called "*novel disseisin*," because the justices in eyre went their circuits from seven years to seven years; and no assise was allowed before them, which commenced before the last circuit, called an *ancient assise*; and that which was upon a disseisin since the last circuit, an assise of *novel* or recent disseisin. Co. Litt. 153. b.

This remedy lies where a tenant in fee-simple, fee-tail, or for term of life, is put out and disseised of his lands or tenements, rents, common of pasture, common way, or of an office of profit, toll, &c. Glanv. l. 10. Reg. Orig. 197. Assise lies for tithes, by stat. 32 Hen. VIII. c. 7. Cro. Eliz. 559.; but not for an annuity, pension, &c.

For preventing frequent and vexatious disseisins, it is enacted by the statute of Merton, 20 Hen. III. c. 3. that if a person disseised recover seisin of the land again by assise of *novel disseisin*, and be again disseised of the same tenements by the same disseisor, he shall have a writ of "*re-disseisin*;" and if he recover therein, the re-disseisor shall be imprisoned. And by the statute of Marlberge, 52 Hen. VIII. c. 8. shall also pay a fine to the king; to which the statute Westm. 2. 13 Edw. I. c. 26. hath superadded double damages to the party aggrieved. In like manner, by the same statute of Merton, when any lands or tenements are recovered by assise of "*mort d'ancestor*," or other jury, or any judgment of the court, if the party be afterwards disseised by the same person against whom judgment was obtained, he shall have

a writ of "*post-diffellin*," against him; which subjects the post-diffellor to the same penalties as a re-diffellor. The reason of which, given by Sir Edward Coke, 2 Inst. 83, 84, is, because such proceeding is a contempt of the king's courts, and in despite of the law. Bracton, l. 4. c. 49. Bl. Comm. vol. iii. p. 188.

The court of Common Pleas, or King's Bench, may hold plea of assises of land in the county of Middlesex, by writ out of Chancery. 1 Litt. Abr. 105. And in cities and corporations an "*assise of first seisin*" lies for recovery of possession of lands, within forty days after the diffellin, as the ordinary assise is in the county. F. N. B. 7.

Assise of Darrein Presentment, or last presentation, lies when a man, or his ancestors, under whom he claims, have presented a clerk to a benefice, who is instituted; and afterwards upon the next avoidance, a stranger presents a clerk, and thereby disturbs him that is the real patron. In this case the patron shall have this writ directed to the sheriff to summon an assise or jury, to inquire who was the last patron that presented to the church now vacant, of which the plaintiff complains that he is deforced by the defendant; and, according as the assise determines that question, a writ shall issue to the bishop, to institute the clerk of that patron in whose favour the determination is made, and also to give damages, in pursuance of statute Westm. 2. 13 Edw. I. c. 5. The statute of 7 Ann. c. 18. having given a right to any person to bring a writ of "*quare impedit*," and to recover (if his title be good), notwithstanding the last presentation, by whomsoever made; assises of darrein presentment now not being in any wise conclusive, have been totally disused, as indeed they began to be before; a "*quare impedit*," being a more general, and therefore a more usual action. For the assise of darrein presentment lies only where a man has an advowson by descent from his ancestors; but the writ of "*quare impedit*" is equally remedial, whether a man claims title by descent or purchase. 2 Inst. 355. Bl. Com. vol. iii. p. 246.

Assise of Juris utrum, sometimes styled the parson's writ of right, being the highest writ which he can have, lies for a parson or prebendary at common law, and for a vicar by stat. 12 Edw. III. c. 17. and is in the nature of an assise, to inquire whether the tenements in question are frankalmoin belonging to the church of the demandant, or else the lay-fee or the tenant. By this the demandant may recover lands and tenements, belonging to the church, which were aliened by the predecessor; or of which he was diffellid; or which were recovered against him by verdict, confession, or default, without praying in aid of the patron and ordinary; or on which any person has intruded since the predecessor's death. F. N. B. 48, 49. But since the restraining statute of 13 Eliz. c. 10. whereby the alienation of the predecessor, or a recovery suffered by him of the lands of the church, is declared to be absolutely void, this remedy is of very little use, unless where the parson himself has been deforced for more than twenty years; for the successor, at any competent time after his accession to the benefice, may enter, or bring an ejectment. B1. Com. vol. iii. p. 253.

Assise is also used, according to Lyttleton, for a jury. This that author supposes to be by a *metonymia effecti*, the jury being so called, because summoned by virtue of the writ of assise.

Yet it must be observed that the JURY summoned upon a writ of right is likewise called the assise; but this may be said to be *καταχρηστικως*, or abusively so termed. Assise, in this signification, is divided into *magna* & *parva*.

Assise is farther used, according to Lyttleton, for an ordinance or statute, regulating the weight, size, or di-

mensions of certain commodities. Thus the ancient statute of bread and ale, anno 51 Hen. III. is termed the *assise of bread and ale*, *assisa panis & cerevise*. See *Assise of Bread*.

Assise is further used for the scantling or quantity itself prescribed by the statute. When wheat is of such or such price, bread shall be of such assise. See *BREAD*.

We have divers statutes for fixing the assise of fish, cloths, wood, billets, faggots, and the like. Vide 34 & 35 Hen. VIII. c. 3. 2 Ann. c. 15. 10 Ann. c. 6. 19 Car. II. c. 3. 4 Jac. I. c. 9. 1 Geo. I. stat. 2. c. 18.

Fixing any assise of cloth, or prescribing what length, breadth, weight, &c. it shall have, Sir Josiah Child thinks, does more hurt than good. As the fashions and humours of mankind are variable, to supply all markets at all times, we must have all sorts, cheap and light, as well as heavier and better. Stretching with tenters is essential to our drapery, and the precise degree or quantity of it cannot without injury be prescribed by any law; but must be left to the vender's or exporter's discretion.

Assise of the Forest, is a statute or condition containing orders to be observed in the king's forest. It is called an assise, because it sets down and appoints a certain measure, rate, or order, in the things it concerns.

Assise, again, is used for the whole process in court, founded on a writ of assise; and sometimes for a part of it, viz. the issue, or verdict of the jury.

Thus we read, that "assises of novel disseisin shall not be taken but in their shires; and after this manner, &c." Mag. Chart. cap. 12. So in Merton, cap. 4. Hen. III. we meet with, "certified by assise, quitted by assise, &c."

Assise of the King, a name given to the statute of view of frank-pledge, 18 Ed. II.

Assise at large is brought by an infant to inquire of a disseisin, and whether his ancestor were of full age, good memory, &c. when he made the deed pleaded, whereby he claims his right.

Assise in Point of Assise, *assisa in modum assise*, is when the tenant, as it were, setting foot to foot with the demandant, without any thing further, pleads directly the writ, no wrong, no disseisin.

Assise out of the Point of Assise, is when the tenant pleadeth something by exception, as a foreign release, or foreign matter triable in a foreign country; which must be tried by a jury, before the principal cause can proceed.

Assise of Right of Damages is where the tenant confesseth an ouster, and referring it to a demurrer in law, whether it were rightly done or not, is adjudged to have done wrong; whereupon the demandant shall have a writ of assise to recover damages. Bracton, l. 4. F. N. B. 105.

Assise of Arms, a name given to an act of 27 Hen. II. which provided that every man's armour should descend to his heir, for defence of the realm; and which, together with the statute of Winchester, 13 Edw. I. c. 6. obliged every man, according to his estate and degree, to provide a determinate quantity of such arms as were then in use, in order to keep the peace.

Assise, Black, in *History*, an assise held at Oxford, in July, A. D. 1577, so called on account of a sudden "damp" which is said to have arisen, and after nearly smothering the whole court and audience, occasioned the death of the judge, high sheriff, most of the jury, and above 500 of the spectators. This fatality was ascribed by the vulgar to magic; but the discernment of lord Bacon saw through the mist of superstition. The symptoms of this disorder, which seems to have been the first appearance of the gaol-fever in England, marked the most extreme putridity.

ASSISE, *Cerificate of*, in *Law*, a writ granted by stat. Westm. 2. c. 25. to a party aggrieved, by a verdict or judgment given against him in an assise, when he had something to plead, as a record or release, which could not have been pleaded by his bailiff, or when the assise was taken against himself by default, to have the deed tried, and the record brought in before the justices, and the former jury summoned to appear before them at a certain day and place, for a further examination and trial of the matter. This, in reality, was neither more nor less than a second trial of the same cause by the same jury. Bracton, l. 4. tr. 5. c. 6. f. 2. F. N. B. 181. 2. Int. 415.

ASSISE, *Continuance of*. See CONTINUANCE.

ASSISE, *Justices of*. See JUSTICES.

ASSISE, *Limitation of*. See LIMITATION.

ASSISE, *Rents of*. See RENT.

ASSISER, or **ASSIZER**, of *weights and measures*, is an officer who has the care and oversight of those matters.

ASSISI, in *Geography*, a town of Italy, belonging to the states of the church and duchy of Spoleto; it is the see of a bishop, and famous for being the native place of St. Francis, and for the beautiful church belonging to the order instituted by that saint, in which some say he is buried; as well as for the great number of pilgrims resorting to it. It is fifteen miles west of Nocera.

ASSISII, in *Ecclesiastical Writers*, denote persons benefited in a cathedral church, not in a rank below that of canons. The assisi perhaps answered to our minor canons. They were thus called, either because they were allowed an assisa or pension; or from *assidus*, *diligent*.

ASSISOR, the same with assessor. In Scotland, assisors are the same with our jurors.

ASSISTANCE. See AID.

ASSISTANT is used for a person or officer appointed to attend another principal officer, for the more easy and regular discharge of his function.—Such a bishop or priest had seven or eight assistants.

ASSISTANT, in Roman Catholic countries, is particularly applied to a kind of counsellors, or comptrollers, added to the generals or superiors of monasteries, &c. to take care of the affairs of the community.

The general of the Jesuits has five assistants, of consummate experience, chosen by him out of all the provinces of the order, and denominated from the kingdoms or countries to which they belong, i. e. Italy, Spain, Germany, France, and Portugal. In a like sense, most of our trading companies have their courts of assistants.

ASSISTANTS are also those condemned to assist in the execution of a criminal.

ASSISUS, in *Ancient Law Writers*, denotes a thing demised or farmed out for such an assise or certain rent, in money or provisions. Hence *terra assisa* was commonly opposed to *terra deminica*; this last being held in demesne, or occupied by the lord, whereas the former was let out to tenants. Hence also *redditus assisus* denotes the set or standing rent.

ASSITHMENT, or **ASSYTHMENT**, in the *Law of Scotland*, is a compensation for a man slain.

Assithment is the same with what, in the *English Law*, is called *Man-BOTE*.

ASSIUS LAPIS, in *Physiology*. See LAPIS ASSIUS.

ASSO, in *Ancient Geography*, a town of Hispania Tarraconensis, in the country of the Bætitani. Ptolemy.

ASSOCIATE, compounded of *ad*, and *socius*, *company*, an adjunct, partner, or member.

ASSOCIATION, **ASSOCIATIO**, the act of associating, or forming a society or company.

Association is properly a contract or treaty of partnership, whereby two or more persons unite together, either for their mutual assistance, or for the joint carrying on of an affair; or even for a more commodious manner of life.

In a military sense, it denotes any number of men embodied in arms for mutual defence in their district, and for preserving the public tranquillity against foreign and domestic enemies.

The closest of all associations is that made by the band of matrimony. See SOCIETY.

ASSOCIATION of Ideas, is where two or more ideas constantly and immediately follow or succeed one another in the mind, so that one shall almost infallibly produce the other; whether there be any natural relation between them or not. Or, it is that principle or faculty by which two or more sensations, ideas, or motions, are so united together, that any one impressed alone shall excite all the rest.

Where there is a real affinity or connection in ideas, it is the excellency of the mind to be able to collect, compare, and range them in order, in its inquiries: but where there is none, nor any cause to be assigned for their accompanying each other, but what is owing to mere accident or habit, this unnatural association becomes a great imperfection, and is, generally speaking, a main cause of error or wrong deductions in reasoning. Thus, the idea of goblins and sprites has really no more affinity with darknets than with light; and yet let a foolish maid inculcate these ideas often on the mind of a child, and raise them there together, it is possible he shall never be able to separate them again so long as he lives, but darknets shall ever bring with it those frightful ideas.—Let custom, from the very childhood, have joined the idea of figure and shape to the idea of God, and what absurdities will that mind be liable to about the Deity!

Such wrong combinations of ideas, Mr. Locke shews, are a great cause of the irreconcilable opposition between the different sects of philosophy and religion: for we cannot imagine, that all who hold tenets different from, and sometimes even contradictory to one another, should wilfully and knowingly impose upon themselves, and refuse truth offered by plain reason: but some loose and independent ideas are by education, custom, and the constant din of their party, so coupled in their minds, that they always appear there together: these they can no more separate in their thoughts, than if they were but one idea, and they operate as if they were so. This gives sense to jargon, demonstration to absurdities, consistency to nonsense, and is the foundation of the greatest, and almost of all, the errors in the world.

Mr. Hume observes (*Essays*, vol. i. p. 73.), that there is a principle of connection between the different thoughts or ideas of the mind; and that, in their appearances to the memory or imagination, they introduce each other with a certain degree of method and regularity. Of this connection he alleges evidence from our more serious thinking or discourse, from our wildest and most wandering reveries, and even our dreams, and from our loosest and finest conversation. Among different languages also, words expressive of ideas the most compounded, nearly correspond to each other; and hence it is inferred, that the simple ideas comprehended in the compound ones are bound together by some universal principle, which has an equal influence on all mankind. This writer ascribes the association or connection of ideas to three principles; viz. "resemblance," "contiguity" in time or place, and "cause" or "effect." These, he says (p. 54.), are the only bonds that unite our thoughts

thoughts together, and beget that regular train of reflection or discourse, which, in a greater or less degree, takes place among all mankind. Although it should be allowed, that these are real principles of association or connection in our ideas, it may be urged that ideas succeed one other without resemblance or contiguity as to time and place, and without the mutual correspondence or relation of cause and effect; and that there are other associations besides those of ideas, which are associated with passions and emotions, and passions and emotions are associated together. A particular idea is associated together with a proper name, and often with the general name of the species; general conceptions, or mixed modes, as they are denominated by Mr. Locke, are associated with signs both audible and visible, and signs are associated with one another. Virtue, as it consists in action and intention, does not resemble the sound virtue, is not contiguous to it in time or place, and is neither its cause nor its effect; nor can it be imagined that the arbitrary signs of various objects should have any natural relation to one another. But if there were no other principles of association besides those of Mr. Hume, the author himself has not shewn how they account for the phenomena.

Dr. Hartley, whatever may be thought of his general system, has attempted to form a mechanical theory of the human mind and its various operations by means of "association." The principle or law of association seems to have been first noticed by Mr. Locke; but he applies it to the solution of very few phenomena. Mr. Gay, in a "Dissertation upon Virtue," prefixed to "Law's translation of King's Origin of Evil," deduces the moral feelings from association; and Dr. Hartley traces all, or at least most of the other phenomena of mind to the same cause. This law of association extends to SENSATIONS, to IDEAS, and to MUSCULAR Motions; which see respectively.

Accordingly he distinguishes it into synchronous and successive; and ascribes our simple and complex ideas to the influence of this principle or habit. Particular sensations result from previous vibrations conveyed through the nerves to the medullary substance of the brain; and these are so intimately associated together, that any one of them, when impressed alone, shall be able to excite in the mind the ideas of all the rest. Thus we derive the ideas of natural bodies from the association of the several sensible qualities with the names that express them, and with each other. The sight of part of a large building suggests the idea of the rest instantaneously, by a synchronous association of the parts; and the sound of the words, which begin a familiar sentence, brings to remembrance the remaining parts in order by successive association. Dr. Hartley maintains that simple ideas run into complex ideas by association; and apprehends that by pursuing and perfecting this doctrine, we may some time or other be enabled to analyse those complex ideas that are commonly called the ideas of reflection, or intellectual ideas, into their several component parts, i. e. into the simple ideas of sensation of which they consist; and that this doctrine may be of considerable use in the art of logic, and in explaining the various phenomena of the human mind. For a further explication of Dr. Hartley's doctrine of association, the philosophical principles upon which it depends, and the mode of its application, the reader must be referred to his "Observations on Man," vol. ii. or part i. passim; and also to Priestley's "Abridgment of Hartley," 8vo. & Stewart's "Elements of the Philosophy of the Human Mind," 4to. 1792. ch. v.; Darwin's Zoonomia, vol. i. § 5—10.

A late writer observes, that the doctrine of association is to

be very carefully distinguished from the theory of vibrations, being established upon independent evidence and undeniable facts. This therefore, he adds, must stand, though the other should be regarded only as a plausible hypothesis, destitute of satisfactory proof. It was to prevent the confusion of the nature and evidence of association and vibration, says this writer, that Dr. Priestley published his edition of Hartley's work, from which the theory of vibrations is entirely excluded. Bellsham's Elements of the Philosophy of the Mind, and of Moral Philosophy, 8vo. 1801. p. 54. See also *Æther*, *Idea*, *Memory*, *Sensation*, *Vibrations*, and *Vibratiuncles*.

ASSOCIATION, in *Law*, is a writ or patent sent by the king, either of his own motion, or at the suit of a party plaintiff, to the justices of assize, to have other persons associated to them, in order to take the assize.

Upon this patent of association, the king sends his writ to the justices of the assize, thereby commanding them to admit such as are so sent.

The clerk of the assize is usually associate of course; in other cases some learned sergeants at law are appointed. See *ASSISE*.

ASSOCIATION of *Parliament*. In the reign of king William III. the parliament entered into a solemn association to defend his majesty's person and government against all plots and conspiracies; and all persons bearing offices civil or military were enjoined to subscribe the association to stand by king William, on pain of forfeitures and penalties, &c. by stat. 7. and 8 W. III. c. 27.

ASSOCIATION, *Feathers Tavern*, consisted of a number of clergymen, and of gentlemen in the professions of civil law and physic, who, wishing to be exempted from the obligation of subscribing the thirty-nine articles of religion, applied in the year 1772, by petition to parliament for this purpose. Their society was so called from the place where they met. The object at which they aimed was to be permitted to hold their preferments, upon condition of merely subscribing to the holy scriptures, agreeably to the grand Protestant principle; which is, that every thing necessary to salvation is fully contained in these scriptures, and that they are the sole rule of faith and manners. The request, however, was not thought to comport with the nature of a civil establishment in religion; and principally on this ground, it was strenuously opposed by many distinguished members of parliament, and as strenuously defended by some of the first persons in the house of commons. After a long and interesting debate, the admission of the petition was rejected by a large majority. It was the general opinion, that those who propose to reap the benefits of the established church, ought to comply with the terms on which they are offered.

ASSOCIATION, *Protestant*, took its rise from an act passed in 1778, for relieving his majesty's subjects, professing the Romish religion, from certain penalties and disabilities imposed upon them in the eleventh and twelfth years of the reign of king William III. The act was passed unanimously; nor did it at first appear to excite any great alarm among persons of any class. The papists, as they now thought the government inclined to be more indulgent to them than it had formerly been, began to take somewhat greater liberties in the exercise of their religion than those to which they had been accustomed. By degrees, a number of persons in London, and in some other parts of the kingdom, began to express great apprehensions of the increase of popery, and to exclaim against the late act, by which they thought it was countenanced and supported. Meetings of these zealous persons were held from time to time in London; and they formed themselves into a body under the

the title of the "Protestant Association," and at length lord George Gordon became their president. The object of their association was to procure a repeal of the late act in favour of the papists. The persons who attended these meetings were, many of them, honest and well-intentioned people, who had a just aversion to popery, but who did not duly consider that, an intolerant spirit was at least as censurable in a protestant as in a papist. In a little while, however, their number, consisting of persons in the lower ranks of life, became very considerable. A petition to parliament was framed, for a repeal of the late act, and the utmost pains were employed to procure subscriptions to it. The number of subscribers is said to have amounted to 120,000 persons. In order to give weight to their petition, it was determined that it should be attended by great numbers of the petitioners in person; and a public advertisement was issued for that purpose, signed by lord George Gordon. Accordingly it is supposed that at least 50,000 persons assembled on the second of June in St. George's Fields, and proceeded in great order to the house of commons, where their petition was presented by their president. Several members of both houses of parliament were grossly insulted and ill-treated by the populace, and in the evening a mob assembled which demolished two Romish chapels. The metropolis, for several subsequent days, became an unexampled scene of alarm, terror, and devastation; and for some time the magistrates in general manifested little activity. At length, when the rioters were making a formidable attack upon all property, and every man's personal security was endangered, the military interposed, and, after considerable exertions, restored the capital of the kingdom to order and tranquillity, after a devastation that had continued for six days, and not without the loss of many lives. The number of persons killed and wounded by the military in the suppression of these riots, is said to have amounted to 458 persons. It would be unjust, however, to impute to the protestant association, as the first agents in this business thought proper to style themselves, the whole of the mischief that ensued, or to suppose that they foresaw the calamities to which they gave occasion. Yet it must be allowed, that these unhappy scenes owed their origin to their bigotry and delusion; and that the members of that association manifested a spirit the very reverse of that which distinguishes real and enlightened protestants, and very disgraceful to the national character. It has been said, that no member of the protestant association was executed or tried for any share in the riots; and it is most probable, that those who engaged in this disastrous business from religious bigotry, would have the discretion to retire before the last excesses, and before the intervention of the military. Several of the rioters were afterwards apprehended, tried, and executed. Lord George Gordon was committed to the Tower on the tenth of June, arraigned on the twenty-fifth of January, 1781; and on the fifth of February, tried under a charge of constructive treason, and acquitted.

ASSOILE, in our *Ancient Law-Books*, signifies to absolve, deliver, or set free from an excommunication. See **ABSOLUTION**.

ASSOKO, in *Geography*, a town of Africa, the capital of Ilini, in an island of the same name, formed by the river Ilini; which is the ordinary residence of the king and his attendants.

ASSOM. See **ASSRM**.

ASSONANCE, in *Rhetoric* and *Poetry*, a term used where the words of a phrase, or verse, have the same sound or termination, and yet make no proper rhyme.

These are usually vicious in English; the Romans some-

times used them with elegance: "Militem comparavit, exercitum ordinavit, aciem lustravit."

The Latins call it *similiter desinens*; and the Greeks *ἁπομοιμαστος*.

ASSONANT Rhymes, is a term particularly applied to a kind of verses common among the Spaniards, where a resemblance of sound serves instead of a natural rhyme.

Thus *ligera, cubierta, tierra, mesu*, may answer each other in a kind of assonant rhyme, because they have each an *e* in the penultimate syllable, and an *a* in the last.

ASSONGSONG, in *Geography*. See *Island of ASSUMPTION*.

ASSONIA, in *Botany*, a genus of plants, so named in honour of Ignatius de Affo, a Spanish botanist. Lin. gen. Schreb. n. 1123. Cavanill. Diff. 3. p. 120. Dombeya, ib. p. 121. Class, *monadelphica dodecandria*. Nat. Ord. *columbifera*. *Malvaceae*, Juss. Gen. Char. Cal. perianth double; outer three-leaved, unilateral, deciduous; inner one-leaved, five-parted; parts lanceolate, acute, reflex. Cor. petals five, roundish, narrowed at the base, spreading, withering, affixed to the pitcher of the stamens. Stam. filaments fifteen, filiform, upright, shorter than the corolla, conjoined at the base in the form of a pitcher; anthers oblong, subsagittate, erect; five linear-lanceolate, somewhat erect, coloured, petal-fermed straps between the stamens, proceeding from the pitcher. Pist. germ roundish, five-furrowed; style simple, longer than the stamens, permanent; stigmas five, recurved. Per. capsule subglobose, or turbinate, five-celled; cells separable, bivalve. Seeds, solitary or in pairs, subovate. Obf. *assonia* cav. with the outer perianth one-leaved, three-toothed, and with five styles, does not seem separable from *Dombeya* cav. with the outer perianth three-leaved, and a single style, any more than the *hibiscus tiliaceus* from the other *hibiscus*; or the one styled *sidas*, from the rest; especially as *Dombeya* ovate cav. has the style divided almost to the base. We have therefore followed Schreber and Martyn in uniting *Dombeya* with *assonia*.

Species, 1. *A. populnea*. Cavan. Diff. 120. t. 42 f. 1. "Leaves cordate, ovate-acuminate; flowers corymbed." A small tree resembling *hibiscus populneus*. The French call it *bois de senteur bleu* on galeux, because the wood is sweet-scented, and blue in the centre, and when old it becomes very hard. Leaves alternately scattered, large, entire, and hang obliquely; outer calyx so small as scarcely to be observed; petals small, oblong, obliquely sickle-shaped, first white, afterwards ferruginous. A native of the isle of Bourbon, in hilly woods. 2. *A. palmata*, *Dombeya palmata*, Cavan. l. c. "Leaves cordate, palmate, smoothish, lobes seven, acute, ferrate-crenate; flowers corymbed." Stem arboreous; leaves alternate, on long footstalks; lobes oblong-acuminate; stipules lanceolate, tomentose, deciduous; flowers in solitary peduncles, at the ends of the branches, tomentose; corolla an inch and a half wide, changing from white to a sulphur colour, and lastly ferruginous. A native of the isle of Bourbon, where it is called by the natives *nahot-tantan*. 3. *A. acutangula*. Cavan. l. c. "Leaves cordate, roundish, three-cusped, crenate; flowers racemed." Stem arboreous; leaves alternate, of the length of the footstalks, seven-nerved, and commonly with an angular tooth between the base and lateral divisions; racemes solitary, axillary; calyxes extremely tomentose; corolla as that of the *A. palmata* (2), but veined and coriaceous; fruit pear-shaped. A native of the isle of Bourbon. 4. *A. angulata*, *Dombeya angulata*. Cavan. l. c. "Leaves cordate, roundish, angular at top, ferrate-toothed tomentose; umbels numerous; common peduncles shorter than the petiole." Arboreous; branches tomentose; leaves with three angles at the tip, seven-nerved; stipules embracing the

the stem; umbels axillary, solitary; fruit globular, with two fls. in each cell. A native of the isle of Bourbon. 5. *A. decandra*, Dombeya fibrifolia. Cav. l. c. "Leaves cordate, roundish, crenate; flowers raceme-corymbed, arborescent." All the shrub very tomentose; leaves shaped like those of the common lime-tree, seven-nerved, tomentose; peduncles axillary, solitary, divided at the end into opposite horizontal racemes. A native of the isle of Bourbon. 6. *A. tomentosa*, Dombeya tomentosa. Cavan. l. c. "Leaves cordate, roundish, crenate, tomentose, with almost circular veins; flowers umbelled." Stem arborescent branched; the whole tree very tomentose; stipules coriaceous, broad-ovate, acuminate, ciliate, half-stem clasping; common peduncle very long, forked at the top, and terminated by two umbels; petals roundish, sickle-shaped. A native of Madagascar. 7. *A. punctata*, Dombeya punctata. Cavan. l. c. "Leaves ovate-lanceolate, long, quite entire, tomentose underneath, rugged with dots on the upper surface." Trunk about the thickness of the human leg or thigh, covered with dark-brown bark; branches alternate, tomentose; leaves three or four inches long (sometimes crenulate or sinuate), rounded at the base; flowers on a long axillary common peduncle, umbelled, white, but becoming ferruginous by age; pedicels twenty or thirty, one-flowered. A native of the isle of Bourbon. 8. *A. decanthera*, Dombeya decanthera. Cavan. l. c. "Leaves ovate-acuminate, repand-crenate, smooth; flaments five, two-anthered; flowers small, umbelled." Stem arborescent, with a brown furrowed bark; leaves alternate, scattered, four times as long as the petioles; the outer calyx consists of three very small bristles; corolla scarcely three lines in diameter; filaments ten, five barren, five fertile; germ five cornered, one seed in each cell of the fruit. A native of Madagascar. 9. *A. umbellata*, Dombeya umbellata. Cavan. l. c. "Leaves cordate, ovate-oblong, acuminate, repand smooth; flowers umbelled, globular." A tree entirely smooth, with a brown bark; leaves longer than the petioles, either repand about the edge, or obsolete and broadly crenate; common peduncles solitary, axillary, on the tops of the branches reddish, very smooth, terminated by a single globose umbel. A native of the isle of Bourbon, where ropes are made of the bark. 10. *A. ovata*, Dombeya ovata. Cavan. l. c. "Leaves ovate, toothed, five-nerved, tomentose; style very small." Stem shrubby, branched, covered with a ferruginous nap; leaves alternate, white underneath, rugged on the upper surface, double the length of the petioles; stipules capillary, tomentose; peduncles forked at the top, with a corymb at each division; corolla small; petals narrow, roundish at the end, not sickle-shaped; their claws are permanent, and deeply ferruginous. Fruit globular, five-cornered, within the segments of the calyx. A native of the isle of Bourbon. 11. *A. ferruginea*, Dombeya ferruginea. Cavan. l. c. "Leaves ovate-oblong, seven-nerved, ferruginous beneath; petioles, peduncles, and calyxes tomentose." Stem arborescent, from eight to ten feet high; branches covered with a rufous nap; leaves on the extreme twigs, feathered alternately, acuminate, tooth-ferrulate, tomentose on the under surface; peduncles double the length of the petiole, forked at the top, with a many-flowered corymb on each division. This, perhaps, may be a variety of the *A. ovata*; the leaves, however, are much broader at the base, acuminate, seven-nerved, and very much toothed; whereas in that they are strictly ovate, five-nerved, and the teeth are distant. A native of the isle of Mauritius, and first discovered by Commerson in 1769.

Propagation and Culture. See HIBISCUS and PENTAPETES.

ASSONIA, or DOMBEYA *Phoenicea*. See PENTAPETES.

ASSORUS, in *Ancient Geography*, a town of Macedonia, in Mygdonia. Ptolemy. Also, a town of Sicily, seated on a hill to the left of the river Chryfus. Diod. Sic.

ASSOS, or ASSUM, a sea-port town of Asia Minor, in the Troas, fortified both by art and nature, according to Strabo. Acts, xx. 13.

ASSOS, or ASSO, is now a sea-port of Asiatic Turkey, in Natolia, on a gulf of the Aegean sea, to which it gives name, four leagues S. E. from Troas, and eleven leagues west of Adramiti. N. lat. 39° 38'. E. long. 26° 1'.

ASSOS, ASOS, or ASUM, a small town of Crete.—*Affos*, a small river of Greece, in the district of Phocis, which ran from N. to S. at the foot of the mountain Edyleon, and joined the Cephissus.

ASSOUAN, in *Geography*, near the ancient SYENE, a poor village on the east side of the Nile, with a small fort commanded by an aga of the janizaries, N. lat. 24° 0' 45". E. long. 33° 30'. This place is called by the Arabs *Affouan*, which signifies *enlightened*, in allusion as Bruce supposes, to the circumstance of the well mentioned by Pliny (H. N. l. ii. c. 73.) enlightened within by the sun's being directly over it in June. Bruce's Travels, vol. i. p. 158. See SYENE.

ASSRUMINA, in *Botany*, the name given by the people of Guinea to the shrub whose leaves they use as a cure for the long worms which are found in their flesh in those parts of the world; they only bruise the leaves, and apply a large lump of the mass to the part where the worm is, and they are eased at once, without the pain and hazard of drawing it out. Phil. Trans. N° 232.

ASSULATUS, in *Natural History*, a species of ECHINUS. The shell is scutellate, the scutels united by transverse sutures. Klein, p. 15. 26. β . Cidaris testulata of Klein, p. 16. 27. is supposed to be a variety of this kind.

ASSUMPSIT, in *Law*, denotes a voluntary promise by which a man assumes and takes upon him to perform, or to pay any thing to another.

This term comprehends any verbal promise made upon consideration, and is variously expressed by the civilians, according to the nature of the promise: sometimes by pactum; sometimes by promissio, pollicitatio, or constitutum.

If the promise be to do any explicit act, it is an express contract, as much as any covenant; and the breach of it is an equal injury. However, the remedy is not exactly the same. Since, instead of an action of covenant, there only lies an action upon the case, for which it is called the assumpsit or undertaking of the defendant; the failure of performing which is the wrong or injury done to the plaintiff, the damages of which the jury are to estimate and settle. As if a builder promises, undertakes, or assumes to Cain, that he will build and cover his house within a time limited, and fails to do it; Caius has an action on the case against the builder for this breach of his express promise, undertaking, or *assumpsit*; and shall recover a pecuniary satisfaction for the injury sustained by such delay. So also in case of a debt by simple contract, if the debtor promises to pay it and does not, this breach of promise entitles the creditor to his action on the case, instead of being driven to an action of debt, 4 Rep. 92. Thus likewise a promissory note, or note of hand not under seal, to pay money at a day certain, is an *express assumpsit*; and the payee at common law, or by custom and act of parliament the indorsee, may recover the value of the note in damages, if it remains unpaid. Action on the case on assumpsit lies, for not making a good estate of land sold, according to promise; not paying money upon a bargain and sale, according to agreement; not delivering goods promised on demand; this is by *express assumpsit*.

assumpsit. When one becomes legally indebted to another for goods sold, the law implies a promise that he will pay the debt; and if it be not paid, *indebitatus assumpsit* lies: and the same lies for goods sold and delivered to a stranger "ad requisitionem" of the defendant; the price being agreed upon and proved. 1 Danv. Abr. 26, 27. If a tenant, being in arrear for rent, settles an account of arrears with his landlord, and promises to pay him the sum in arrear, an *assumpsit* lies on this promise. 1 Rol. Abr. 9. If a man and woman, being unmarried, mutually promise to marry each other, and afterwards the man marries another woman, by which he renders himself incapable of performing his contract, an *assumpsit* lies, in which the woman shall recover damages. Carter, 233. There are, however, five cases, specified by the statute of frauds and perjuries, 29 Car. II. c. 5, in which no verbal promise will be sufficient ground of action, without some note or memorandum in writing, signed by the party who is to become chargeable. 1. Where an executor or administrator promises to answer damages out of his own estate. 2. Where a man undertakes to answer for the debt, default, or miscarriage of another. 3. Where any agreement is made, upon consideration of marriage. 4. Where any contract or sale is made of lands, tenements, or hereditaments, or any interest therein. 5. Where there is any agreement that is not to be performed within a year from the time of its being made. In all these cases a mere verbal *assumpsit* is void. The consideration is the ground of the common action on the case; and no such action lies against a man for a promise, where there is no consideration why he should make the promise.

Besides *express* contracts, there are others implied by law: and these are such as reason and justice dictate, and which, therefore, the law presumes that every man has contracted to perform: and, upon this presumption, to become answerable to such persons as suffer by his non-performance. Of this nature are, *first*, such as are necessarily implied by the fundamental constitution of government, to which every man is a contracting party. Thus it is that every person is bound and hath virtually agreed to pay such particular sums of money, as are charged on him by the sentence, or assessed by the interpretation of the law. By the same principle of an implied original contract to submit to the rules of the community of which we are members, a forfeiture imposed by the bye laws and private ordinances of a corporation upon any that belong to the body, or an amercement set in a court-leet or court-baron upon any of the suitors to the court, create a debt in the eye of the law; and such forfeiture or amercement, unpaid, works an injury to the party or parties entitled to receive it, for which the remedy is by action of debt. The same reason may with equal justice be applied to all penal statutes, or such acts of parliament that inflict a forfeiture for transgressing the provisions enacted by them. A *second* class of implied contracts are such as arise from natural reason, and the just construction of law; and this class extends to all presumptive undertakings or *assumpsits*, which, though never perhaps actually made, yet constantly arise from this general implication and intendment of the courts of judicature, that every man hath engaged to perform what his duty or justice requires. Thus, if I employ a person to transact any business for me, or to perform any work, the law implies that I undertook or assumed to pay him so much as his labour deserved. If I neglect to make him amends, he has a remedy by an action on the case upon this implied *assumpsit*. The valuation of his trouble is submitted to the judgment of a jury, who will assess such a sum in damages as they think he really merited. This is called an *assumpsit* on a "*quantum meruit*." There is also an

implied *assumpsit*, on a "*quantum valuit*," similar to the former; where one takes up goods or wares of a tradesman, without expressly agreeing for the price. Here the law concludes, that both parties had intentionally agreed, that the real value of the goods should be paid: and an action on the case may be brought accordingly, if the vendor refuses to pay that value. Another species of implied *assumpsits* is when one has had and received money belonging to another, without any valuable consideration given on the receiver's part; for the law construes this to be money had and received for the use of the owner only; and implies that the person so receiving promised and undertook to account for it to the true proprietor. And if he unjustly detain it, an action on the case lies against him for the breach of such implied promise, and undertaking; and he will be made to repair the owner in damages, equivalent to what he has detained in violation of such promise. This is applicable to almost every case where the defendant has received money, which "*ex quo et hinc*" he ought to account. 1 Burr. 1012. Moreover, when a person has had out and expended his own money for the use of another at his request, the law implies a promise of repayment, and an action will lie on this *assumpsit*. Carth. 446. 2 Keb. 99. Also, upon a stated account between two merchants, or other persons, the law implies that he against whom the balance appears has engaged to pay it to the other; though there be no actual promise. From this implication, actions on the case are frequently brought, declaring that the plaintiff and defendant had settled their accounts together, "*informal consensu*," which gives name to this species of *assumpsit*, and that the defendant engaged to pay the plaintiff the balance, but has since neglected to do it. The last class of contracts, implied by reason and construction of law, arises upon the supposition, that any one who undertakes any office, employment, trust, or duty, contracts with those who employ or entrust him to perform it with integrity, diligence, and skill; and, if by his wanting either of these qualities, any injury accrues to individuals, they have their remedy in damages by a special action on the case. If a sheriff does not execute a writ sent to him, or wilfully makes a false return, the party aggrieved shall in both cases have an action on the case for damages, to be assessed by a jury. Moor, 431. 2 Rep. 99. If a sheriff or gaoler suffers a prisoner, taken upon mesne process, or during the pendency of a suit, to escape, he is liable to an action on the case; but if, after judgment, a debtor charged in execution for a certain sum be permitted to escape, a gaoler or sheriff is compellable by action of debt for a sum liquidated and ascertained, to satisfy the creditor his whole demand. stat. Westm. 2. 13 Edw. I. c. 11. and 1 Ric. II. c. 12. 2 Inst. 382. An advocate or attorney betraying the cause of their client, or, being retained, neglecting to appear at the trial, by which the cause miscarries, are liable to an action on the case, for a reparation to their injured client. Finch L. 188. There is also in law an implied contract with a common innkeeper, to secure the goods of his guest; with a common carrier or barge-master, to be answerable for the goods he carries; with a common farrier, that he shoes a horse well, without laming him; with a common taylor, or other workman, that he performs his business in a workman-like manner; in which if they fail, an action on the case lies for the recovery of damages for such breach of their general undertaking. 11 Rep. 54. 1 Saund. 324. If an innkeeper, or other victualler, hangs out a sign, and opens his house for travellers, it is an implied engagement to entertain all persons who travel that way; and upon this universal *assumpsit* an action on the case will lie against him

for damages, if he without good reason refuses to admit a traveller. 1 Ventr. 335. If one cheats with false cards or dice, or by false weights and measures, or by selling one commodity for another, an action on the case lies against him for damages, upon the contract which the law always implies, that every transaction is fair and honest. 10 Rep. 56. In contracts for provisions, it is always implied, that that they are wholesome, and if they be not, the same remedy may be had. If cloth is warranted to be of such a length, when it is not, an action on the case lies for damages. Finch L. 189. Also, if a horse be warranted sound, and he wants the sight of an eye, it has been held that an action on the case lies to recover damages for this imposition. Salk. 611. Bl. Com. vol. iii. p. 158, &c. See CONTRACT, and PROMISE.

ASSUMPTION, in *Aniquity*, a feast celebrated in the Romish church, in honour of the miraculous ascent of the Holy Virgin, as they describe it, body and soul into heaven.

ASSUMPTION, was also, among our ancestors, used for the day of the death of any saint: "quia ejus anima in cælum assumitur." See ANNIVERSARY.

ASSUMPTION, in *Geography*, an episcopal city of South America, in the province of Paraguay, situate in the eastern division of the province, on a river of the same name, a little above the place where it is joined by the river Picomaga. It was built by the Spaniards in 1538, and is distinguished by the salubrity of its situation, by the fertility of the territory in which it stands, producing a great variety of native and exotic fruits in the highest perfection, and also by the number of its inhabitants, who are partly descendants of Spanish families that settled in the place, and partly Mestizos and Mulattoes. This city lies about fifty leagues above the confluence of the Paraguay and Parana, where the former begins to be called the river de la Plata. It is the residence of a governor appointed by the king of Spain, under the viceroy of Peru. Near the city is a lake, remarkable for having in the middle of it a rock, which rises to a prodigious height like an obelisk. S. lat. 25° 30'. W. long. 57° 40'.

ASSUMPTION, or *Assonson*, one of the Mariannæ or Ladrones islands, situate according to La Perouse's chart in N. lat. 19° 45'. and W. long. 145° 35'. It is a volcanic island, about three leagues in circumference; and its highest point is about 200 toises above the level of the sea. Its form is that of a perfect cone, whose surface, as far as forty toises above the level of the sea, is as black as coal. Some cocoa-nut trees occupy nearly a fifteenth part of the circumference of the island, for a depth of forty toises, which are in some measure sheltered from the east wind; and this is the only part of the island where it is possible to anchor, in a depth of water of thirty fathoms over a bottom of black sand, extending nearly a quarter of a league. The lava, flowing from the island, has formed precipices and hollows, bordered with a few stunted cocoa-nut trees, thinly scattered and mixed with limes and a small number of plants; and it has covered the whole circumference as far as a border of about forty toises towards the sea. The summit appeared to be vitrified, resembling black glass, and its termination was concealed by clouds. Although no smoke was visible, the sulphureous smell which extended half a league out to sea, induced a suspicion that the fire of the volcano was not extinguished, and that its last eruption was not very ancient: more especially as there appeared no trace of decomposition in the lava, on the middle of the mountain. The island exhibits no appearance of having been ever inhabited, even by quadrupeds, much less by

human beings. Some very large crabs were found here; and these, it is apprehended, have driven away the sea-birds, who lay on shore, and whose eggs they would devour. Some very fine shells were found in the hollows of the rocks; and three or four new species of the banana-tree were collected. No fish was perceived, besides a red ray, some small shalks, and a sea-serpent, which might be three feet long and three inches thick. No water could be procured in this desolate island, except some small quantity lodged in the hollows of the rocks. The sea glides along the shore and forms, at every point, a surf which renders debarkation extremely dangerous. Voyage of La Perouse, vol. i. p. 24. Eng. Transl. Lond. 1798.

ASSUMPTION, is also an island lying on the south-west coast of California, forming with a projecting point of land a bay, both on its north-east and south-east sides. N. lat. 28°. W. long. 120°.

ASSUMPTION, a river of North America, in New York, which falls in from the east into the lake Ontario, after a N. W. and W. course of about 28 miles; 5 miles S. E. from Pl. Gaverse.

ASSUMPTION, a name sometimes given to the island ANTICOSTI.

ASSUMPTION, in *Logic*, is the minor or second proposition, in a categorical syllogism.

ASSUMPTION is sometimes also used for a consequence drawn from the propositions whereof an argument is composed. Thus we say, the premises are true, but the *assumption* is captious.

ASSUMPTIVE ARMS, in *Heraldry*. See ARMS.

ASSURÉE, in *Ancient Geography*, an episcopal town of Africa, in the proconsular province, placed by Antonine (Itiner.), on the road from Carthage to Susatuke, 108 miles from the former, and 42 from the latter.

ASSURANCE, POLICY OF. See POLICY.

ASSURANCE, in *Commerce*. See INSURANCE.

We have also *offices of assurance for life*, where policies are granted for securing a sum of money on the extinction of any given life, in consideration of an adequate compensation either paid down in one sum, or by annual instalments during the continuance of such life.

ASSURANCES on *Lives*. By *assuring* a life is meant, obtaining security for a sum of money to be received should the life drop, in consideration of such a payment made to the *assurer*, as shall be a sufficient compensation for the loss and hazard to which he exposes himself. In estimating this compensation, the amount of it will depend entirely on the rate of interest at which money is improved, and the probability of the duration of the life to be assured. If the interest be high, and also the probability high of the duration of the life, this compensation or premium of assurance will be proportionably low; on the contrary, if the rate of interest be low, and the probability of living be also low, the premium will be proportionably high. In order to explain this, let 100l. be supposed to be assured on a life for a year to come; that is, let 100l. be supposed payable a year hence, provided a life of a given age fails in that time. Were the interest of money at 5 per cent., and the life sure of failing, the value of the assurance would be the same with the present value of 100l. payable at the end of a year, reckoning interest at 5 per cent., that is, it would be that sum, which being now put out to interest at 5 per cent. would produce 100l. at the end of the year, or 95l. 4s. 8d. See ANNUITIES, Tab. II.

On the contrary, if it be an even chance, or the odds be equal, whether the life does or does not fail in the year, the value of the *assurance* will be half the former value, or

47l. 12s. 4d. If the odds *against* its failing be two to one, that is, if it may be expected that some one of three lives, at the age of the given life, will fail in the year, the value of the *assurance* will be a *third* of the first value, reckoning the same interest. or 31l. 14s. 11d. If the odds be nineteen to one, or if it may be expected that some one out of twenty lives, at the age of the given life, will fail in a year, the value of the *assurance* will be a *twentieth* part of the first value, or 4l. 15s. 3d. If the odds be forty-nine to one, or only one out of fifty such lives as the given life can be expected to fail in the year, the value of the *assurance* will be a *fiftieth* part of the first value; that is, it will be 11. 18s. 1d. Now the odds of three to one are, according to the *Northampton* Table of Observations (see MORTALITY), the odds that a life aged 92 will not drop in a year. The odds of 19 to 1 are the odds, according to the same table, that a life aged 65 will not drop in a year; and the odds of 49 to 1 are the odds that a life aged 39 will not drop in a year. It follows, therefore, that the value of the *assurance* of 100l. for a year on a life aged 92 is 31l. 14s. 11d.; on a life aged 65, 4l. 15s. 3d. on a life aged 39, 11. 18s. 1d., reckoning interest at 5 *per cent.* If interest be reckoned at 3 *per cent.* these values will be 32l. 7s. 3d.; 4l. 17s.; 11. 18s. 10d.

The *assurances* most commonly practiced are those on single lives, either for a given term, or during their whole continuance. When a life is assured for a given term or number of years, the value may be paid either in one *single present payment*, or in *annual* payments, to be continued till the failure of the life, should that happen within the term; or if not, till the determination of the term.

The method of finding these values cannot be easily understood by those who are unacquainted with the doctrine of life-annuities, as it has been taught by mathematicians; but the following observations may be of use to give some general idea of the subject.—Let us suppose that a person aged 39 years wants to assure 100l. on his life for 27 years, or till he is 66 years of age, and that he chuses to advance the proper compensation for it in a *fixed annual* payment, the first to be made immediately, and the following payments to be continued till either the term ends, or his life drops. The value of the *assurance* for the *first* year, is by what has been already shewn, 7l. 18s. 1d. reckoning interest at 5 *per cent.* The value of the *assurance* for the *last* year of the term, supposing him to have lived to the beginning of it, or to have completed 65, is likewise, by what has been already shewn, 4l. 15s. 3d., reckoning all along at the same interest. If, therefore, the value of the *assurance* for the whole 27 years is to be one constant sum payable at the beginning of every year, that sum, it is obvious, ought to be *greater* than the *first*, and *less* than the *last*; or a sum which is some *mean* between 7l. 18s. 1d. and 4l. 15s. 3d. The rule for finding this mean in all cases is the following.

“From the value of an annuity *certain* for the given term, found by Tab. III. under the article ANNUITIES, subtract the value of the life for the given term, found by the method explained under the article LIFE-ANNUITIES, and reserve the remainder. Multiply the value of 1l. due at the end of the given term (found by Tab. I. under the article ANNUITIES), by the *perpetuity* (see REMARK II.), and also by the *probability* (see MORTALITY), that the given life shall fail in the given term. This product being added to the *reserved remainder*, let the total be multiplied by the sum to be assured, and afterwards divided by the *perpetuity* increased by unity, then let this *quotient* be *reserved*. Find next the value of an annuity on the given life for one year

less than the given term, and the *reserved quotient* being divided by this last value, increased by unity, will give the required value of the *assurance* in a *fixed annual* payment, till either the life fails, or the term ends.”

EXAMPLE.

Let the term be 27 years, the life aged 39, the sum 100l., and the interest 5 *per cent.*

SOLUTION.

The value of the life of a person whose age is 39, for 27 years, is (reckoning interest at 5 *per cent.* and by the *Northampton* Table of LIFE ANNUITIES) 11.197. This value subtracted from 14.643 (the value of an annuity *certain* for 27 years, see Tab. III. ANNUITIES), leaves 3.452, the remainder to be *reserved*. The value of 1l. to be received at the end of 27 years is .26785, by Tab. II. under the article ANNUITIES. The probability that the life of a person aged 39 shall fail in 27 years, is, by the *Northampton* Table, (see MORTALITY) $\frac{27}{1118}$; and the *perpetuity* is 20. These numbers multiplied by one another, and 3.452 added to the product, make 6.568, which multiplied into 100l. the given sum, and divided by 21, the *perpetuity* increased by unity, gives 31.276 for the *quotient* to be *reserved*.

The value of an annuity on a life of 39 for 26 years, is 11.019. Dividing therefore 31.276 (the *reserved quotient*) by 12.019, or the value of the above annuity, with unity added, we have 2.601, or 2l. 12s., which is the required value, in *fixed annual* payments, of the *assurance* of 100l. on the given life for 27 years, reckoning interest at 5 *per cent.*

The value of the same *assurance* in one *present payment* is the *quotient reserved* above, or 31l. 5s. 6d.; in other words, it is the value of an annuity of 2l. 12s. for 26 years on a life of 39; the first payment of which is to be made immediately, and the remaining ones at the *beginning* of each year; or, it is the sum arising in the foregoing operation *before* the division by the value of the life for the term of 26 years.

If the *assurance* is to be made for the whole possible duration of the life, the method of finding the value will be more simple, and the rule for this purpose is as follows. “From the *perpetuity* subtract the value of the given life, and multiply the remainder by the given sum, and this last product divided by the *perpetuity*, increased by unity, will give the value in a *single present payment*. And this payment, divided by the value of the life, will give the value of the *assurance* in *annual payments* during the continuance of the life.”

EXAMPLE.

Let the age of the life be, as in the last example, 39; the sum to be assured for its whole duration 100l.; and the rate of interest 5 *per cent.* The value of the life, according to the *Northampton* Table (see LIFE ANNUITIES), is 11.979. The value of the life subtracted from 20 (the *perpetuity*) is 8.021, which multiplied by 100, the given sum, and divided by 21, the *perpetuity* increased by unity, gives 38.195 l. or 38l. 4s. for the value in a *single payment* of the *assurance* of 100l. for the whole duration of a life aged 39, reckoning interest at 5 *per cent.* And this payment divided by 11.979 is 3.188 l. or 3l. 3s. 9d. the value of the same *assurance* in *annual payments* during the continuance of the life.

REMARK I.

If the value of the *assurance* is desired in *annual payments*, the first of which, instead of being made at the *end* of the year as the preceding rule supposes, is to be made *immediately*, the value in a *single payment* (found as directed above) must be divided by the value of the life *increased* by unity;

that is, in the present instance, by 12.679, which will make the required value of the assurance 2,941 l. instead of 3,188 l. or 2 l. 18 s. 10 d. instead of 3 l. 3 s. 9 d.

The reason of adding unity to the values of lives taken from the tables is, that in all the tables the values of annuities on lives are given on the supposition that the first payment is not to be made till the end of a year. If therefore the first yearly payment is to be made immediately, the value must exceed that in the tables by one year's purchase.

REMARK II.

The *perpetuity* means the value of the five-fold of an estate, which is found by dividing 100 l. by its interest for a year. For example, if the rate of interest be 5 l. *per cent.* 100 l. divided by 5 gives 20 for the perpetuity; if the rate of interest be 4, 3, or 3 *per cent.* 100 l. divided by 4, 3.5 or 3, will give 25, 28.571, or 33.333 for the perpetuity.

REMARK III.

If instead of a *gross sum*, an *estate* or a *perpetual annuity* is to be assured during the whole duration of a life, the value in a *single payment* will be "the value of the life subtracted from the perpetuity, and the remainder multiplied by the annuity, or by the rent of the estate."—And the value in *annual payments beginning immediately*, will be "the single payment divided by the value of the life increased by unity."—Universally, it ought to be remembered that the *assurance* of an *estate* or *annuity* after any given life or lives, is worth as much more than the *assurance* of a corresponding sum, as 100 l. increased by its interest for a year is greater than 100 l.—Thus the present values, in *single and annual payments* of the *assurance* of an estate of 5 l. *per ann.* for ever, and of a 100 l. in money on the whole duration, or on any part of an assigned life, are to one another (interest being at 5 *per cent.*) as 105 l. to 100 l. The reason of the difference is, that the algebraical calculations, by which these values are determined, suppose that the *gross sum* and the first yearly payment of the *annuity* are to be received at the same time after the extinction of the lives. It is easy to see, that this is a circumstance which must make the latter of more value.

This specimen is sufficient to explain the general nature and principles of assurances on single lives, and to teach in all cases the method of finding the values of such assurances. To those who wish to be further informed on this subject, it may not be improper to add the following mathematical demonstrations of the rules which have been given above. Let *a* be the number of persons living at the age of any given life *A*; let *a'*, *a''*, *a'''*, &c. be the number of persons who have died in the 1st, 2d, 3d, &c. year after the age of *A*; let *r* be 1 l. increased by its interest for a year, and *S* the sum to be assured. The probability that *A* dies in the 1st year is $\frac{a'}{a}$, the value therefore of the assurance in that year is $\frac{S \cdot a'}{ar}$. The probability that *A* dies in the 2d, after having survived the 1st year, is $\frac{a''}{a}$, and consequently the value of the assurance in the 2d year is $\frac{S \cdot a''}{ar^2}$. In like manner, the value of the assurance in the 3d, 4th, 5th, ----- *n*th year, supposing *m* to denote the number of persons who have died in the *n*th or last year, is $\frac{S \cdot a'''}{ar^3}$, $\frac{S \cdot a^{iv}}{ar^4}$, $\frac{S \cdot a^v}{ar^5}$ ----- and $\frac{S \cdot m}{ar^n}$ respectively. The whole value, therefore, of

the assurance for *n* years is $S \times \frac{a'}{ar} + \frac{a''}{ar^2} + \frac{a'''}{ar^3} + \dots + \frac{m}{ar^n}$.

But the series $\frac{a'}{ar} + \frac{a''}{ar^2} + \frac{a'''}{ar^3}$, &c. is $= \frac{1}{r} - \frac{a-a'}{ar} + \frac{1}{r^2} - \frac{a-a'+a''}{ar^2} + \frac{1}{r^3} - \frac{a-a'+a''+a'''}{ar^3} + \dots - \frac{1}{r^n} + \frac{a-m}{ar^n}$ (supposing *l* to be the number of persons who have died in the *n-1*th year). The series $\frac{a-a'}{ar} + \frac{a-a'+a''}{ar^2}$, &c. $++ \frac{a-n}{ar^n}$ is known to express the value of an annuity on the life of *A* for *n* years, and the series $\frac{1}{r} + \frac{1}{r^2} + \frac{1}{r^3} + \dots + \frac{1}{r^n}$ to express the value of an annuity certain for *n* years. Call the first of these series *N*, and the second *N'*, then will the whole of the above series be $= N - N' - \frac{N}{r} + \frac{A}{r} + \frac{1}{r^{n+1}} - \frac{a-m}{ar^{n+1}} = \frac{r-1}{r} \times N - A + \frac{1}{r} \times \frac{m}{r-1}$. Now since $\frac{1}{r-1}$ is equal to the perpetuity (or *p*), $\frac{r-1}{r}$ will be $= \frac{1}{p+1}$ and $\frac{1}{r} = \frac{p}{p+1}$; hence the whole value of the assurance of *S* for *n* years will be $\frac{S}{p+1} \times N - A + \frac{m \cdot p}{ar}$ agreeable to the rule given above.

If the assurance be for the whole continuance of life, the fraction $\frac{m \cdot p}{ar}$ vanishes, *N* becomes equal to the perpetuity, and *A* to the value of an annuity for the whole life of *A*, so that in this case the expression becomes simply $= \frac{S}{p+1} \times p - A$, which is the rule given in words for finding the value of an assurance on the whole possible duration of the life of *A*.

If the assurance be that of an *estate* or a *perpetual annuity*, the value of each payment of such annuity depending on the failure of the life of *A* in one, two, three, &c. years to *n* years will be $\frac{1}{r} - \frac{a-a'}{ar}$, $\frac{1}{r^2} - \frac{a-a'+a''}{ar^2}$, $\frac{1}{r^3} - \frac{a-a'+a''+a'''}{ar^3}$ ----- $\frac{1}{r^n} - \frac{a-m}{ar^n}$, and the value of the fee-simple after *n* years, depending on the contingency of *A* having died in the mean time, will be $\frac{m \cdot p}{ar^n}$; the whole value, therefore, of the assurance will be $N - A + \frac{m \cdot p}{ar}$ multiplied into the annuity; or simply $p - A$ multiplied into such annuity, if the assurance is to be continued during the whole duration of *A*'s life. For the more ample discussion of this subject, the reader is referred to Mr. Simpson's "Select Exercises," Dr. Price's "Treatise on Reversionary Payments," and Mr. Morgan's "Doctrine of Annuities and Assurances stated and explained." *Assurances* may be made on any number of *joint* lives, or on the *longest* of any lives. Rules for finding the values of such assurances

assurances are given in the books just referred to.—There are further *assurances* on survivorships; by which is meant an obligation for the value received, to pay a given sum or annuity, provided a given life shall survive any other given life or lives. The method of finding these values is given under the article SURVIVORSHIP.

All these different kinds of *assurances* are of the greatest use; and the offices for making them are a particular advantage to the public. The principal of these offices in England are, the Amicable Society, incorporated for a perpetual assurance; the Society for Equitable Assurances on Lives and Survivorships; the Royal Exchange Assurance; the Westminster and the Pelican Life-Offices. The Amicable Society requires an annual payment of 5*l.* from every member payable quarterly during life. The whole annual income hence arising is equally divided among the representatives of such members as die every year; and this renders the dividends among the claimants in different years more or less according to the number of members who have happened to die in those years. But this society engages that the dividends shall not be *less* than 150*l.* to each claimant, though they may be *more*.—None are admitted whose ages are *greater* than 45, or *less* than 12; nor is there any difference of contribution allowed on account of difference of age. This society has subsisted ever since 1706, and its credit and usefulness are well-established.—Its plan, however, is liable to several objections.—First, it is evident that regulating the dividends among the *representatives* by the number of members who die every year, is not equitable; because it makes the benefit which is to accrue from the assurance, to depend, not on the value of the contribution, but on a *contingency*; that is, on the number of members who have happened to die in the year. Secondly, its requiring the same payments from all persons under 45, is also not equitable, for the payment of a person admitted at 12 ought not to be more than *half* the payment of a person admitted at 45. Thirdly, by limiting the sums assured on one and the same life to 450*l.* it is but ill adapted to make a competent provision for the families of its members; nor can it be of any service to persons whose age exceeds 45 years; a period of life, which it has been found from experience that many, if not most persons, have exceeded before they have begun to provide for their families by assuring their lives. It is likewise by no means fitted to the circumstances of persons who want to make assurances on their lives for only one year, or for a short term of years. Thus, the true value of the assurance of 150*l.* for five years on the life of a person whose age is 29, may be found by the first rule to be nearly three guineas *per ann.* supposing interest at 3 *per cent.* and the probabilities of the duration of human life as they are given in the *Northampton* Table of Observations. But such an assurance could not be made in this society without an annual payment of 5*l.*

Neither is the plan of this society at all adapted to the circumstances of persons who want to make *assurances* on particular survivorships. For example, a person possessed of an estate or salary, which must be lost with his life, has a person dependent upon him, for whom he desires to secure a sum of money payable at his death. But he desires this only as a security against the danger of his dying *first*. In these circumstances he enters into this society; and by an annual payment of 5*l.* entitles his *nominee* at his death to 150*l.* In a few years, perhaps, his *nominee* happens to die, and the object of his *assurance* having thus ceased, he determines to give up the advantage arising from his former payments and to withdraw from the society. The right method in this case would have been to have taken from such a person the true value of the sum assured “on the supposition of non-pay-

ment, provided he should survive.” Had this been done, he would have paid for the *assurance* (supposing interest at 3 *per cent.* his age 30, the age of his *nominee* also 20, and the values of lives as given by Dr. Price from the *Northampton* Table) 31. 6*s.* 8*d.* in annual payments, to begin immediately and to be continued during the joint duration of his own life and the life of his *nominee*.

None of these objections, however, are applicable to the other offices just mentioned. In all of these assurances may be made for any term and at any age between eight and sixty-seven years, either at single or annual premiums, proportioned to the age of the person assured, and to the risk or hazard attending the assurance. The business transacted in these offices is very extensive, and so far as relates to the *premiums* they require, is founded on strict calculation. These *premiums*, which are now indiscriminately adopted by all of them, were originally computed in the year 1781 for the use of the Equitable Society.—an institution to entirely guided by computation in all its practice, that in ascertaining its profits at fixed periods, and distributing them among its members, it has never failed to proceed on the same sure principles, and by this means to render itself one of the greatest public benefits to this country. In consequence of its immense capital, and the very wide extent of its business, it certainly far exceeds any other office of the same kind; and therefore by giving an account of its rise and progress, a proper idea will be obtained of the nature of life-assurances, as well as of the important benefits which are derived from them.

This society was established in the year 1762, in consequence of proposals which had been made, and lectures recommending such a design, which had been read by Mr. Thomas Simpson; and the premiums then adopted for its practice were computed by Mr. James Dodson, the author of the *Mathematical Repository*. It assures any sums or reversionary annuities on any life or lives, for any number of years, as well as for the whole continuance of the lives, and in any manner that may be best adapted to the views of the persons assured; that is, either by making the assured sums payable *certainly* at the failure of any given lives, or on condition of *survivorship*; and also, either by taking the price of the assurance in *one present payment*, or in *annual payments* during any single or joint lives, or any terms less than the whole possible duration of the lives. Any persons, for instance, who depend on incomes which must be lost when they die, or who are only tenants for life in estates, may, by assuring an equivalent on their own lives, guard their families or representatives against the loss which would accrue by their death. Hence, clergymen, counsellors, persons holding any places of profit, traders, and others who have families whose subsistence depends on the continuance of their lives, may be enabled to make provision for their families after their decease. All persons likewise who enjoy annuities for the lives of others, may here secure themselves against the loss they would sustain, should they survive the persons on whose lives the annuities depend, by making *assurances* which would entitle them to any sums payable on condition their survivorship should take place. Any person entitled to an estate, annuity, legacy, or office after another person provided he survives, may here secure an equivalent for his family at his decease, provided he does *not* survive. Husbands may in this society secure annuities for their wives, provided they should leave them widows. Parents, by assuring the lives of their children, when infants, till they attain a given age, may secure for them, should they live to that age, such sums as may be necessary to put them out to apprenticeships, or to make capitals or fortunes for them, with which to set out in business, or to marry. Any persons, apprehensive of being left without support in old age, when incapable

incapable of labour, may purchase an annuity to commence at any future year of his life and to continue during the remainder of his life, and he may do this at a small expence if he is young, and willing to wait for the commencement of his annuity, till he is fifty-five or sixty years of age. In short there are no kinds of *assurance* on lives or survivorships which this society does not make. In doing this, while it proceeds on mathematical principles in computing its premiums, it takes advantage of making these computations at so low an interest as 3 per cent. in order to gain such a profit as shall enable it to bear the expences of management, and render it a *permanent* benefit to the public. In the infancy of the institution also, it adopted tables of the values and probabilities of lives in *London*, where, as in all great towns, the rate of human mortality is much greater than it is among mankind in general. But after an experience of twenty years, it found that tables giving higher probabilities of life might be safely used, and therefore it made choice of those more correct tables which were published by Dr. Price from observations at *Northampton*: and it appears, from comparing the decrements of life in the society with those in the table just mentioned that, during a term of thirty-four years, the ratio of mortality in the former is to that in the latter between the ages of 10 and 20 as 1 to 2

20 and 30 as 1 to 2
30 and 40 as 3 to 5
40 and 50 as 3 to 5
50 and 60 as 5 to 7
60 and 80 as 3 to 4,

or that in all ages between 10 and 80, fewer deaths have happened in the society than should have happened according to the tables from which its premiums have been computed in the proportion of *seven* to *three*. In consequence of this and of other still less equivocal proofs of its prosperity, the society has been enabled since its first establishment not only to reduce its premiums above *one half*, but to make such additions to the claims in the years 1782, 1786, 1791, 1793, 1795, and 1800, as amount at present to the sums specified below:

For every 100l. assured in	}	1762,	{ an addition over and above the sum assured of }	258	£. s.
		1763,	ditto	-	249 10
		1764,	ditto	-	241

		1797,	ditto	-	8
		1798,	ditto	-	6
		1799,	ditto	-	4
		1800,	ditto	-	2

These are advantages peculiar to this society, and therefore it is no wonder that its business should so far surpass that of every other institution of the same kind. But in the midst of its prosperity the society has hitherto proceeded with the utmost prudence and caution. Aware of the danger of being led astray by the dazzling appearance of a large capital, necessarily increased by an influx of new members, it has provided by a special law, that, as on former occasions, so in future, no distribution of its stock shall ever be made without a previous investigation of its finances; that this investigation shall take place once in ten years; that the distribution shall never exceed *two-thirds* of the surplus stock of the society; and that no such distribution shall be adopted at all without the concurrence of *five-fifths* of its members, attending at three successive general courts. As far as human prudence and foresight can provide against danger, these precautions are likely to secure the society, and to increase its usefulness. But there is one danger against which no laws can guard it: we mean the danger of employing ignorant persons to conduct the management of its affairs. It must be manifest from the preceding account of this society, that none but skilful mathematicians are qualified for this business; and it is to be hoped that on any future vacancies, no other regard will be had in filling them up, than to the ability and integrity of the candidates. The melancholy experience of other societies for the benefit of age, for the benefit of widows, &c. which were established about thirty years ago, and which have long since ended in disappointment and ruin, should serve to guard this society against the attempts of ignorance, as much as the present prosperous state of its affairs should incite it to persevere in that wise and temperate course which has displayed so much prudence and skill in the management of its affairs, and raised it so high in the opinion of the public.

The following are the rates of *assurance* on single lives in this society, and also very nearly in the *Royal Exchange*, and other offices, where those premiums have been adopted with little or no variation.

Age	One year.			Seven years at an annual premium.			Whole life at an annual premium.		
	£.	s.	d.	£.	s.	d.	£.	s.	d.
10	0	17	9	1	1	5	1	17	7

67	5	5	6	6	5	2	8	12	1

ASSURANCE, *Royal Exchange*, is a corporation or company established by an act 6 Geo. I. c. 18.; and, by their charter, executed June 22, 1720, empowered to assure ships and goods at sea, or going to sea, and to lend money on bottomry; and to raise for this purpose a capital of 1,500,000l.; on condition that, upon three years' notice being given by parliament, at any time within thirty-one years from the date of the charter, and repayment of the sum of 300,000l. which the company had agreed to pay to government, the corporation should cease. In the following year they obtained another charter, dated the 26th April 1721, by which they were authorized to assure lives, and also to assure houses and goods from fire, and were empowered to raise a farther capital of 500,000l. making, with the former sum, two millions. It was also enacted, that, in consequence of the company having paid into the exchequer 111,250l. and having covenanted to pay the farther sum of 38,750l. within three months, they should be released from payment of the remainder of the 300,000l. The whole

capital of 2,000,000l. was subscribed, but it was thought necessary to call for the payment of only 500,000l.; which, after paying the 150,000 to government, had been found sufficient for carrying on the extensive concerns of the company. A new branch was added to their business, by an act, obtained in 1793, enabling them to grant and purchase annuities on lives, either immediate or in reversion; and, in 1801, the company obtained an act for assuring vessels and their cargoes on canals and inland navigations, in which act the London Assurance company are likewise included.

The dividend to the proprietors, which has gradually increased from 3 to 7½ per cent. becomes due at Christmas and Midsummer, and is usually paid about the 15th January and July. [At Midsummer 1802, an occasional dividend was made in flock, being 10l. five per cents, 1797, for every 100l. of the company's stock.] The transfer-days are Tuesdays and Thursdays, between the hours of eleven and one. The dividends are paid on Mondays, Wednesdays, Fridays, and Saturdays, from ten to two.

THE TABLE OF RATES OF THE ROYAL EXCHANGE ASSURANCE ANNUITY COMPANY.
September 15th, 1802.

N. B. The foregoing Annuities are receivable in Quarterly Payments.

The person making the assurance is to declare the place and date of birth of the person whose life is to be assured; whether he has had the small-pox; whether subject to the gout; and whether in the army or navy.

The life assured to appear at the office, or to one of the company's agents, or pay

10s. per cent. on assurances for one year.

15s. per cent. for more than one year, and } in the first
not exceeding seven years, } payment

20s. per cent. if for more than seven years, } only.

One quarter per cent. additional, will be taken on the full payment as admission-money.

Fifteen days are allowed for payment of the annual premiums after they respectively become due, but if the same remain unpaid more than the said fifteen days, and not exceeding three calendar months, a fine of ten shillings per cent. must be paid, and a warrantee given of the health of the life assured.

Conditions of Assurance made by Persons on their own Lives.

The assurance to be void if the person whose life is assured shall depart beyond the limits of Europe, shall die upon the seas (except in his majesty's packets passing between Great Britain and Ireland); or shall enter into or engage in any military or naval service whatever, without the previous consent of the company; or shall die by suicide, duelling, or the hand of justice; or shall not be, at the time the assurance is made, in good health.

Conditions of Assurance made by Persons on the Lives of others.

The assurance to be void if the person whose life is assured shall depart beyond the limits of Europe, shall die upon the seas (except in his majesty's packets passing between Great Britain and Ireland); or shall enter into or engage in any military or naval service whatever, without the previous consent of the company; or shall not be, at the time the assurance is made, in good health.—Any person making an assurance on the life of another, must be intersted therein, agreeable to act 14 Geo. III. c. 48. which prohibits wagering, or speculative insurances.

N.B. Assurances on the lives of persons engaged in the army or navy, or going beyond the limits of Europe, may be made by special agreement.

ASSURANCE, London. The charters of this company were granted at the same time with those of the Royal-Exchange Assurance, for the same purposes, and upon similar conditions; one of which is, that no person possessing stock in either company can purchase stock in the other, under penalty of forfeiting the share so purchased. The principal difference in the business of the two offices is, that the London assurance confine themselves to sea and fire assurances, very seldom assuring lives, and not being empowered to grant annuities. Their stock is 1,000,000l. divided into shares of 25l. each, on which 12l. 10s. has been paid in, making the whole sum paid in 500,000l. The dividend has been raised to 18s. per share per annum, and becomes due at Lady-day and Michaelmas. The transfer-days are Tuesdays and Thursdays, from eleven to three o'clock. The dividends are paid on Mondays, Wednesdays, and Fridays, from eleven to three.

ASSURANCE, Collateral, in Law. See **COLLATERAL**.

ASSURANCES, Common, of the kingdom, express the legal evidences of the conveyance or translation of property; by which every man's estate is assured to him, and all controversies, doubts, and difficulties, are either prevented or removed. These common assurances are of four kinds: 1. By matter *in pais*, or deed; which is an assurance transacted between two or more private persons *in pais*, in the country;

that is, according to the old common law, upon the very spot to be transferred. See **DEED**. 2. By matter of record, or an assurance transacted only in the king's public courts of record. See **RECORD**. 3. By special custom, obtaining in some particular places, and relating only to some particular species of property. See **CUSTOM**. These three assurances are such as take effect during the life of the party conveying or assuring. 4. The fourth takes no effect till after his death; and that is by devise, contained in his last will and testament. See **DEVISE**, and **WILL**. Bl. Com. vol. ii. p. 254.

ASSURGENT Leaves, in *Botany*. denotes such as are first bent down, and then rise erect towards the apex. This term fearely differs from *ascendens* or *incurvus*, and seems peculiarly proper for describing the change which takes place in the position of the leaves of mimosa, and other sleeping plants.

ASSURGENT, in *Heraldry*, a term used for a man or beast rising out of the sea.

ASSUROR, a merchant or other person, who assures, or makes out a policy of assurance for a ship, house, life, or the like. Assurers are not answerable for what damages arise through the negligence, or other fault of the master or seamen; or even those which arise from any vice or defect in the thing assured. See **INSURANCE**.

ASSURRITANI, or **ASSURRANI,** in *Ecclesiastical History*, a branch of Donatists in the middle of the fourth century. The Assurritani maintained the son to be inferior to the father; they rebaptized their converts from the catholics, and asserted that the church is not composed of good and bad, but of the good alone.

ASSURUS, or **ASSURAS,** now *Kiffer*, in *Ancient Geography*, a town of Africa, situate in the inland country of the ancient Bizacium, to the west of Adrumetum, and south-east of Sicca Veneria.

ASSY, in *Geography*, a town of France, in the department of the Oise, and chief place of a caanton in the district of Crespy, eight miles south of Crespy.

ASSYANI, in *Ancient Geography*, an ancient town of the Tauric Chersonesus.

ASSYRIA, a kingdom of Asia, of the extent, origin, and duration of which very different accounts have been given by ancient writers. Ctesias and Diodorus Siculus affirm, that the Assyrian monarchy, under Ninus and Semiramis, comprehended the greater part of the known world: but, if this had been the case, it is not likely that Homer and Herodotus would have omitted a fact so remarkable. The sacred records intimate, that none of the ancient states or kingdoms were of considerable extent; for neither Chedorlaomer, nor any of the neighbouring princes, were tributary or subject to Assyria; and we find nothing, says Playfair, of the greatness or power of this kingdom in the history of the Judges, and succeeding kings of Israel, though the latter kingdom was oppressed and enslaved by many different powers in that period. It is therefore highly probable, that Assyria was originally of small extent. According to Ptolemy, this country was bounded on the north by part of Armenia and mount Niphates; on the west by the Tigris; on the south by Susiana; and on the east by part of Media, and the mountains Choatra and Zagros. The country within these limits is called, by some of the ancients, **ADIABENE**, and by others **ATURIA** or **ATYRIA**. It is divided, by Ptolemy, into the following provinces or districts; viz. **CALACHINE** or **Calacine**, **ARRAPACHITIS**, **ADIABENE**, **ARBELITIS**, **APOLLONIATIS**, **SITTACENE**, and **CHALONITIS**. Among the rivers of Assyria we may reckon the **TIGRIS**, the **LYCUS**, the **CAPRUS**, and the **GORGUS**.

GORGUS. Of the origin, revolutions, and termination of Assyria, properly so called, and distinguished from the grand monarchy which afterwards bore this appellation, the following account is given by Mr. Playfair, as the most probable. The founder of it was Ashur, the second son of Shem, who departed from Shinar, upon the usurpation of Nimrod, at the head of a large body of adventurers, and laid the foundations of Nineveh, where he resided, and erected a new kingdom, called Assyria after his name. See **ASHUR.** Gen. x. 11. These events happened not long after Nimrod had established the Chaldean monarchy, and fixed his residence at Babylon; but it does not appear that Nimrod reigned in Assyria. The kingdoms of Assyria and Babylon were originally distinct and separate (Micah, v. 6.); and in this state they remained until Ninus conquered Babylon, and made it tributary to the Assyrian empire. Ninus, the successor of Ashur (Gen. x. 11. Diod. Sicul. l. i.), seized on Chaldæa after the death of Nimrod, and united the kingdoms of Assyria and Babylon. This great prince is said to have subdued Asia, Persia, Media, Egypt, &c. If he did so, the effects of his conquests were of no long duration; for, in the days of Abraham, we do not find that any of the neighbouring kingdoms were subject to Assyria. Ninus was succeeded by Semiramis, a princess bold, enterprising, and fortunate; of whose adventures and exploits many fabulous relations have been recorded. Playfair is of opinion, that there were two princesses of this name who flourished at different periods: one, the consort of Ninus, and another, who lived five generations before Nitocris, queen of Nebuchadnezzar. Euseb. Chron. p. 58. Herod. l. i. c. 184. See **SEMIRAMIS.** Of the successors of Ninus and Semiramis nothing certain is recorded. The last of the ancient Assyrian kings was Sardanapalus, who was besieged in his capital by Arbaces, governor of Media, in concurrence with the Babylonians. These united forces defeated the Assyrian army, demolished the capital, and became masters of the empire, B. C. 821. See **ARBACES,** and **SARDANAPALUS.** Such is the substance of the account given by Ctesias, and after him by several ancient Greek and Latin writers; and particularly by Diodorus Siculus. These writers have referred the commencement of the Assyrian empire to about sixty or seventy years after Noah's flood; but concerning its beginning, as well as its duration, ancient writers have given very different accounts. Africanus and Eusebius suppose that Ninus, the second Assyrian king, began to reign 309 years after the flood, and 43 years before the birth of Abraham. Berosus, the Chaldean historian, dates the foundation of the empire from the building of the tower of Babel, about 131 years after the flood. Cassiodorus admits an interval of more than four centuries between these two remarkable events. Usher extends this interval to 1085 years; and Jackson reduces it to 531. As to the period of the duration of this empire, Ctesias, Diodorus, and others, make it 1360 years; Justin, 1300; Castor, 1280; Syncellus, 1460; Scaliger, 1306; Eusebius, 1240; Velleius Paterculus, 1070; Herodotus, 520; and Appian makes the whole duration of the Assyrian, Median, and Persian empires, not to exceed 900 years. In Blair's Tables the commencement of the Assyrian empire is assigned to the year before Christ, 2059, and its termination to the year before Christ 820; so that its whole duration comprehends 1239 years. Goguet refers the conquest of Babylon by Ninus, king of Assyria, and the consequent union of the Babylonian throne with that of Nineveh, to the 590th year after the flood, or the 1758th year B. C. In settling this date, he places the foundation of the kingdom of Babylon by Nimrod, about the year 150 after the flood. This king-

dom, as most chronologers allow, had subsisted 440 years, under two distinct dynasties or families, at the time of Babylon's being taken by the Assyrians. The first of these dynasties, whose kings were Chaldeans, possessed the throne 225 years; and the second, originally from Arabia, reigned 215 years; and the total is 440 years. If to these years we add 150 years from the flood to the foundation of Babylon by Nimrod, the capture of Babylon will fall in the 590th year after the flood, and consequently in the 1758th year B. C. After the capture of Babylon, the two monarchies formed one state, under the name of the Assyrian empire. From this time the kingdom of Babylon was no more than a province of the Assyrian empire, to the time in which the revolt of the Medes gave the Babylonians an opportunity of shaking off the Assyrian yoke, about 770 B. C. As most of these computations are primarily borrowed from Ctesias, it may not be improper to inquire how far his testimony is credible. Aristotle, who was almost his contemporary, declares him to be unworthy of credit; and his history of India evinces him to be a fabulous writer. Although he gives us the names of the Assyrian kings from Belus and his son Ninus to Sardanapalus, the last king of that monarchy, yet his list is a mere medley of Greek, Persian, Egyptian, and other names; and except in two or three instances, they have no affinity with the names of the Assyrians mentioned in scripture. The true empire of the Assyrians, described in scripture, whose kings were Pul, Tiglath-pileser, &c. he does not mention, though much nearer to his own times; and this circumstance shews that he was ignorant of the antiquities of the Assyrians.

After the death of Sardanapalus, says Mr. Playfair, the Assyrian empire was divided into three kingdoms; viz. the Median, Assyrian, and Babylonian. Arbaces retained the supreme authority, and nominated governors in Assyria and Babylon, who were honoured with the title of kings, while they remained subject and tributary to the Persian monarchs. Belesis, he says, a Chaldean priest, who assisted Arbaces in the conquest of Sardanapalus, received the government of Babylon as the reward of his services; and Pul was entrusted with that of Assyria. The Assyrian governor gradually enlarged the boundaries of his kingdom, and was succeeded by Tiglath-pileser, Salmanassar, and Sennacherib, who asserted and maintained their independence. After the death of Assar-haddon, the brother and successor of Sennacherib, the kingdom of Assyria was split, and annexed to the kingdoms of Media and Babylon. Several tributary princes afterwards reigned in Nineveh; but we hear no more of the kings of Assyria, but of those of Babylon. Cyaxares, king of Media, assisted Nebuchadnezzar, king of Babylon, in the siege of Nineveh, which they took and destroyed B. C. 606.

The history of Assyria, deduced from scripture, and acknowledged as the only authentic one by sir Isaac Newton and many others, ascribes the foundation of the monarchy to Pul or Phul, about the second year of Menahem, king of Israel, twenty-four years before the era of Nabonassar, 1379 years after the flood, and according to Blair 769, or according to Newton 790, years before Christ. Menahem having taken forcible possession of the throne of Israel by the murder of Shallum (2 Kings, xv. 10.), was attacked by Pul, but prevented the hostilities meditated against him, by presenting the invader with a thousand talents of silver. Pul, thus gratified, took the kingdom of Israel under his protection, returned to his own country, after having received voluntary homage from several nations in his march, as he had done from Israel, and became the founder of a great empire. As it was in the days of Pul that the Assyrians began to afflict the inhabitants of Palestine (2 Kings xi. 9. and

1 Chron. v. 26.), this was the time, according to sir Isaac Newton, when the Assyrian empire arose. Thus he interprets the words "since the time of the Kings of Assyria" (Nehem. ix. 32.); i. e. since the time of the kingdom of Assyria, or since the rise of that empire. But though this was the period in which the Assyrians afflicted Israel, it is not so evident that the time of the kings of Assyria must necessarily be understood of the rise of the Assyrian empire. However Newton thus reasons; and observes, "that Pul and his successors afflicted Israel, and conquered the nations round about them; and upon the ruin of many small and ancient kingdoms erected their empire, conquering the Medes, as well as other nations." It is further argued that God by the prophet Amos, in the reign of Jeroboam, about ten or twenty years before the reign of Pul (see ch. vi. 13, 14.), threatened to raise up a nation against Israel; and that as Pul reigned presently after the prophecy of Amos, and was the first upon record who began to fulfil it, he may be justly reckoned the first conqueror and founder of this empire. See 1 Chron. v. 26. Pul was succeeded on the throne of Assyria by his elder son Tiglath-pileser, and at the same time he left Babylon to his younger son Nabonassar, B. C. 747. Of the conquests of this second king of Assyria against the kings of Israel and Syria, when he took Damascus and captivated the Syrians, we have an account in 2 Kings, xv. 29. 37. xvi. 5. 9. 1 Chron. v. 26. Amos, i. 5. Joseph. Ant. l. 9. c. 13., by which the prophecy of Amos was fulfilled, and from which it appears that the empire of the Assyrians was now become great and powerful. The next king of Assyria was Shalmaneser or Salmanassar, who succeeded Tiglath-pileser, B. C. 729, and invaded Phœnicia, took the city of Samaria, and B. C. 721 carried the ten tribes into captivity, placing them in Chalach and Chabor, by the river Gazon, and in the cities of the Medes. Jos. Ant. l. 9. c. 14. 2 Kings, xvii. 6. Shalmaneser was succeeded by Sennacherib, B. C. 719; and in the year B. C. 714 he was put to flight, with great slaughter, by the Ethiopians and Egyptians. In the year B. C. 711, the Medes revolted from the Assyrians; Sennacherib was slain; and he was succeeded by his son Esarhaddon, Afferhadon, Afordan, Affaradin, or Sarchedon, by which names he is called by different writers. He began his reign at Nineveh in the year of Nabonassar 42; and in the year 68 extended it over Babylon. He then carried the remainder of the Samaritans into captivity, and peopled Samaria with captives brought from several parts of his kingdom, and in the year of Nabonassar 77 or 78, he seems to have put an end to the reign of the Ethiopians over Egypt. "In the reign of Sennacherib and Affer-Hadon," says sir I. Newton, "the Assyrian empire seems arrived at its greatness; being united under one monarch, and containing Assyria, Media, Apolloniatis, Susiana, Chaldæa, Mesopotamia, Cilicia, Syria, Phœnicia, Egypt, Ethiopia, and part of Arabia; and reaching eastward into Elymais, and Parætacene, a province of the Medes, and if Chalach and Chabor be Colchis and Iberia, as some think, and as may seem probable from the circumscription used by those nations till the days of Herodotus (l. ii. c. 104), we are also to add these two provinces, with the two Armenias, Pontus, and Cappadocia, as far as to the river Halys. For Herodotus (l. i. c. 72. l. vii. c. 63.) tells us, that the people of Cappadocia, as far as to that river, were called Syrians by the Greeks, both before and after the days of Cyrus; and that the Assyrians were also called Syrians by the Greeks." Affer-Hadon was succeeded in the year B. C. 668, by Saoluchinus. At this time Manasseh was allowed to return home and fortify Jerusalem; and the Egyptians also, after the Assyrians had harassed Egypt and Ethiopia three years (Isai. xx. 3, 4.), were

set at liberty. Saoluchinus, after a reign of twenty years, was succeeded at Babylon, and probably at Nineveh also, by Chyniladon, in the year B. C. 647. This Chyniladon is supposed by Newton to be the Nabuchadonosor mentioned in the book of Judith (i. 1—15.), who made war upon Arphaxad king of the Medes, and though deserted by his auxiliaries of Cilicia, Damascus, Syria, Phœnicia, Moab, Ammon, and Egypt, routed the army of the Medes, and slew Arphaxad. This Arphaxad is supposed to be either Dejoces, or his son Phraortes, mentioned by Herodotus (i. i. c. 102.). Soon after the death of Phraortes in the year B. C. 635, the Scythians invaded the Medes and Persians; and in 625, Nabopolassar, the commander of the forces of Chyniladon in Chaldæa, revolted from him, and became king of Babylon. Chyniladon was either then, or soon after, succeeded at Nineveh by the last king of Assyria, called Sarac by Polyhistor. The authors of the Universal History suppose Saoluchinus to have been the Nabuchadonosor of Scripture, and Chyniladon or Chynaladan to have been the Sarac of Polyhistor. At length Nebuchadnezzar, the son of Nabopolassar, married Amyite, the daughter of Atyages king of the Medes, and sister of Cyaxeres; and by this marriage the two families having contracted affinity, they conspired against the Assyrians. Nabopolassar being old, and Atyages dead, their sons Nebuchadnezzar and Cyaxeres led the armies of the two nations against Nineveh; slew Sarac, destroyed the city, and shared the kingdom of the Assyrians. This victory the Jews refer to the Chaldeans; the Greeks, to the Medes; Tobit (xiv. 15.), Polyhistor (apud Euseb. in Chron.), Josephus (l. x. c. 2. § 2. p. 435.), and Ctesias (apud Diod. Sic. l. ii. c. 24. p. 78.), to both. With this victory commenced the great successes of Nebuchadnezzar and Cyaxeres, and it laid the foundation of the two collateral empires of the Babylonians and Medes, which were branches of the Assyrian empire; and hence the time of the fall of the Assyrian empire is determined, the conquerors being then in their youth. In the reign of Josiah, when Zephaniah prophesied, Nineveh and the kingdom of Assyria were standing, and their fall was predicted by that prophet, Zeph. i. 3. and ii. 15. And in the end of his reign, Pharaoh Necho king of Egypt, the successor of Psammetichus, went up against the king of Assyria to the river Euphrates, to fight against Carchemish or Circutium, and in his way thither slew Josiah (2 Kings, xxiii. 29. 2 Chron. xxxv. 20.); and therefore the last king of Assyria was not yet slain. But in the third and fourth year of Jehoiakim, the successor of Josiah, the two conquerors having taken Nineveh and finished their war in Assyria, prosecuted their conquests westward; and leading their forces against the king of Egypt, as an invader of their right of conquest, they beat him at Carchemish, and took from him whatever he had recently taken from the Assyrians (2 Kings, xxiv. 7. Jer. xlvi. 2. Eupolemus apud Euseb. Præp. l. ix. c. 35.); and therefore we cannot err, says sir Isaac Newton, above a year or two, if we refer the destruction of Nineveh, and fall of the Assyrian empire, to the third year of Jehoiakim, or the 140th, or according to Blair the 141st year of Nabonassar, that is the year 607 B. C. Newton suggests, that the name of the last king Sarac might have been contracted from Sarchedon; as this name was from Afferhadon, Afferhadon-Pul, or Sardanapalus: but how, says his learned commentator, bishop Horsley, is this consistent with what he has so fully proved in the preceding discussion of this subject, that Afferhadon had two successors at Nineveh, Saoluchinus and Chyniladon; or with his assertion, that Sarac, the last Assyrian king, was the successor of Chyniladon?

Blair, in his Chronological Tables, states the commencement of the reign of Phul, in the year 777 B. C.; the succession

succession of Tiglath-pileser, in the first year of Nabonassar, or 747 B. C.; that of Salmanassar, in 727 B. C.; that of Sennacherib in 712, B. C.; that of Esarhadon or Assuradinus, in 709 B. C.; and the union of Assyria and Babylon under Assuradinus in 680 B. C.: and upon the separation of Assyria and Babylon in 667 B. C. he makes Sardanapalus king of Babylon, who then commenced his reign, and was succeeded in 647 B. C. by Chyniladanus; and the king of Assyria, who commenced his reign in 667, he calls Ninus II. and his successor, in 641, Nabuchodonosor; and the last king of Assyria, Sarac or Sardanapalus, whose reign commenced in the year 621 B. C.; and the union of Adyria and Media he refers to the sixteenth year of this king, and the twentieth of Cyaxares king of Media, or the 604th year B. C.: in which year Nineveh was taken and destroyed by the united armies of Cyaxares and Nabopolassar.

Of the government, laws, religion, learning, customs, &c. of the ancient Assyrians, nothing absolutely certain is recorded. Their kingdom was at first small, and subsisted for several ages under hereditary chiefs; and their government was very simple. Afterwards when they rose to the sublimity of empire, their government seems to have been truly despotic, and the empire to have been hereditary. Their laws were probably few, and depended upon the arbitrary will of the prince. To Ninus we may ascribe the division of the Assyrian empire into provinces and governments, for we find (Diod. Sic. l. ii.) that this institution was fully established in the reigns of Semiramis and her successors. In this empire the people were distributed into a certain number of tribes (Herodot. l. i. Strabo, l. xvi.); and their occupations or professions were hereditary. The Assyrians had several distinct councils, and several tribunals for the regulation of public affairs. Of councils there were three, which were created by the body of the people, and who governed the state in conjunction with the sovereign. The first consisted of officers who had retired from military employments; the second of the nobility; and the third of the old men. The sovereigns also had three tribunals, whose province it was to watch over the conduct of the people. The first was employed in disposing of the young women in marriage, and in punishing adultery; the second took cognizance of theft; and the third of all acts of violence. Strabo, l. xvi. As to their religion, they were idolaters, and had their idols and temples. In customs, arts, and learning, they differed but little, if at all, from the Babylonians. The Assyrians are said to have one practice, with respect to marriage, that is worthy of attention. All the young girls, who were marriageable, were assembled in one place, and a public crier put them up to sale one after another. The money which was received for those that were handsome and fetched a high price, was bestowed as a portion with those whose persons were more plain and homely. When the most beautiful were disposed of, the more ordinary were offered with a certain sum, and allotted to those who were willing to take them with the smallest portion. In this manner all the young women were provided with husbands. This ingenious and politic method of facilitating and promoting marriages, was also practised by several other nations. If at any time it happened that the parties could not agree, the man was obliged to refund the money which he had received. It was likewise very expressly forbidden to use women ill, or to carry them into any foreign country. Herodotus informs us, that this wife institution was abolished towards the end of the Assyrian monarchy. Herodot. l. i. Ælian. Var. Hist. l. iv. c. 1. Strabo, l. xvi. The Assyrians have been competitors with the Egyptians for the honour of having invented alphabetic writing. It appears from the few remains now extant of

the writing of these ancient nations, that their letters had a great affinity with each other. They much resembled one another in shape; and they ranged them in the same manner, from right to left. Playfair's Chronology, p. 67—70. Newton's Chron. ch. iii. apud Oper. by H. Wren, t. v. p. 193—211. Anc. Un. Hist. vol. iii. p. 325—367. Goguet's Orig. of Laws, &c. vol. i. p. 41.

ASSYRIAN *L. Arts*, *Licere Assyria*, a denomination given by several Rabbins and Talmudists to the characters of the present Hebrew alphabet, as supposing them to have been borrowed from the Assyrians during the Jewish captivity in Babylon. Montfaucon.

ASTA, in *Antient Geography*, a town of Liguria, or Piedmont, which was a Roman colony, upon a river of the same name, not far from the Tanarus. The fortifications of this place afforded a temporary shelter to the emperor Honorius, when he was pursued by the Goths. A. D. 403.; and he was relieved from the danger of a successful siege, and the indignity of a capitulation to the Barbarians, by the reasonable arrival of Stilicho, who cut his way through the Gothic camp under the walls of Asta, and thus revived the hopes and vindicated the honour of Rome. See ASTA.—Also, a town of Spain, in Bætica, south of Nebrissa, upon the left arm of the Bætis, which discharged itself into the bay of Gades.

ASTA, in *Geography*, a town of the United Netherlands, in the duchy of Guelderland, four miles south-east of Culenburg.—Also, a river of Spain, which empties itself into the bay of Biscay, at Villa Viejoia.

ASTABAT, a town of Armenia, thirty-three leagues south-east of Erivan.

ASTABENI, in *Antient Geography*, a people of Asia, in Hyrcania. Ptolemy.

ASTABORAS, a river of Abyssinia, forming, as Pliny has said, the left channel of Atbara; or as the Greeks have called it, the island or peninsula of Merœ; as Astapus forms the right channel. Astaboras, is the name given by the natives to the Tacazze, or the Sims of the ancients. It joins the Nile in N. lat. 17° 47'. See ARBARA, MEROE, and TACAZZE.

ASTACAMPRON, a promontory of Asia, in the Indian sea, to the left of the gulf of Baryza. Arrian.

ASTACANA, a town of Asia, in Bactriana, called *Astacia* by Ammianus Marcellinus. Ptolemy.

ASTACANI, a name given by some to the ASSACANI.

ASTACAPRA, a town of India, on this side of the Ganges, situated between the mouths of the Indus. Ptolemy.

ASTACENA, a country of Asia, in Pontus, which took its name from the river Astaces which traversed it.

ASTACENUM *ÆSTUARIVM*, *Marisina*, a gulf of Spain in Bætica. Ptolemy.

ASTACENUS *SINUS*, a gulf of the Propontis, on which was situated the town of Nicomedia.

ASTACHAR, in *Geography*, formerly *Astacara*, a town of Persia, near Bendimir and the ruins of Persepolis. It is now a village, having however a caravanera, mosques, and the ruins of a palace.

ASTACHILICIS, a town of Africa, in Mauritania. Ptolemy.

ASTACHILIS, *TESSALLAH*, a place of the interior country of Africa, in Mauritania Cæsariensis, which was a Roman station, situate in the mountains south of Portus Magnus. Ptolemy.

ASTACUS, in *Entomology*, a species of *CANCER*, with a smooth thorax; proboscis toothed along the sides; and a single tooth on each side at the base. This is the common craw-fish, that inhabit rivers, and lodges itself in holes

which it forms in the banks. Very frequent in many countries of Europe.

ASTACUS is also the name of a genus in the Fabrician system, formed of those species of the Linnean *Canceri*, that have four pedunculate antennæ, the two fore-ones of which are long and filaceous, and the posterior ones cleft. Among these the lobster and craw-fish are included.

ASTACUS, in *Ancient Geography*, a town of Asia, in Bithynia, situate upon the Asiatic gulf, according to Strabo. The city was built by the Megarians and Athenians, and destroyed by Lyfimachus, and its inhabitants transported to Nicomedia, by whom it was founded or re-established. Some have said that Nicomedia was built on the ruins of Astacus. — Also, a town of Greece, in Acarnania.

ASTÆ, a people of Europe, in Thrace. Steph. Byz.

ASTAGENI, a people of Arabia Felix. Ptolemy.

ASTAGON, in *Geography*, a town of Africa, in Monocrophi, on the confines of Zanguabar.

ASTAMAR, **ACTAMAR**, or **ABAUNAS**, a large lake, with a fortified town of the same name, in Armenia. N. lat. 36° 30'. E. long. 44° 14'.

ASTAN, a river of Arabia, in Lahsa, which is probably the stream in Neged mentioned by D'Anville, and is represented by Niebuhr as only a wadi or brook which runs after rains.

ASTANDA, called also **ASTALIN**, in *Antiquity*, a royal courier or messenger, the same with **ANGARUS**.

King Darius of Persia is said by Plutarch, in his book on the fortune of Alexander, to have formerly been an astanda.

ASTANDA, in *Ancient Geography*, a town of Asia, in Aria. Ptolemy.

ASTAPA, **ESTEPALA VIEJA**, a town of Spain, in Bætica, south-west of Singili. It is distinguished by the records of its vigorous defence against Marius and the Romans, in the year of Rome 546. When they were no longer able to resist the besiegers, they kindled a fire into which they threw all their effects, and rushed with their women and children into the midst of their enemies, by whom they were vanquished and slain; but no trophy of victory remained for their conquerors.

ASTAPÆI, a people of Africa, placed by Steph. Byz. in Libya.

ASTAPUS, a river of Abyssinia, which with the Astaboras formed the peninsula of Merœ. This river, known now by the name of the "White River," is represented by Diodorus Siculus as proceeding from large lakes to the southward, and having thrown itself into the Nile, makes with it the right hand channel including Merœ in Atbara. See **ASTABORAS** and **MFROE**.

ASTARA, in *Geography*, a town of Persia, in Ghilan, on the Caspian sea.

ASTARABAT, a town of Persia, in Segestan, 100 miles north of Zareng, and 220 W. N. W. of Candahar.

ASTARAC, a small territory of France, situate in the late province of Gascony, about eight leagues square, of which the capital is Mirand.

ASTAROTH, in *Ancient Geography*, a town of Palestine, in Batanea, or Bathan. This was a strong city belonging to the half tribe of Manassah, on the other side of Jordan. It was granted to the Levites of the family of Gershon, according to Joshua.

ASTAROTH-CARNAIM, another town of Palestine, south-west of the former, and distant from it nine miles, between Adraa and Abila. It is supposed to have derived its name from Astarte, called Astaroth, the deity of the

Phœnicians, and Carnaim, signifying horns or a crescent, with which she was represented.

ASTAROTH, in *Mythology*, an idol of the Philistines, which the Jews destroyed at the command of Samuel. It was also the name of a deity of the Sidonians, which was worshipped by Solomon in his idolatrous days. See **ASTARTE**.

ASTARTA, in *Ancient Geography*, an island of Ethiopia. Steph. Byz.

ASTARTE, a deity of the Assyrians, under which appellation they worshipped the moon, and from them that species of idolatry extended to the Phœnicians, Carthaginians, and other ancient nations. Adonis, who was an Assyrian by descent, is said to have married Astarte; and after their death they were elevated to the rank of gods; and as it was the opinion of ancient times, that the souls of distinguished personages after their death inhabited the stars, it has been imagined that those of Adonis and Astarte made choice of the sun and moon for their respective residence; and hence their worship and that of these luminaries was the same. Astarte was called in Hebrew Astaroth or Astaroth; which appellation some have erroneously ascribed to her having been represented in the form of a sheep. Others have conjectured, from the etymology of the word *Ajstaroth*, which signifies "flocks of sheep or goats," that in ancient times, when men were chiefly addicted to a pastoral life, and peculiarly delighted in this occupation, the most approved families of excellence and beauty were deduced from hence; and this has been supposed to have been the reason of the name Astaroth or Astarte. Astarte was usually represented, like Isis, with cow's horns on her head, and for the same reason, namely, for exhibiting the moon's increase and decrease; as she was consecrated into that planet, and adored under the denomination of the "queen of heaven." Her principal worship was established at Hierapolis in Syria, where she had a magnificent temple, and more than 300 priests employed at her altars.

Cicero, and also Suidas, suppose that the Astarte of the Phœnicians was one of the four Venuses, whom the Roman orator enumerates. Beger and Bochart add, that she was Venus armed, or the goddess of war; and Pausanias, on whose authority they rely, says, that the Cythreans, who adored her under this form and appellation, had received this worship from the Phœnicians. Astarte, according to Lucian, was the moon; and Juno among the Carthaginians, according to St. Augustin, who, as Bochart imagines, had derived their opinion from Horace, l. ii. od. 1. and Virgil *Æn.* l. i. 15. This goddess was represented by her votaries in different nations, under a variety of forms and attributes. The Sidonians represented her under the figure of a hen who covered her chickens with her wings. The Astarte, mentioned by Cicero, was exhibited in Phœnicia with a quiver and arrows. In her temple on mount Libanus, where she was moursing her lost Adonis, her head was veiled, and rested on her left hand, and floods of tears streamed down her cheeks. Among the Assyrians, she was sometimes termed a goddess, and sometimes a god, on account of the ambiguity of gender in the oriental languages, and because the Hebrews knew no distinction of sex in the gods. The mythological writers, in general, have thought that Astarte is, under different names, the Venus or Mylitta of the Assyrians, the Mithra of the Persians, the Isis of the Egyptians, the Io and Venus Urania of the Greeks, the great goddess of the Syrians, the Derceto of Afcalon, and probably Diana, &c. When the black conical stone, which was thought to have fallen from heaven at Emefa, and under the form of the sun was worshipped in that place,

and under the appellation of Elagabalus, was brought to Rome by the emperor who assumed this name, and fixed in a magnificent temple raised on the Palatine mount, this imperial fanatic made choice of Astarte, under which name the moon was adored by the African, for his consort. Accordingly her image, with the rich offerings of her temple as a marriage portion, was transported with solemn pomp from Carthage to Rome; and the day of these mythic nuptials was a general festival in the capital, and throughout the empire. Antiquaries have supposed that she is exhibited as a half-naked female, &c. on the medals of Berytus and Cæsarea; in a chariot, &c. on a medal of Elagabalus at Sidon; and on the medals of Carthage, in the form of a female seated on a lion, with a thunderbolt in her hand. Prostitution was practised by the female worshippers of Astarte at Byblus, in Phœnicia, in Babylon, and in Carthage.

ASTASANA, in *Ancient Geography*, a town of Asia, in Asia. Ptolemy.

ASTATI, in *Ecclesiastical History*, the followers of one Sergius, in the ninth century, who renewed the errors of the MANICHEES.

The word is derived from the privative *a* and *ιστημι*, *to stand*, and signifies any thing unstable and inconsistent. They prevailed much under the emperor Nicephorus; but his successor, Michael Curopalates, curbed them with very severe laws.

ASTCHIKCUNUPI, in *Geography*, a large lake in New Britain, abounding with whales, and supposed to communicate with the Northern sea.

ASTELM, in *Rhetoric*, a genteel way of irony, or handsome way of deriding another. Such is that of Virgil:

“Qui Bavianum non odit, aniet tua carmina Mævi.”

ASTÉIXIS, in *Ancient Geography*, a mountain of Africa, part of mount Atlas, to the south of Mauritania Cæsariensis.

ASTELEBE, a town of Asia Minor in Lydia. Steph. Byz.

ASTELEPHUS, a river of Colchis which ran into the Euxine sea. Arrian.

ASTELL, MARY, in *Biography*, the daughter of a merchant at Newcastle-upon-Tyne, was born in the year 1688, and instructed by her uncle, who was a clergyman, in logic, mathematics, and philosophy, as well as in the Latin and French languages. At twenty years of age she removed to London, and devoted the principal part of her time to study. In order to excite emulation and a desire of improvement among her sex, she published “A Serious Proposal to the Ladies, wherein a method is offered for the improvement of their minds,” printed in 12mo. at London in 1697. Her proposal, which was the establishment of a seminary for female education, excited so much attention, that a lady, supposed to be the queen, formed a design of giving 10,000*l.* towards erecting a kind of college for the education of the female sex, and as an asylum to such ladies as might wish to retire from the world; but bishop Burnet discouraged the liberal intention, by alleging, that such an institution would too much resemble a nunnery. Mrs. Astell’s “Reflections on Marriage,” written in consequence of a matrimonial disappointment, were published in 1700 and 1705. Mrs. Astell was orthodox in her religious creed, and in her politics an advocate for the doctrine of non-resistance. Besides some controversial pieces, such as “Moderation truly stated,” “A Fair Way with the Dissenters,” “An Impartial Inquiry into the Causes of the Rebellion,” and “A Vindication of the Royal Martyr,” all printed in 4to. in 1704; she also distinguished herself

by a more elaborate performance, published in 1705, and intitled, “The Christian Religion as professed by a Daughter of the Church of England,” in which she had the reputation to attack Locke and Tillotson. The close of her life was embittered by the anguish of a cancer in her breast, and she bore amputation with fortitude. She died in the year 1731. Her manners were austere, and her principles rigid; and though she attracted notice at the time in which she lived, neither her natural talents nor literary attainments would command attention among the females of the present day. Gradually the waste of time occasioned by trifling visitors, and yet superfluous of dissipated falsehoods to her servants according to the refinement of modern practice, she used to accost such intruders on their approach, and jocosely say to them, “Mrs. Astell is not at home.” Ballard’s Mem. of British Ladies. Biog. Brit.

ASTENAS, in *Ancient Geography*, a town of Spain in Bætica. Strabo.

ASTENOUS, in *Entomology*, a species of PAPILIO (Eq. *Achi*) that inhabits the Cape of Good Hope. The wings are black both above and beneath; a radiated white spot on the anterior pair; disk of the posterior ones yellow. Fabricius. This is *papilio pompæus* of Cramer; and *papilio minor* of the same author is supposed to be a variety of this species.

ASTER, in *Botany*, Starwort (*Aster*, a star, the flower being radiated). Lin. Gen. 954. Schreb. 1291. Juss. 181. Gaertn. t. 170. Class, *synzonia polygamia polyperla*. Nat. Order, *compositi radiati Corymbifera*. Juss. Gen. Char. *Cal.* common imbricate; the inner scales prominent a little at the end, lower ones spreading. *Cor.* compound radiate; corollules hermaphrodite, numerous in the disk; females ligulate, more than ten in the ray; proper of the hermaphrodite, funnel shaped, with a five-cleft spreading border; of the female ligulate, lanceolate, three-toothed, at length rolling back. *Siam.* hermaphrodite; filaments five; capillary very short; anthers cylindric, tubulous. *Pist.* germ oblong. *Styl.* filiform, the length of the stamens. *Sigma* bifid, spreading. Females, germ and style the same; stigmas two, oblong revolute. *Per.* none. *Calyx* scarcely changed. *Seeds* solitary, oblong, ovate; down capillary; rec. naked, flattish.

Eff. Gen. Char. Recept. naked; down simple. *Cor.* rays more than ten. *Cal.* imbricate, lower scales spreading. * *Shrubby*.

Species 1. *A. taxifolius*, yew-leaved star-wort. “Under-shrubby; leaves decurrent, subulate, channelled, ciliate; flowers terminal.” Stem scaree a foot high; leaves alternate, crowded. linear, revolute; flowers sessile, or subpedunculated, solitary. 2. *A. reflexus*, reflected starwort. “Shrubby; leaves ovate, subimbricate, recurved, serrate-ciliate; flowers terminal.” Stem proliferos; leaves crowded, sessile, little, smooth, lower ones ferrate, upper ciliate; flowers solitary, sessile, ray blood-red. 3. *A. crinitus*. “Sub-shrubby; leaves ovate-oblong, acute, tomentose underneath; calyx terminated in a hair.” Branches with few divisions; leaves sessile, exquisitely pointed, rough about the edges; peduncles terminal, leafy, one-flowered; ray of the flower blue. 4. *A. fruticosus*, shrubby starwort. “Shrubby; leaves linear, dotted; peduncles one-flowered, naked.” Stems three feet high; branches woody, furnished with clusters of narrow leaves like those of the larch tree; flowers solitary, upon long slender peduncles; they are of a pale blue colour, and appear in March. Leaves narrow, acute, approximating. Cultivated in 1759 by Mr. Müller. This and the preceding species grow wild at the cape of Good Hope.

** *Herbaceous, entire-leaved, peduncles naked.*

5. *A. tenellus*, bristly-leaved starwort. Curt. Bot. Mag. 35. "Leaves filiform, prickle-ciliate; calyxes hemispherical, with equal leaflets." Stem annual, seven inches high; leaves scattered, linear, mucronate underneath; flowers peduncled, solitary, terminal; disk of the corolla yellow, ray blue, often rolled back. A native of the Cape. Introduced here by Masson in 1774. 6. *A. alpinus*, great blue mountain starwort. Curt. Mag. 199. "Leaves subspatulate, rough with hairs, entire; stems simple, one-flowered." With us it rises to near a foot in height; at the top of each stalk is one large blue flower; stem-leaves two, seldom three, they are ovate, ciliate, petiolate next the root, on the stem slender, lanceolate. It flowers in June. A native of the Alps and Pyrenées. Cultivated by Miller in 1759. 7. *A. sibiricus*, Siberian starwort, Gmel. Sib. 2. 186. "Leaves lanceolate, almost stem-clasping, ferrate, hairy-scabrous; calyxes lax; leaflets lanceolate acuminate." Stems two feet high; peduncles one-flowered; ray of the corolla blue. A native of Siberia. Flowers in August. Cultivated by Miller in 1768. 8. *A. Tripolium*, sea-starwort, Hudf. With. Lightf. Smith 883. Eng. Bot. 87. "Leaves linear-lanceolate, entire, fleshy, smooth, three-nerved, calycine leaflets membranaceous, obtuse." Height of the stem very variable; flowers numerous, handsome, yellow in the disk, blue at the ray. There is a variety destitute of rays. A native of muddy sea shores and mouths of rivers in every part of our coast. 9. *A. Amellus*, Italian starwort, Jacq. Aust. 5. 425. "Leaves oblong-lanceolate, entire, scabrous; branches corymboid; calyxes imbricate, subsquarrose; leaflets obtuse, the inner membranaceous, coloured at the end." Stems numerous, branching at the top into eight or ten peduncles, each terminated by a single large flower having blue rays, with a yellow disk. A native of the south of Europe. Cultivated by Gerard in 1596. 10. *A. divaricatus*, divaricate starwort. "Branches divaricate; leaves ovate, ferrate; floral leaves quite entire, rather obtuse, stem-clasping." Stems rough, about two feet high, dividing towards the top into many forked branches; flowers grow almost in an umbel. A native of Virginia.

*** *Herbaceous, entire-leaved, peduncles scaly.*

11. *A. hyssopifolius*, hyssop-leaved starwort. "Leaves linear-lanceolate, drawn to a point at the base, entire, stiff; branchlets corymboid, fastigiata; leaflets frequently linear, imbricate; calyxes imbricate." Stem a foot high; eight purple florets in the ray; disk elevated, greenish; filaments testaceous; pistil yellow. A native of North America. Cultivated in 1760 by Miller. 12. *A. dumosus*, bushy starwort. "Leaves linear, entire, smooth, those on the branchlets very short; branches panicled; calyxes cylindrical, closely imbricated." Stem two feet high, much branched; branchlets filiform; stem-leaves narrow-lanceolate, on the branches linear; flowers small, very white, disk yellow. Cultivated in Chelsea garden in 1725. 13. *A. ericoides*, heath-leaved starwort. "Leaves linear, entire, very smooth, those of the branchlets subulate, approximating, those of the stem elongated; calyxes subsquarrose; leaflets acute, stem smooth." Stalks slender, three feet high; branches numerous, forming a thick bush, and terminated by single flowers. Cultivated by Miller in 1758. 14. *A. tenuifolius*, fine-leaved starwort. "Leaves sublinear, quite entire; peduncles leafy." Stems five feet high, slender, angular, smooth, with few branches; leaves alternate, roughish; flowers terminal, solitary, small, white; peduncles with small subulate leaflets scattered over them. 15. *A. linearifolius*, fawory-leaved starwort. "Leaves linear, entire, mucronate, scabrous, stiff, upper ones lax, remote;

calyxes imbricate; branches fastigiata." Stems purplish; leaves very rough, sharp, keeled, scattered; peduncles alternate; flowers few, terminal, solitary. Cultivated here in 1712. 16. *A. linifolius*, flax-leaved starwort. "Leaves linear, entire, roughish; branches corymboid, fastigiata with small leaflets; calyxes imbricate; rays about equal to the disk." Leaves lanceolate, gradually narrowing to the end; peduncles with many small subulate scales; stems strong, from two to three feet high, with many branches, terminated by one blue flower. Cultivated in 1739 by Miller. These species are natives of North America. 17. *A. acris*. "Leaves lanceolate-linear, stiff, entire, flat; flowers corymboid fastigiata; peduncles leafy." Much branched; leaves very narrow; flowers of a pale bluish colour, in large clusters at the top of the plant. A native of the south of Europe. 18. *A. concolor*. "Leaves ovate, sessile, quite entire; stem simple; raceme terminal." Four feet high; flowers of a pale blue colour; the whole plant tomentose; raceme simple, with very short peduncles. A native of Virginia. 19. *A. rigidus*, stiff-leaved starwort. "Leaves linear, alternate; flowers terminal, solitary." Leaves small, stiff, many; stem woody, almost simple, terminated by one specious flower; floretules of the ray purple, long. A native of Virginia. 20. *A. novae angliae*, New-England starwort. "Leaves lanceolate, entire, cordate, stem-clasping, hairy; calyxes longer than the disk, loose; leaflets linear-lanceolate, nearly equal; stem hispid." Stems many, five feet high, brown, terminated by large purple violet flowers, growing in a loose panicle, and appear in August; peduncles very short. A native of New-England and Virginia. Cultivated in 1731 by Miller. There is a variety, with numerous panicled branches. 21. *A. undulatus*, waved starwort. "Leaves ferrate, hairy waved, lower cordate; petioles winged, dilated at the base; branchlets virgate; calyxes imbricate; stem hispid." Stems two or three feet high; leaves broad, heart-shaped at bottom; flowers on loose spikes, of a pale blue colour, inclining to white; leaves on the peduncles minute, ovate. A native of North America. Cultivated in 1699, by J. Bobart. 22. *A. grandiflorus*, Catsby's starwort, Mill. fig. t. 282. "Leaves stem-clasping, linear, entire, hispid, ciliate; those of the branches and calyx reflex." Stems many, three or four feet high, stiff, reddish, hairy; leaves of the branches small, lanceolate, rough, about the size of those on common hyssop; branches each terminated by one large blue flower. Mr. Catsby, in 1720, brought this plant from Virginia.

**** *Herbaceous, leaves ferrate, peduncles smooth.*

23. *A. cordifolius*, heart-leaved starwort. "Leaves heart-shaped, acute, finely ferrate, underneath hairy; petioles almost simple; branches panicled; stem rough with hairs." Stem smoothish, much branched at top; root-leaves cordate, shaply ferrate; lower stem leaves ovate, ferrate, with edged petioles; upper spatulate-lanceolate, stem-clasping; ray whitish, with twelve floretules. A native of North America. Cultivated in 1759 by Miller. 24. *A. puniceus*, red-stalked starwort. "Leaves stem-clasping, lanceolate-ferrate, subscabrous; branches panicled; calyxes surpassing the disk; leaflets linear-lanceolate, nearly equal, stem hispid." Stems purple; more than two feet high; flowers forming a corymb, blue, on single peduncles. A native of North America. Cultivated here in 1739. There are two varieties of this species. 25. *A. annuus*, annual starwort, Flor. Dan. 486. "Leaves somewhat hairy, lower ones subovate, ferrate; the upper lanceolate; calyxes hemispheric; leaflets subequal, strigose." Stems about two feet high, terminated by a corymb of white flowers in August; annual. A native of North America. Cultivated here in 1640. 26. *A. vernalis*, vernal starwort. "Root-leaves lanceolate, quite entire, obtuse;

obtuse; stem almost naked; filiform, a little branching; peduncles naked." Stem green, hairy, erect; leaves like those of daisy; floscules, slender, white. A native of Virginia.

* * * * *Herbaceous, leaves ferrate, peduncles leafy.*

27. *A. indicus*, Indian starwort. "Leaves ovate-oblong, ferrate; floral leaves oval-lanceolate, quite entire; branchlets one-flowered." Stem herbaceous, round, striated, branched, two feet high; lower leaves oblong, remotely and acutely ferrate; upper lanceolate, entire, gradually diminishing towards the top; flowers solitary. A native of Japan and China. 28. *A. laevis*, smooth aster. "Leaves stem-clasping, entire, shining; root-leaves subferrate; branches simple, bearing about one flower; calyxes imbricate, peduncles leafy, subdivided; leaflets somewhat wedge-shaped; acute, thickened at the end; stem smooth." Ray blue. A native of North America. Cultivated in 1758 by Miller. 29. *A. mutabilis*, variable starwort. "Leaves almost stem-clasping, lanceolate, ferrate, glossy, drawn to a point below; branchlets virgate; calyxes rather leafy; lax; stem smooth." Leaves of the peduncles and calyx squarrose and recurved; ray a deep purple; disk first yellow, afterwards purple. Cultivated by Miller in 1731. 30. *A. Tradescanti*, Tradescant's starwort. "Leaves lanceolate, ferrate, sessile, smooth; middle branches virgate; calyxes closely imbricate; stem round, smooth." Radical leaves four inches long like those of willow; stems round, smooth, woody, brownish; ray varies from white to purple, consisting of twenty florets. A native of Virginia. Cultivated in 1731 by Miller. There are two varieties, viz. the dwarf and tall starwort. 31. *A. Novi Belgii*, New Holland starwort. "Leaves almost stem-clasping, lanceolate, smooth, but scabrous about the edge, the lower ferrate; branches subdivided; calyxes loosely imbricate, leaflets linear-lanceolate; stem round, smooth." Stem four feet high, having broad leaves at the bottom, diminishing gradually to the top; disk of the corolla yellow; ray pale blue, revolute. It is very like *A. mutabilis*. Its flowers appear in the latter end of August. A native of N. America. Cultivated in 1759 by Miller. 32. *A. tardiflorus*, late-flowering starwort. "Leaves sessile, lanceolate, drawn to a point at the base, ferrate, smooth; calyxes lax, leaflets lanceolate-linear, subequal, smooth." Stems two feet high, scarcely branching, smooth; leaves large, smooth, rather stiff, ferrate at the middle, and having a pubescent streak; flowers like those of the foregoing. It differs from the 31st in having the branches more divaricate, and a knot or joint at the base. A native of N. America, introduced here in 1775 by Mr. Cree. 33. *A. miser*, small white-flowered starwort. "Leaves sessile, lanceolate, subferrate, smooth; calyxes imbricate, leaflets acute; disk equal to the rays." Stem a foot and a half high, thick, green, less panicle than the rest; stem-leaves a little ferrate, nodding, those of the branches lanceolate; ray white, very small, poor, disk small, convex, pale, with dark yellow styles. A native of N. America. Introduced here in 1776 by Monf. Thonin. 34. *A. macrophyllus*, broad-leaved blue starwort. "Leaves ferrate, oblong; the upper ovate, sessile, those on the stem cordate, petioled; upper petioles winged." Peduncles crowded at the top, often trifid. A native of N. America. Cultivated in 1739 by Miller. 35. *A. chinensis*, China aster or starwort. "Leaves ovate, angular, toothed, petioled; calyxes expanding, leafy, terminal." Height from eighteen inches to two feet, putting out long bending branches from top to bottom; leaves next the ground, and at the origin of the branches resemble those of common goosefoot (*chenopodium*); those on the branches are much smaller, and the upper ones narrow

and very entire. The flowers are largest and handsomest of any of this genus. Disk yellow, floscules of the ray broad and long. Dillenius and Miller affirm, that this species came originally to Europe from China; Linnæus doubts of this. Beside the common varieties, white, blue, purple, and red, both single and double, there is now another in the gardens, with variegated blue and white flowers. 36. *A. tataricus*, Tartarian starwort. "Root leaves lanceolate-ovate, ferrate, scabrous; stem few-flowered." Radical leaves large, running into petioles; stem rough, scarcely twice as long as the radical leaves; flowers large, five or eight in number; the peduncle has two alternate slender entire bractes; ray of the corolla blue. A native of Siberia. 37. *A. bispidus*, shaggy starwort. "Lower leaves oblong, crenate, scabrous, stem leaves lanceolate, entire, ciliate, stem scabrous." Stem erect, hispid, branching, a foot high; lower leaves obtuse, remotely notched; flowers terminal, solitary; ray white; down ferruginous. 38. *A. scaber*, rugged starwort. "Leaves oblong, ferrate, scabrous, peduncles panicle." Stem herbaceous, a foot high, at top branched in panicles; leaves alternate, petioled, pointed, above green, rough, with white cilia, underneath pale, veined, smooth; flowers in terminal panicle branchlets. Both the above are natives of Japan.

Species recited by Mr. Miller, &c.

39. *A. glaber*, peach-leaved starwort. "Leaves oblong-lanceolate, acute, ferrate, stem branching, flowers terminal, calyxes linear, erect." Five feet high, bearing large, pale blue flowers. A native of N. America. 40. *A. fruticosus*, late-flowering blue starwort, or Michaelmas daisy. "Leaves oblong, acute, broader at the base, half stem clasping, stem branching, flowers terminal, and for the most part solitary." Stems numerous, three feet high; branches lateral, bearing large pale blue flowers. Brought from Virginia, by Tradescant. 41. *A. præcox*, early starwort. "Leaves oblong, acute, scabrous, sharply toothed, half stem clasping, stem hairy, flowers corymbed, calyxes hairy, erect." Stems a foot and a half high; flowers large, blue, expanding in July. A native of the Alps and Pyrenees. 42. *A. altissimus*, lofty starwort. See puniceus (2) n. 24. 43. *A. ramosissimus*, branching starwort. "Leaves linear-lanceolate, stiff; stem very branching, spreading; flowers placed regularly one above another; peduncles leafy." Stems slender, purplish, about three feet high; branches numerous spreading; flowers small, pale purple, appearing in November. A native of N. America. 44. *A. umbellatus*, umbelled starwort. "Leaves lanceolate, drawn to a point at the base, entire, scabrous about the edge, branches corymbed, fastigate." Stems several feet high, channelled; ray of the flower white. A native of N. America, flowering in July and August. Cultivated by Miller in 1759. 45. *A. nervosus*, three-nerved starwort. "Leaves linear-lanceolate, acute, nerved; stem simple, flowers terminal in a kind of umbel." This much resembles the umbellatus, but the leaves are narrower, whiter on the under side, and have three longitudinal veins. The flowers are also larger and whiter. Sent from Pennsylvania to P. Collinson, esq. who gave it to Miller. 46. *A. paniculatus*, panicle starwort. "Lower leaves ovate, half stem clasping at the base; upper leaves lanceolate, small; stem panicle, branches one-flowered, peduncles leafy." About four feet high; branches erect, forming a loose spike of large blue flowers. A native of N. America. 47. *A. latifolius*. "Leaves linear-lanceolate, smooth, three-nerved, flowers corymbed, terminal." Stems a foot and a half high, terminated by peduncles on every side, each sustaining one pale blue flower. A native of Canada. 48. *A. procumbens*, procumbent starwort. Mill. fig. t. 57. f. 2.

f. 2. "Leaves ovate, toothed; stem procumbent; peduncles naked, axillary, one flowered." Stems round, inclining to the ground, about four or five inches long, destitute of leaves, each supporting one flower of the shape and size of the common daisy, of a whitish purple colour. Discovered by Dr. Houslow, about Vera Cruz in America. Perhaps some of these may not be distinct from the foregoing ones, as there are certainly many species recited by authors which have not yet taken their proper place in the system, and require a very sagacious botanist to arrange them. In Gordon's Catalogue we find the following names not noticed by Linnæus: 1. *A. alienatus*, virgatus, salicifolius, purpureus, aureatus, repens, corymbosus. 49. *A. holosericus*, Forst. "Herbaceous, leaves oblong-lanceolate, ferrate, underneath silver-filky; scapes one-flowered, leafy." A native of New Zealand. 50. *A. coriaceus*, Forst. "Herbaceous, leaves ovate, quite entire, furrowed above, woolly underneath, scapes one-flowered, leafy, woolly." A native of New Zealand.

Species of Aster, from Aiton's Hort. Kew.

51. *A. cymbalaria*, cymbalaria-leaved starwort. "Shrubby, leaves ovate, sinuate, rough, with hairs, calyxes imbricate, hairy." Found at the Cape, by Masson. Introduced here in 1786. It flowers most of the summer. 52. *A. nemoralis*, wood starwort. "Leaves linear-lanceolate, drawn to a point at the base, somewhat scabrous; branches filiform, one-flowered; calyxes lax imbricate, leaflets acute." A foot high, ray of the corolla blue, disk white. It flowers in August. A native of Nova Scotia. Introduced in 1778, by W. Malcolm. 53. *A. paludosus*, marsh starwort. "Leaves linear, stem clasping, entire, smooth, scabrous at the edge; peduncles almost naked, calyxes squarrose." Leaves three or four inches long, remote, ray blue, large, disk yellow. A native of the swamps of Carolina. Introduced by Mr. Fairbairne, in 1784. It puts out flowers in September and October. 54. *A. patens*, spreading, hairy-stalked, starwort. "Leaves oblong, entire, acute, cordate, almost stem-clasping, scabrous, branches spreading, elongated, few-flowered, calyxes imbricate, subsquarrose, stem rough with hairs." Three feet high; branches remote, pubescent; leaves bent obliquely at the base; ray pale blue, disk tawny. A native of Virginia, flowering in September. Introduced about 1773, by G. Aufrere, esq. 55. *A. foliosus*, leafy starwort. "Leaves lanceolate-linear, entire, smooth; those on the branchlets spreading very much; calyxes imbricate, leaflets acute, stem pubescent." A native of N. America. Cultivated by Dr. Sherard in 1732. It flowers in October. 56. *A. multiflorus*, small-leaved starwort. "Leaves linear, entire, smoothish; branches one-ranked; calyxes imbricate, squarrose, scales somewhat leafy, acute; stem pubescent." Stems unequal to support the abundance of its flowers; leaves rough, the veins form rhomboids: scales of the calyx minute, reflex; flowering branches and peduncles covered with leafy scales; ray white, small. A native of North America. Cultivated by Dr. Sherard in 1732. F. October. There is an early and a late flowering variety of this species. 57. *A. salicifolius*, willow-leaved starwort. "Leaves linear-lanceolate, quite entire, smooth; calyx imbricate, lax; stem glossy. Stem five or six feet high, leaflets of the calyx acute, expanding at the end; ray of a bluish flesh-colour. A native of N. America. Cultivated in 1760, by Miller. 58. *A. effusus*, Labrador starwort. "Leaves lanceolate, almost stem-clasping, quite entire, smooth, scabrous about the edge; calyxes lax, leaflets equal." Stem two feet high, hispid; ray blue. A native of N. America. Introduced here in 1776, by Mess. Gordon and Co. F. in July and August. 59. *A. junceus*, slender-stalked starwort. "Leaves lanceolate-

linear, sessile, smooth, the lowest subserrate, those of the branchlets lanceolate; branches virgate; calyxes imbricate; stem smoothish." Four feet high, leaflets of the calyx acute, spreading at the end; ray slightly flesh-coloured; disk elevated, pale yellow. A native of N. America. Cultivated in 1758, by Miller. F. in October. 60. *A. pendulus*, pendulous starwort. "Leaves elliptic-lanceolate, ferrate, smooth, those of the branchlets rather remote; branches very much divaricated, pendulous; stem pubescent." Ray of the flower white; disk yellow, changing to ferruginous. A native of North America. Cultivated in 1758 by Miller. F. October. 61. *A. diffusus*, diffuse starwort. "Leaves elliptic-lanceolate, ferrate, smooth, proportioned; branches spreading; calyxes imbricate; stem pubescent." Ray white. A native of North America. Introduced by Messrs. Kennedy and Lee in 1777. F. September. There is a red and white-flowered variety. 62. *A. divergens*, spreading downy-stalked starwort. "Leaves elliptic-lanceolate, ferrate, smooth; those on the stem linear-lanceolate, elongated; branches spreading; calyxes imbricate; stem pubescent." Above five feet high, weak; calyx cylindrical, with numerous acute leaflets; ray white; shorter than the calyx, disk reddish. A native of North America. Cultivated in 1758 by Miller. F. October. 63. *A. corymbosus*, corymbed starwort. "Leaves cordate, smooth, acuminate, all finely ferrate; petioles simple; branches fastigiate; stem smooth." A native of North America. Cultivated in 1765, by P. Collinson, esq. F. September. 64. *A. spectabilis*, showy starwort. "Leaves lanceolate, somewhat scabrous; the lower ferrate; branches corymbed; calyxes leaflets lax, nearly wedge-shaped, sharpish, squarrose." Two feet high; ray blue. A native of North America. Introduced in 1777, by Dr. Pitcairn. F. August and September. 65. *A. radula*, rough starwort. "Leaves lanceolate, ferrate, acuminate, wrinkled, very scabrous; calyxes imbricate; leaflets lanceolate, obtuse." A native of Nova Scotia. Introduced in 1785 by Dr. Pitcairn. F. September.

Propagation and Culture. The species from the Cape N° 1—5, and N° 51, together with N° 27, 37, and 38, not producing seeds in England, are propagated by cuttings any time during the summer. These should be planted in small pots filled with light earth, and plunged into an old hot-bed; where, if they are shaded from the sun, and gently watered, they will put out roots in six weeks, when they may be placed in the open air; and in about a month afterwards they should be separated, each in a small pot, and filled with light sandy earth. In October they must be removed into the green-house, and placed where they may enjoy as much free air as possible; but be secured from frosts or damps; so that they are much easier preserved in a glass-case, where they will have more light and air than in a green-house; but they must not be placed in a stove, for artificial heat will soon destroy the plants. The North American species, which make at least three-fifths of the genus, together with the Alpine and Italian asters, are easily propagated by parting the roots in autumn; they are most of them hardy, and will thrive in almost any soil and situation; for these reasons, and because they adorn the latter season with the abundance and variety of their specious flowers, they are valuable plants, especially among shrubs, and in large ornamental plantations, properly mixed with golden rods, and other perennial, autumnal, hardy plants. The sorts most cultivated, are the grandiflorus, linifolius, linearifolius, tenuifolius, ericoides, dumosus, ferotinus, alpinus, novæ anglie, and puniceus or altissimus. Some of the species (N° 6, 41, 42,) prefer a shady situation and moist soil. They are apt to spread very much at the

the roots, so as to be troublesome, and the seeds of some are blown about and come up like weeds. The Italian star-wort (9) has not been so much cultivated in England since the great variety of American species has been introduced, though it is by no means inferior to the best of them. It is propagated by parting the roots soon after the plant is out of flower. The roots should not be removed oftener than every third year. Catesby's star-wort (22) not multiplying fast by its roots, may be propagated in plenty by cuttings from the young shoots in May, which, if planted in light earth and shaded from the sun, will flower the same year. When the annual star-wort (25) is once introduced, the seeds will scatter, and the plants come up without care. The China asler (35) being an annual plant, is propagated by seeds, which must be sown in the spring on a warm border, or rather upon a gentle-hot-bed, just to bring up the plants; for they should be enured to the open air as soon as possible; when the plants are three inches high, they should be taken up and planted in a bed of rich earth, at six inches distance every way, observing to shade them from the sun till they have taken new root; and if the season is dry, they must be often refreshed with water. In this bed they may remain a month or five weeks, by which time they will be strong enough to transplant into the borders of the flower garden, where they are designed to remain; or into pots to adorn court-yards, &c. The plants should be taken up carefully with large balls of earth at their roots; after they are planted, and the earth closed about their roots, there should be some water given them to settle the earth. If the ground be rich, these plants will flower in August, and form the greatest ornament in the flower garden in autumn. They ripen in the beginning of October, and should be gathered when they are perfectly dry. Procumbent star-wort (48) being a native of a warm climate, will not live in the open air in England. The seeds must be sown in a hot-bed; and the plants will require a stove to preserve them during the winter. See Martyn's Miller's Dict.

ASTER. See ARCTOTIS, ARNICA, BUPHTHALMUM, CARPESIMUM, CHRYSANTHEMUM, CHRYSOCOMA, CINERARIA, CONYZA, ERIGERON, GORTERIA, INULA, SENECIO, SOLIDAGO, TUSSILAGO.

ASTER, in *Mineralogy*, a denomination given to a species of Samian earth.

ASTER, in *Natural History*, a species of HYDRA in Gmelin's Syst. Nat. This is the *actinia asler* of Ellis, and inhabits the American seas. The stem is thick, fleshy, subcylindrical, smooth, truncated, and radiated with tentacula.

ASTER is also a denomination, in the *Ancient Pharmacy*, given to a kind of medicine, invented by Andromachus, against defluxions, and divers other pains.

ASTERIA is the name of a gem, usually called the cat's eye, or *oculus celi*. It has only two colours, a pale brown and a white, the brown seeming the ground, and the white playing about it, as the fire colour in the opal. It is considerably hard, and will take a fine polish, but is usually worn with its native shape and smoothness.

It is found in the East and West Indies, and in Europe. The island of Borneo affords some very fine ones, but they are usually small; they are very common in the sands of rivers of New Spain: and in Bohemia they are not infrequently found immersed in the same masses of jasper with the OPAL.

ASTERIA is also the name of a figured stone. See STAR-stone.

ASTERIA, in *Ancient Geography*, a small island between

those of Ithaca and Cephalenia. Strabo. This is called *Asteris* by Homer in the *Odyssy*.

ASTERIAS, in *Botany*. See GENTIANA.

ASTERIAS, in *Entomology*, a species of PAPILO (*P. Tr.*), the wings of which are black, with two bands of yellow spot; anal angle fulvous, with a black dot. Fabricius mantissa. Inhabits America.

ASTERIAS, in *Natural History*, a genus of *Terna* in the mollusca tribe, the body of which is depressed, grooved beneath; covered with a coriaceous crust, and marked with tentacula; mouth central, of five valves. These are the stelle marine, star-fish, or sea-stars of most authors; and all inhabitants of the sea; reproduce parts which have been lost by violence; and move either by swimming or crawling. In shape they vary exceedingly, and hence Gmelin has arranged them under different families, as *lonata*, *stellata*, and *radiata*. The species he enumerates are these: nobilis, pulvillus, militaris, luna, papposa, spongiosa, rubens, seposita, eudeca, minuta, glacialis, reticulata, physiana, nodosa, violacea, sanguinolenta, perforata, aranciaca, equestris, laxigata, membranacea, granularis, rosea, patula, ophidaria, senileata, ciliaris, fibroformis, tenella, pectinata, multiradiata, caput meduse, euryale, oligactes, nigra, tricolor, and fragilis; which see respectively.—*A. aculeata*; five rayed; disk orbicular; covered with glabrous prickles. *A. aranciaca*; disk broad; rays somewhat depressed, and prickly along the margins. Inhabits the North and Mediterranean sea. Müll. Gmel. &c.

ASTERIAS, in *Ornithology*, a term synonymous with *astur*, &c.; a name by which some old writers have called the common goshawk, falco palumbarius. Linn. The name *asturis* has been applied by Ray to the same bird.

ASTERIE, in *Entomology*, a species of PAPILO. (*Nymph. Gem.*) Wings dentated, varied with pale yellow, a large bipupillated spot on the posterior pair, above; beneath pale, with three ocellar spots. Fab. &c. Linnæus describes this insect as papilio alis dentatis lutea variis, singulis utriusque ocellis sesquialteris; anteriore pupilla gemina. Syst. Nat. It is figured by Cramer and Kleemann.

ASTERION, in *Astronomy*, one of the CANES VENATICI.

ASTERION, in *Ancient Geography*, a river of Peloponnesus. Paulanias.—Also, a town of Greece, in Præonia. Livy, l. 24. c. 24.—Also, a town of Thessaly, seated on a mountain, called also *Perysia*. Steph. Byz.

ASTERISCOIDES, in *Botany*. See OSMIS.

ASTERISCUS. See ANTHEMIS, BUPHTHALMUM, and SILPHIUM.

ASTERI-SIMILIS. See ERIGERON.

ASTERISK, a character in form of a small star, set over any word or sentence, to make it the more conspicuous, or to refer to the margin, or elsewhere, for a quotation, explanation, or the like.

The word is a diminutive of *αστερις*, a star.

ASTERISM, from *αστερις*, *id.* in *Astronomy*, the same with CONSTELLATION.

ASTERIUS, in *Ancient Geography*, an island on the coast of Ionia, at a distance from the mouth of the Meander; south-east of the promontory of Troglitum, north of that of Posideum, and W. N. W. from the town of Miletus. It was famous for the victory obtained near it by the Greeks, gained on the same day when they triumphed over the same enemies at Plataea.

ASTERIUS Urbanus, in *Biography*, a writer against the Montanists, was either a bishop or presbyter, and lived about the beginning of the third century. Copious extracts of a treatise, which was the substance of his disputations

held at Ancyra in Galatia, are preserved by Eusebius. *Hist. Eccl.* l. v. c. 16, 17. See *Cave Hist. Lit.* t. i. p. 85. *Lardner's Works*, vol. ii. p. 387.

ASTIRIUS, a writer of the Arian sect, in the reign of Constantius, or about the beginning of the fourth century, was a sophist of Cappadocia, and renouncing Gentilism, he embraced Christianity. About the year 304, during the persecution of Maximian, his virtuous resolution failed him, and he offered sacrifices to the Pagan divinities, which prevented his attaining the honour of being a bishop, to which he aspired. But though he was recovered by Lucian, he was attached to Arianism; and whenever he is mentioned by Athanasius, he is called a cunning sophist, and a patron of heresy. Philostorgius, however, represents him as a moderate Arian, having taught, that the Son was in substance like the Father, and a complete likeness of the Father. According to Jerom, he wrote commentaries upon the epistle to the Romans, upon the Gospels, and upon the Psalms, and many other things, "which were much read," he says, "by the men of his party." Some passages of his writings are cited by Athanasius and Eusebius, in which, says Lardner, "there appear an air of piety, and zeal for the Christian religion." *Cave H. L.* t. i. p. 201. *Lardner's Works*, vol. iv. p. 123.

A-STERN, denotes any distance behind a ship; as opposed to A-HEAD.

ASTEROCEPHALUS, in *Botany*. See SCABIOSA.

ASTEROIDES, *bastard star-word*, in *Botany*, See ISULA, EUPHTHALMUM, and CONYZA.

ASTEROIDS, formed of *αστρος*, *star*, and *ειδος*, *form*, and denoting that they resemble fixed stars, in *Astronomy*, a name given by Dr. Herschell to the new planets, or two celestial bodies, *Ceres* and *Pallas*, lately discovered; and which he defines as "celestial bodies, which move in orbits either of little or of considerable eccentricity round the sun, the plane of which may be inclined to the ecliptic in any angle whatsoever. This motion may be direct or retrograde; and they may or may not have considerable atmospheres, very small comas, disks, or nuclei. According to the definitions which he premises, planets are celestial bodies of a considerable size and small eccentricity of orbit, moving in planes that do not deviate many degrees from that of the earth, in a direct course, and in orbits at considerable distances from each other, with atmospheres of considerable extent, but bearing hardly any sensible proportion to their diameters, and having satellites or rings: and comets are very small celestial bodies, moving in directions wholly undetermined and in very eccentric or apparently parabolic orbits, situated in every variety of position, and having very extensive atmospheres. Dr. Herschell having compared the newly discovered stars by the criteria introduced in the above definitions, maintains, that they differ in so many respects from both planets and comets, as to warrant his not referring them to either of these two classes. Our astronomical readers will probably think the difference not sufficient to render this kind of distribution necessary; they will regret, that the author has contributed to introduce, without absolute necessity, a new term in the science of astronomy; and they will perhaps be of opinion, that the new name of "Asteroid," is not the most appropriate and expressive that could have been devised. An asteroid is a body resembling fixed stars; but the two new planets have no one circumstance in common with those distant bodies. If a new name must be found, let them be called by some appellation, which shall, in some degree, be descriptive of, or at least consistent with, their properties. "The invention of a name," says an anonymous writer, "is but a poor

achievement in him who has discovered whole worlds." *Phil. Transf.* for 1802, Part II. p. 213, &c.

ASTEROPE, in *Mythology*, one of the daughters of Atlas, the first of the principal stars that compose the Pleiades. *Ovid. Fall.* iv. 170.

ASTEROPIYTON, in *Natural History*, the name given to a kind of star-fish, which is composed of a great number of cylindric rays, each branching out into several others, so as to represent the branched stalks of a very intricate shrub.

ASTEROPLATYCARPOS, in *Botany*. See ΟΤΗΟΝΝΑ.

ASTEROPODIUM, in *Natural History*, the name given by authors to a kind of extraneous fossil, of an imbricated texture, composed of a number of small convex or concave plates, and serving, when entire, as a base or root to the *asteria*, or star-stone.

It is very plain, that this is the remains of some animal body, probably of the star-fish kind, to which the *asteria* have also once belonged; but our imperfect knowledge in the animal history, has not yet ascertained us of the particular creature; the most probable conjecture is, that it is the Magellanic star-fish, the rays of which nicely and exactly represent some of the most perfect *asteropodia*.

ASTEROPTERUS, in *Botany*. See ISULA, and LEYSERA.

ASTERUSIA, in *Ancient Geography*, a mountain towards the sea, in the southern part of the isle of Crete.—Also, a town situate upon mount Caucasus, founded by a Cretan colony, according to Steph. Byz.

ASTESAN, or *County of Asti*, in *Geography*, a country of Piedmont, in Italy, bounded on the west by the principality of Chieri and Carmagnola, on the north by the Verceilois and the Alexandrin, and on the south by the marquise of Gorzegno; about twenty-five miles long and ten broad.

ASTHÆA, or ASTHALA, in *Ancient Geography*, an island of Asia, on the coast of Gedrosia. Ptolemy.

ASTHAGURA, a town of India, on this side of the Ganges. Ptolemy.

ASTHENIA, in *Medicine*, a term employed to denote bodily debility. It is derived from *α* privative, and *σθενος*, *valour*. In the system of Sauvages, and some other nosological writers, it forms a distinct genus, being classed with syncope, and other similar diseases; but it is commonly used by physicians in a more extended sense, so as to embrace all that vast variety of chronic complaints, in which there is a general languor of the body, from the vital functions and muscular actions not being performed with that degree of energy which is necessary to health. The general therapeutical treatment proper in cases of debility, consists in the employment of tonic medicines, such as the Peruvian bark, bitters, chalybeates, the cold bath, or temperate bath, sea-bathing, country air, a mild nourishing diet, riding on horse-back, &c. It should be remarked, however, that this general tonic plan is not applicable, in its full extent, to all asthenic diseases, some of them being complicated with visceral and other local obstructions and inflammations, which require peculiarities of treatment, as will be duly noticed in the course of our observations under those several heads.

ASTHMA, a shortness of breath; from *ασμα*, or *ασπις*, *spiro*, *anbulo*, *I breathe*, *I pant*.

The disease which bears this name may be defined to be a short and laborious respiration, accompanied with a wheezing noise, generally coming on by fits, and going off by a cough, and spitting up of phlegm. It is not ushered in by fever.

In Sauvages's system it is classed under anhelationes; in Cullen's, under spasmi. The former enumerates no less than eighteen species thereof; the latter only three, viz. *A. spontaneum*, *A. exanthematicum*, and *A. plethoricum*. Another writer has subdivided this disorder into four species. Some of these distinctions are unfounded, and most of them are of little or no utility in practice. By far the greater number of those cases of difficult respiration, which Sauvages has referred to asthma, belong to dyspnoea; a symptom common to various and opposite diseases, and distinguished from asthma by its manner of coming on, by its duration, and by the set of morbid phenomena with which it is associated. Thus the shortness of breath which occurs in pleurisy, peripneumony, consumption, catarrh, dropsy of the chest, &c. is only a concomitant of those diseases, but not the disease itself; and is therefore not asthma, but dyspnoea. The same may be said of those cases which Floyer has enumerated as instances of *continued asthma*.

There is strictly but one idiopathic species of asthma; the *periodic* or *convulsive* asthma (the asthma *astatica* of Cullen; the dry or flatulent asthma of others); the *luminal* asthma, as it is termed, being for the most part a variety thereof.

The periodic or convulsive asthma has been so well described by the celebrated Floyer, who himself laboured under this disease for the space of thirty years, that we shall chiefly take from him the history of its phenomena.

For some hours preceding a fit of asthma, the patient experiences a sense of straightness, a fullness at the pit of the stomach, and is much troubled with flatulency. At the same time there is a heaviness of the head, drowsiness, propensity to yawning, and a discharge of pale urine. If these symptoms come on towards the afternoon, they are followed at night by a tightness and weight across the chest, by oppression of the breath, and some wheezing. There is generally, too, a convulsive cough, with little or no expectoration. In the course of the night, the symptoms become more urgent, the inspirations are made with the utmost labour, the chest and shoulders being lifted up with great violence, and in a convulsive manner. In this distressing state the patient is necessitated to get out of bed, and to remain in an erect posture. Although the expirations are not so difficult as the inspirations, yet they are performed very slowly, and with a wheezing noise. In this stage of the fit, a person can neither speak nor cough. His face appears pale or livid; his hands and feet are cold; and his pulse is generally weak and irregular. He has a great desire for fresh air, and is much oppressed by a close heated room, by dust, smoke, or bad smells; and even by the weight of his clothes upon his chest. After some continuance of the attack, head-ach is superadded to the other symptoms; and the pulse becoming somewhat accelerated, there is a slight degree of feverishness, the necessary consequence of fatigue and irritation. As the fit declines, there is a breaking of wind both upwards and downwards, and frequently a motion to stool. The urine, which before the fit was pale, is now high-coloured, and deposits a sediment. If the attack last but two or three hours after rising out of bed, the straightness of breathing abates, and some phlegm is spit up.

When a short fit happens, it is accompanied only with wind and spitting; with a quickness of the pulse, a disposition to sweat, and a discharge of higher-coloured water in the morning. It is not preceded, as in the former case, by oppression at the pit of the stomach, nor by pale urine, nor by much drowsiness over-night. This is what Floyer calls a *spitting-fit*. It is only a milder form of the other attack.

The duration of an asthmatic paroxysm varies in different individuals, and in the same individual at different times. Sometimes it continues only a few hours, at other times it lasts three or four days. In those cases, very little phlegm is spit up, and that of a dark colour, is spit up for the first two days; on the third or fourth it is coughed up more freely, of a less viscid consistence, and of a better colour. At the end of four or five days, the cough and spitting gradually abate, and the patient remains free from oppression of the breast, until the next return of a fit. The intervals between the attacks are extremely various, sometimes short, sometimes long. The short intervals do not exceed the space of ten, six, or seven days; the longer intervals extend not rarely to fourteen, or fifteen days. The longer the paroxysm, in general, the longer the interval; and vice versa. The late Dr. Heberden has remarked, that some asthmatics experience only four attacks in a year; others only two, viz. in spring and autumn; and some not more than one attack annually, and that every winter. Others only once in two years; and these last, and especially another instance mentioned by him, must be regarded as rare and anomalous cases. The periods of recurrence are much influenced by changes of the atmosphere. Rainy weather, foggy weather, an approach of a fall of snow, a change from frost to thaw, or a change of wind into the east, will often bring on a fit; which, however, may happen from other causes, in every kind of weather. As the fits usually recur, in confirmed asthmatic subjects, once a fortnight, they must often take place on or near the changes of the moon. Hence the asthmatic periods have been supposed to be regulated by the phases of that celestial body. The recurrence of the paroxysms, however, is known to happen at other times; so that it is evident there is no necessary connection between them and the lunar changes. Alterations of the weather, happening at those periods, are (as Floyer has remarked) the probable cause.

Asthma may occur at any age; but, except where there is a mal-conformation of the chest, it seldom attacks in early life. It usually afflicts persons of mature or advanced age. People who follow certain occupations are more liable to it than others; such are millers, madders, stone-cutters, wool-combers, flax-dressers, &c. Many of these instances, however, of short breathing belong rather to dyspnoea, than to asthma. Although the attacks are so severe and distressing for the time, yet in the intervals the patient commonly enjoys a tolerable share of health, and is able to engage in the pursuits of business or pleasure, according to his station in life; nor do they seem, in numerous instances, to have much effect in shortening the natural period of human existence, many asthmatics having been known to live to the age of seventy and upwards. The disease, however, terminates at length in peripneumony, consumption, dropsy, lethargy, or apoplexy.

Œdematous swellings of the legs, ulcers in those parts, the bleeding piles, a fit of the gout, or an eruption on the skin, have suddenly produced, in very desperate cases, a favourable termination of an attack, and have suspended the recurrence of the paroxysms for a great length of time.

Besides the changes of the atmosphere, and certain irritations (such as dust, smoke, &c.) before mentioned, there are other causes which are capable of exciting a fit of asthma; such are errors in diet, violent exercise, long fasting, profuse evacuations, intense study, retro-pulsion of cutaneous eruptions, and of gout, passions of the mind, &c. With regard to the *proximate cause*, Cullen supposed it to consist in a spasmodic contraction of the muscular fibres of the Trachea, preventing the free ingress and egress of the air.

and consequently the due expansion of the lungs. This opinion, however, is not altogether reasonable with the known structure of the bronchia, and has accordingly been controverted by a late writer (Dr. Bruce); who has assigned in its stead, irritation, either from an offending material in the lungs themselves, or from acrimony and disease in the stomach, intestines, and other viscera of the abdomen. There is little doubt, however, that the morbus which he supposes to be the cause, is rather the effect of the morbid action of the lungs. Others have attempted to refer all the phenomena of an asthmatic attack to a spasmodic affection of the diaphragm (Barber, Institut. Medicinæ Practicæ, vol. iv. pars. i. in nota ad fact. coil.), which, according to Floyer's description of his own feelings, seems to be rendered stiff, and tied or drawn up by the mediastinum. The resistance thus opposed to the natural dilatation of the chest, would, it is said, necessarily occasion a vehement and convulsive action of the intercostal and other muscles concerned in respiration. All this, however, is mere conjecture; and it is to be regretted, that dissections have been of very little use towards elucidating this pathological discussion.

Whatever be the proximate cause of asthma, all its symptoms are stamped with the character of spasm and irritation; a circumstance which at once points out the plan of treatment that should be adopted; in regard to which, we are to consider, 1. The remedies which should be resorted to during the fits; and, 2. Those which should be employed during the intervals, to prevent their recurrence.

When a fit comes on, the patient, if recumbent, should be raised up, and kept in a sitting posture. All external pressure from clothes or bandages should be removed from the breast, and fresh air should be admitted into the room; which should be kept cool, and free from smoke, dust, and every sort of disagreeable smell. Should there be much tendency to sickness, an ipecacuanha emetic will be proper; after the operation of which an antispasmodic draught should be given, composed of æther, calomel, and opium, mixed with a sufficient quantity of peppermint water, or cinnamon water. In some cases, a few drops of spirit of ammonia may be added to this draught, which should be repeated every hour, or every second hour, according to the urgency of the symptoms. The strong smelling antispasmodics, such as amber, musk, and asa fetida, should be avoided. From the white oxyd of zinc (calcined zinc), or sulphat of zinc (vitriolated zinc), less benefit has been derived, than the reports of some authors had given reason to expect. The digitalis has been employed with advantage, according to some late accounts, in the paroxysm of convulsive asthma; but it promises to be more generally useful in that species which is termed the *humoural asthma*, under which we shall therefore mention its doses and mode of exhibition. With a view of promoting a diaphoresis, the aqua ammoniæ acetatæ may be given, in conjunction with the antispasmodics above mentioned; but all heating sudorifics will be improper. In some instances, the wine of tartarized antimony may be added with good effect to the antispasmodic medicines. Floyer has recommended the internal use of vinegar; but though it may have afforded relief in some cases, we are persuaded it will disagree with the majority of such patients; and will, indeed, be extremely harmful to hysterical and gouty asthmatics. For these, the absorbent earths, such as magnesia and chalk (with which till a few grains of rhubarb should be joined), will answer much better. While these medicines are given, a blister should be applied between the shoulders, but not upon the sternum, where its weight would incommode the patient. Bleeding is rarely admissible. The diet during the fit should consist of cold toast and water, milk and water in a tepid

state, a cup of strong coffee, &c. Solid animal food and puddings should be withheld; nor should a glass of wine be allowed, except to very infirm and aged asthmatics, or in case of alarming delirium. Even then, a dose of sal volatile drops in water will generally be preferable.

As the fit declines, and a tendency to spitting shews itself, that effect should be promoted by the exhibition of expectorating medicines; such as ipecacuanha, oxymel of squill, and ammoniacum. Of the first of these, not more than two or three grains should be given for a dose, so as to excite, in this stage of the disorder, merely nausea, but not vomiting. The two others should be joined together in the form of a draught or mixture, with or without the addition of æther. Colligens should be prevented by a laxative-clyster, or by other means; but it should be remembered, that much evacuation by the bowels is always hurtful in these cases.

Considering the strong desire expressed by persons labouring under an attack of asthma for fresh air, and that the appearances of the sputum are such as seem to indicate an excess of the carbonaceous principle in the blood, it was natural to suppose much relief might be obtained by the inhalation of oxygen gas. Accordingly this gas mixed with common air in various proportions, has been administered by different practitioners to such patients; but not with the expected success. Other factitious airs have also been tried, such as hydrogen and hydrocarbonate. But if in any case of asthma, these gaseous substances have produced a beneficial effect, it has been too transitory and inconsiderable to entitle them to be ranked among the remedies that may be relied upon for the cure of this disease. The vapour of radical vinegar, or acetic acid (see Duncan's Annals of Medicine, vol. iii.), will be found an equally uncertain auxiliary; and æther-vapour is much better adapted to that condition of the lungs which occurs in consumptions.

When the fit has gone through its course, such remedies should be prescribed as are calculated to prove its return. These should be taken from the class of tonics and stomachics, such as the Peruvian bark, bitters, chalybeates, &c. With these should be joined the temperate bath, or cold bath (in summer and autumn), change of air, and regular exercise of walking, or riding on horseback. The benefit derived from following the plough, as asserted by Baglivi, is to be attributed partly to the country air, but more to the exercise of walking. A dry and pure air, but not that of an elevated situation, is in general best suited to asthmatics; there are, however, frequent exceptions to this observation, some patients having fewer and less violent attacks in the contaminated atmosphere of the metropolis and other large towns than in the country. The bowels should be kept regular, by rhubarb and aloetic aperients. Small doses of calomel may be given with great advantage, in many cases; and especially where the asthmatic affection is connected with a disease of the skin. Whenever the patient's feelings warn him of an approaching attack, he should take an emetic, and after its operation an opiate: and at all times he should encourage a tendency to spitting, by ammoniacum and squill. Issues have been recommended by some practitioners for lessening the frequency and violence of the paroxysms. It is said that king William continued perfectly free from his asthmatic complaint, during the whole of the time that the wound he received on his shoulder, in the battle of the Boyne, kept open and discharged matter.

The diet, during the intervals of the fits, should be carefully attended to. All flatulent vegetables, all sorts of pastry and puddings, all fat and slimy food, and broths, should

be avoided. A moderate quantity of butcher's meat, and poultry, roasted or boiled, will be proper every day, with a small proportion of the more digestible and nutritious vegetables. Strong ale should be wholly forbidden. In some few instances, no harm seems to have arisen from the use of fresh small beer or porter; but in general toast and water will be the most suitable beverage. Wine should be allowed very sparingly. In regulating its quantity, the age, constitution, and habits of the patient should be duly attended to. It does not appear that the smoking of tobacco, which some physicians have recommended, is really beneficial in these complaints.

As this disease occurs so frequently, and is of so obstinate a nature, those who have the misfortune to be afflicted with it necessarily become their own physicians. Hence we have been induced to extend our observations, on this subject, to a greater length than we shall hereafter do (with very few exceptions), on single diseases. But we have yet to add a word or two on the *humoral asthma*. Under this term some physicians have comprehended the anasarca of the lungs; but we understand by it that species or variety of shortness of breath and wheezing, which is accompanied with a constant cough, and expectoration of mucus, and which is distinguished from phtisis and catarrh by being unattended with fever. It is distinguished from a dropy of the chest, by the absence of a numbness of the arms; and (after the cessation of a temporary aggravation of the short-breathing from accidental causes), by the patient being able to bear the horizontal posture. It is the pituitous asthma of some writers. Cullen has referred it to dyspnoea; but it rather belongs to this head, as it generally begins under the form of convulsive asthma; and, like it, is liable to accidental aggravations from changes of the weather, and the other exciting causes before mentioned. In regard to its therapeutical treatment, emetics and expectorants (joined with æther and other antispasmodics); and blisters and issues, are as serviceable here as in the convulsive asthma; but the employment of diuretics is more particularly indicated; such as squill, acetated kal. and the digitalis. Ten or fifteen drops of the tincture of this herb, or one grain, or a grain and a half of the powdered leaves, joined with a fourth part of opium, should be given at a dose, and be repeated twice in twelve or fourteen hours, until the shortness of the breath is relieved by a flow of urine, or until such an effect is produced on the pulse, the head, or the bowels, as shall make it necessary to suspend the use of the medicine. Depositions of seneka or dulcamara (see Practical Synopsis of the Materia Medica, vol. i. p. 152. 232.) may be prescribed in place of the digitalis, where this last shall be found to disagree. The patient should wear flannel next his skin, except during the summer, and should at all times be particularly attentive to keep his feet warm and dry.

Among systematic writers, Willis, Hoffman, and Cullen, should be consulted on this disease; and among the authors of distinct treatises, Floyer on Asthma 1698, Ryan on ditto 1793, and Bree on Disordered Respiration 1800.

ASTI, in *Geography*, a large city of Piedmont, the capital of the county of Asti, situate in a delightful and fertile valley, on the banks of the Tanaro. Few cities in Lombardy exceed it in its palaces and public buildings; and the surrounding country is embellished by the seats of the nobility and gentry. By the extent of its walls, which include the suburbs, it may be supposed to have been formerly well fortified; but those works are now decaying. The cathedral is an elegant structure with a lofty roof, a fine cupola, and good painting in fresco; upon this is an inscription which expresses that it was anciently a temple of

Juno, and converted into a Christian church by a St. Suro, one of Jesus's seventy disciples. It has more than thirty other churches, parochial and conventual. Several remains of antiquity are seen in this place; and it is said to have been a favourite town with Augustus Cæsar and the emperors. It is the see of a bishop, suffragan of the archbishop of Milan; 24 miles east from Turin, and 20 west from Alessandria. N. lat. 44° 50'. E. long. 8° 2'. See ASTA.

ASTI, in *Ant. Geography*, a people of Europe, in Thracia, who possessed the town of Calybe.

ASTICA, or ASTICÆ, a country of Thrace, extending along the Euxine sea, and commencing at a small distance north-west of Constantinople.

ASTIGI, or ASTIGIS, *Ætj.* a town of Spain, in Bætica, upon the Singilis, nearly south of Corduba. This town was a Roman colony, and denominated "Augusta Firma."

ASTIGI JULIENSIS, a town of Spain, situate between the river Bætis and the sea. Pliny.

ASTIPULATOR, in the Roman order, the person by whose consent and leave a nun takes the religious habit. Du Cange.

ASTONISHMENT, denotes a high degree of wonder or surpris: Johnson defines it a confusion of mind from fear or wonder. Dr. Cogges, in his "Philosophical Treatise of the Passion," comely defines high astonishment as the incubus of the mind, which feels nothing at the instant so much as its inability to act.

ASTORCHA, in *Diatryp*, a name by which some authors call the yellow *jacchus*, and others the purple, commonly called the Arabian.

ASTORES ISLAND, in *Geography*, lies north-east from the north point of the island of Madagafcar, in the Indian Ocean. S. lat. 19° 22'. E. long. 53° 20'.

ASTORGA, a city of Spain, in the province of Leon, situate in a plain near the river Tueria. It is a strong place and the see of a bishop, suffragan of Compostella. It was formerly the capital of the Asturias, but is now only the chief place of a marquisate erected here in 1465. It is called "the city of priests," from the number of ecclesiastics belonging to the cathedral; twenty-eight miles nearly west of Leon. N. lat. 42° 33'. W. long. 6° 16'.

ASTRABAD, a town of Persia, and capital of a district of the same name, is situated at the south-eastern extremity of the Caspian sea, near a considerable bay, with a chain of mountains behind. The Russians land at this bay, and then proceed to the capital. The province of Astrabad lies in the north-west part of Persia, having Chorasan on the east, part of Tartary on the north, and Comis and a branch of mount Taurus to the south. The country in general is mountainous, and the soil, except near the banks of the rivers which run through it, sandy and barren. The productions of this province are silk, rice, and cotton, like those of Mazanderan, and its exports and imports nearly similar. The commerce of Astrabad is chiefly with Candabar. This city lies very convenient for a harbour to the eastern districts of Chorasan, Bucharia, Samarcand, and even India. N. lat. 36° 50'. E. long. 54°.

ASTRACAN MOUSE, in *Zoology*, the English name of the *Mus Phœas* of Gmelin, and Zarizyn rat of Pennant. See *MUSCUS MUS*.

ASTRAKIAN, or ASTRACHAN, in *Geography*, a city of the Russian empire, formerly the capital of the kingdom of that name, having a large and commodious harbour, with a dock-yard and spacious quays, situate on an island in the Volga, not far from its outlet into the Caspian, in 46° 22' lat. and 65° 43' long. It contains four monasteries, twenty-

twenty-five Russian churches, and two Armenian, one Roman Catholic monastery with a church, one Lutheran church, several medieties, schools, and seminaries, and two printing houses. The principal suburbs are the Tartarian, the Kazanian, and the Siberian. At Astrakhan are 30 houses of brick, and 3773 of timber, besides the suburbs. The number of inhabitants amount to 18,223, without including the foreigners and periodical residents; taken all together, they may be computed at 70,000, as on account of the fishery alone upwards of 20,000 persons are annually drawn thither. Of this mass the Russians are the most numerous, the remainder being made up of Germans, English, French, Italians, Swedes, Armenians, Georgians, Tartars, Persians, Greeks, Kabardinians, Kalmuks, Indians from Hindostan, &c.

Commerce. 1. By sea to Persia, Khiva, Bekharia, India, &c. exporting either linen, wax, soap, wrought gold, silver, and copper, tin, iron in bars and manufactures, steel, quick-silver, alum, vitriol, sal ammoniac, sugar, tea, yafis, &c. in return for which they import, especially from the Persian harbour Mangishlak, raw silk (annually about 3000 poods), various sorts of silk, half silk, and cotton stuffs, Caucasian felt, raw cotton, sumptuous girdles, otterskins, teagras, woven kaftans, frankincense, mountain honey, lamb-skins, cloths, tobacco, rice, Persian perfume, various sorts of fruits, &c. In the year 1775, these exports amounted in value to 561,327 rubles, the imports to 237,224 rubles, and the duties to 24,308 rubles. 2. Freights to Kilia, Gurief, &c. of crown stores, wine, provisions, and commodities for sale. 3. Land trade to the towns lying on the upper parts of the Volga. 4. A very large barter of commodities within the city in the numerous markets: this is carried on by the foreigners, generally by the Armenians and Indians.

Manufactories. In number there are 175, mostly belonging to Armenians, and are employed in weaving silk, half silk and cotton veils and girdles, broad-striped and plain silks, plain cottons, striped linens, in preparing morocco leather, shagreen, &c.

Other trades. 1. The fishery is of very great importance, and belongs to the citizens, who have established a factory, the profits whereof, from 1762 to 1785, amounted to upwards of a million of rubles. 2. The capture of the porpus on the Caspian is likewise carried on by the citizens of Astrakhan, and is extremely lucrative. 3. The culture of orchards and vineyards gives employment to great multitudes of people. The number of vineyards within the circuit of the city is 135, whereof 21 belong to the crown, and the remainder to private owners. 4. The culture of the silk-worm is carried on partly by the citizens, and partly by the crown. The latter has a large silk manufactory.

ASTRAKHAN, Territory or District of, comprehends two extensive steppes or moors, abounding in saline marshes, and in some parts barren heath. 1. The Astrakhan steppe between the Volga and the Don; and 2. The Kalmuk or Ural steppe between the Volga and the Ural. The greater part, therefore, of this district would be entirely sterile, were it not for the salutary overflowings of the Volga, which, at least on the shores of that river, as also of the Don and the Ural, create as fine meadows and pasture grounds as can any where be seen. As corn, in this district, and even in the parts adjacent to Astrakhan, where much industry is bestowed on the culture of the soil, does not succeed well, the deficiency is supplied from Kazan. On the other hand, the finest sorts of fruit flourish here, partly growing wild and partly cultivated in orchards, such as melons, arbutus or water melons, apples, pears, peaches, apricots, quinces, plumbs, cherries, &c. The mulberry tree grows in great abundance. The vine has been domesticated since the year

1673, when the first vineyards were laid out at Astrakhan, and planted with Persian stocks. They produce the purple as well as the white grape, both of excellent flavour; and the clusters of the latter grow to an uncommon size. The vintage lasts from the end of August to the end of September, in the old style, when the greater part of the clusters are pressed, but likewise a great quantity are packed up fresh, and transported to all parts of the empire. Cotton is cultivated to a considerable degree, and succeeds extremely well. Even the saline meadows or steppes are not entirely barren; on them grow wild in great quantities, various kinds of flowers and herbs, such as pansies, poppies, dandelion, fennel, &c. Among the Volga many sweet woods, the roots whereof yield the most valuable medicines, with which the Astrakhan druggists supply the whole empire; saline herbs, viz. salicornia, caryophyllum, salix, flutice, nitriaria, &c. which are employed in soap boiling.

The breeding of cattle is principally carried on by the Kalmuks and Tartars, who, with their prodigious droves, frequent the pastures along the shores of rivers, and nonadventured the steppes. Here are likewise found whole herds of wild goats (oribetras, antelope falga), hares, rabbits, the biton, caples, beards, partridges, grouse, &c. The fishery is in no part of the empire so productive and profitable as in the Caspian and the rivers that flow into it, the Volga and the Ural. Little account is made of the smaller kinds of fish, such as pike, bachel, fudak, which are caught farther up in the Volga and the Ural, and transported through the whole empire. In the Caspian only the several species of sturgeon are taken, viz. the beluga, the sturgeon, the sterlet, and the fevriuga; after them, however, shads and mullet; the former are not unfrequently of an enormous size. In the year 1765, a beluga was caught in the Ural weighing 2520 pounds, and from which 720 pounds of caviar was obtained. Of all the fish of the Volga, the beluga, the sturgeon, and the white salmon are the most precious. The fishery in the Ural is the principal occupation of the Uralian Kozaks; and no where throughout all Russia is this business so well regulated by immemorial usages as here. The chief kinds of fish taken in this river are the beluga, sturgeon, fevriuga, sterlet, shad, bachel, white salmon, &c. All these fish swim in shoals, and the fevriuga in such incredible multitudes, that, particularly near Gurief, the swarms of them are clearly seen below the surface of the water. The fish are here, as on the Volga, mostly salted down, the roes made into caviar, and the founds into singlafs; but the fish caught in the winter are transported frozen. Beavers are found in the Sunfla, tortoises in the Terek, the Don, the Volga, &c. The Terek and the Kuban likewise yield belugas, sturgeon, and sterlets. The Caspian abounds more in porpuses than any of the other lakes or inland seas. Among the insects of these parts several are venomous, and tarantulas are frequently seen. The hot baths on the banks of the Terek were explored by order of Peter the Great in the year 1717. The principal of them is the St. Peter's bath, consisting of three springs at a considerable distance asunder. Their proper heat is 71° of Reaumur, be the temperature of the atmosphere what it may. The heat of the other sources rises from 41 to 60 degrees of the same thermometer. According to Guldenstedt, they contain sulphur and alkaline salt, no iron, but a considerable portion of calcareous earth. Besides these are several other springs. M. Guldenstedt, in 1771 and 1773, cured forty patients by means of these baths, and since that time the use of them has become very common in the surrounding territory.

The chief employments of the inhabitants are the labours

of the fishery, the curing of the fish, the preparing of caviar and fish-glass, which is extremely well made, particularly at Gurief, and the making of wine. The white wine produced here is almost as white as water, the red only reddish. Both are exceeding light, but well flavoured sweet table wines. They commonly lose their agreeable taste after two years, turning sour, and then they are converted into brandy or vinegar. Great quantities of the grapes are dried and sent through the country, as raisins, or boiled into a syrup. The silkworm employs a great number of hands about the Terek, between Kisliar and Mofdok, near Aitrakhan, &c. likewise in the silk and cotton manufactories in Aitrakhan. In this city also yellow, black, and particularly red Russia leather is fabricated of the greatest beauty and best quality. The shagreen, which is manufactured here mostly by Tartars and Armenians, is a valuable species of leather, not prepared in any other country. The Tartarian soap, which is made at and about Aitrakhan, of pot-ashes and the blubber of the sea-dog, is in great repute, and used in the cloth-manufactories. The chief salt-petre works, about sixty versts above Aitrakhan, are situate on an arm of the Volga, and carried on by the artillery company. They produce such abundance of salt-petre, that, after deducting the stated quantities for the powder-mills, many thousand poods are annually exported from St. Petersburg, on the crown's account.

This is the only government of the empire that has coasts on the Caspian. The grand mart of the Caspian commerce is Aitrakhan. The other Russian ports on this sea are Kisliar and Gurief. The principal part of this commerce is in the hands of the Armenians; next to these are the Russians, then follow the Indians, the Persians, the Truckmenian and Chivintzian Tartars, and lastly the Nogay Tartars belonging to Aitrakhan. The commodities in which this trade consists, have been already mentioned. It was likewise observed, that it is divided into the sea and land commerce; the exports by the former amount at present to about 1,200,000, and the imports to a million rubles: the latter is carried on by way of Kisliar and Mofdok, and amounts to about 300,000 rubles, the imports being about three-fourths of that sum.—The inland trade of this government with the other provinces of the Russian empire is very considerable. Its products having been particularised above, it needs here only to be observed, that in exchange it receives chiefly by the Volga, various kinds of European commodities, the greater part whereof are again exported to Persia, &c.

Aitrakhan is a viceroyalty, and consists: 1. of the former government of that name, which was a Tartarian kingdom till it was conquered by the Russians in the year 1554; 2. of the Caucasian territory; and 3. of the north-eastern division of the Kuban, which for the most part fell to Russia by the peace of 1774, and the border treaty in 1783. It was erected into a viceroyalty in 1785, and has its own governor-general.

The ecclesiastical concerns of the Russians are under the jurisdiction of the archbishop of Aitrakhan and Stavropol. The other religious parties have presidents appointed over them, or manage their own spiritual affairs independently among themselves.

The public expenditure of this government, including the pay of the military, is stated at 1,473,373 rubles.—Moreover, this and the government of Saratof, have assigned them in common 7000 rubles to provide for emergencies with the neighbouring tribes.

Along the Ural, from Uralsk to Gurief, is a line of forts, for securing the borders against the Kirghises, which are garrisoned by Uralian Kozaks, who, in compensation

for their service, have a grant of the free fishery of the Ural. The corps of them, always in readiness to march, consists of 12,000 men.

Along the Kuban and the Terek lines are likewise drawn, and on the Volga, from Aitrakhan upwards, are several foreposts or redoubts.

This considerable district of Tartary formerly bore the name of Kapibak, in honour of the son of a commander, whom his mother brought into the world in the hollow of a tree; it was afterward denominated Nagaiya. The city was anciently called Tmutorakan; but in process of time got the appellation of Adhi-Darchan, which the Russians corruptly pronounce Aitrakhan. Old Aitrakhan was situate eight versts higher up than where the present city stands, and its still scarce still discovers ruins of ancient edifices. At that time it bore the name of Tmutorakan; and Lomonosof positively asserts, that czar Yaroslav Vladimirovitch waged war, in conjunction with his brother Mislaf, against the sovereignty of Tmutorakan, and terminated hostilities by entering into an alliance with him; a circumstance which would prove, on one hand, that the pretensions of Russia upon Aitrakhan are of a much earlier date than the reign of Ivan Vasilievitch, and, on the other hand, authenticates the denomination of Tmutorakan, attributed to it. As to the particular time, however, when this city was transferred to another spot, as well as that when it changed its name, little or no knowledge is at present to be obtained.

The term Adhi-Darchan implies, "A pilgrim of Mecca has granted liberty." Whence it is pretended, that a noble Tartar, on his return from a pilgrimage to Mecca, precisely at the time when the labourers were at work in laying the foundations of the city in its new place, granted liberty to one of his slaves, whether as a sort of favourable omen to the success of the undertaking, or to testify, according to the principles of the Mohammedan religion, his gratitude to heaven for the fortunate issue of his journey: however this may be, it is asserted that the natives seized on the event for giving the city the appellation of Adhi-Darchan, as expressive of their wishes for the perpetual preservation of their liberty. The Russians, however, derive its name from Ahtar and khun, maintaining that it ought to be pronounced Ahtarkhan, as if there had formerly been in that country a king or khan Ahtar or Aitra, of whom, by the way, not the slightest vestige is to be traced in any history.

Aitrakhan then had been in the possession of the Russians long before the time when it submitted afresh to the valour of czar Ivan Vasilievitch. Formal proofs of this fact are found in the archives of the city; where it is related, that its first Russian sovereign was Mislaf Vladimirovitch, and that this prince caused a church to be built of stone at Tmutorakan. It was not till the year 1237, when Bathyus, whom the Tartars call Batai, having ravaged all Russia and invested both shores of the Volga with his Tartars, that the Russians lost the kingdom of Aitrakhan, and were obliged to pass their lives, for a great number of years, in perpetual wars: which lasted till the Greater Tartary received a decisive blow, which was followed by the wars of Kozan, when Ivan Vasilievitch began to raise his head, at length reconquered the kingdom of Aitrakhan, and annexed it to the Russian empire.

ASTREA, from *αστρα*, star, in *Astronomy*, a name which some give to the sign Virgo, by others called Erigone, and sometimes Ius.

ASTREA, in *Mythology*, was the daughter of Asterus and Themis, and regarded as the goddess of justice. She was

was represented as a virgin with an austere but dignified countenance; holding a balance in one hand, and a sword in the other.

The poets feign that Justice quitted heaven to reside on earth, in the golden age; but, growing weary of the iniquities of mankind, she left the earth, and returned to heaven, where she commenced a constellation of stars, and from her orb still looks down on the ways of men. Ovid. Met. lib. i. ver. 147.

ASTRÆUS, in *Ancient Geography*, a river of Greece, in Macedonia.

ASTRÆUS, in *Mythology*, one of the giants or Titans, who made war with Jupiter. He was enamoured of Aurora, and she became the mother of the winds and stars.

ASTRAGAL, ASTRAGALUS, in *Anatomy*, the upper bone of the tarsus, which, by its conjunction with the bones of the leg, forms the ankle-joint. See SKELETON, *description of the bones of the lower extremity*.

Some also apply the name astragalus to the vertebrae of the neck.—Homer, in his *Odyssæy*, uses the term in this sense.

ASTRAGAL, in *Architecture*, from ἀστράγαλος, the heel-bone, also the vertebrae of the neck. It is a small moulding, having a semicircular profile, used in various parts of buildings. But it is more particularly applied to express the moulding which separates the shaft from the capital of a column, and probably represented the rings or hoops that were put round wooden columns, to prevent them from splitting. See ARCHITECTURE, *Plate I*.

In Egyptian architecture we sometimes meet with astragals at the top of the shafts, and sometimes with several between the top and bottom, though frequently there is no moulding between the shaft and capital.

In the earliest examples of Grecian architecture, such as the Doric temples at Corinth, Athens, Sicily, and Paestum, there are no astragals or projecting mouldings separating the shaft from the capital: but instead of these there are grooves, generally three in number, cut into the solid. The original intention of this does not appear to be sufficiently obvious; nor whether it was done for ornament, or to conceal the joint that would otherwise be seen at that place, between the capital and shaft. In the ancient examples of the Ionic order, the astragal is never omitted under the capital. In the oldest specimen of the Corinthian order, that of the monument of Lycerates at Athens, there is no astragal, but there is a sunk space between the shaft and capital, in which probably was inserted a circular moulding, or ring of metal, or other material.

In Roman architecture we always find astragals at the top of the shaft, whether the order employed be of the Doric, Ionic, or Corinthian kind; though sometimes they were made in the form of square fillets or hoops, instead of that of circular rings.

The astragal was frequently, by the ancients, cut into the form of beads of various shapes; and many of the moderns, who have been more licentious in their ornaments, have covered it with leaves and flowers. The proportions of the astragal depend entirely upon its application; so that no rules can be given for it.

ASTRAGAL, in *Gunnery*, is a kind of ring or moulding on a piece of ordnance, at about half a foot distance from the muzzle or mouth; serving as an ornament to the piece, as the former does to a column.

ASTRAGAL Tyles. See TYLE.

ASTRAGALOIDES, in *Botany*. See ASTRAGALUS, and PHACA.

ASTRAGALOMANCY, derived from ἀστράγαλος, an

αστράγαλος, *divination*, a species of divination performed by throwing small pieces, with marks corresponding to the letters of the alphabet; the accidental disposition of which formed the answer required. This kind of divination was practised in a temple of Hercules, at Achaia. Hist. de l'Acad. Inscrit. tom. i. p. 102.

ASTRAGALOTTE, in *Natural History*, a species of fossil alum, thus called from its resembling a talus, or ankle-bone; whence it is also denominated talare.

ASTRAGALUS, in *Botany*, milk-vetch. Lin. gen. 892. Schreb. 1208. Juss. 358. Gærtn. t. 154. *Tragacantha* Tournef. Class. *diadelphica decandria*. Nat. Ord. *papilionaceæ*, or *leguminosæ*. Gen. Char. Cal. perianth one-leaved, tubular, five-toothed, acute; lower toothlets gradually less. Cor. papilionaceous; banner longer than the other petals, reflex on the sides, emarginate, obtuse, straight; wings oblong, shorter than the banner; keel length of the wings, emarginate. Stam. filaments diadelphous, simple, nine-cleft, almost straight; anthers roundish. Pist. germ nearly columnar; style subulate-ascending; stigma obtuse. Per. legume two-celled; cells bent to one side. Seeds, kidney-shaped.

Ess. Gen. Char. legume two-celled, gibbous.

Stems leafy, erect; not prostrate.

Species, 1. *A. alpestris*, fox-tail milk vetch. Mill. fig. 58. "Caulescent; spikes cylindric, subsessile; calyxes and legumes woolly." Stem upright, hairy, about two feet high; leaves pinnate; leaflets ovate, eighteen or twenty pairs; flowers yellow, in close, obtuse, axillary spikes; legumes shut up in woolly calyxes, and have two cells containing three or four square seeds in each. It flowers in June and July. A native of the Alps and Siberia. Cultivated by Miller in 1739. 2. *A. christianus*. "Caulescent, erect; flowers glomerate, subsessile, from all the leafy axillas." Stalks nearly three feet high, broad at bottom, and gradually diminishing upwards; leaves very long, which also diminish upward, and form a sort of pyramid; these are winged, consisting of pairs, of large oval lobes terminated by an odd one; flowers in clusters from the alae of the leaves; they are of a bright yellow, and succeeded by cylindrical pods; seeds yellow, square. It flowers in July. Discovered in the Levant by Tournefort. 3. *A. capitatus*. "Caulescent; heads globular; peduncles very long; leaflets emarginate." Stalks erect: long peduncles from the axils, supporting a head of purple flowers, which appear in July. Discovered in the Levant by Tournefort. 4. *A. pilosus*, pale-flowered milk vetch. "Caulescent, erect, hairy, flowers in spikes; legumes subulate, hairy." Stem more than a foot high, round, hard, branching; leaflets ten or twelve pairs, elliptic, lanceolate, hirsute; flowers on axillary peduncles, about fifteen, yellow; legume nearly cylindric, whitish, silky. A native of the Valais, Siberia, &c. It flowers from June till August. Cultivated by Miller in 1732. 5. *A. sulcatus*, furrowed milk vetch. "Caulescent, erect, smooth, striated, stiff; leaflets linear, lanceolate, acute; legumes three-sided." Stems three feet high, round, smooth, leaflets about nine pairs, with an odd one, smooth, oblong, entire, on very short petioles; peduncles racemed, axillary, supporting many erect pale violet flowers; legumes smooth, acuminate, triangular; seeds brown, round, kidney-shaped. A native of Siberia. Introduced by Dr. Piteairn in 1785. 6. *A. galegiformis*, goat's-rue-leaved milk vetch. "Caulescent, stiff, smooth, flowers in racemes, pendulous; legumes three-sided, mucronate at both ends." Stems more than five feet high; leaflets twelve or fourteen pairs, oval, with an odd one; peduncles axillary, on which are small yellow flowers; legumes smooth, short, pedicelled within the calyx,

with

with two seeds on each side. Cultivated by Miller in 1739. F. June. 7. *A. chinensis*. "Caulescent, stiff, smooth; flowers in racemes, pendulous; legumes ovate, inflated, mucronate at both ends." This much resembles the lail; the legumes however are different, and the flowers of this are variegated. The seeds were sent from China to Sweden in the year 1760. 8. *A. Onobrychis*, purple-spiked milk vetch. "Caulescent, procumbent, diffusid; spikes peduncled, banner twice as long as the wings; leaflets linear." Stems procumbent at the base, streaked, branching; leaves lanceolate, spreading, with twelve pair of lobes; peduncles furrowed, stiff, longer than the leaves; bractes lanceolate; corollas red. The whole plant is sprinkled with white and black villose hairs. Haller describes this plant very differently. A native of Austria. Cultivated here in 1640. It flowers in June and July. 9. *A. uliginosus*, violet-coloured milk vetch, Gmel. Sib. 4. 40. t. 17. "Caulescent, almost upright; flowers in spikes; legumes almost upright, naked, tumid, round-flatted, point reflex." This resembles *A. cicer*, N° 13, except in the legumes; the top of the keel is violet coloured. It was found by Gmelin in the moist meadows of Siberia, and introduced here by Thouin in 1775. 10. *A. carolinianus*, Carolina milk vetch, Dill. Elth. 45. t. 39. f. 45. "Caulescent upright, even; peduncles in spikes; legumes ovate-cylindric, acuminate by the style." Stems three feet high; leaves composed of eighteen or twenty pairs of oval smooth leaflets; flowers of a greenish yellow on axillary peduncles. A native of Carolina. It flowers in July and August. 11. *A. asper*, rough milk vetch, Jacq. Ic. rar. t. 33. "Caulescent, stiff, even, roughish; flowers in spikes on elongated peduncles; legumes oblong." Stems annual, two feet high, round, streaked, leafy, branched; leaves composed of about ten pairs of lanceolate-linear acute leaflets; spikes long, with pale flowers; legume thickening above, acuminate, upright, roughish. It flowers in June. Cultivated at Vienna from seeds sent from Astracan.

** *Stems leafy, diffusid.*

12. *A. canadensis*, woolly milk vetch, Dill. Elt. 46. t. 39. f. 45. "Caulescent, diffuse; legumes subcylindric, mucronate; leaflets almost naked." Stems round, about two feet high; leaflets ten pairs, smooth on both sides, rather glaucous underneath; peduncles axillary, streaked; flowers yellow; legume, oblong, concave, flatted. A native of Virginia and Canada. It flowers in July. Cultivated by Dr. Sherard in 1732. 13. *A. Cicer*, bladdered milk vetch, Jacq. Aufl. 3. 251. "Caulescent, prostrate; legumes subglobular, inflated, mucronate, hairy." Stem eighteen inches, very branching; leaflets twelve or fifteen pairs, oval, obtuse, hispid; peduncles axillary, supporting erect spikes of twenty or thirty pale yellow flowers; legumes completely two-celled, with many seeds. Miller who cultivated this plant in 1739, gives a description of this species, which is somewhat different from the above. 14. *A. microphyllus*, small, round-podded milk vetch. "Caulescent, erect-expanding; leaflets oval; calyxes rather tumid; legumes roundish." Stem a foot high, flexuose, with spreading short branches; leaflets thirteen or fifteen pairs, blunt, sometimes emarginate; peduncles solitary, with horizontal yellow flowers, twice the length of the calyx; legumes inflated, villose. A native of Siberia and Germany, flowering in June. Introduced by Dr. Jacquin. 15. *A. glycyphillus*, sweet milk vetch or wild liquorice, Hudf. With. Smith. Flor. Brit. Eng. Bot. 203. "Caulescent, prostrate; legumes subtriquetrous, bowed; leaves ovate, longer than the peduncles." Stems prostrate, round, flexuose, furrowed, a little hairy; leaflets from four to six pairs, ovate or ellip-

tic; stipules large, ovate, somewhat toothed, peduncles shorter than the leaves, spiked with ten or twenty greenish yellow flowers; calyx bell-shaped, oblique, having the superior segments very short; legumes incurved, triquetrocylindric, smooth, many-seeded. A native of Britain and other parts of Europe. 16. *A. hamifera*, dwarf yellow-flowered milk vetch. "Caulescent, procumbent; legumes subulate, recurved, smooth; leaflets obovate, villose underneath." Root annual, branches striated and trailing on the ground; leaflets about eight pairs; peduncles axillary, terminated with pale yellow flowers in June. A native of Messina and Montpellier. Cultivated here in 1620. 17. *A. contortuplicatus*, wave podded milk vetch. "Caulescent, procumbent; legumes withrid, channelled, villose." An annual, varying greatly in size in different soils. It is a native of Siberia, and was introduced here in 1783, by Thouin. 18. *A. boeticus*, triangular-podded milk vetch. "Caulescent, procumbent, spikes peduncled; legumes prismatic, straight, three-sided, hooked at the top." Annual; branches trailing, near two feet long; leaflets about ten pairs, blunt; peduncles axillary, supporting four or five yellow flowers. It flowers in July. A native of Spain and Portugal. Cultivated by Miller in 1759. 19. *A. Laxmanni*, Jacq. Hort. 3. 22. t. 57. "Caulescent, procumbent; spikes elongated; legumes oblong, three-cornered, marked with a furrow, mucronate, villose." Stems branching, subangular, prostrate, a foot long, produced as are the branches into long rising peduncles, streaked and ending in a close spike; leaflets about twelve pairs, oblong, sessile, entire; bractes setaceous; flowers pale blue. It is a native of Siberia, and flowers in June and July. 20. *A. Stella*. "Caulescent, diffuse; heads peduncled, lateral; legumes straight, subulate, mucronate." Stems spreading, a foot long, striated, hispid with white crowded hairs; branches numerous; leaflets on each side of the midrib nine, ovate, obtuse; stipules ovate, acute; peduncles about the length of the leaves, supporting about fifteen bluish flowers; legumes hairy, grooved on each side, with a reflex point. A native of Montpellier. 21. *A. fuscus*, stary milk vetch. "Caulescent, diffuse; heads subsessile, lateral; legumes subulate, reflected at the point." Annual; stems weak; leaflets ten pairs, hairy; flowers small, axillary, of a copper colour. A native of the south of France. Cultivated by Parkinson, in 1616. 22. *A. austriacus*, Austrian milk vetch, Jacq. Aufl. 2. 56. t. 195. "Caulescent, prostrate; smooth, striated, weak; leaflets sublinear, emarginate; legumes round." From seven inches to a foot high; stipules semioval, entire; leaflets sublinear, emarginate, about eight pairs; peduncles racemed, with bluish flowers. It flowers in May and June. 23. *A. leontinus*, Jac. Ic. rar. 37. "Caulescent, prostrate; legumes ovate, villose; flowers spiked, erect." Stipules short, ovate-lanceolate, half stem-clasping; leaflets ten pairs, oblong-oval, entire, pubescent; branches with a spike of whitish or pale blue flowers; legumes at the top. 24. *A. pentaglottis*. "Caulescent, procumbent; legumes headed, folded back, compressed, converging, crested, with a reflected point." *A. procumbens*, Mill. Dict. n. 18. *A. echinatus*, Murr. Prod. 222. *A. cristatus*, Gouan Illud. 50. Leaflets fifteen, oblong, emarginate, pubescent underneath; petioles hairy; stipules ovate, lanceolate; peduncles axillary, decumbent, hairy, terminating in a head of five purplish flowers; legumes bent in, warted, hooked at the top. Linnæus, Miller, and Murray, have described this species differently. A native of Spain. 25. *A. epiglottis*, heart-podded milk vetch. "Caulescent, procumbent; legumes headed, sessile, nodding, cordate, mucronate, folded back, naked." Annual; it sends out from the root three hairy trailing

branches; leaflets blunt, about twelve pairs; peduncles axillary, naked, terminated by a round head of large deep purple-coloured flowers; legumes rough, and when opened shaped like a heart, ending in a sharp point, and containing three or four seeds. The stem according to Chevalier Murray does not divide, and has hairs closely pressed to it; leaflets six pairs, and not more; corollas purple; Linnæus says white. A native of Provence, Spain, &c. in mountainous woods, flowering in July. Cultivated in 1768, by Miller. 26. *A. hypoglottis*, purple mountain milk vetch. With. 643. Smith Brit. 779. Eng. Bot. 274. *A. arenarius*, Huds. *A. epiglottis*, Dickl. H. Sicc. fasc. 1. "Cauliscent, prostrate, flowers in heads, legumes ovate, channelled on the back, hairy, hooked at the end." Stems flexuose, prostrate, three or four inches high; leaflets of the pinnae numerous, small, ovate, hairy underneath; peduncles scarcely longer than the leaves, headed; bractes very much shorter than the calyxes; flowers variegated with white purple; calyx tubercular, rough hairy black with a little white intermixed; legumes ovate, turgid, hairy. It flowers in June and July. Found in several parts of England, in sandy and chalky pastures. The flowers are sometimes white. 27. *A. sylviacus*, Syrian milk vetch. "Cauliscent, procumbent; heads peduncled, flowers reflected, legumes tomentose, ovate-oblong. A native of Siberia. 28. *A. arenarius*. "Subcaulescent, procumbent, flowers subracemed, erect, leaves tomentose." Stem inclining, six inches high, branched, covered with a nap; leaflets of the pinnae linear-lanceolate, entire, complicate; stipules bifid, scarious, tomentose; peduncles supporting about four blue flowers; legumes sickle-shaped, tomentose, acuminate, channelled. A native of Scania, in loose sand. 29. *A. Glaux*, small milk vetch. "Cauliscent, diffuse; heads peduncled, imbricate, ovate, flowers erect, legumes ovate, callous, inflated." Stems seven inches long, villose towards the top; leaflets twenty or twenty-three, small, ovate-oblong, scattered underneath with white hairs. A native of Spain. Cultivated at the Oxford garden in 1658. 30. *A. sinicus*. Phil. Trans. a. 1764. "Cauliscent, prostrate, umbels peduncled, legumes prismatic, subulate at top." Root annual, stems spreading on the ground; leaflets suborbiculate; flowers purplish, wings white, keel purple. A native of China. 31. *A. alpinus*, Alpine milk vetch, Flor. Dan. t. 51. "Cauliscent, procumbent; flowers pendulous, racemed, legumes acute at both ends, hairy." Stems above a foot high; leaflets hirsute, ovate, often ten pairs; stipules two, ovate, lanceolate, very short, white; flowers in umbels of twelve or fifteen specious white flowers; calyx rough, with black hairs; legume rough, black, inflated, crooked. A native of the mountains of Swisserland and Lapland. Introduced here about the year 1771. 32. *A. Annodytes*. Pallas It. 2. t. 10. "Cauliscent, undershrubby, flowers twin, legumes ovate, twin woolly." Annual. Stems branching, woolly; leaflets from five to eleven, rather oblong, hoary. It grows on the sandy hills of Southern Siberia. 33. *A. trimestris*, Egyptian milk vetch. "Subcaulescent, scapes mostly two-flowered, legumes hooked, subulate, two-keeled." Annual. Stem six or seven inches high, hirsute, reddish. Sometimes a scape appears before the stems; leaflets about eleven pairs, oblong, emarginate; hirsute, entire; stipules fetaceous, hairy; peduncles racemed with three or four spreading, pale-yellow flowers. A native of Egypt, flowering in July. Introduced here before 1777.

*** *Scape naked, without a leafy stem.*

34. *A. verticillaris*. "Leaflets aggregate, semi-verticilled." Leaves pinnate, four or five at each insertion, so as to appear whorled stems. A native of Siberia. 35. *A. montanus*. Jacq. Auk. 2. 164. "Nearly stemless, scapes longer than the

leaf, flowers loosely spiked, erect, legumes ovate, with an inflected point." The whole plant slightly villose; stipules oblong, imbricate, covering the stem; leaflets lanceolate, pointed, rounded at the base, the lower ones shorter and bent down; flowers blue, from eight to ten, according to Haller, but Linneus says they are red and erect. A native of the warmer parts of Europe. 36. *A. vesiculosus*. "Scapes longer than the leaves, flowers loosely spiked, calyxes and legumes inflated, hirsute." Cauliscent, half a foot high; leaflets six pairs, oval, hoary, entire; peduncles firm, furrowed, higher than the whole plant besides, with a head of from five to eight flowers, having the banner purple, wings yellow, keel white. A native of Dauphiné and Siberia. 37. *A. physodes*. "Scapes equal to the leaves, legumes subglobular, inflated, naked." Flowers in a spike, yellow, succeeded by swollen pods, containing several greenish seeds; bractes villose. A native of Siberia, flowering in June. 38. *A. caprinus*. "Scape erect, leaflets ciliate, legumes ovate, tumid, villose." Leaflets from fifteen to twenty pairs, hairy on the edge; peduncles a foot long, spiked, with many pale-yellow flowers; legumes thick, three-sided, mucronate. A native of Barbary and Russia. 39. *A. urdensis*, silky milk vetch. Huds. Lightf. With. Smith. Brit. Eng. Bot. 466. "Stemless, scape erect, longer than the leaves, legumes oblong, inflated, villose, erect." Radical leaves with many pairs of leaflets, firm, naked; stipules scarious; scapes erect, headed, and finally spiked; bractes the length of the calyx, linear-lanceolate; calyx tubular, rough, with black and white hairs; corolla a violet colour; legumes erect, cylindrical, oblong, turgid, beset with black hairs pressed down. It grows on the mountains of Scotland. 40. *A. monstresulanus*, Montpellier milk vetch. "Scapes declining, the length of the leaves, legumes subulate, round, rather bowed, smooth." Scapes procumbent, twice as long as the leaves, leaflets ovate, acute, pubescent, from ten to twenty pairs; scape simple, bearing a raceme of nearly thirty purple flowers; legumes long, slender. A native of the south of France. Introduced in 1776, by Pitcairn. 41. *A. incanus*. "Scapes declining, leaflets tomentose, legumes subulate, rather bowed, hoary, incurved at top." Scapes rough, supporting often twenty flowers; legumes a little bent, turgid. It differs from the 40th in having the leaves rounder and hoary, the legumes almost straight and more turgid. A native of the south of France. 42. *A. campestris*, field milk vetch. "Calyxes and legumes villose, leaflets lanceolate, acute, scape decumbent." Stem none, but procumbent runners half an inch long; leaflets about fifteen pairs, hairy, shining; scape radical, bearing ten or twelve flowers in a loose raceme; bractes lanceolate, shorter than the calyx; corollas a pale-yellow. A native of Swisserland and Germany. Introduced in 1778. 43. *A. depressus*, dwarf white-flowered milk vetch. "Scapes shorter than the leaf, legumes nodding, leaflets submarginate, naked." Branches very short, pressed close to the ground; scapes with nearly seven flowers, small and white; legumes cylindrical, acuminate, the length of the scape, smooth; leaflets numerous, oval, with hoary hairs underneath. Cultivated in 1772, in the Oxford botanic garden. 44. *A. uncatas*. "Scapeless, legumes subulate, hooked, longer than the leaf, leaflets obovate." Annual. Stems trailing; leaflets broader at their end, than at their base, and indented so as to be nearly heart-shaped; flowers white, in axillary loose spikes; legumes sickle-shaped. Discovered about Aleppo, by Dr. Ruffel. 45. *A. ciliatus*, hairy-podded milk vetch, Woodv. Med. Bot. supp. "Scapeless, legumes woolly, leaves villose." Leaflets twenty one to thirty three, ovate, sessile, hairy; flowers numerous, radical, subsessile, yellow; calyx ovate, swelling, white with down, legumes oval, beset with fine hairs,

pointed

pointed at both ends. A native of Hungary. Since the year 1786, this plant has been much celebrated as a remedy in syphilitic complaints. Its success in curing old venereal affections was experienced by Quarin, in the general hospital at Vienna, and the efficacy of this plant was afterwards acknowledged over all Germany. Its root is employed in decoction, in the proportion of half an ounce, to a pint of water, and taken warm night and morning.

Stems woody.

46. *A. tragacanth*, Cmel. Sib. 4. 52. n. 67. "Nearly stemless; flowers radical, numerous, subsessile." It has no stem or scape, but has branches from the root, spreading on the ground, with small villose-pinnate leaves; calyxes hirsute, with black teeth; corollas yellow; legumes roundish, smooth. A native of Switzerland, Siberia, and Armenia. 47. *A. Tragacantha*, goat's thorn. Woodv. Med. Bot. 2. t. 98. "Trunk arborefcnt; petioles becoming spinefcnt." Stems a foot long, leafy, branching; leaflets about ten pairs, small, ovate; bractes ovate, lanceolate; flowers erect, four or five in a cluster, having a purple keel, and a yellowish white banner and wings. A native of the sea-shore near Marfeilles, of Switzerland, mount Aetna, Olympus, &c. Cultivated here in 1540. Miller makes four sorts of tragacantha. From this species is gathered the gum tragacanth used for various purposes, as well as an article in the materia medica. It forces its way through the crevices of the bark to which it adheres and concretes. This gum differs from all others, in giving a thick confistence to a much greater quantity of water, which it slowly imbibes, and but imperfectly dissolves. It is used as a demulcent, and peculiarly well adapted for the formation of troches.

Other species.

48. *A. fatidus*, Villar's Dauph. 3. t. 43. f. 1. "Stemless; leaves prostrate, viscid, sharply linear; scape erect, with few flowers." Leaflets greenish, yellow, subhirsute, viscid, about twenty pairs, much less than those of the campeltris, which it much resembles; but in this the legumes are more inflated, and put forth a greater number of heads of yellow flowers. A native of Dauphiné, also of mount Cenis, and other high Alps. 49. *A. Halleri*. "Scapes leafless; leaves ovate-lanceolate, smooth; legumes inflated, hirsute, erect." This also approaches to the campeltris, but differs in the bractes, in the smoothness of the leaves, in having a longer flower, white, and not a violet-coloured keel. A native of the mountains of the Valais and Piedmont. 50. *A. quinquefolia*, Allion. Ped. t. 19. f. 2. "Stemless, hirsute; scapes longer than the leaves; legumes inflated, ovate, in heads." This has the habit of anthyllis vulneraria. The corolla is but little extended beyond the calyx; the keel and wings of a dusky-colour; the banner of a pale yellow, emarginate; legumes short, rather lispid, crooked at the style. A native of mount Cenis. 51. *A. tenuiflora*, upright milk-vetch. "Caulifcent, erect; spikes peduncled; banner twice as long as the wings; leaflets linear." Leaflets from eleven to thirteen; peduncles long, straight, obtusely triangular. It resembles *A. onobrychis* so as to be thought a variety, but differs in having rather tomentose leaflets, larger flowers, and solitary stipules. A native of Siberia. Introduced here by Pallas, in 1780. 52. *A. virgata*, green-flowered milk-vetch. "Caulifcent, erect; legumes bent back; peduncles many-flowered, longer than the leaf; leaflets lanceolate, acute." A native of Siberia, and introduced by P. S. Pallas, in 1781. 53. *A. Garbancillo*, Cavan. Hist. n. 93. t. 84. "Stem slender, upright; pinnules ovate-oblong, somewhat tomentose; peduncles naked, elongated." Stem a foot and a half high, covered with a very short white nap; leaflets numerous, ovate-oblong, one-nerved, subtomentose; stipules stem-clasping,

cowled, bifid at the tip; peduncles naked, elongated; axillary, ending in spikes of pale violet-coloured flowers. A native of Peru. It flowered in the royal garden, Madrid. 54. *A. lispida*, Billardiere. Ic. Sp. t. 1. "Caulifcent, procumbent; leaflets and legumes ovate, lispid; corolla shorter than the calyx." Stem herbaceous, procumbent, hairy, six inches high; leaflets ovate-oblong, lispid, with appressed rigid hairs, tubercled at the base; flowers in spikes, yellow, with lanceolate lispid bractes; legume ovate-oblong, compressed, a little lispid; seeds kidney-shaped. 55. *A. emarginata*, Billard. l. c. "Almost roundish, three or four inches high; heads globose; legumes woody." Leaflets three or four, ovate-oblong, emarginate, tomentose; stipules ovate, lanceolate, shrivelling; flowers in a globose head, purplish, with lanceolate hairy bractes; legume subovate, acute, compressed at top, wrapped in fibrous wool. 56. *A. lanata*, Billard. l. c. "Stemless, with a naked trunk, the length of the leaves; legumes in close spikes, woody, half-ovate, three-sided, subulate; leaves villose." Leaves radical; leaflets generally from eleven to twenty-three, ovate, tomentose, sessile; flowers yellow, on a close spike, with dissimilar hairy bractes. This and the two preceding species are natives of mount Libanus. 57. *A. leucophaea*, Lin. Trans. t. 252. "Caulifcent, procumbent; legumes subcylindric, straight, smooth; leaflets obovate, villose underneath." Allied to *A. hamosus*; but differs in having rounder leaves, more flowers on the spike, and especially in having straight pods, which are very short. Native country unknown. Cultivated in the Chelsea garden. 58. *A. alba*, L'Herit. Stirp. nov. 6. 167. "Sub-caulifcent, prostrate; scapes twice as long as the leaf; legumes gaping; leaves pectinate, right angled." *A. hians*, Jacq. Ic. t. 153. Branches short, round; twigs villose; leaves six inches long; leaflets fifteen to twenty pairs, gradually smaller at the top, lanceolate, entire, acute, concave, villose, hirsute beneath; scapes radical, solitary, naked, terminated in spikes crowded with purple flowers; bractes linear, acute, under each flower; legumes oblong, turgid, having a groove on each side, villose, one-celled, one-valved. A native of the loftiest mountains of Siberia. 59. *A. unifolius*, L'Herit. Stirp. nov. 6. 168. "Suffruticose, procumbent; stipules solitary, stem-clasping, opposite to the leaves, bifid." A native of Peru, where it was found by Dombey. 60. *A. varius*, L'Herit. l. c. 6. 169. "Caulifcent, suffruticose, upright; flowers in loose spikes; legumes linear; stipules fuliginose downward." A low little shrub, about a cubit in height; leaflets six or seven pairs, linear or narrow-lanceolate, sharp at both ends; stipules half stem-clasping, two-parted, acute, spreading, and rolled back; spikes axillary, solitary, on peduncles longer than the leaves; flowers subsessile, purple, with linear acute villose bractes; legume linear, round, villose. A native of Siberia. 61. *A. umbellata*, L'Herit. l. c. 6. 170. "Suffruticose, prostrate, leaves hairy; petioles spinefcnt; calyxes awed." It differs from the tragacantha in having green leaves, and being smaller; the petioles scarcely spinefcnt, and not very firm; the flowers purple; the calyxes teeth having long awes. A native of Switzerland and Provence. 62. *A. paghleri*, L'Herit. l. c. 6. 171. "Large, oriental, &c. Tourn. Cor. 30. Poesch. It. 2. 188. t. 88. "Slender, procumbent; leaves stem-clasping, tomentose; petioles and leaves pungent and smooth." This is remarkable for the heads or balls of flowers, which are purple. A native of the Levant. 63. *A. alba*, L'Herit. l. c. T. critica, Re. Tourn. Cor. 29. "The leaves are minute; the flowers small, white, with a purple line on the banner; peduncles axillary, short, two-flowered." A native of Crete or Candia.

Propagation and Culture. All the species may be raised

from feeds. These should be sown in April on an open border of light earth; the annual sorts where they are to remain; the perennials to be transplanted to the places for which they are destined. They are in general hardy, and require no other care than to draw the plants where they come up too thick, leaving them a foot and a half or two feet asunder, and to keep them clear from weeds. Observe only that some (as n. 26. 35. 37.) require a shady situation and strong soil; others (as n. 6. 39.) an open situation and dry soil: n. 2. & 33. must be planted in a warm border: 3. 7. 10. 12. 30. must be raised on a moderate hot-bed, in the spring; and when the plants are fit to be removed, they should be each put into a small pot, filled with light earth, and plunged again into the hot-bed, shading them from the sun, until they have taken root; after which they should have free air admitted to them daily, in proportion to the warmth of the season, and should be frequently, but gently, watered. In May, they should be removed to a sheltered situation, and remain till October, when they ought to be placed under a common frame. In the spring they may be turned out of the pots, and planted in a warm border, where they will flower, and sometimes produce feeds. If the winter prove severe, a little old tan should be laid over the roots. The tragacanth plants, when they are large enough, should be planted into pots, and placed in the shade till they have taken root; after which they are to be removed into an open situation, where they may remain to the end of October, and then placed under a common frame, well secured from the frost. Some of these plants may be set on a warm dry border. These plants may also be increased by slips, which, for want of feeds, is the method commonly used here. The best time for doing this is in April, just as the plants begin to shoot, at which time the tender branches should be slipped off, and the lower part be divested of decayed leaves; then they should be planted in a temperate hot-bed, which must be covered with mats to screen them from the heat of the sun by day, and the cold by night. These slips should be frequently gently watered, until they have taken root; after which they may be exposed to the open air; and, in very dry weather, refreshed with water. On this bed they may remain until the following spring, covering them with mats in very severe weather. In April they may be transplanted either into pots, filled with light sandy earth; or into warm borders, where, if the soil be dry, gravelly, or poor, they will endure almost the severest cold of our climate: but if they are planted in a rich soil, they often decay in winter. See Martyn's Miller's Dict.

ASTRAGALUS. See ANTHYLUS, BISERPULA, CROTALARIA, GLYCINE, HEDYSARUM, INDIGOFERA, OROZUS, PHACA.

ASTRAL, from *astron*, of the Greek *αστρον*, star, something belonging to the stars, or depending on the stars.

ASTRAL, or sidereal year. See YEAR.

ASTRANTIA, in Botany (from *αστρον*, astrum, and *ανθος*, obvium, Lin.), mallow-wort. Lin. gen. 327. Schreb. 459. Gertn. 20. Class, *pentandria digynia*. Nat. Order of *umbelliferae*. Gen. Char. Cal. umbel universal, with very few rays (often three); partial, with very numerous ones; involucre universal, with leaflets doubled to the ray; partial, with leaflets about twenty, lanceolate, spreading, equal, coloured, longer than the umbellule; perianth proper, five-toothed, acute, erect, permanent. Cor. universal, uniform; foscules of the ray abortive; proper, with petals five, erect, inf x, bifid. Stam. filaments five, simple, the length of the corollule; anthers simple. Pist. germ oblong, inferior; styles two, erect, filiform; stigmas simple, spreading. Per. fruit ovate, obtuse, crowned, striated, bipartite. Seeds, two,

ovate-oblong, covered with the crust of the pericarp, wrinkled.

Ess. Gen. Char. Partial involucre lanceolate, spreading, equal, longer, coloured; flowers very many, abortive.

Species, 1. *A. major*, great mallow-wort, (β) *A. nigra* minor. "Leaves five-lobed; lobes trifid." Stem eighteen inches high, little branched; leaves shining, petioled, deeply five-cleft, lobes trifid, and sharply serrate; leaves of the involucre veined; all the flowers are peduncled, and the peduncles are shorter than the involucre; the umbels are large, and the calyxes awned; the involucre is either purple or white; hence Miller, following Pournetfort, has made of this two species. A native of the south of Europe, flowering in August. Cultivated here by Gerard. 2. *A. carnio-lica*. Jacq. Ault. 5. 31. "Leaves five or seven-lobed, simple or bifid." The whole plant is smooth. Stem round, erect, slender, from six to twelve inches high, with only one leaf on it; it is divided at top into striated branches, in the form of an umbel; number of the umbels very variable; bractes small, ovate, concave, blunt, pale; leaflets of the universal involucre sessile, acute, entire, or divided into two or three lobes; leaflets of the partial from six to twelve, oblong, lanceolate, entire; male and female florets irregularly mixed; the former on longer peduncles; petals white, appearing heart-shaped, by being bent in at the tip. A native of Carniola, flowering in July and August. 3. *A. minor*, little or Alpine mallow-wort. "Leaves digitate, serrate." It seldom attains a foot in height. Petioles four inches long; leaves divided into eight segments, deeply serrate; universal involucre composed of several very narrow leaflets; peduncles of the partial umbels very large, slender towards the top, often dividing into three, each having a small umbel, with small white involucre. A native of the Alpine vallies of Switzerland. Cultivated by Miller. 4. *A. ciliaris*. "Leaves lanceolate, serrate-ciliate." A foot high, rusty, erect, streaked, divided at top into a few flowering branches; radical leaves petioled; stem-leaves four to six, sessile; half stem clasping; umbel elongated, three-rayed; umbellules many rayed, very short; involucre two or three-leaved, resembling the leaves; involucre ten, leaves broad-lanceolate, acute, coloured. A native of the cape of Good Hope. 5. *A. Epipactis*. Jacq. Ault. 5. 32. App. t. 11. "Leaves five-parted, obtuse, serrate." Root black on the outside, producing one leaf and one scape; leaf shorter than the scape, three-parted, on a triangular petiole; scape smooth, angular, naked, one-flowered; involucre five-leaved; flowers in a head, yellow. A native of Idria, Gorizia, and Hungary.

Propagation and Culture. These plants, except the fourth, are very hardy, and may be propagated either by sowing their seeds, or by parting their roots. If from seeds, they should be sown in autumn, on a shady border, and at Michaelmas they should be transplanted where they are to remain, observing to give them a moist and shady situation. Every third or fourth year they ought to be taken up at the end of October, and their roots parted and planted again. The fourth requires the protection of a dry stove in winter.

ASTRARII, in *Middle Age Writers*, the same with *mansonarii*, those who live in the house or family, at the time, for instance, when a person dies. Du-Cange.

These are also denominated *astro additi*, q. d. tied to the hearth.

ASTRARIUS *Heres*; is used in our *Old Writers*, where the ancestor, by conveyance, hath set his heir apparent, and his family, in a house, in his life-time.

Spelman carries the import of the word farther, as if it denoted

denoted an heir to whom the inheritance was given by his predecessor in his own life, by a writing in form.

The word is formed from *ajbre*, an ancient French term for the hearth of a chimney.

ASTRASSUS, in *Ancient Geography*, a town of India, on this side of the Ganges. Ptolemy.

ASTRATA, an island of the Arabian gulf, on the coast of Ethiopia. Ptolemy.

ASTREA, in *Entomology*, a species of PHALÆNA (*Noctua*), of a brown colour both above and beneath; disk transparent; and thorax snowy-white, dotted with black. This insect inhabits New Holland. Fabricius, &c.

ASTRICTION, from *ajtringo*, I bind, in *Medicine*, a term which, when it refers to the intestinal canal, denotes costiveness; when it refers to the skin, denotes a want of perspiration. It is seldom used by modern physicians.

ASTRICTOR *Toga*. See *Toga*.

ASTRILD, in *Ornithology*, a species of LOXIA that inhabits the Canary islands and various other parts of America and Africa. It is rather larger than the common wren, of a brown colour, undulated with blackish; bill, orbits of the eye, and breast scarlet. Gmel. &c. This is *fringilla unilata*, Pall. *Senegallus striatus*, Briff. *Ie Senegali rayé*, Buff. *Wax-bill* of Edwards, and *wax-bill grosbeak* of Latham.

Individuals of this species vary much in colour, and there are in particular two varieties that deserve attention; namely, the red-rumped grosbeak, and white-rumped grosbeak, (♂) *Senegallus pectore exalbido, uropygii fascia rubra*; and (♀) *Senegallus corpore subtus ex roseo albo* of Gmelin. Both of these are about the size of the former; the red-rumped kind has the breast and belly of a dirty white, and, besides the upper tail coverts being crimson, has a bar of the same colour across the vent. In some specimens, the under parts incline to yellow; the sides of the rump, and wing coverts spotted with white; and the bill bordered with black; one of this kind was brought by Sonnerat from the isle of France. Buffon calls the red-rumped variety le feveran, and moineau du Senegal. The white-rumped kind also inhabits Senegal; the throat and sides of the neck are bluish white; the rest of the underparts and rump white, tinged with rose colour; top of the head, neck, and back blue, palest on the head; and legs red. The colour of the legs distinctly marks this variety from the former, for in the first-mentioned kind they are brown, and in the second dark grey.

ASTRINGENS, *crocus maris*. See *Crocus*.

ASTRINGENTS, in the *Materia Medica*. This term is applied to a class of substances which, according to Dr. Cullen's accurate definition, when applied to the human body, "produce a contraction and condensation in the soft solids, and thereby increase their density and force of cohesion. If applied to longitudinal fibres, the contraction is made in the length of these; but if applied to circular fibres, they diminish the diameters of the vessels or cavities which the vessels surround."

Astringency in any substance is most accurately detected by the taste, by corrugating the tongue, and giving a sensation of harshness and roughness to the palate.

Astringents appear to act nearly in a similar manner on the simple or dead animal fibre as on the living solid, in either case thickening and hardening; when applied to the living solid, they produce increase of tone and strength, restrain inordinate actions, and check excessive discharges from any of the vessels or cavities; and to the dead fibre occasion that density, toughness, imperviousness to water in a greater or less degree, and insusceptibility to the common causes of putrefaction, in which consists the process of TANNING, or preparation of leather.

No single chemical test (except the direct experiment on animal fibre) will always detect the property of astringency, as this is found to reside in many different classes of substances. Acids, especially the stronger mineral, are powerfully astringent; as also are several metallic salts, such as the solutions of iron, zinc, copper, and lead in various acids; likewise a few earthy salts, such as alum and selenite, or sulphate of lime; also alcohol, or any kind of ardent spirit, the operation of which in hardening animal fibre is very remarkable. But the most numerous class of astringents are those taken from the vegetable kingdom, especially from the barks of several trees, and some of the natural gum resins. Modern chemistry has ascertained some highly important facts concerning the nature of the vegetable astringents, which should be noticed here in order to correct some erroneous opinions that are very prevalent in all medical writers. The property of striking an inky blackness with solutions of iron, has been constantly given as one of the surest tests of astringency in vegetables. Of this, the familiar instance of making common writing ink with an infusion of the oak gall-nut, is known to every one; but it should be remembered, that this property is owing to a peculiar acid, the GALLIC, and not to the true astringent principle, in modern chemical language called TANNIN, to which the acid of galls here happens to be united. Of this we shall treat fully, under these important articles; but the pharmaceutical chemist should now be aware, that the test of blackness with iron is by no means a sure indication of astringency, but only a probable presumption of its presence. Thus one of the strongest of the known astringents, the terra japonica, or catechu, will not give the smallest degree of blackness to solutions of iron, as it contains only tannin, the true astringent principle; and not the Gallic acid. The proper test for this substance, besides the effect on the tongue, is a solution of any kind of animal jelly; of which more hereafter.

When the true astringent principle is naturally mixed with any acid, the taste of *acridness* is given, in which the corrugation of the papilla of the tongue is most peculiarly remarkable. The juices of several unripe fruits, the gall-nut, and many of those astringents that contain much gallic acid, and give a strong black with iron, are examples of this.

Tannin is itself somewhat bitter, and appears to be also united, in many cases, with some principle which gives it more than its usual bitterness. This is probably the case with most of the astringent bitters employed in medicine, and it is in this combination, that astringents prove so eminently tonic. In some instances the tannin is united with a sweet substance, as in the examples of the catechu, and the lignum campechense.

Astringents when employed externally to stop hæmorrhage, are then termed STYPTICS.

Astringents are very largely used in medicine, and with the highest advantage. The cases where they are most unequivocally beneficial, and in which the operation may be ascribed purely to the astringent property, are diarrheas, or ferrous evacuations from the intestinal canal. They have also long been thought of use in restraining discharges of different kinds, even when not directly applied to the part, so that astringent medicines are frequently given by the stomach, in order to check profuse fluor albus, gleet, and sometimes hæmoptysis. Their operation in such cases, however, is much more questionable, and the benefit here produced, perhaps, may with more propriety be ascribed to a tonic or stimulant property.

ASTROBII, in *Antient Geography*, a people of Asia, near the Indus. Arrian.

ASTROBOLISM.

ASTROBOLISM, derived from *αστρον*, *star*, and *βολη*, *I strike*, the same with *sphaeculus*; though properly applied to plants which are destroyed in the dog-days, as if blasted by that star.

ASTRODICTICUM, an astronomical instrument invented by M. Weighelius, by means of which many persons shall be able at the same time to behold the same star.

ASTROGNOSIA, from *αστρον*, *star*, and *γνωσις*, *I know*; the art of knowing the fixed stars, their names, ranks, situations in the constellations, and the like.

ASTROITES, in *Natural History*, a species of *MADRIPORA* found in the seas of South America. The stars are numerous, immersed, and have the disk concavo-cylindrical. This is *madrepora (radans) aggregata folida, stellis confertis convexiusculis, centri poro radiante, striis scabriusculis* of Pallas; and *altrea aperturis cavernarum minimis massa inaequali* of Brown's Nat. Hist. Jam. It is found in large masses; and is of a whitish colour. The interstices are porous.

ASTROLABE, derived from *αστρον*, *star*, and *λαβη*, *I take*, alluding to its use in observing the stars; and by the Arabs called *Azhar-lab*, formed by corruption from the common Greek name; was originally used for a system or assemblage of the several circles of the sphere, in their proper order and situation with respect to each other; and the ancient astrolabes appear to have been much the same with our armillary spheres.

The first and most celebrated of this kind was that of Hipparchus, which he made at Alexandria, the capital of Egypt, and lodged in a secure place, where it served for divers astronomical operations. Ptolemy made the same use of it; but as the instrument had several inconveniences, he contrived to change its figure, though perfectly natural, and agreeable to the doctrine of the sphere; and to reduce the whole astrolabe upon a plain surface, to which he gave the denomination of the planisphere.—Hence

ASTROLABE is used among the moderns for a planisphere; or a stereographic projection of the circles of the sphere upon the plane of some great circle thereof.

The usual planes of projection are that of the equinoctial, the eye being supposed in the pole of the world; that of the meridian, the eye being supposed in the point of intersection of the equinoctial and horizon; and that of the horizon.

Stoffler, Gemma Frisius, and Clavius, have treated at large of the astrolabe.—For a farther account of the nature and kinds thereof, see PLANISPHERE.

ASTROLABE, or *Sun Astrolabe*, more particularly denotes an instrument chiefly used for taking the altitude of the pole, the sun, or stars, at sea.

The common astrolabe, represented *PLATE NAVIGATION, fig. 1.* consists of a large brass ring about fifteen inches in diameter, whose limb, or a convenient part thereof, is divided into degrees and minutes; fitted with a moveable index or label, which turns upon the centre, and carries two sights.—At the zenith is a ring A, to hang it by, in time of observation.

To use the astrolabe, turn it so to the sun as that the rays may pass freely through both the sights F and G, in which case the edge of the label cuts the altitude in the divided limb.

The astrolabe, though now disused, is esteemed by many equal to any of the other instruments used for taking the altitude at sea; especially between the tropics, when the sun comes near the zenith.—There are a great many other uses of the astrolabe; on which Clavius, Henricus, &c. have written entire volumes.

ASTROLOGICAL *Fate*. See FATE.

ASTROLOGUE, in *Ichthyology*, the French name of the species of *URASCOPIUS* called *japonicus* by Gmelin, from its inhabiting the seas about Japan.

ASTROLOGY, the art of foretelling future events, from the aspect, positions, and influences of the heavenly bodies.

The word is compounded of *αστρον*, *star*, and *λογος*, *discourse*; whence, in the literal sense of the term, astrology should signify no more than the doctrine or science of the stars; which, indeed, was its original acceptation, and formed the ancient astrology; though, in course of time, an alteration has arisen; that which the ancients called astrology, being afterwards termed ASTRONOMY.

Astrology may be divided into two branches, *natural* and *judiciary*.

To the former belongs the predicting of natural effects; as, the changes of weather, winds, storms, hurricanes, thunder, floods, earthquakes, &c. This art properly belongs to *PHYSIOLOGY*, or *natural philosophy*; and is only to be deduced *à posteriori*, from phenomena and observations. Its foundation and merits the reader may gather from what we have said under AIR, ATMOSPHERE, and WEATHER. For this astrology, Mr. Boyle makes an apology, in his *History of the Air*.

ASTROLOGY, *Judiciary* or *Judicial*, which is what we commonly call *simple astrology*, is that which pretends to foretell moral events; i. e. such as have a dependence on the free will and agency of man; as if they were directed by the stars. This art, which owed its origin to the practice of knavery or credulity, and which the celebrated Mr. Briggs denominated a mere system of groundless conceits (*Ward's Lives*, p. 126.), is now universally exploded by the intelligent part of mankind. There was a time, however, when this science, frivolous and ridiculous as it may be justly denominated, furnished very powerful incentives to the study of astronomy. Without some knowledge of the motions and aspects of the stars, the astrologers would have been unable to draw their horoscopes, and of course to read the fates of men in the face of the heavens. Accordingly, Kepler observes (*Præf. ad Rudolph. Tab. p. 4.*), “that astrology is the foolish daughter of a wife mother, and that, for 100 years past, this wife mother could not have lived without the help of her foolish daughter.” “I repent bitterly,” says Kepler, “having so much decried astrology;” and he conceived that the study of astronomy had been greatly neglected, ever since men ceased to apply themselves to astrology. Of the origin of this absurd and unfounded science, whatever might be the relative elevation in which it was held, it is not difficult to give a plausible account. When heroes, and persons who by extraordinary services had rendered their names venerable and immortal, received divine honours, some particular celestial bodies, of which the sun, moon, and other planets seemed to be the most suitable, were assigned to these divinities; and after this appropriation, folly, which never stops where it begins, proceeded still farther, and ascribed to them the attributes and powers for which the deities, after whom they were named, had been celebrated in the fictions of the mythologists. This, in process of time, laid the foundation of astrology; and hence the planet Mars, for instance, like the deity of that name, was said to cause and to be fond of war, and Venus to preside over love and its pleasures.

The professors of this kind of astrology maintain, “That the heavens are one great volume or book, wherein God has written the history of the world; and in which every man may read his own fortune, and the transactions of his time.—The art, they say, had its rise from the same hands as astronomy

astronomy itself: while the ancient Assyrians, whose serene unclouded sky favoured their celestial observation, were intent on tracing the paths and periods of the heavenly bodies, they discovered a constant settled relation of analogy between them and things below; and hence were led to conclude these to be the *Paras*, the Destinies, so much talked of, which preside at our births, and dispose of our future fate.

"The laws therefore of this relation being ascertained, by a series of observations, and the share each planet has therein; by knowing the precise time of any person's nativity, they were enabled, from their knowledge in astronomy, to erect a scheme or horoscope of the situation of the planets, at that point of time; and hence by considering their degrees of power and influence, and how each was either strengthened or tempered by some other, to compute what must be the result thereof."

Judicial astrology is commonly said to have been invented in Chaldea, and thence transmitted to the Egyptians, Greeks, and Romans; though some will have it of Egyptian origin, and ascribe the invention to Chama. But it is to the Arabs that we owe it. Of the first invention of a fanciful science which very generally prevailed, it is not very easy to ascertain the original inventors. The principles on which it was founded, were very extensive in their dissemination. The Chaldeans and the Egyptians, and indeed almost all the nations of antiquity, were infatigable with the chimeras of astrology. That of the Chaldeans originated in the notion, that the stars have an influence, either beneficial or malignant, upon the affairs of men, which may be discovered, and made the ground of certain prediction, in particular cases: and the whole art consisted in applying astronomical observations to this fanciful purpose, and by such means imposing upon the credulity of the vulgar. The Egyptian priests would not neglect the cultivation of an art, which together with that of magic, would give them such an irresistible sway over an ignorant and superstitious populace. Diodorus Siculus (l. i. p. 51.) relates, that the Chaldeans learned these arts from the Egyptians; and he would not have made this assertion, if there had not been at least a general tradition that they were practised from the earliest times in Egypt. Among the Arabians, and in the eastern courts, the truths of science could be recommended only by ignorance and folly, and the astronomer would have been disregarded, had he not debased his honesty by the vain predictions of astrology. The truth of this art was allowed by Albumazar (see ALBUMAZAR), and the best of the Arabian astronomers, who draw their most certain predictions, not from Venus and Mercury, but from Jupiter and the sun. Abulpharag. *Dynast.* p. 161—162.

At Rome, the people were so debilitated with this art, that the astrologers, or, as they were then called, the mathematicians, maintained their ground in spite of all the edicts of the emperors to expel them from the city. Tiberius (A. D. 4.) founded his hopes of the empire to which he aspired, on the predictions of Thrasyllus, who had been with him during his abode at Rhodes. However he would not repose any confidence in his art till he had put him to a trial in which several had miscarried and fallen victims. Accordingly, one of his freedmen conducted the astrologer through steep and difficult paths to a contrivance fixed on the top of a house, erected on a steep rock close to the sea. If Tiberius suspected fraud or fallacy in the predictions of those who practised the art, they were thrown into the sea that beat against the rock on which this house of trial stood. Thrasyllus was conducted to this place, and had the good fortune to please Tiberius, by promising him the empire,

and by the ingenious turn he gave to every thing he said. Tiberius tried him, whether he could draw his own horoscope, and whether by comparing the time of his birth with the present state of the heavens, he could tell what he was to dread or hope for at that instant. The astrologer, without doubt apprized of the fate of his predecessors, looked at the stars and shuddered; the more he considered them the more he trembled; and at length exclaimed that he was threatened with great and imminent danger. Tiberius, convinced of his skill by this experiment, embraced him and admitted him into the number of his confidential friends. His answers, when he was consulted, Tiberius regarded as oracular; and he determined to learn the science himself. At Rhodes, he had leisure to receive lessons from Thrasyllus, and profited by them to such a degree, that he had the honour in a credulous age of having delivered predictions that were verified by the event. Augustus, however (A. D. 11.), revived the ancient law against astrologers; and to express his contempt for their pretended skill, and to show how much he disregarded any of their predictions, he published and posted up at Rome the scheme of his own nativity, or a state of the position of the stars at the instant of his birth. In the year 16, the old ordinances against astrologers were again revived; two of them were capitally punished, and the rest banished from Italy. But Tiberius, who believed in astrology, and frequently recurred to it, prevented the rigorous execution of the decree; and those who promised to renounce their art were permitted to stay at Rome. The old laws against astrologers were again enforced in the year 52, and the senate passed a very severe decree against them; but these measures were ineffectual to their suppression. In the year 69, Vitellius, though he inclined to credit their predictions, issued an edict against them, commanding them to leave Italy within a limited time; but so great was their confidence at this time in their own security, that they posted up a placent against his order, and commanded the emperor to leave the world before the day appointed for their banishment. The emperor Domitian, though he firmly believed in their delusive arts, passed an edict by which they were all banished from Rome. His credulity proved an occasion of distressing terror to him towards the close of his reign, for an astrologer, called Alchano, is said to have predicted the day and manner of his death. The emperor Adrian was very much addicted to both astrology and divination; and thus, occasionally protected and encouraged, and sometimes proscribed and banished them. The astrologers maintained their influence at Rome to the time of St. Augustine, for the subject of one of his homilies (in P. L. vi. p. 32. ed. Froben. 1556) is the reconciliation of one of these pretended mathematicians with the church. See GREGORY VII.

The curious may find farther information concerning this visionary and pernicious art, as it was practised among the ancients, in Sext. Emp. *adv. Mathem.* l. vi. p. 339. *Diod. Sic.* l. ii. p. 83. *Manilius.* l. ii. v. 276. *Janibien. de Myth.* § 8. c. 4. *Fab. Bibl. Græc.* v. iii. p. 394. *Vossius de Theolog. Græc.* l. ii. c. 47. We shall conclude in this place the noble reflection of Horace, *lib. i. od. vi. 1.*

• Tu ne quaeris, scire alicui quoniam tibi
Finem Duxerunt, Jove, nec, nec Polyphoæ
Tentans numeros: ut nec alicui quædæm tibi
• Aik not—'tis in plans to inquire—what date
The limit of your life shall be by fate;
Nor vainly Babylon's numbers try,
But wisely wait your lot, to live or die."

The Bramins, who introduced and practised this art among the Indians, have lately made themselves the

ters of good and evil hours, which gives them great authority: they are consulted as oracles; and they have taken care never to tell their answers but at good rates.

The same superstition has prevailed in more modern ages and nations. The French historians remark, that in the time of queen Catherine de Medicis, astrology was in so much vogue, that the most inconsiderable thing was not to be done without consulting the stars. And in the reigns of king Henry III. and IV. of France, the predictions of astrologers were the common theme of the court conversation.

This predominant humour in that court was well rallied by Barclay, in his *Argenis*, lib. ii. on occasion of an astrologer, who had undertaken to instruct king Henry in the event of a war then threatened by the faction of the Guises.

Judiciary astrology still retains its credit in the east, and pretenders are always found ready to take advantage of the popular credulity. Some of the grandees retain an astrologer among their dependents, and their learned men do not appear to dispute the truth of their science, though the chief dupes of the imposture are found among the populace. The astrologers pretend to foretel future events from inspection of the horoscope, and to predict wars, pestilence, and other public calamities; but they are, in general, very superficially acquainted with the principles of the science which they profess.

ASTROLUS, in *Natural History*, a name given by authors to a white and splendid stone, small in size, and of a roundish figure, resembling the eyes of fishes.

ASTROMETEOROLOGIA, the art of foretelling the weather and its changes, from the aspects and configurations of the moon and planets.

This makes a species of astrology, distinguished by some under the denomination of meteorological astrology.

ASTRON, in *Ancient Geography*, a river of Asia Minor, in the Troade. Pliny.

ASTRONIUM, in *Botany* (*απὸ τοῦ ἀστῆρος*), Jacq. Amer. 261. Lin. 1111. Schreb. 1515. Juss. 427. Class, *diocia pentandria*. Generic Char. Male. *Cal.* perianth five-leaved, coloured, small; leaflets ovate, concave, obtuse, spreading. *Cor.* petals five, ovate, very obtuse, flat, spreading very much; nectary five, roundish, very small glands in the disk of the flower. *Stam.* filaments five, subulate, spreading, the length of the corolla; anthers oblong, incumbent. Female. *Cal.* perianth five-leaved, coloured; leaflets oblong, concave, obtuse, converging. *Cor.* petals five, sub-ovate, obtuse, concave, erect, less than the calyx, permanent. *Pist.* germ ovate, obtuse; styles three, short, reflex; stigmas subcapitate. *Per.* none. *Calyx* increased, coloured; its leaflets at first expanded into a pendulous star, at length dropping the seed. *Seed*, one, oval, the length of the calyx, lactescent.

Ess. Gen. Char. Male, *Cal.* five-leaved. *Cor.* five-petalled. Female, *Cal.* five-leaved. *Cor.* five-petalled. *Styles*, three. *Seed*, one.

Species, *A. graveolens*. A tree from twelve to thirty feet in height, abounding with a terbinthinate juice. The leaves are unequally pinnate, with three pairs of leaflets, which are oblong, ovate, acuminate, smooth, veined, three inches in length; panicles lax, half a foot long in the females; flowers small, red. A native of the woods about Carthage in New Spain, flowering in May and June.

ASTRONOMICAL, something that relates to astronomy.

ASTRONOMICAL *Calendar, Characters, Column, Horizon, Hours, Month, Quadrant, Ring-Dial, Sector, Talks, Telescope, Time, Year.* See the several substantives.

ASTRONOMICAL *Observations.* See OBSERVATIONS, OBSERVATORY, and CATALOGUE.

ASTRONOMICAL *Place* of a star or planet, is its longitude or place in the ecliptic, reckoned from the beginning of Aries, in *consequentia*, or according to the natural order of the signs.

ASTRONOMICALS, a name used by some writers for sexagesimal fractions, on account of their use in astronomical calculations.

ASTRONOMICUS RADIUS. See RADIUS.

ASTRONOMY, formed of *αστρον*, *star*, and *νομος*, *law* or *rule*, is a mixed mathematical science, which treats of the heavenly bodies, their motions, periods, eclipses, magnitudes, &c. and of the causes on which they depend.

The early history of this science, like that of many other ancient discoveries, is too much disguised by fabulous and allegorical representations, to admit of any regular or satisfactory elucidation. It is probable, however, that some knowledge of this kind must have been nearly coeval with the human race; for besides motives of mere curiosity, which are sufficient to have excited men in all ages to examine the magnificent and varying canopy of the heavens, it is evident that some parts of the science are so connected with the common concerns of life, as to render the cultivation of them indispensably necessary.

Many traces of it have accordingly been found among various nations, which shew that several of the most remarkable celestial phenomena, at least, must have been observed, and a knowledge of them disseminated at a very remote period. But in what age or country the science first originated, or by whom it was gradually methodized and improved, is extremely uncertain; nothing more being known on this subject than what can be obtained from the scanty and incidental information of ancient writers, whose accounts are often too extravagant and improbable to deserve much attention.

Among other relations of this kind, may be reckoned what is mentioned by Josephus in his *Antiquities*, who, in speaking of the progress that had been made in astronomy by Seth and his posterity, before the deluge, asserts that they engraved the principles of the science on two pillars, one of stone and the other of brick, called the pillars of Seth; and that the former of these was entire in his time. He also ascribes to the Antediluvians a knowledge of the astronomical cycle of 600 years, which Montucla (in his *Histoire des Mathematiques*) thinks, with much greater reason, was an invention of the Chaldeans; and that whatever information was possessed by the Jewish annalist with respect to this remarkable period, was probably obtained either from that people, or from some ancient writings which no longer subsist.

But not to insist upon this and other uncertain testimonies of the ancients, it will be sufficient to observe that, notwithstanding the contrariety of opinions which have prevailed on this subject, the greater part of authors are agreed in fixing the origin of astronomy either in Chaldaea or in Egypt; both of which nations pretended to a very high antiquity, and equally claimed the honour of producing the first cultivators of this science. The Chaldeans, in particular, boasted of their temple, or prodigiously high tower, of Belus, which is thought by some to have been an astronomical observatory, and of their celebrated philosopher and astronomer Zoroaster, whom they placed 500 years before the destruction of Troy: while the Egyptians, with similar ostentation, vaunted of their colleges of priests, which were the depositaries of every species of knowledge; and of the monument of Ofymandyas, in which it is said

there

there was a golden circle of 365 cubits in circumference, and one cubic thick, divided into 365 equal parts, according to the days of the year, and containing the heliacal risings and settings of the stars for each day, &c. See *HUMAN YEAR*.

It is evident, indeed, without placing much reliance upon these accounts, that both Chaldaea and Egypt were countries extremely proper for astronomical observations, being almost constantly favoured with a pure atmosphere and a serene sky; and whatever may be thought of the tower of Babel, or the circle of Olymndyas, we cannot but form a very advantageous opinion of the knowledge of the Egyptians in practical astronomy, from the position which they have given to their pyramids, whose faces are directed with great precision towards the four cardinal points of the compass. For as it is scarcely possible that a situation so exact could have been the effect of chance, we must conclude that they were acquainted with a correct method of drawing a meridian line; which is a matter of more difficulty than is usually thought; it being well known that Tycho Brahe, the most able astronomer of his time, committed an error of several minutes in tracing that of his observatory of Uraniburg. See *MERIDIAN*.

The Chaldeans also must have made very considerable advances in this science, if we can rely upon the testimony of Simplicius, who informs us that, at the taking of Babylon by Alexander the Great, they cited a regular series of astronomical observations for 1903 years back; and that these, through the means of Callisthenes, were afterwards communicated to the Greeks by Aristotle. But it is much to be wished that the truth of these ancient observations was better established, particularly as their historian Berofus, who appears to have lived but a little before the time of Alexander, makes no mention of any astronomical monument of this people, which was more than about 480 years anterior to that period. And, indeed, the most ancient Chaldean observations, of which any mention is made by astronomical writers, are those of three eclipses of the moon, employed by Ptolemy in his *Almagest*, which were made in the years 27 and 28 of the era of Nabonassar, or 721 and 720 years before Christ.

But though Ptolemy, and perhaps Hipparchus, from whom he had probably taken them, made no use of any observations more ancient than those here mentioned, we cannot from thence conclude that the Chaldeans first began to follow the celestial motions at this period. For such as were made in much earlier times might be suspected on several accounts; and it is besides highly probable that most of those which preceded the era of Nabonassar were not accompanied with dates sufficiently accurate to be employed by these astronomers. The Babylonian calendar, before this era, was in great confusion, not having been properly regulated; and it is obvious that ancient observations, either of this or any similar kind, can be but of little use, except we are able to ascertain the precise time at which they were made.

Besides these eclipses mentioned by Ptolemy, nothing more now remains of the Chaldean astronomy, except what is attributed to them by some ancient authors, with respect to certain periods of years, which they appear to have formed for the more ready computation of the places of the heavenly bodies. And though the accounts which have been given us of one of the most remarkable of these cycles, by Suidas and Pliny, are not wholly free from objections, there can be little doubt of its having been first invented by that people. This is the celebrated period called the Chaldean Saros, which consists of 223 lunar months, or a little more than 18½ years; and which so far agrees with the combined mo-

tions of the sun and moon, as always to bring them again into nearly the same position at the end of each cycle that they had at its commencement.

Both the Chaldeans and Egyptians, indeed, are generally supposed to have possessed a very considerable knowledge of several other branches of this science; but as those here mentioned; but for want of proper authorities, they can only be judged of by some conjectures which they appear to have had of the motions of the world, and by the agreement which has been found among several ancient measures of the circumference of the globe. The Egyptians, in particular, appear to have known long before the Christian era, that the year consisted of 365½ days, and that the planet Mercury and Venus moved round the sun. We are also well assured of the great antiquity of the science among this people, from the recent discoveries which have been made in that country during the late war; and particularly from the figure of a zodiac brought from thence by the French, which Lalande considered as extremely ancient.

But among the various nations which claim the honour of having first cultivated this science, none pretend to possess observations of greater antiquity than the Chinese. The most remarkable of these is a conjunction of five of the planets, which, according to their annals, is said to have taken place in the reign of their emperor Tchouen-lian, about 2500 years before Christ. They also mention an eclipse of the sun, which happened in the constellation Scorpio, about the year 2150 of the same era; and which is said to have proved fatal to two Chinese astronomers of the names of Ho and Hi, who were condemned to death by the emperor Tchong-kang, on account of their omitting, through negligence and intoxication, to announce the precise time at which it arrived. And from these data, apparently well attested, several eminent astronomers have endeavoured to discover whether these events could have possibly happened about the time here mentioned; but the subject is attended with too many difficulties to afford any satisfactory result.

All that we know of the Chinese astronomy is from the accounts which have been given of it by the Jesuit missionaries, who are much divided in their opinions with respect to its very great antiquity; some supposing it to have flourished at a more earlier period than others. F. Du Halde, however, asserts, that it was cultivated by their great lawgiver Confucius; and that Tchou-cong, the most skillful astronomer that China ever produced, lived more than 1500 years before Christ, and passed whole nights in observing the celestial bodies, and arranging them into constellations. But whatever might have been the knowledge of this people in former times, the state of astronomy is very low in that country at present, although it is cultivated at Peking by public authority, in the same manner as in most of the capital cities of Europe.

The inhabitants of Japan, Siam, and the Mogul's empire, also appear to have been acquainted with astronomy from time immemorial; and the famous observatory at Benares (see *OBSERVATORY*) is a monument both of the great ingenuity of the Indians, and of their skill in that science. A knowledge of this subject is also supposed to have prevailed among the Americans; though, in their divisions of time, they made use of the solar and not of the lunar motions. The Mexicans, in particular, are said to have discovered a singular predication for the number 52, which they used as a kind of cycle in order of their computations. And the abbé Clavigero asserts it as a remarkable fact, that having discovered the eclipses of a few hours in the solar above the lunar year, they made use of intercalary days to bring them to an equality, as was done by Julius

Cæsar in the Roman calendar; but with this difference, that, instead of one day every four years, they interposed 13 days every 52 years, which produces the same effect.

But the most interesting account of the rise and progress of this science hitherto given, is that which is detailed by M. Bailly, in his learned and elaborate history of Ancient and Modern Astronomy; in which he endeavours to trace its origin among the Chaldeans, Egyptians, Persians, Indians, and Chinese, to a very early period. And in consequence of the researches he has made on this subject, he is led to maintain, that the knowledge common to the whole of those nations, has been derived from the same original source; namely, a most ancient and highly-cultivated people of Asia, of whose memory every trace is now extinct; but who have been the parent-instructors of all around them.

M. Bailly does not pretend to fix, with certainty, the precise situation of this ancient people; but he offers several reasons for conjecturing that it must have been somewhere about the 49th or 52th degree of north latitude, in the southern regions of Siberia. Among various other coincidences, he observes, that many of the European and Asiatic nations attribute their origin to that quarter, where the civil and religious rites, common to each, were probably first formed; and what he considers as a strong astronomical support of his hypothesis is, that the observations of the stars, collected by Ptolemy, must have been made in a climate where the longest day was 16 hours, which corresponds to the latitude here mentioned. But as that region exhibits no traces of its ever having been inhabited by a polished people, his theory, though highly ingenious, has not sufficient force to draw our assent to his conclusions.

In investigating the antiquity and progress of astronomy among the Indians, M. Bailly examines and compares four different sets of astronomical tables of the Indian philosophers, viz. that of the Siamese, explained by M. Cassini, in 1689; that brought from India by M. le Gentil of the Academy of Sciences; and two other manuscript tables found among the papers of the late M. de Lisle; which, he observes, accord together, and all refer to the meridian of Benares. From these tables it appears, that the Indian astronomy has two principal epochs, the first being founded on a conjunction of the sun, moon and planets, which is said to have taken place 3102 years before Christ; and the other 1491 years before the same æra. These periods are so connected by the mean motions of the sun, moon and planets, that one of them must necessarily be fictitious; and though the celebrated author above mentioned, has endeavoured to shew that the first of them must have been founded on observations, there is great reason for believing that it was rather imagined for the purpose of giving a common origin to the signs of the zodiac, and the motions of the celestial bodies.

It is true indeed, if, parting from the epoch 1491, we ascend, by means of the Indian tables to the year 3102, before the Christian æra, we shall find a general conjunction of the sun, moon, and planets, as these tables suppose; but this conjunction, which is too different from the result given by the best modern tables to have ever taken place, shews that the epoch to which they refer, is not founded upon observations; and, in fact, some elements of the Indian astronomy, seem to indicate that they were determined even long before this first epoch. The equation of the sun's centre, in particular, which they fix at $2^{\circ} 10' 32''$, could not, according to the calculations of M. Laplace, have been of this magnitude but near the year 4300 before Christ; and besides this, the equations of the centre of Jupiter and

Mars are so different from what they ought to have been at this epoch, that nothing can be concluded from them in favour of their high antiquity.

To conclude, the whole of these tables, and, above all, the conjunction which they suppose at the same epoch, prove, on the contrary, that they must have been constructed, or at least rectified, in much more modern times. The ancient reputation, however, of the Indians, both in this and other sciences, leaves but little doubt, that astronomy was cultivated among them at a very remote period; and of this, the remarkable accuracy with which they have assigned the mean motions of the sun and moon, are sufficient proofs, as such exactitude could only have been obtained from a long series of observations. This opinion has also been ably supported by Mr. Playfair, in a dissertation on the astronomy of the Bramins, published in the second volume of the transactions of the Royal Society of Edinburgh, where he has, likewise, adduced many instances of their critical knowledge in the other mathematical sciences, employed in their precepts and calculations.

The Greeks did not begin to cultivate astronomy till a long time after the Egyptians, of whom they were the disciples; and it is extremely difficult, amidst the fables which so much abound in the earlier periods of their history, to obtain any very correct information with respect to their knowledge in this science. All that we can learn is, that they had made observations on the celestial bodies, and divided the heavens into constellations, 13 or 14 centuries before the Christian æra; this being the period, according to the opinion of the most eminent chronologers, to which we must refer the sphere of Eudoxus.

The number of their philosophical institutions, however, afford no observer of any note, till much later times; most of their ancient sects having treated astronomy as a science purely speculative, without properly attending either to facts, or their causes. But notwithstanding the reveries in which they often indulged, their knowledge began to be greatly improved by Thales the Milesian, and other Greeks who travelled into Egypt, and brought from thence the chief principles of the science. This philosopher, who died at the age of 96 in the year 548 before Christ, was the founder of the Ionian sect, and appears to have been the first who taught his countrymen the globular figure of the earth, the obliquity of the ecliptic, and the causes of solar and lunar eclipses; which latter phenomena he is also said to have been able to predict.

Thales had for his successors Anaximander, Anaximenes, and Anaxagoras, to the first of whom is attributed the invention of the gnomon, and geographical charts; but for which he was probably indebted to the Egyptians. He is also said to have maintained that the sun was a mass of fire as large as the earth, which, though far below the truth with respect to size, was an opinion, for those early times, that does its author much credit; though to him, as in the case of Galileo, the truths he had discovered were the cause of his persecution. Both himself and his children were proscribed by the Athenians, for his attempting to subject the works of the gods to immutable laws; and his life would have paid the sacrifice of his temerity, but for the care of Pericles, his friend and disciple, who got his sentence of death changed into exile.

Next after the Ionian school was that of Pythagoras, who was born at Samos, about the year 506 before the Christian æra, and who, in the celebrity he acquired, far exceeded his predecessors. Like Thales he visited Egypt, and afterwards the Brahmans of India, from whom he is supposed to have obtained many of the astronomical truths which

which he brought with him into Italy, to which country he was obliged to retire on account of the despotism which then prevailed at Athens. Here he first taught the true system of the world, which, many centuries after, was revived by Copernicus; but hid his doctrines from the vulgar, in imitation of the Egyptian priests who had been his instructors. It was even thought, in this school, that the planets were inhabited bodies, like the earth; and that the stars, which are disseminated through infinite space, are suns, and the centres of other planetary systems. They also considered the comets as permanent bodies, moving round the sun, and not as perishing meteors, formed in the atmosphere, as they were thought to be in after times.

From this time to the foundation of the school of Alexandria, the history of astronomy among the Greeks offers nothing remarkable, except some attempts of Eudoxus to explain the celestial phenomena; and the celebrated cycle of 19 years, which had been imagined by Meton, in order to conciliate the solar and lunar motions. This is the most accurate period, for a short interval of time, that could have been devised for embracing an exact number of revolutions of these two luminaries; and is so simple and useful, that, when Meton proposed it to the Greeks, assembled at the Olympic games, as the basis of their calendar, it was received with great approbation, and unanimously adopted by all their colonies.

In the school of Alexandria, we see, for the first time, a combined system of observations, made with instruments proper for measuring angles, and calculated trigonometrically. Astronomy, accordingly, took a new form, which succeeding ages have only brought to greater perfection. The position of the stars began at this time to be determined; they traced the course of the planets with greater care; and the inequalities of the solar and lunar motions became better known. It was, in short, in this celebrated school, that a new system of astronomy arose, which embraced the whole of the celestial motions; and though inferior to that of Pythagoras, and even false in theory, it afforded the means, by the numerous observations which it furnished, of detecting its own fallacy, and of enabling astronomers in later times to discover the true system of nature.

Aristyllus and Timocharis were the first observers in this rising institution. They flourished about the year 290 before Christ; and by their assiduous labours, were the means of greatly improving this science. It was from their observations of the principal zodiacal stars, that Hipparchus was led to discover the precession of the equinoxes; and Ptolemy also founded upon them his theory of the motions of the planets.

Next after these, was Aristarchus of Samos, who made the most delicate elements of the science the objects of his research. Among other things of this kind, he attempted to determine the magnitude and distance of the sun; and though, as may be supposed, the results he obtained were considerably wide of the truth, the methods he employed to resolve these difficult problems, do great honour to his genius. He also endeavoured to revive the opinion of the Pythagorean school, with respect to the motion of the earth; but as his writings upon this subject have not been preserved, we are ignorant to what point he had advanced, by this means, in his explication of the celestial phenomena.

The celebrity of his successor Eratosthenes, arises chiefly from his attempt to measure the earth, and his observations on the obliquity of the ecliptic. Having remarked at Syene, a well which was enlightened to its bottom by the

sun, on the day of the summer solstice, he observed the meridian height of the sun on the same day at Alexandria; and found that the celestial arc, contained between the two places, was the 50th part of the whole circumference; and as their distance was estimated at 500 stadia, he fixed the length of a great circle of the earth at 25,000; but as the length of the stadium, employed by this astronomer is not known, we cannot appreciate the exactness of his measurement.

Among others who cultivated and improved this science, we may also mention the celebrated Archimedes, who constructed a kind of planetarium or orrery, for representing the principal phenomena of the heavenly bodies. But of all the astronomers of antiquity, Hipparchus of Bithynia is the one, who, by the number and precision of his observations, as well as by the important results which he derived from them, is the most entitled to our esteem. He flourished at Alexandria about the year 162 before the Christian era; and began his astronomical labours by attempting to determine, with more exactness than had hitherto been done, the length of the tropical year, which he fixed at 365 days, 5 hours, and 55 minutes, being near 4½ minutes too great. Like most of his predecessors, he founded his system upon an uniform circular motion of the sun; but instead of placing the earth in the centre of the solar orbit, he removed it to the distance of $\frac{1}{12}$ th part of the radius, and fixed the apogee to the sixth degree of Gemini. By means of these data, he formed the first solar tables of which any mention is made in the history of astronomy; and though defective and even erroneous in principle, they are a durable monument of his genius, which three centuries afterwards were respected by Ptolemy, without his presuming to alter them.

The great astronomer next considered the motions of the moon, and endeavoured to measure the exact time of her revolution, by a comparison of ancient eclipses. He also determined the eccentricity and inclination of her orbit, as well as the motion of her nodes and apogee; and calculated all the eclipses that were to happen for 600 years to come. We are, besides, indebted to him for the important discovery of the precession of the equinoxes (see PRECESSION), which was the fruit of the long and difficult enterprise he undertook of making a catalogue of the fixed stars, with their latitudes, longitudes, and apparent magnitudes.

Geography is also indebted to Hipparchus for the method of fixing the situation of places upon the earth, by means of their latitude and longitude; in obtaining the latter of which, he appears to have been the first who employed eclipses of the moon; and as these researches required numerous calculations, they gave birth, under his hands, to spherical trigonometry. Many of his principal works perished with the library of Alexandria; but his catalogue of the stars, and several of his observations, have been preserved by Ptolemy in his Almagest.

Between the time of Hipparchus and Ptolemy, the chief observers of any note are Agrippa, Menelaus, and Theon; the two latter of which are better known as geometricians, than astronomers. We remark, however, in this interval, the reformation of the calendar by Julius Cæsar, and a more exact knowledge of the flux and reflux of the ocean (see TIDES). Posidonius, a celebrated stoic philosopher, who lived about eighty years before Christ, appears to have been the first who observed the relation of these phenomena with the motions of the moon; and of which Pliny, the naturalist, has given a description, remarkable for its accuracy.

Ptolemy, the worthy successor of Hipparchus, was born

at Pelusium in Egypt, in the beginning of the second century of Christianity, and was the first who undertook to reform the whole of this science, by establishing it upon a new foundation. In this enterprise, the system he formed is now well known to be erroneous; but the edifice he erected lasted near 1400 years; and even at this time, though it is entirely destroyed, his *Almagest*, considered as the depository of ancient observations, is one of the most precious monuments of antiquity. See *ALMAGEST*.

One of the most important discoveries of this astronomer is that of the evection of the moon (see *EVECTION*), which he has assigned with so much exactness, that M. Le Ponce, in opposition to the opinion of other writers, thinks it sufficient to entitle him to the character of an accurate observer; and that the charge, which has been made against him, of appropriating the discoveries of his predecessors, is not well founded.

It may also be remarked, that Ptolemy has rendered great services to geography, by collecting all the determinations of the latitudes and longitudes of places then known; and by his laying the foundation of the method of projections, for the construction of geographical charts, which was but little known before his time. In short, the various works which he executed, upon a variety of subjects, are strong proofs of a great and enlightened mind, and will always insure him a distinguished rank in the history of the sciences.

With the labours of this great astronomer ended the glory of the Alexandrian school, which had now subsisted for more than five centuries, with as much credit to itself as advantage to the sciences; but the successors of Hipparchus and Ptolemy, contented themselves with commenting on their works, without adding any thing remarkable to their discoveries. The knowledge of nature, which had hitherto been cultivated with so much success, gave way to the desolating irruption of the Saracens, who were led by a ferocious zeal to destroy the celebrated library of Alexandria, which contained for many treasures of learning and genius. By a singular turn, however, of human affairs, this people became afterwards the protectors and cultivators of literature and science, and were then sensible, that this frantic measure had deprived them of the most precious fruits of their victories.

The caliph Almanzor first introduced a taste for the sciences into his empire; and his grandson, Almamon, who ascended the throne in 813, was a great encourager and improver of astronomy. Having constructed proper instruments, he made many accurate observations; and, among others, determined the obliquity of the ecliptic to be $23^{\circ} 35'$. Under his auspices also, a degree of the meridian was measured, a second time, in the plains of Sinjar, on the borders of the Red Sea. About the same time, or at a somewhat later period, Alhazeni likewise wrote a treatise on astronomy; and hence the science began to be greatly cultivated by the Arabians; particularly by Alhazeni, who gave a new and improved theory of the sun, from which he derived results that are much valued for their accuracy; and above all, as they directly confirm the diminution of the eccentricity of the solar orbit, as since demonstrated by the theory of gravity, and by the secular equation of the moon. His work, intitled "The Science of the Stars," is still extant, and was long esteemed by the Arabians. But after his time, though the Saracens had many eminent astronomers, several centuries elapsed without producing any very valuable observations, excepting those of some ecliptic, observed by Ibn Junis, astronomer to the caliph of Egypt, which serve to shew the acceleration of the mean motion of the moon.

The Persians, who for a long time were of the same reli-

gion, and subjected to the same sovereigns with the Arabs, began about the middle of the eleventh century, to throw off the yoke of the caliph; and at this period, their calendar received, by the care of their astronomer Omar Cheyan, a new form, founded upon an ingenious intercalation, which consisted in making eight bissextile years at the end of every thirty-three common years. See *BISSEXTILE*. About the same time, also, Holo-n-Bezokim, one of their sovereigns, assembled the most considerable astronomers at Maragha, where he erected a magnificent observatory, the care of which was confided to Nasir-Eddin. But of all the princes of this nation, the one who distinguished himself the most, by his zeal for astronomy, was Ulugh Beg, a grandson of the celebrated Tamurlane, who was a great proficient in this science. He formed, from his own observations, at Samerend, the capital of his empire, a new catalogue of the stars, and the best tables of the sun and planets that had been given before those of Tycho Brahe. He also determined, in 1437, with a quadrant 180 feet high, the obliquity of the ecliptic, which he found equal to $23^{\circ} 31' 57''$.

During this period, the greatest part of Europe was immersed in ignorance and barbarity; which would have probably continued much longer, but for the settlement of the Moors in Spain, who first introduced a taste for literature and the sciences into this part of the world. The Arabs by this means became our instructors, as the Egyptians had been formerly of the Greeks; and, by a singular fatality, the learning which they transmitted to us, has disappeared among this people, as astronomy became neglected in the temples of Egypt and Chaldea, in proportion to the progress which it made in the school of Alexandria.

One of the first encouragers of learning in Europe was Frederick II., who, about 1230, set about restoring some decayed universities, and founding a new one at Vienna. He also caused the works of Aristotle and Ptolemy's *Almagest*, to be translated into Latin; from which later circumstance we may date the revival of astronomy in Europe. Two years after this, John of Halifax, commonly known by the name of Sacro Bosco, compiled from Ptolemy, Alhazeni, Alfraganus, and other Arabic astronomers, his work "De Sphæra," which continued in great estimation for more than 300 years afterwards, and was honoured with commentaries by Clavius and other learned men. Alphonso, king of Castile, may also be reckoned as one of the most zealous encouragers and protectors of this science; though, being but ill favoured by the astronomers of that time, the tables which he published were not found to answer the great expence which attended them.

About the same period also Roger Bacon, an English monk, besides many learned works of various kinds, wrote several treatises on astronomy; after which but little progress was made in this science till the time of Purbach, Regiomontanus, and Walthar, who all flourished about the end of the fifteenth century, and by their labours prepared the way for the great discoveries which followed. Regiomontanus, in particular, who was born at Koningberg, a town of Franconia, in 1436, and whose proper name was John Muller, rendered considerable services to astronomy, not only by his observations and writings, but by his trigonometrical tables of sines and tangents, which he computed to a radius of 1000000 for every minute of the quadrant, and by this means greatly facilitated astronomical computations, which had now become both numerous and intricate. John Werner, who succeeded Walthar as astronomer at Nuremberg, is also deserving of notice, as being the first who proposed the method of finding the longitude

longitude at sea by observing the moon's distance from the sun and certain fixed stars, which is now so successfully practised in the British navy.

Next after these was Nicholas Copernicus, the celebrated restorer of the old Pythagorean system of the world, which had been now set aside ever since the time of Ptolemy. He was born at Thorn, in Polish Prussia, in 1473, and having gone through a regular course of studies at Cracow, and afterwards at Rome, he was made by the interest of his uncle, who was bishop of Warmia, a canon of Frauenberg; in which peaceful retreat, after 36 years of observations and meditations, he established his theory of the motion of the earth, with such new and demonstrative arguments in its favour, that it has gradually prevailed from that time, and is now universally received by the learned throughout Europe.

This great man, however, had not the satisfaction of witnessing the success of his undertaking, being threatened by the persecution of religious bigots on the one side, and with an obstinate and violent opposition from those who called themselves philosophers on the other; it was not without the greatest sollicitations that he could be prevailed upon to give up his papers to his friends, with permission to make them public; but from continued importunities of this kind, he at length complied, and his book, "De Revolutionibus Orbium Cœlestium," after being suppressed for many years, was at length published, and a copy of it brought to him a few hours before his death. His disciple Rheticus, who has rendered great services to the mathematical sciences by his extensive tables of sines, tangents, and secants, to every ten seconds, was the first who adopted his ideas; but they made but little progress till towards the beginning of the 17th century.

In this interval, however, the science was not wholly neglected. Nonius in particular wrote several valuable treatises on Astronomy and Navigation, and invented some useful instruments, more accurate than those before known; one of these being the astronomical quadrant, on which he divided the degrees into minutes, by a number of concentric circles. Apian also, in 1540, wrote a book called the "Casibrian Astronomy," in which he shews how to observe the places of the stars and planets by the astrolabe; to resolve astronomical problems by means of certain instruments, and to predict and calculate eclipses; and at the end of his work are added observations of five comets, one of which has been supposed to be the same with that described by Herclius; and whose return was accordingly looked for in the year 1789, but it did not appear. Gemma Frisius, who lived about this time, is likewise deserving of notice, as being the first who recommended time-keepers for finding the longitude at sea.

The history of the science, about this epoch, also offers us a great number of excellent practical astronomers; one of the most illustrious of whom was William IV. landgrave of Hesse-Cassel, who built an observatory in that city, and furnished it with a number of the best instruments that could be obtained at that time, with which he made his own observations. He also attached to himself the celebrated astronomer Rechinan, and Junus Burgius, and with their help formed a catalogue of 400 stars with their latitudes and longitudes, adapted to the beginning of the year 1593. It was also from his pressing sollicitations, that Tycho Brahe, one of the greatest observers that ever existed, procured the advantages that he enjoyed under Frederic II. king of Denmark.

This excellent Danish astronomer, who was born at Knudstorp in the county of Schonon, in 1546, began to mani-

fest his taste for this science at the early age of 14. An eclipse of the sun which happened in 1560, first attracted his attention, and the justice of the calculation which announced the date of it, inspired him with a strong desire of investigating the principles upon which it was founded. He began to write on this point on his return, and a part of his family, to these pursuits, which probably formed only the casual attachment to them, he made a journey into Germany, where he formed connections, and entered into a correspondence with some of the most eminent astronomers of that country; particularly with the landgrave of Hesse, who received him in the most flattering manner, and recommended him to the notice of his sovereign. Becoming by this means better known, on his return to Dourark, Frederic II. gave him the little island of Huen, at the entrance of the Baltic, where he built an observatory, under the name of Uraniburg, and in which, during a course of twenty years, he made a prodigious number of observations.

His tranquillity, however, in this happy retreat, was at length interrupted; for soon after the death of Frederic, which happened in 1606, he was obliged, through the importunities of some envious and malicious persons, of his position and establishment, and was not even allowed to follow his pursuits at Copenhagen; a miracle of that time, of the name of Walcheidorp, having forbid him to continue his observations. Happily, however, he found a powerful protector in the emperor Rodolphus II., who ordered him to be properly provided for at his own expence, and gave him a commodious house at Prague. After residing in this city till the year 1601, he was taken off by a sudden death, in the midst of his labours, and at an age while he was yet capable of rendering great services to astronomy.

This great man, as is well known, was the inventor of a kind of Semi-Ptolemaic system of astronomy, which was afterwards called by his name, and which he vainly endeavoured to establish instead of the Copernican or true system. But though he was not happy in this respect, he has been of great use to astronomy by his numerous observations and discoveries. Among other things he was well acquainted with the nature of refractions (see REFRACTION); and hence he was able to determine the places of a great number of the fixed stars, with an accuracy unknown to former times. He also proved, against the opinion which then prevailed, that the comets are higher than the moon (see COMET); and from his observations on this and the rest of the planets, the theories of their motions were afterwards corrected and improved, so that for such services he will always be celebrated and admired by astronomers.

Tycho Brahe, in the latter part of his life, had for his disciple and assistant the celebrated Kepler, who was born in 1571, at Weil in the duchy of Wirtemberg, and was one of those rare characters that appear in the world only at particular times, to prepare the way for new and important discoveries. Like his master Tycho, he appears to have attracted himself to the science at a very early age; and if it be the privilege of genius to charge received ideas, and to announce truths which had never before been discovered, he may justly be considered as one of the greatest men that had yet appeared. Hipparchus, Ptolemy, Tycho Brahe, and even Copernicus himself, were indebted for a great part of their knowledge to the Egyptians, Chaldeans, and Indians, who were their masters in this science; but Kepler, by his own talents and industry, has made discoveries of which no traces are to be found in the works of antiquity.

The philosopher, the most useful to the sciences, is he who to a precise and imaginative, unites a serene judgment,

and though ardently desirous to elevate himself to the cause of the phenomena, is equally apprehensive that he may be mistaken in that which he assigns to them. Kepler owed to nature the first of these advantages, and the second to Tycho Brahe, who perceived his genius, and advised him to abandon his attachment to the mysterious analogies of figures and numbers to which he was then addicted, and to attend more closely to facts and their consequences. This appears to have had its proper effect, and Tycho dying a few years afterwards, Kepler was put in possession of his collection of observations, which he employed to the most useful purposes, having founded upon them three of the most important discoveries that have ever been made in natural philosophy.

It was an opposition of Mars, which determined him to occupy himself, in preference, upon the motion of this planet; and being then strongly attached to the Ptolemaic system as modified by Tycho Brahe, as well as to the opinion which had hitherto been generally received, that all the celestial motions must be perfectly circular and uniform, he endeavoured, for a long time, to represent those of Mars according to this hypothesis. At length, however, after many trials of this kind which he has given in detail, in his treatise called "Stella Martis," he discovered that the orbit of Mars is an ellipse of which the sun is placed in one of the foci, and that the planet moves in it in such a manner, that the radius vector, or a line drawn from the centre of the sun to that of the planet, describes areas proportional to the times. This law he also soon afterwards extended to all the planets; and in 1626, he published, according to this theory, his Rudolphine tables, which will be for ever memorable in astronomy, as being the first that were founded on the true laws of the planetary motions.

It is here worthy of remark, that without the speculations of the Greek mathematicians, upon the curves formed by the sections of a cone, it is highly probable that we should yet have remained ignorant of some of the most curious and important laws of nature. The ellipse being one of these curves, its lengthened figure suggested to the mind of Kepler the idea that the planet Mars, whose orbit he had found to be more oval than circular, might possibly move in it; and soon after, by means of the numerous properties which the ancient geometers had discovered of the conic sections, he assured himself of the truth of this hypothesis. The history of the sciences affords many examples of this kind of application of pure geometry, and of the advantages attending it; for every thing, in the immense claim of truths, is connected; and frequently a single observation of apparently trifling consequence, has led to a more intimate knowledge of nature, of which the phenomena are the mathematical results of a small number of invariable laws.

The perception of this truth was probably what first gave rise to the mysterious analogies of the Pythagoreans; and Kepler, who had indulged himself in researches of this kind, was indebted to it for one of his most brilliant discoveries. Being persuaded that the mean distances of the planets from the sun ought to be conformable to these analogies, he compared them, for a long time, both with the properties of the five regular bodies, and with the notes of music. At length, after seventeen years of meditation and calculation, having had the idea of comparing them with the powers of the numbers by which they are expressed, he found that the squares of the times of the revolutions of the planets are to each other as the cubes of their mean distances from the sun; and that the same law applies equally to their satellites.

Astronomy is likewise indebted to Kepler for several other discoveries; which, though not equal to the former, are

still of considerable importance. He believed that it was the attraction of the moon which caused the flux and reflux of the ocean; and he had so far an insight into the general law of gravitation, as to suspect, that the irregularities of the lunar motions were occasioned by the combined actions of the earth and the sun. In his work on Optics, he has also explained the mechanism of vision, which was before unknown; and in another performance, called "Stereometria Dolorum," he has presented several views on the nature of infinities, which had considerable influence on the revolution that geometry underwent about the end of the last century.

It is afflictive to relate, that this great man, who may be considered as the founder of modern astronomy, had his last days embittered by the horrors of poverty and distress. A small pension, which was scarcely sufficient for his subsistence, was frequently withheld or unpaid; and the trouble and vexation which this occasioned him, obscured his genius, and shortened his existence. He died on the 15th of November 1631, in the fifty-ninth year of his age, leaving nothing for his wife and family, but the glory of his name, and the fame he had so justly acquired; but as these were insufficient to relieve his own wants, they could afford but little comfort to a helpless wife, and her wretched offspring, whose indigence is said to have been such that they had not even the common necessaries of life.

In the time of Kepler, there were not wanting several other considerable proficient in astronomy. Edward Wright, an Englishman, made several good meridian observations of the sun, with a quadrant of six feet radius, in the years 1594, 1595, and 1596, from which he improved the theory of the sun's motion, and computed his declination more accurately than had been done before. He also published, in 1599, an excellent work, entitled, "Certain Errors in Navigation discovered and detected;" containing a new method of projecting maps and charts, which has commonly, though erroneously, been ascribed to Mercator. The science is also greatly indebted to baron Napier of Scotland, not only for his ever memorable invention of logarithms, which has so wonderfully facilitated the business of calculation, but for some excellent theorems and improvements in spherics. About this time, likewise, Bayer, a German, published his "Uranometria," or complete Celestial Atlas, containing the figures of all the constellations visible in Europe; into which he introduced the highly useful invention of marking the stars by their names, or the letters of the Greek alphabet, which renders them so easy to be referred to with distinctness and precision.

At the same time also, that Kepler, in Germany, was tracing the orbits of the planets, and settling the laws of their motions, Galileo (who was born at Pisa, in Italy, in 1564) was meditating upon the doctrine of motion in general, and investigating its principles; and from the admirable discoveries which he made in this branch of the physico-mechanical sciences, Newton and Huygens were afterwards enabled to derive the most brilliant and complete theories of all the planetary motions. About this period also, a fortunate accident produced the most marvellous instrument that human industry and sagacity could have ever hoped to discover; and which, by giving a far greater extension and precision to astronomical observations, shewed many irregularities and new phenomena, which had hitherto remained unknown.

This invention was that of the telescope, which was no sooner known to Galileo, than he set himself about to improve it; and the discoveries he was by this means enabled to make, were as new as they were surprising. The face of the moon appeared full of cavities and asperities, resembling

vallies and mountains. The sun, which had generally been considered as a globe of pure fire, was observed to be sullied by a number of dark spots, which appeared on various parts of his surface. A great number of new stars were discovered in every part of the heavens; the planet Jupiter was found to be attended with four moons, which moved round him in the same manner that our moon moves round the earth; the phases of Venus appeared like those of the moon, as had before been concluded by Copernicus from his theory; and in short, most of the observations he made furnished new proofs of the truth of the Copernican system.

In publishing the discoveries which he had made with this new instrument, Galileo shewed in the most incontestible manner, the annual and diurnal motion of the earth; which doctrine, however, was thought so alarming, that it was immediately declared heretical, by a congregation of cardinals, who were assembled upon the occasion; and its venerable author, one of the most virtuous and enlightened men of his age, was obliged to abjure, upon his knees, and in the most solemn manner, a truth, which nature and his own understanding had shewn him to be incontrovertible. After this, he was condemned to perpetual imprisonment; from which, however, at the end of a year, he was enlarged, by the solicitations of the grand duke; but, that he might not withdraw himself from the power of the inquisition, he was forbid to quit the territory of Florence, where he died in 1642; carrying with him the regrets of Europe, enlightened by his labours, and their indignation against the odious tribunal which had treated him so unworthily. For the oath of abjuration, and further particulars of this transaction, see Bonnyeaile's Astronomy, p. 101. 3d edit. and the article GALILEO in this work.

The celebrated Harriot also, who has hitherto been known only as an algebraist, made, much about the same time, similar discoveries with those of Galileo, as appears by his papers not yet printed, which are in the possession of the earl of Egremont. Mr. Horrox, likewise, a young astronomer of great merit, about this time, deserves to be mentioned, on account of his observation of the transit of Venus over the sun's disk (see TRANSIT), on the 24th of November 1639; which event he announced to his friend Mr. Crabtree; and these two together had the singular satisfaction of witnessing, for the first time, a phenomenon which had never before been seen by human eyes. Horrox had even formed a new theory of the moon, which I taken notice of by Newton; but his early death, which happened in the beginning of the year 1640, put a stop to his useful labours.

The discoveries of Huygens succeeded those of Kepler and Galileo; and few men have, perhaps, merited more of the sciences, by the importance and sublimity of his researches. Among other things, his happy application of the pendulum to clocks, is one of the most advantageous presents that was ever made to astronomy. He was also the first who found that the singular appearances of Saturn, are produced by a ring, by which the planet is surrounded; and his assiduity in observing it, led him to the discovery of one of its satellites. Geometry, mechanics, and optics, are also indebted to him for a great number of discoveries; and if this rare genius had had the idea of combining his theorems on centrifugal forces, with his inquiries into the development of curves, and the laws of Kepler, he would have enriched from Newton his theory of curvilinear motions, and that of gravitation; but these are the things in which discoveries generally consist.

Next to Huygens, may be mentioned Hevelius, a burgo-master of Dantzic, who rendered himself highly useful to

astronomy by his numerous and immense labours: few observers having ever existed who were more indefatigable. It is to be lamented, however, that he refused to make use of instruments with telescopic sights, an invention introduced about that time by the celebrated Dr. Hook, and which gave a precision to observations unknown to former astronomers. He even contested their utility, and a warm dispute having arisen between him and Dr. Hook upon this subject, Dr. Halley, then a young man rising fast into fame and eminence, was sent to examine his instruments, which were found to be excellent of their kind. The two astronomers made several observations together, much to their satisfaction; and among them was one of an occultation of Jupiter by the moon, by which they determined the diameter of the latter to be $30' 33''$.

About this epoch, astronomy began to be more generally cultivated and improved, in consequence of the establishment of several learned societies, which, by exciting a spirit of emulation and enterprise among their members, greatly contributed to the advancement of every branch of the mathematical and physical sciences. The chief of these were the Royal Society of London, and that of the Academy of Sciences of Paris; both of which have rendered great services to astronomy, as well by the eminent men they have produced, as by the zeal and ardour with which the science has constantly been promoted by them. One of the first effects produced by these establishments, was the great improvement of telescopes and other instruments, which had hitherto been too much neglected for want of proper encouragement. Huygens constructed a telescope of 123 feet; with which he long observed the moon and planets, and was the first that discovered Saturn's ring. The celebrated Cassini also employed instruments of this kind, of 200 and 300 feet focus, with which he saw the five satellites of Saturn, with his zones or belts, as well as the shadows of Jupiter's satellites passing over his body.

The length of refracting telescopes, however, was still a great inconvenience; to remedy which, as well as the great aberration of their rays, Mersemmus is said to have first started the idea of making telescopes with reflectors, instead of lenses, in a letter to Descartes; and in 1653, James Gregory of Aberdeen, shewed how such an instrument might be constructed. Newton, also, after spending some time on the construction of both these sorts of telescopes, discovered the great inconvenience which arises to reflectors, from the different refrangibility of the rays of light, and therefore pursuing the other kind, he presented in the year 1672, to the Royal Society, two reflectors, with spherical specula, as he could not then contrive the means of giving them a parabolic figure. It is proper to observe, however, that the defects of refracting telescopes, arising from the different refrangibility of the rays of light, have since been completely obviated by the ingenious Mr. Dollond. See ACHROMATIC TELESCOPE.

Towards the latter part of the seventeenth century, and the beginning of the eighteenth, practical astronomy seems rather to have languished; but at the same time, the theoretical part was carried to the highest degree of perfection, by the immortal Newton in his "Principia," and by the astronomy of David Gregory. (See NEVINIAS PAINTESSONAY.) About this time also, clock and watch-work was greatly improved by Mr. Graham, who likewise constructed the old eight feet mural arch at the Royal Observatory at Greenwich, and the zenith sector of twenty-four feet radius, with which Dr. Bradley discovered the aberration of the fixed stars. (See ABERRATION.) The reflecting telescope of Gregory and Newton, was also greatly improved by Mr. Halley; but who

who is still better known for his admirable invention of the reflecting quadrant or sector, now called by his name, and which is universally used at sea, and in all nice observations. Mr. Bird also, about the middle of the eighteenth century, rendered great services to astronomy, by his method of constructing and dividing large astronomical instruments; which has since been carried to the greatest degree of perfection by that admirable artist Mr. John Ramsden, whose recent death will be long regretted by astronomers, and men of science in general. Reflecting telescopes were likewise not less improved by Mr. Short, who also first executed the divided object-glass micrometer, which had been proposed and described by M. Louville and others.

Thus the astronomical improvements in the last century, have been chiefly owing to the greater perfection of instruments, and to the establishment of regular observatories in various parts of Europe. Romer, a celebrated Danish astronomer, first made use of a meridian telescope; and by observing the eclipses of Jupiter's satellites, was led to his discovery of the motion of light, which he communicated to the academy of sciences at Paris, in 1675. Mr. Flamsteed was also appointed the first astronomer royal at Greenwich, about the same time, where he observed all the celestial phenomena for more than forty-four years; and as the fruits of his labours, published a catalogue of 3000 stars, with their places, to the year 1688, as also new solar tables, and a theory of the moon according to Horrox. Cassini, also, the first French astronomer royal, greatly distinguished himself by his numerous observations on the sun, moon, and planets, and by the improvements he made in the elements of their motions.

In 1719, Mr. Flamsteed was succeeded by Dr. Halley, the friend of Newton, and a man of the first eminence in all the classes of literature and science; who had been sent at the early age of twenty-one, to the island of St. Helena, to observe the southern stars, a catalogue of which he published in 1679; and a few years afterwards he gave to the public, his "Synopsis Astronomiæ Cometicæ," in which he ventured to predict the return of a comet in 1758, or 1759. He was the first who discovered the acceleration of the moon's mean motion; and is the author of a very ingenious method for finding her parallax, by three observed places of a solar eclipse: he also shewed the use that might be made of the approaching transit of Venus, in 1761, in determining the distance of the sun from the earth; and recommended the method of determining the longitude by the moon's distance from the sun and certain fixed stars, which has since been carried into execution at the instance of the present astronomer royal. Dr. Halley also composed tables of the sun, moon, and planets, with which he compared the observations he made of the moon at Greenwich, amounting to near 1500, and noticed the differences. About this time, an attempt was made in France, to measure a degree of the earth, which was the occasion of a warm dispute concerning its figure. M. Cassini concluded, from the measurement of Picani, that it was an oblong spheroid; but Newton, from a consideration of the laws of gravity, and the diurnal motion of the earth, had determined its figure to be that of an oblate spheroid, flattened at the poles, and protuberant at the equator. To determine this point, Louis XV. ordered two degrees of the meridian to be measured, one under or near the equator; and the other as near as possible to the pole, the result of which arduous undertaking was a confirmation of Newton's investigation. M. de Maupertuis, Clairaut, &c. were employed on the northern expedition; and Condamine, Bouguer, Don Ulloa of Spain, &c. on the southern; who all fulfilled their commissions with great credit to themselves,

and advantage to the sciences, making many observations besides those immediately connected with this subject. Among others, it was found, by those who went to the south, that the attraction of the great mountains of Peru had a sensible effect on the plumb lines of their large instruments, which afforded an experimental proof of the Newtonian doctrine of gravitation, that has since been completely verified by the observations of Dr. Mackenzie, made on the mountain Schellien in Scotland. See AN EXERCISE of Mountains.

On the death of Dr. Halley, in 1742, he was succeeded by Dr. Bradley, who has rendered himself highly celebrated by two of the finest discoveries that have ever been made in astronomy, the aberration of light and the nutation of the earth's axis. Among other things, he also formed new and accurate tables of the motions of Jupiter's satellites, as well as the most correct table of refractions yet extant. Also, with a large transit instrument, and a new mural quadrant of eight feet radius, constructed by Bird, in 1750, he made an immense number of observations, for settling the places of all the stars in the British catalogue, together with near 150 places of the moon, the greater part of which he compared with Mayer's tables.

Dr. Bradley was succeeded in 1762, in his office of astronomer royal, by Mr. Bliss, but who, being in a declining state of health, died in 1765, and was succeeded by Nevil Maskelyne, D. D. the present astronomer royal, who has rendered considerable services to this science, by his publication of the "Nautical Almanac" the "Requisite Tables," &c. and more particularly by the great assiduity and zeal he has displayed in bringing the lunar method of determining the longitude at sea into general practice.

In the mean time, many other eminent mathematicians, both of our own, and other countries, were assiduously employed in endeavouring to promote the science of astronomy. The theory of the moon was particularly considered by Mefs. Clairaut, d'Alembert, Euler, Simpson, Walmesley, and Mayer; the latter of whom computed a set of lunar tables, for which, on account of their superior accuracy, he was rewarded with a premium of 3000*l.* by the board of longitude, who brought them into use in the computation of the nautical ephemeris which was published by their order. Some very accurate tables of the satellites of Jupiter, were also composed from observations by Mr. Wargentin, an excellent Swedish astronomer, and which have since been corrected by the author, so as to render them superior to any yet published.

Among the French astronomers who have also contributed to the advancement of this science, we are particularly indebted to M. de la Caille for an excellent set of solar tables, in which he has made allowances for the attractions of Jupiter, Venus, and the Moon, as well as for the observations which he made at the cape of Good Hope, in concert with the most celebrated astronomers in Europe, in order to determine the parallax of the sun, moon, and the planet Mars; and for adjusting the places of the stars in the southern hemisphere, which he has done with great accuracy. In Italy also the science was cultivated with great success by S. Bianchini, Boscovich, Frisi, Manfredi, Zanotti, and others; and in Germany, by Euler, Mayer, Lambert, &c.

Such was the state of astronomy when Dr. Herschel, by augmenting the powers of telescopes beyond the most sanguine expectations, opened a scene altogether unlooked for. By this indefatigable observer we are made acquainted with a new primary planet belonging to our system, called the Georgium Sidus, attended by six satellites, which he discovered on the 13th of March 1781, and which being at twice

the distance of Saturn from the sun, has doubled the bounds formerly assigned to the solar system. We are also indebted to him for a variety of observations on several other interesting astronomical subjects; such as the discovery of two additional satellites to Saturn, of which the number is now five; a new method of measuring the lunar mountains; the rotation of the planets on their axes; on the parallax of the fixed stars; catalogues of double, triple stars, &c.; of nebulae; and of the proper motion of the sun and solar system; the accounts of which, together with many other valuable papers, he has communicated from time to time in different parts of the Philosophical Transactions. Within the last year also another new planet has been discovered by M. Piazzi of Palermo, between Mars and Jupiter, to which he has given the name of Ceres Ferdinandus; and even the discovery of a third has been announced in some of the foreign journals; but for any regular account of this we must wait for further information. See GEORGIVM SIDUS, CERES Ferdinandus, and PALLAS.

It is with great pleasure we observe that at no former period has this science been cultivated with more ardour than it is at present, both in this and every other country in Europe. In France, the physico-mathematical part of the science has been greatly improved and extended by the celebrated M. la Place, who, in his elaborate work, the "Mécanique Céleste," has investigated all the phenomena, which the attraction or universal gravitation of matter can produce on the forms and motions of the celestial bodies, by their mutual actions on each other. M. Lalande, the patriarch of astronomers, is also still indefatigable in his pursuits, and by the zeal he constantly manifests for the interests of this science, has greatly promoted the study of it in almost every quarter of the globe; but particularly in Germany, where M. von Zach is equally assiduous in forwarding its improvement. In all its collateral branches also we observe a degree of activity that has never been exceeded. New measurements of the earth have been undertaken both in this country and in France, which, from the great improvements of instruments, and the skill and industry of the observers, promise a greater accuracy in the results than could have been obtained by those who were formerly engaged in this undertaking. From the zeal and abilities of major Mudge, in particular, who is now employed by our government to make a trigonometrical survey of the country, we may expect the most accurate details on this subject that have ever yet been presented to the public.

We shall conclude by observing that there still remains a number of discoveries to be made in this science. We have not yet determined the times of rotation and the proper figures of some of the planets and their satellites; nor do we know with sufficient precision the masses of those bodies. The theory of their motions also consists in a series of approximations, of which the convergence depends both upon the perfection of instruments, and the progress of analysis, and which for that reason ought to acquire continually new degrees of exactness. Observations on the return of comets already observed, as well as on those which may hereafter appear, should likewise be made with great care, and particularly on such as may entirely change their orbits, as it has been conjectured was the case by the action of Jupiter on the one which appeared in 1770; as also such accidents which the proximity, and even the shock of these bodies, may occasion to the planets and their satellites; such are the principal objects which should engage the attention of future astronomers.

For more particular accounts of the writings and authors on this science, the reader may consult Weidler's "History Vol. III.

of Astronomy," which is brought down to the year 1737, as also "Bailly's History of Ancient and Modern Astronomy," Montucla's "Histoire des Mathématiques," and the first volume of Lalande's Astronomy. The more modern and popular works on the subject are numerous and well known; as those of Eulerus, Lagrange, Laplace, Bonycastle, &c.; in the latter of which, in particular, the elementary parts, and general outline of the science, are described with great perspicuity and elegance.

ASTRONOMY is sometimes divided with respect to its different dates, into *antæ* and *æ*.

ASTRONOMY, *Antæ*, is such as the art stood under Ptolemy and his followers, with all the apparatus of fixed orbs, epicycles, eccentrics, deferents, trochoids, &c.

ASTRONOMY, *Æ*, is such as the art has been in the Copernicians, by whom the fictitious machines were thrown out, and the constitution of the heavens reduced to a few simple, natural, and certain principles.

In Ricciolus's *Almagestum Novum*, published in 1651, we have the several hypotheses of all the astronomers, ancient as well as modern.—And in Dr. Gregory's *Elementa Astronomicæ Physicæ & Geometricæ*, in 1702, the whole modern astronomy, as founded on the discoveries of Copernicus, Kepler, and sir Isaac Newton.—The substance of the old astronomy is given by Tacquet; and of the new astronomy by Whiston, in his *Prælectiones Astronomicæ*, in 1707. Mercator's *Institutiones Astronomicæ*, published in 1676, contains the whole doctrine, both according to the ancients and moderns; and Dr. Kell's *Introductio ad veteram Astronomicam*, in 1718, comprehends the modern; to which might be added Vince's *Astronomy*, in 2 vols. 4to. 1800; and his *Practical Astronomy*, 4to.

ASTROPECTEN, in *Natural History*, a name given by some authors to a species of star-fish, composed of a body, or central nucleus, furrowed in the manner of the shells of the common scallop, and parting into five principal rays, from each of which there issue several transverse processes, covered with a hairy down.

ASTROPODIA. See ASTERIA, and STAR-FISH.

ASTROSCOPE, in *Astronomy*, a kind of astronomical instrument, composed of two cones, on whose surface the constellations, with their stars, are delineated, by means of which the stars may easily be known.

The telescope is the invention of Wil. Schickhard, formerly professor of mathematics at Tubingen, who published a treatise expressly on it, in 1658.

ASTROSCOPIA, from *αστρον*, *μωσ*, and *σκοπεω*, *to inspect*, the art of observing and examining the stars by means of telescopes, in order to discover their nature and properties.

Huygens improved this art considerably in his "Astronomia Comperativa Tuli Opticæ mechanicæ Phœnicæ" where he shews how to manage the largest glasses without help of a tube. See TELESCOPE.

ASTROTHERMATA, in *Astronomy*, the places or positions of the stars in a theme of the heavens. *Vital. Lex. Math.*

ASTROTHERSIA, from *αστρον* and *θηρσιν*, *to pierce*, is used by some for a constellation or image in the heavens, composed of several stars.

ASTRUC, JONAS, M. D. in *Biography*, a learned physician, and author of numerous medical and philosophical works, was born at Saube, a considerable town in Lower Languedoc, on the 15th of March 1684. He was early initiated into the knowledge of the classics by his father, and was sent to complete his education to the university at Montpellier, where in 1700 he obtained master of arts,

and in 1702, bachelor of medicine. In the same year he published his dissertation "De motus fermentativi causa," which was soon followed by several controversial pieces on the manner in which the food is digested in the stomach, which he contended was effected by a peculiar leaven, exciting fermentations; contrary to the opinion of Pitcairne and other mechanical physicians, who attempted to prove that our food was triturated or ground to a pulp in the stomach by the action of the abdominal and other muscles, to which they gave a power equal to several thousand pounds weight. In 1710, he was made professor of anatomy and medicine at Toulouse. In 1716, he returned to Montpellier, where he was called to the professor's chair vacant by the death of Chatelain. In 1720, he published his treatise "De Hydrophobia," and in 1721 "Sur l'Origine des Maladies Epidemiques, principalement de la Peste," in which he strongly supports the opinion that the plague is a contagious disease, in opposition to Chicanen and other writers, who then, as now, attempted to establish a contrary doctrine. He supposed there was some analogy between the poison of the plague and the venereal disease. He took an early and active part in the dispute between the faculty of medicine and the surgeons at Paris; and as he was well versed in the history of medicine, he shewed that in early times the chirurgians were examined by physicians previous to their being allowed to practise. In 1729, he was invited to Poland, and made physician to the king, Augustus the second; but finding this place less favourable to his studies, he returned to France, and fixed himself at Paris; and in 1730, was appointed consulting physician to the king, and soon after, on the death of Geoffroy, professor of medicine in the Royal College at Paris, where the reputation he had previously acquired procured him a numerous and respectable auditory; pupils flocking to him from all parts of Europe. In 1737, he published "Memoires pour l'Histoire naturelle de Languedoc," in which a particular account is given of the mineral waters of Balaruc. In 1745, he published "Tractatus Pathologicus;" and 1748, "Tractatus Therapeuticus," both in 8vo.; which were in their time well received, but are superseded now by the adoption of new theories, in their turn to give way to subsequent speculations. In 1736, he published his principal work "De Morbis Veneris," which soon, and deservedly, raised his fame to the highest pitch of eminence. The work was eagerly received, and translated into all the modern languages; the learned in every country being desirous of naturalising a production, containing the completest history, description, and mode of treating the disease that had appeared. In the first part, the author labours to shew, that the disease was new, and of a nature distinct from all others; that it was first imported into Europe by the Spaniards who attended Columbus in the discovery of America. This part has lately been controverted, and passages from various early writers have been produced, that are supposed to point out the disease; a single symptom or two resembling some of those attending the lues venerea being obscurely noticed in them. He considers mercury as the sole specific in the cure of the lues venerea, and of the different ways of administering it, prefers that by injection. The author soon after published "Doutes sur l'Inoculation de la petite verole proposee a la Faculté de Paris," but without his name; and in 1759, "Traité des Tumeurs et des Ulceres, avec deux Lettres, 1. sur la composition des quelques remedes; et 2. sur la nature et le succés des nouveaux remedes qu'on propose pour la guerison des maladies venerieuses." In this work which has considerable merit, the author treats largely of hydatids passed off by stool and by vomiting, or

found in the livers of persons who have died tabid. He is one of the first writers who denies his assent to the opinion that marks, distortions, and mutilations of the bodies of infants, are occasioned by the imaginations of the mothers. In 1761, he published "Traité des Maladies des Femmes," 6 vols. 12mo.; this has been translated into English, as well as his "Art d'Accoucher, reduit a ses principes;" the last work he lived to finish. The author had tried the effect of cicuta, he tells us, in cancer, but without advantage; and thinks its reputation for resolving scirrhus had arisen from indurated glands of the breast which were taken for them, but were not scirrhus, having disappeared under its use. This opinion has been confirmed by later experience. On the whole, we find in this writer great marks of genius, as well as of labour and research, and he will be deservedly handed down to posterity as one who has contributed considerably to the improvement of the art of medicine. As early as the year 1743, he was admitted member of the faculty of medicine at Paris; he was a constant attendant at their meetings, and a zealous protector of their privileges. With an active mind, he had the good fortune to enjoy a strong and vigorous constitution, which enabled him to continue his professional exertions until within a very small time of his death, which happened on the 5th of May 1766, at the age of 82 years. In the second volume of the author's treatise "De Morbis Veneris," he has given a catalogue of all the writers who had treated on the subject before him, with brief sketches of their lives, and analysis of their works. This part appears to have been executed with fidelity, and has afforded us useful and valuable materials in our labours, as has likewise a posthumous work of the author, his "Memoires pour servir a l'Histoire de la Faculté du Medicine de Montpellier," published by Lorry in 1767, in 4to., and enriched with a beautiful coloured portrait of the author, and an account of his life. Hall. Bib. Med. & Chirur. Lorry Eloge Hist. de M. Astruc. One very singular work little noticed, and perhaps little deserving notice, as founded solely on speculation and conjecture, was his "Conjectures sur les memoires originaux dont il paroit que Moïse se servi pour composer le livre de Genese," Bruxelles, 1759. It does not appear that the works of this celebrated writer were ever collected and published together; but they are certainly deserving that attention.

ASTRUM, or ΑΣΤΡΟΝ, in *Astronomy*, a constellation or assemblage of stars. In which sense it is distinguished from *aster*, which denotes a single star.

Some apply the term, in a more particular sense, to the Great Dog; or rather to the great bright star in his mouth. Vital.

ASTRUM, in *Ancient Geography*, the name of a large town of the Peloponnesus, in the Argolide.

ASTRUNO, in *Geography*, a mountain of Italy, famous for its baths.

ASTRUP, a town of Germany, in the circle of Westphalia, and bishopric of Osnaburgh, four miles north of Osnaburgh.

ASTURA, in *Ancient Geography*, a river of Italy, and also an island, according to Pliny.—Cicero had a villa of this name near the sea, within view of Circæum and Antium, whither he retired, with his brother and nephew, when he first received at his Tusculan villa the news of the proscription in which they were included, and whence they proposed to transport themselves directly out of the reach of their enemies. Here Cicero found a vessel ready for him, in which he immediately embarked; but the winds being adverse, he was obliged to land at Circæum, near which he spent a night, in great anxiety and irresolution. The

question

question upon which he deliberated was, what course he should take; and whether he should fly to Brutus or to Cassius, or to S. Pompeius; but, after all his deliberations, none of them pleased him so much as the expedient of dying; so that, as Plutarch says, he had some thoughts of returning to the city, and killing himself in Cæsar's house; in order to leave the guilt and curse of his blood upon Cæsar's perfidy and ingratitude: but the importunity of his servants induced him to sail forwards to Cajeta, where he landed to repose himself in his Formian villa, about a mile from the coast; "weary of life and the sea, and declaring that he would die in that country which he had often saved." Hither he was pursued by the soldiers that were sent in quest of him; and though he fled into the woods, he was overtaken and put to death. Middleton's Cicero, vol. ii. p. 495.

ASTURA, in *Geography*, a good harbour on the south-west coast of Italy, about twelve or fourteen leagues south-east from the mouth of the Tiber, at the bottom of a bay east from port Neptune, and nearly east from mount Cereelli.

ASTURAGAMICOSK, a lake of Lower Canada, eighty-one leagues north-east of Quebec. N. lat. $50^{\circ} 25'$. W. long. $67^{\circ} 25'$.

ASTURIA, in *Ancient Geography*, a kingdom of Spain, subdued by the Roman emperor Augustus, after the people had long resisted, in connection with the Cantabrians, repeated attempts to reduce them under the Roman yoke. But at length the distress of famine was so great, that they determined to surrender; upon which the Cantabrians, who, desperate as their situation was, were resolved to renew their efforts, fell upon them, and compelled 10,000 of them to seek an asylum in the Roman intrenchments. Tiberius, however, refused to admit them into the camp; so that despairing of relief, some fell upon their own swords, others threw themselves into the flames which they had kindled for this purpose, and others dispatched themselves by poison. The surviving Asturians collected all their strength against the next campaign; but the utmost efforts of their valour and despair proved fruitless. Weakened by repeated defeats, they were under the necessity of submitting to the Roman power, till the subversion of that empire by the Goths. In the beginning of the eighth century Don Palayo restored the Spanish monarchy in the Asturias. Asturia, the capital of the Asturians, was, in ancient times, the famous "Colonia Augusta," mentioned by Pliney. This place divided the Astures into *Augustani* and *Transmontani*. The seventh Roman legion, intitled "Augusta Gemina," was settled between the Asturian sea and the capital of this district, called "Asturia Augusta," now ASTORGA. The country derives its name from the river Astura, and is now denominated "Asturias." It was formerly celebrated by the poets for the gold it produced.

ASTURIAS, in *Geography*, the ancient *Asturia*, a province of Spain, about forty-eight leagues long, and eighteen broad; bounded on the east by Biscay, on the south by Old Castile and Leon, on the west by Galicia, and on the north by the bay of Biscay. It is usually divided into two parts or districts called Asturia of Oviedo, and Asturia of Santillane; and hence it derives its plural name Asturias. The country is generally mountainous and rugged; and towards the south are the mountains which branch from the Pyrenées, and separate it from Old Castile and Leon; these are covered with extensive forests. The soil, however, produces a sufficiency of corn, great quantities of fruit, and excellent wine. Its horses are in great esteem, and maintain their reputation from the time of the Romans, who preferred them to all the other horses in Spain. The inhabitants,

who value themselves even at this day on the purity of their blood, and their descent from the ancient Goths, are poor, but honest, generous, brave, and laborious. The principal towns are Oviedo, Santillane, and San Andero. The eldest son of the king of Spain takes the title of the prince of Asturias, and bears the arms of the country.

ASTURICANI, in *Ancient Geography*, a people of Asiatic Sarmatia. Ptolemy.

ASTURASPES. A name formerly given to a river of Abyssinia, now called MAREB. It is one of the rivers represented by the ancients as forming the island of Meroe.

ASTY, a village of Egypt, mentioned by Diodorus Siculus; in the vicinity of Canopus, according to Steph. Byz.

ASTYAGES, in *Biography*, king of the Medes, was the son of Cyaxares, according to Herodotus (l. i. c. 74.) and Pausanias (l. v. c. 10. p. 398.); and began his reign, according to Blair's tables, in the year 585 B. C. Sir Isaac Newton (Chron. apud Oper. t. v. p. 222.) says, that Herodotus, followed by Pausanias, has inverted the order of the kings Astyages and Cyaxares; making Cyaxares to be the son and successor of Phraortes, and the father and predecessor of Astyages, the father of Mandane, and grandfather of Cyrus. Considering, he adds, that Cyaxares reigned long, and that no author mentions more kings of Media than one, called Astyages; and that Æschylus, who lived in those days, knew but of two great monarchs of Media and Persia, the father and the son, older than Cyrus, he concludes, that Astyages, the father of Mandane, and grandfather of Cyrus, was the father and predecessor of Cyaxares; and that the son and successor of Cyaxares, was called Darius. Accordingly, he says, that Astyages began his reign at the death of Phraortes, who was slain by the Assyrians in the year of Nabonassar 111., or 637 B. C., and reigned 26 years. According to Herodotus, Astyages married his daughter to a Persian nobleman named Cambyses. During her pregnancy he had a dream, signifying that the child that was to be born should rule over all Asia. This prediction alarmed him; and he determined to destroy the child. Harpagus, who was employed for this purpose, disobeyed the royal command, and intrusted the nurture and education of the infant Cyrus with one of the king's herdsmen. When Cyrus was ten years old, Astyages discovered the fraud, and caused the only son of Harpagus to be killed, and his flesh to be served up to him in a banquet. Harpagus for some time dissimulated his indignation at this act of barbarity, but waiting a favourable opportunity of revenge, he called Cyrus, arrived at manhood, from Persia, whither he had been sent to his real parents, and assisted him to revolt against his grandfather. Astyages was defeated; and caused the Magi, who had led him to imagine that the danger apprehended from his son's revolt was at an end, to be all impaled. In a second engagement he was defeated and made prisoner; upon which he was deposed by Cyrus, after having reigned 35 years, and the Medes were subjected to the Persians. Astyages was confined to his palace, but suffered to close his life by a natural death. Xenophon, in his "Cyropædia," a work which the best critics have considered more as a fiction than a true history, represents Cyrus as having been openly educated at the court of his grandfather Astyages, who retained the crown till his death, and was succeeded by his son Cyaxares II. Astyages has been reckoned by some the "Ahasuerus" of scripture. Anc. Un. Hist. vol. iv. p. 23. See MEDIA, and PERSIA.

ASTYANAX, in *Ancient History*, the only son of Hector and Andromache. Calchas, the soothsayer, predicted,

dicted, that if he lived to manhood, he would be more valiant than his father, and avenge his death. It was therefore determined to dispatch him in his minority. Andromache took pains for concealing him; but, it is said, that Ulysses discovered him, and precipitated him from the top of the Trojan walls. The death of Andromach is the principal subject of Euripides's tragedy of the Trojans.

ASTYONOMI, in *Antiquity*, were magistrates at Athens who had the inspection of the fleets, and also of players on instruments and buffoons. They were ten in number, and corresponded to the plebeian aediles of Rome. See **AGORANOMI**.

ASTYPALÆA, in *Ancient Geography*, an island of Asia, in the Cretan sea, where, according to Cicero (*De Nat. Deor.* l. iii. c. 19.), divine honours were rendered to Achilles. Steph. Byz. says, that this island, one of the Cyclades, was called Pyria when the Carians possessed it, and afterwards Pylea. Its name Astypalea, in its proper signification, means the "aer and city," and is said to be derived from that of the daughter of Phoenix and Pirameus, sister of Europa, and beloved by Neptune, by whom he had Ancæus, who reigned over the people named Delegi. Pausan. l. vii. c. 4. It was also called "Theotrapeza," i. e. the table of the gods, because its soil is fertile, and almost enamelled with flowers. It now bears the name of **STAMPALIA**.—Also, a town of the island of Cos. Strabo.—Also, a promontory of Asia Minor, in Caria, in the territory of Miusus. Strabo.—Also, a town of the island of Samos.

ASTYRA, or **ASTYRÆ**, a town of Æolis; but it no longer subsisted in the time of Pliny.—Also, a village of Asia Minor, in the Troada, near mount Ida, in the vicinity of which was a grove consecrated to Diana Astyrææ.—Also, a town of Phœnicia, in the neighbourhood of the isle of Rhodes. Steph. Byz.

ASTYRON, a town of Illyria, built by the Argonauts.

ASUADA, a town of Palestine. Not. Imp.

ASUCA BAY, in *Geography*, lies on the south part of the gulf of Sofala, on the S. E. coast of Africa, in the Indian ocean.

ASUM, in *Ancient Geography*, a town of the island of Crete (Pliny), the Asos of Steph. Byz. whence Jupiter derived the appellation of Asius.

ASUM, or *Ogim*, in *Geography*, a town of Africa, on the sea-coast of the kingdom of Adel.

ASUMATZ, a town of Walachia, eight miles east of Buchorell.

ASWAD, a town of Arabia, 28 miles south of Saada.

ASYLA, in *Ancient Geography*, a town of Spain, in the country of the Tartetani. Ptolemy.

ASYLUM, a sanctuary or place of refuge, where a criminal who shelters himself is deemed inviolable, and not to be touched by any officer of justice.

The word is compounded of the privative præfixe *α*, and *συλα*, *I horis*; because no person could be taken out of an asylum without sacrilege.

The first asylum was established at Athens, by the descendants of Hercules, to shelter themselves from the fury of his enemies; to serve as a refuge for children who fled from the ill treatment of their parents, and, as some have said, to be a sanctuary for suppliants in general. This is said by Statius, *Theb.* xii. and Servius, in *Æneid* viii. to have been the first asylum; others suppose that it was first built at Thebes by Cadmus, for the reception of all criminals. Pausan. l. vi. *Æn.* l. ii. v. 112. Eurip. *Hecuba*,

v. 146. In imitation of the asylum of Cadmus, Romulus established one between the two groves on the Capitoline mount, which was free of access to all criminals. The oracle of Delphos, according to Plutarch, sanctioned this political establishment of Romulus with its approbation. When Romulus enlarged his new city, which by this policy was stocked with inhabitants, the asylum was included within the walls, and those who had fled to it, being brought under some regulations, became citizens of Rome. Plut. in Rom. l. v. c. 19. *Them.* l. i. l. ii.

The temple, altars, statues, and tombs of heroes, were, anciently, the ordinary retreat of those who found themselves aggrieved by the rigour of the laws, or oppressed by the violence of tyrants; but temples were held the most sacred and inviolable refuge. It was supposed, that the gods took upon them to punish the criminal who thus threw himself upon them; and that it would be a great impiety in man to take vengeance out of the hands of the immortal.

The Israelites had their cities of refuge, which were of God's own appointment; where the guilty, who had not committed any deliberate crime, found safety and protection. As to the heathens, they allowed refuge and impunity even to the vilest and most flagrant offenders, some out of superstition, and others for the sake of peopling their cities; and it was by this means, and with such inhabitants, that Thebes, Athens, and Rome, were first stocked. We even read of asylums at Lyons and Vienna, among the ancient Gauls; and there are some cities in Germany which still preserve the ancient right of asylum.

Hence, on the medals of several ancient cities, particularly in Syria, we meet with the inscription **ΑΣΥΛΟΙ**, to which is added **ΙΕΡΑΙ**. This quality of asylum was given them, according to M. Spanheim, in regard to their temples, and of the gods revered by them.

The same qualities have also been given to deities: thus Diana of Ephesus is called **ΑΣΥΛΟ**. Add, that the camp, formed by Romulus and Remus, was called asylum, and afterwards became a city, in which was a temple erected to the god Asylius, *Gen. Asylius*. It appears from Plautus (*Motell.* v. 1.), that slaves had particular asylums: such was the temple at Athens; or the tomb of Theseus; because he never refused to avenge the oppressed, and to succour the wretched. The temple of Diana at Ephesus was an asylum for debtors. In process of time, asylums were multiplied, that it became necessary to regulate and reform them, in the reign of Tiberius, as we are informed by Tacitus (*Annal.* l. iii. c. 60.); and Suetonius (*Tiberii.* c. 37.) says, they were utterly abolished.

The emperors Honorius and Theodosius granting the like immunities to churches, the bishops and monks laid hold of a certain tract or territory, without which they fixed the bounds of the secular jurisdiction: and so well did they manage their privileges, that convents, in a little time, became next akin to fortresses, where the most notorious villains were in safety, and braved the power of the magistrature.

These privileges, at length, were extended not only to the churches and church-yards, but also to the bishops' houses, whence the criminal could not be removed without a legal assurance of life, and an entire remission of the crime. The reason of the extension was, that they might not be obliged to live abroad in the churches, &c. where several of the occasions of life could not be decently performed.

But, at length these asylums, or sanctuaries, were also stripped of most of their immunities, because they served to make guilt and libertinism more bold and daring. In England,

gland, particularly, they were entirely abolished. See JANUARY.

ASYMMETRY, derived from the privative *a*, *α*, *α*, with, and *μετρον, metron*, q. d. *without measure*, a want of proportion, or correspondence between the parts of a thing. See SYMMETRY.

In Mathematics, the word is more particularly used for what we more usually call incommensurability; which is when between two quantities there is no common measure: as between the side and diagonal of a square. In numbers, surd roots, as $\sqrt{2}$, &c. are incommensurable to rational numbers.

ASYMPTOTE, in *Geometry*, a line which continually approaches nearer and nearer to another; yet will never meet with it, though indefinitely produced.

The word is compounded of the privative *a*, *α*, *α*, with, and *μετρον, metron*, from *μετρον, I metron*, q. d. *measure*, or which never meet. Some Latin authors call this line *limitis*.

Various eminentes divers sorts of asymptotes; some straight, others curve; some convex, others concave, &c. and further, produces an infinite sort for describing them. Though in strictness, the term asymptotes seems appropriated to right lines. Asymptotes, then, are properly right lines, which approach nearer and nearer to some curve, of which they are said to be the asymptotes; but which, though they and their curve were indefinitely continued, would never meet: consequently asymptotes may be conceived as tangents to their curves at an infinite distance. Two curves are also said to be asymptotical, when they thus continually approach, without a possibility of meeting. Thus two parabolas, whose axes are in the same right line, are asymptotical to one another.

Of lines of the second kind, or curves of the first kind, that is, the conic sections, only the hyperbola has asymptotes, which are two in number, the properties of which have been long ago demonstrated by Apollonius Pergensis.

All curves of the second kind have at least one asymptote; but they may have three; and all curves of the fourth kind may have four asymptotes.

The conchoid, cissoid, and logarithmic curve, though not reputed geometrical curves, have each also one asymptote.

The nature of asymptotes will be easily conceived from the instance of the asymptote of a conchoid. Suppose MMAM, &c. (*Plate ANALYSIS, fig. 1.*) to be a part of a conchoid, C its pole, and the right line BD, to be drawn that the parts QA, EA, OM, &c. of right lines drawn from the pole C, are equal to each other; then will the line PD be an asymptote of the curve; because the perpendicular MI, &c. is shorter than MO, and MR than MQ, &c. so that the two lines continually approach; yet the points M, &c. and R, &c. can never coincide, since there is still a portion of a line to keep them asunder; which portion of a line is infinitely divisible, and consequently must be diminished infinitely before it becomes nothing.

ASYMPTOTES of the HYPERBOLA are thus described. Suppose a right line DE (*Plate I. CONICES, fig. 20.*) drawn through the vertex A of the hyperbola, parallel to the ordinate Mn, and equal to the conjugate axis, viz. the part DA, or AE, equal to the semi-axis: then two right lines drawn from the centre C of the hyperbola through the points D and E, viz. the right lines CF and CG, are asymptotes of the curve. The parts of any right line lying between the curve of the common hyperbola and its asymptotes, are equal to one another on both sides, that is $rm = MR$. Thus also, in hyperbolas of the second kind, if a right line be drawn, intersecting the curve and its three asymptotes in three points, the sum of the two parts of that right line ex-

terded in the same direction from any two of the asymptotes to two points of the curve, is equal to the third part, which extends in the contrary direction from the third asymptote to the third point of the curve.

If the hyperbola GMR (*Plate 12, N. 2.*) be of any kind whose vertex is at the centre, and whose parameter is expressed by the general equation $xy = a^2$; and the right line PM be drawn a parallel perpendicular to the asymptote CS, and the parallelogram P, OM be completed: this parallelogram is to the hyperbolic space PAKGB, contained under the diameter PK, the curve or the hyperbolic GM indefinitely continued toward G, and the part PB of the asymptote PK, as the square of the semi-axis, as $a - n$ is to n ; and for n less than a , the full space is finite, and equal to a^2 ; but when $n = a$, as it will be in the common hyperbola, the ratio of the foregoing parallelogram to that space is a to a^2 ; that is, is either greater than the parallel gram, and n cannot be of that sort; and when n is less than a , n may well be negative, and the parallelogram will be to the space as a negative number to a positive one, and the full space is called by Dr. Wallis more than infinite. See THEOREM.

ASYMPTOTE of a Logarithmic Curve. If MS (*Plate 33.*) be the logarithmic curve, PR an asymptote, PT the subtangent, and MP an ordinate; then will the indeterminate space RPMS = PM \times PT; and the solid generated by the rotation of this curve about the asymptote VP, will be half of a cylinder whose altitude is equal to the length of the subtangent, and the semidiameter of the base equal to the ordinate QV. See LOGARITHM.

ASYMPTOTES, are by some distinguished into various orders. An asymptote is said to be of the first order, when it coincides with the base of the curvilinear figure: of the second order, when it is a right line parallel to the base: of the third order, when it is a right line oblique to the base: of the fourth order, when it is a common parabola, that has its axis perpendicular to the base: and, in general, of the order $n + 2$, when it is a parabola, the ordinate of which is always as a power of the base, whose exponent is n . The asymptote is oblique to the base, when the ratio of the first fluxion of the ordinate to the fluxion of the base, approaches to an assignable ratio, as its limit: but it is parallel to the base, or coincides with it, when this limit is not assignable.

The determination of the asymptotes of curves, is a curious part of the higher geometry. M. de Fontenelle has given several theorems relating to this subject, in his "Geometrie de l'Infini." See also Stirling's "Liber tertii Criticis," Page xv. where the subject of asymptotes is elaborately considered; and Clamer, "Introduction a l'Analyse des Figures courbes," Part 147, &c. in which is given an excellent theory of geometrical curves and their branches. This subject is also treated admirably by Mr. Maclaurin, in his Fluxions, book the 2d, p. 120, where he has been careful to avoid the metaphysical notions concerning infinites and infinitesimals. The curves and lines by curves, and their asymptotes, that he has so extensively, sometimes have limits to which they may approach, so as to differ less from those limits than by any given quantity. This happens in hyperbolas of all kinds, except the first, or Apollonian. The same is also true of the new, compared between the logarithmic curve and its asymptote. See also the *curve*. The only defect of the part of the curve and its asymptotes, is that the part of the curve, that the infinitely extended line is equal to its limit.

The asymptotes of the common or Apollonian hyperbola, and in many other curves, has no limit; and it is usual to say, that the one is indefinitely greater by which, however, no more is meant, than that the curve, and its asymptote,

asymptote, may be extended, till the space comprehended between them exceeds any given magnitude. Some authors, and Dr. Wallis among the rest, have talked of some of these areas, as if they were more than infinite. This happened from an analogy they imagined between positive, nothing, and negative, and what is finite, infinite, and more than infinite. See *HYPERBOLA*.

Solids generated by hyperbolic areas, revolving about their asymptotes, have sometimes also their limits; and sometimes they may be produced, till they exceed any given solid. See art. 307. 309. of the above mentioned author. When a curve, and its asymptote, are supposed to be produced infinitely, and the area, comprised between them, to revolve about the asymptote, the surface generated will be finite or infinite, according as the area of the generating figure is finite or infinite.

For the asymptotes of curves, described by the intersections of right lines revolving about given poles, see Mr. MacLaurin's *Fluxions*, art. 313. seq.

ASYMPTOTE, Parabolic. See *PARABOLIC Asymptote*.

ASYMPTOTIC Spaces. See *HYPERBOLA*.

ASYNDETON, derived from the privative *σ*, and *συνδεδω*, *I bind together*, a figure in *Grammar*, implying an omission of words, or a defect of those particles that connect the members of a sentence with one another. The want of such particles represents either the celerity of an action, or the haste and eagerness of the speaker. As, in the instance, "veni, vidi, vici," "I came, I saw, I conquered;" in which Cæsar expresses his conquest of Pharnaces (Suet. in vit. c. 37.); where the copulative *et*, and, is omitted; or in that of Cicero concerning Catiline, "abiit, excessit, evasit, erupit;" "he is gone, departed, escaped, broke out:" or in that verse of Virgil,

"Ferte cito flammæ, date vela, impellite remos."

This concise mode of speaking adds a considerable emphasis to an expression; and, by bringing the several parts of a subject nearer together, affects the mind with greater force. Thus Cicero (pro Muræna. c. 29.) sets Cato's character in a very strong and beautiful light by the use of this figure. "Nature itself has made you a great and excellent man for integrity, gravity, temperance, magnanimity, justice, in a word, for all virtues."

Asyndeton stands opposed to *polyasyndeton*, where the copulatives are multiplied.

ASYNTE POINT, or *Roxa Steir*, in *Geography*, a cape on the west coast of Scotland, in the county of Sutherland. N. lat. 58° 13'. Long. 1° 58' W. Edinburgh.

ASYPHUS, in *Ancient Geography*, a mountain of Africa, in the Marmarica. Ptolemy.

ATA, or *ATATSCHAI*, in *Geography*, a rivulet of Persia, in the province of Schirwan, serving as a boundary to some of the districts into which it was divided.

ATABULI, in *Ancient Geography*, a people of Africa, placed by Pliny in the small island of Merocæ.

ATABULUS, in *Physiology*, a kind of wind in Apulia, of a dry pinching quality, and very noxious in its effects.

The ancient naturalists speak of the atabulus in terms of horror, on account of the ravage it made among the fruits of the earth, which it scorched, or withered up.

ATABYRON, in *Geography*, the name of a mountain in the island of Rhodes, whence the island itself was denominated *Atabyria*. The name is supposed to have been derived from Phœnicia, where Atabyr denoted a place of good pasture, and it was applied to the *TABOR* of scripture, belonging to the tribe of Zabulon. On this mountain was situated a temple of Jupiter, hence called *Atabyrius*, much celebrated by heathen historians and poets. Here, fabulous report says,

brazen oxen announced by their bellowings any approaching calamity. The fable is explained by supposing that the priests of this temple pretended to be endowed with the spirit of prophecy.—Also, a mountain of Sicily, so called on account of a temple of Jupiter Atabyrius, and of Minerva, that was erected on its summit.—Also, a town of Phœnicia, according to Steph. Byz.: or of Cæsaryria, according to Polybius.

ATACAMA, in *Geography*. See *ΑΤΤΑCAMA*.

ATACINI, in *Ancient Geography*, a people of Europe, in Gaul, who inhabited the banks of the Atax (Aude), whence their name, near the Volææ Tectofages, and north of the Saroni. Their capital was Narbo.

ATÆA, a town of Lacedæmon. Steph. Byz.

ATAHUUALPA, in *Biography*, the son of Huana Capac, the daughter of the sovereign of Quito, was appointed by his father, when he died in 1529, his successor in the kingdom of Quito; the rest of his dominions being bequeathed by him to Huascar, his eldest son by a mother of the royal race. The destination of Huana Capac concerning the succession, excited general disgust at Cusco; and Huascar, encouraged by his subjects, required his brother to renounce the government of Quito, and to acknowledge him as his lawful superior. Atahualpa, having secured in his interest a large body of troops which had accompanied his father to Quito, and which formed the flower of the Peruvian warriors, first eluded his brother's demand, and then marched against him in hostile array. This contest between the brothers involved Peru in a civil war, which terminated in the defeat and captivity of Huascar, and in the extermination of the royal race by the murder of all the children of the sun, as the descendants of Manco Capac were denominated, whom Atahualpa could seize either by force or stratagem. At this time Pizarro, the Spanish adventurer, arrived in Peru; and being solicited by messengers deputed by Huascar, to assist him in subduing his brother, who was represented as a rebel and an usurper, he directed his course towards Caxamalca, a small town at the distance of twelve days march from St. Michael, where Atahualpa was encamped, with a considerable body of troops. The reigning inca dispatched a messenger to Pizarro, as he was advancing, with a valuable present, offering his alliance, and assuring him of a friendly reception at Caxamalca. Pizarro, on his part, returned professions of regard, and a declaration that he was now advancing, as the ambassador of a very powerful monarch, with an intention to offer Atahualpa aid against those enemies who disputed his title to the throne. This pacific and friendly declaration removed the inca's fears; and Pizarro was allowed to march, without interruption, to Caxamalca; in his approaches to which he received renewed professions of friendship from Atahualpa, and additional presents. The perfidious Spaniard determined to avail himself of the unsuspecting simplicity with which Atahualpa relied on his professions, and to seize his person during the interview to which he had invited him. Accordingly he made preparations for this purpose; and as the inca drew near the Spanish quarters, with a numerous and splendid train, the friar Valverde advanced to meet him, with a crucifix in one hand, and a breviary in the other; and in a long discourse explained to him the doctrines of religion, and the authority of the pope, closing his harangue with a requisition, that the inca would embrace the Christian faith, acknowledge the supreme jurisdiction of the pope, and submit to the king of Castile as his lawful sovereign. This requisition was enforced by promises of protection, if he complied, and by threats of vengeance if he refused to obey the summons. The inca hesitated and demurred; he pleaded

his right to empire by hereditary succession; he expressed his surprize that a foreign priest should dispose of territories which did not belong to him, and without the consent of the rightful possessor; and he professed that he had no inclination to renounce the religious institutions established by his ancestors, and that he could not abandon the service of the sun, the immortal divinity whom he and his people revered, in order to worship the god of the Spaniards, who was subject to death. As to other matters, which he had never heard before, and the meaning of which he did not now understand, he desired to know where the priest had learned such extraordinary things: "in this book," replied Valverde, reaching out to him his breviary. The inca eagerly opened it, and turning over the leaves, lifted it to his ear: "this," says he, "is silent; it tells me nothing:" and he threw it with disdain to the ground. The enraged monk exclaimed to his countrymen; "to arms, Christians, to arms; the word of God is insulted; avenge this profanation on those impious dogs." The farce being now completed, the Spaniards rushed upon the innocent Peruvians, massacred many of them without mercy, and seized the person of the inca himself, who was detained in captivity. The dejected prince, anxious to regain his liberty, proposed a ransom, and such was the amount of it, that the Spaniards themselves were astonished, even after all they knew concerning the opulence of his kingdom. The apartment in which he was confined was twenty-two feet long, and sixteen broad; and the captive monarch proposed to fill it with vessels of gold as high as he could reach. Pizarro closed with the alluring proposal, and a line was drawn upon the walls of the chamber to mark the stipulated height to which the treasure was to rise. When this immense mass was nearly collected by the faithful attachment and active zeal of his subjects, the inca was allowed to sacrifice to his own safety the life of his captive brother Huascar: but though the Spaniards divided among them the rich spoil of Peru, the inca was continued in confinement. He now became an object of contention between the soldiers of Pizarro, and those that were newly arrived under Almagro; and the latter demanded his life, that there might be no pretext of inequality in sharing the future plunder of Peru, under the notion of its being the inca's ransom. Pizarro at length consented to sacrifice the inca; and after a mock trial, Atahualpa was found guilty, and condemned to be burnt alive. Friar Valverde prostituted the authority of his sacred function to confirm this sentence, and by his signature warranted it to be just. Astonished at his fate, Atahualpa endeavoured to avert it by tears, by promises, and by entreaties that he might be sent to Spain, where a monarch would be the arbiter of his life. Pizarro was unrelenting; and the inca was led to execution. Valverde attended him, and attempted to convert him to embrace the Christian faith, by a promise of procuring a mitigation of his punishment. The dread of a cruel death, at length, extorted from the trembling victim a desire of receiving baptism. The ceremony was performed; and Atahualpa, instead of being burnt, was strangled at the stake. This event happened A. D. 1533; and thus terminated the life and reign of the last inca of Peru. Robertson's *Hist. Amer.* vol. iii. p. 29—57.

ATAJA, in *Ichthyology*, a name given by some writers to a species of *SCILINA*, observed by Forkal. It is an inhabitant of the Red Sea.

ATAIR, in *Astronomy*. See *ALCAIR*.

ATAKKENI, in *Geography*, a town of Asiatic Turkey, in the province of Natolia, forty-four miles north-west of Eregrî.

ATALA, a small town of Sicily, in the valley of De-

mona, agreeably situate on the strait of Messina, between Messina and Taormina.

ATALANTA, in *Entomology*, a species of *PARTILO* that inhabits Europe, and of which a variety is found in America. The wings are black, indented, and spotted with white; a red band across the anterior pair; border of the posterior pair of the same colour. This is *PARTILO Atlantica* of most authors: English Auchenans call it the *red admirable butterfly*, and the French *Atlante*.

ATALANTA, in *Ancient Geography*, *Tutendi*, a small island in a canal formed by the sea between the island of Eubœa to the east, and the coast of Lœris to the west. The ancients, as Pliny, Eusebius, and Diodoras Siculus, have suggested that this tract of land was detached from the adjoining country.—Also, another island in the Saronic gulf.

ATALAYA, or *ATALAVA*, in *Geography*, a small town of Portugal, in the province of Estremadura, consisting of one parish with about 200 inhabitants. It is defended by a fortress on an eminence of difficult access; two leagues south of Tomar.

ATALENUM, in *Ancient Geography*, a town of Asia, in Armenia Major.

ATAMARAM, in *Botany*. See *ANNONA*.

ATAMASCO LILY. See *AMARYLLIS*.

AT-ANCHOR, in *Sea Language*, expresses the situation of a ship riding by her anchor.

ATANTA, in *Botany*, a name given by the people of Guinea to a kind of fumach, called by Peter Rhus *Gambosse trifoliatum ferratum scabium*, from its being trifoliate, and having rough and ferrated leaves. This somewhat resembles the hoary trifoliate African *fumach* of Plukenet, but it differs in this, that its leaves are edged with prickles, whereas those of Plukenet's kind are only deeply sinuated. The people of Guinea are very fond of this for its medicinal virtues; they give it as a restorative, boiled in water. Phil. Transf. N^o 232.

ATAPHYNI, in *Ancient Geography*, a people of Arabia. Steph. Byz.

ATARAXY, a term much used by the *Sceptics* and *Stoics*, to denote that calmness and tranquillity of mind, and that firmness of judgment, which sets us free from any agitations or emotions arising from self-opinion, and the knowledge we imagine ourselves possessed of.

The word is compounded of *αταξία*, but, and *ταξία*, order. In this ataraxy, they supposed the sovereign good, or highest bliss in this life to consist.

ATARNA, in *Ancient Geography*, a town of Mysia upon the Hellespont, over against the isle of Lesbos. In the time of Pliny it was no more than a village; he calls it Aterna; and in D'Anville's chart it is Atarnens.

ATAVILLOS, in *Geography*, a people of South America, in Peru, at the source of the river Xauca, at some distance from the Pacific ocean and from Lima.

ATAXIA, *αταξία*, in *Medicine*, a term which signifies irregularity or disturbance of action, from *α* pre-tive and *ταξία*, order. This term is applied to fevers, when they are irregular in their type; to the pulse, when it is fluttering and unequal; and to the operations of the sensorium commune, when they are hurried and confused. An atactic condition of the pulse and spirits, in acute diseases, is generally a sign of malignancy.

ATAXORA, in *Geography*, a town of Spain, in Navarre, four leagues from Olita.

ATBARA, a province of Abyssinia, the capital of which is Teawa, thirty-three miles north from Rabid, in N. lat. 14° 2' 4". The ancient river Atbaras is now called Atbara, and the province is, according to Bruce,

the ancient peninsula Meffe. The Davaia Arabs, who constantly live in tents, bear a mortal enmity to all who inhabit villages, and, as occasion offered, have laid waste the greatest part of Athara. The strength of Teawa, says Bruce, was about twenty-five houses, of which about ten were armed with coats of mail; and they had about a dozen firelocks. The rest of the inhabitants might amount to 1200 men, naked, miserable and despicable Arabs, like the rest of those that live in villages, who are much inferior to the Arabs that dwell in tents. In this desert and poor country, it is not to be expected that trade of any kind should flourish; but there is a miserable manufacture of coarse woollen cloths, of the size of large towels, sufficient to go round the middle, which pass current, like specie, all over Athara; they are called "Dunoor," and are used instead of silver money. The muskadee, a very bad copper coin, passes for smaller matters; so that the currency of Teawa stands thus:

20 mahalac,	1 crust,
12 crust,	1 metical,
4 metical,	1 vakm.

The value of gold is worth about forty-five shillings; but the only commerce of Teawa is carried on by exchange, as salt for grain, camels for salt; the value of goods varying according to the scarcity or plenty of one sort of commodities with respect to the other. Bruce's Trav. vol. iv. p. 406.

ATCHAIRSKOI, a fortress of Siberia, on the Irtysh, twenty-eight miles south-east of Omisk.

ATCHAK, one of the Fox islands, about 800 versts distant from the Aleutian isles; lying in 56° N. lat. and extending from W.S.W. towards E.N.E. It resembles Copper Island, and has a convenient harbour on the north.

ATCHE, in *Commerce*, a small silver coin, current in the states of the Grand Seigneur, equal to about a third part of the English penny. The atche is the smallest coin used in Turkey; where there is no copper money current, except in the province of Babylon. Some call the atche the little asper: it is stamped like the para, with Arabic characters. Three or four atches are commonly given in exchange for the para.

ATCHIEVEMENT, in *Heralry*, signifies the arms, crests, and supporters, which a person has a lawful right to bear, with all the exterior ornaments, as helmet, mantle, motto, &c. &c. See FUNERAL *Atchi-venants*.

ATCHEIN, in *Geography*. See ACHEEN.

ATCHI KOURIFI, a lake of America, in Labrador, which conveys its water southerly, through a connected chain of small lakes, into the river St. Lawrence.

ATCHINSK, one of the six districts of the province of Tomsk, in Russia, situate on the river Tchulym, falling into the Ob. The town is 424 miles E.S.E. of Tobolsk. N. lat. 56° 20'. E. long. 124° 36'.

ATE, derived from *ατασ*, in *Mythology*, the daughter of Jupiter, and the goddess of mischief. She was cast down from heaven by Jupiter, who, deceived by Juno in causing Euristheus to be born before Hercules, was incensed, and manifested his resentment against her, as the cause of the offence, by precipitating her from heaven, and swearing that she should never return thither. Homer, II. xix. 125. Mythologists explain the fable thus: Ate is the daughter of Jupiter, because evil happens by the permission of providence; and her banishment from heaven to earth signifies the dreadful effects of divine justice among men.

ATECA, in *Geography*, a town of Spain, in Arragon, upon the river Xalon, two leagues above Calatnaud: im-

posed by Cladius to be the ancient "Attacani" of the Celtiberians, cited by others as Daroca.

ATEGAR, a weapon among the Saxons, which seems to have been a hand-saw. The word comes from the Saxon *atona*, *to split*, or *to hew*; and *gar*, *a weapon*.

ATEGUA, in *Ancient Geography*, a town of Spain, situate near the river named "Flumen Sallur," or "Salufusa." Pompey having paid this river, encamped between Ucutis and Aregua, to oblige Caesar to raise the siege of the latter place; but it was taken in his presence. It occurs in the route from Anticilia to Hispalia.

ATEIA, a town of Asia Major, in the Palmyrene, Ptolery.

ATELEIA, in *Mythology*, denotes an exemption from tribute, tax, or other burdens.

Atellaria, *exemption*, is particularly used, in some *Ancient Laws*, for an exemption from offices, granted to the Egyptian clergy by Constantius.

ATELLA, in *Ancient Geography*, a town of Italy, in the Campania, north-west of Capua. It was first declared municipal, and afterwards became a colony. The ruins of this ancient city of the Oscans may be now seen two miles to the south of Aversa, at a place called "S. Aspino di Atella."

ATELLA, in *Geography*, a town of Italy, in the kingdom of Naples, at the foot of the Apennines, in the Basilicata, two leagues from Melph.

ATELLANÆ, in *Antiquity*, a kind of comic and satiric pieces presented on the Roman theatre; somewhat less ludicrous than the farces on the English stage, and yet less grave and serious than the Greek and Latin comedies and tragedies. The atellane, or fabule atellane of the Romans, answered to the satyre among the Greeks. They were thus called from *Atella*, a city of Tuscany, where they were first represented; and from whence, on account of their mirth and humour, they were introduced into Rome. But they became at length so licentious and impudent, that the senate was obliged to suppress them.

ATELLARA, or ATELLARI, in *Geography*, a river of Sicily, which runs into the sea between Syracuse and cape Puffaro.

ATELLUM, in *Ancient Geography*, a town of Italy, in Magna Græcia, north-west of Venusa.

A-TEMPO GIUSTO, in *Music*, implies a steady, just time; not very quick, but firm and exact. *A-tempo*, after relative, a pause, or *ritardando*, implies a return to the full time.

ATENA, in *Geography*, a small town of Italy, in the kingdom of Naples, situate on the river Negro, in the Principato Citra, ten miles west of Melfico Novo.

ATER, in *Ancient Geography*, a mountain of Africa, in the Syrtis Minor, which, according to Pliny, extended itself to a considerable distance from the east to the west, and was called by the Romans, "Mons Ater," because it was scorched by the heat of the sun. The mountainous tract, known to the ancients by the name of Mons Ater, is now denominated the "Black Hamatch."

ATIS, in *Conchology*, a species of *MYTILUS*, described in Molin. Hist. Chili, p. 177. and said to be frequent on the shores of that country. It is sulcated or grooved, with the posterior part fealy. Gmel. This shell is rough like some species of *pinnæ*; dull blue; fish black, and not eatable.

ATIS, a species of *STROMBUS* found in the boggy parts of the island of Amboyna. This shell is smooth, and has the lip separated before and behind. The length is about two inches; colour black, brown, or bay, and white within; very finely striated transversely; aperture ovate; spire subulate,

ulate, and consisting of twelve contiguous flattened whorls. Gmel. Litter, &c.—Müll. in his Hist. Vern. Fluv. et Terr. describes it as *Nemta testis subulata levi, apertura antice posticeque sinuata*.

ATER, in *Entomology*, a species of *DERMESTES* found in the neighbourhood of Upsal, and described by Dr. Thunberg, in Nov. Act. Ups. 4. p. 4. n. 4. It is glossy black, with the wing-cases thinly punctured. This is a small insect.

ATER, a species of *HYDROPHILUS*, a native of Europe. This is black and glabrous; antennæ and flanks reddish. Gmel.

ATER, a species of *BYRRHUS* that inhabits Germany, and in shape and size resembles *byrrhus pilula*. It is black and without spots. Fabr. This is *vispela nigra pilula glabra* of Geoffroy.

ATER, a species of *TENERIO* found in Europe. This is of a black colour, with ferruginous antennæ. Linn.

ATER, a species of *CARABUS* that inhabits Denmark. Black; wing-cases striated; claws somewhat ferruginous. Müll. Zool. Dan.

ATER, a species of *CERAMBYX* (*Callidium* Fabr.) found in the environs of Venice. It is black, with truncated wing-cases, and moderate antennæ. Scopoli. Gmel. &c.

ATER, a species of *GRYLLUS* (*Acha* Fabr.) that inhabits Surinam. The colour is dark brown, and the tail of the female is unarmed. Degeer Inf. 3.—Gmel.

ATER, a species of *CIMEX* (*C. hostriatus* Sc.). This insect is glossy-black, with the apex of the wing-cases very pale. Fabr. Mant. Inhabits Germany, and is about half the size of *cimex zeisterae*.

ATER, is also a species of *CIMEX* in the Linnean Fn. Sv. 944. The body is entire, and in Gmelin's arrangement it belongs to the section *oblongus*. Geoffroy describes it as being black and oblong, and the antennæ terminating each in a brittle or hair. Inhabits the north of Europe and Calabria.

ATER, a species of *CYNIPS*, described by Schrank among the insects of Germany, and which form and inhabit very large excrescences on the stems of plants. It is black, with elevated dots; tarsi of the legs paler.

ATER, a species of *BOMBYLIUS* described by Scopoli, Schæffer, &c. It inhabits Germany. The colour is black; base of the wings half black; abdomen spotted with white. Fabr. Spec. Inf.—Front of the head and thorax downy, and a white dot before each eye.

ATER, a species of *ASILUS* found in Europe. It is black and hairy, with a white beard. Fn. Sv. Scopoli calls it *erax prostratus*.

ATER, a minute species of *Ips* found in England by Mr. Kirby, and described by Mr. Marshall, Lit. Brit. It is subcylindrical and black; thorax dotted with impressed points, and carinated along the middle; wing-cases with crenate fibræ; soles of the feet pitchy black.—General colour black.

ATER, in *Natural History*, a species of *ANGUIS* or snake. It inhabits Ceylon; black, fasciated with white, and the scales tipped with black. Laur. Amp. This is *amphibaena ceylonica femina* of Seba; and *anguis ater*, black-banded slow-worm of Dr. Shaw.

ATER, a species of *LIMAX*, (slug or snail), the body of which is black and rugged. Müll. Gmel. Of this kind there are several varieties; the first (α) is black, and pale beneath; it is figured by Litter, exerc. anat. tab. liii. f. 1—5., and is probably *cochlea nuda* of Gesn. The second variety (β) is black, with a pale greenish dorsal ridge. The third (γ) is described by Swammerdam; it is

black above, white beneath, and the mouth yellowish. The fourth (δ) is *limax fibratus* of Litter; the colour of which is chestnut-brown above, white beneath, and mouth yellowish. The fifth kind is of an obscure brown, with a yellowish mouth and streak on each side.

These are found in woods, meadows, and gardens. The length is from an inch and four lines to five inches. The feelers are black in all; the shield rough, with many punctures; back and belly deeply furrowed or wrinkled.

ATER, in *Ornithology*, a species of *FALCO* that inhabits Europe. The cere and legs are yellow, body above brownish-black; and the head, whitish; tail forked. Gmel. This is a kind of kite, and is somewhat smaller than the common species, *nifrus*. Brul. calls it *milvus niger*; Buff. *nakan noir*; and Cræmer, *braunerwaldygeger*. It is also the black-gled of Sibbal, and black kite of Latham.

ATER, a species of *PSITTACUS*, of a black colour, glossed with green, with bill and eyes red, and yellow wings. This is the black macaw of English writers; *ara noir* of Buff.; and *ararauna ou machao de de Laët*, &c. It lives about the summits of the dry mountains and rocky places in the interior parts of Guiana, and in that respect differs from the other kinds of macaws found in that country. Buffon speaks of it as a species well known to the inhabitants of Guiana, but had never seen it; and observes, that though the plumage is black, it is so blended with green, that in the sunshine it has a most splendid appearance.

ATER, the Gmelinian specific name of the crested black cuckoo of Latham; a kind of *CUCULUS*, with a wedge-formed tail; body shining, black; feathers of the head elongated into a crest; and the first five quill-feathers white at the base. This bird is a native of Africa, being found at the cape of Good Hope, and it is conjectured may be only a variety of *cuculus ferratus*.

The length of this kind is twelve inches; the bill an inch and a quarter in length, and rather incurved. Buffon says in his specimen, the tail feathers are not regularly eunated. The same author supposes his *Jacobin huppé de Coromandel*, or *Coromandel crested cuckoo*, to vary only through the difference of climate.

ATER, a species of *PARUS*, that inhabits the woods of Europe and North America, and is known in England by the name of the colemouse. The head is black; back cinereous; back of the head and breast white. Gmel. &c. The bill and chin of this bird is black; vent, reddish; quill and tail feathers brownish-ash; legs and claws lead-coloured.

ATER, a species of *PARUS*, called in England the Colemouse. It is smaller than the blue titmouse, and is pretty common in woods, orchards, and gardens; feeds on insects, and lays a number of eggs. This bird is found throughout Europe, and inhabits likewise Siberia, and some parts of North America. Linnæus (Fn. Saec.) describes it specifically as having the head black; back cinereous; hind-part of the head and breast white. Scop. Cram. Gmel. &c. This is *parus atricapillus, la mesange a tête noire* of Brisson. av. et la *petite charbonnière* of Buffon; Fisch calls it *kohlmeise*.—General description. Length four inches; weight two drachms; bill black; throat, as well as the head, of the same colour; from the bill, on each side, a broad band of white passing just under the eye to the sides of the neck; between the breast and vent, rufous white; wing-coverts grey, tipped with white, forming two bands of that colour; quill and tail feathers brownish-ash, bordered with gray; tail rather forked; legs and claws lead colour.

ATERGATIS or **ATARGATIS**, called also *D. ater*, in *Mythology*.

Mythology, a goddess of the Syrians, supposed to be the mother of Semiramis. She was represented with the face and breasts of a woman, but the rest of her body resembled a fish. Vossius says the term signifies *without fish*, and conjectures that the votaries of this deity abstained from fish. According to Antipater, the Stoic philosopher of Tarsus, in his treatise on superstition, Atergatis is compounded of *atē*, *without*, and *Gatis*, the name of a Syrian queen, who being very fond of fish, forbade the use of it to her subjects; and the Syrians, it is said, did not eat fish. Fabulous report says, that Atergatis was taken with her son Ichthyus, by Mopsus king of Lydia, who drowned them both in a lake near Ascalon, where they were devoured by fishes; and hence, it is added, proceeded the horror of the Syrians against this sort of aliment. Atergatis, styled Derectus, says Bryant (*Anal. An. Myth.* vol. ii. p. 298.), is a compound of *Ater* or *Ahar*, the same as On and Osiris, an Egyptian deity, and of *gatus* or *catius*, rendered *χάτος* by the Iomans, a fish. Dagon, Sidon, and Derectus, were all names of the same hieroglyphic, and related to the person called Oanes by Berofus and others, and also to the machine wherein he was preserved. He lived both before and after the flood; he was represented at Babylon with two heads; and in other places he was differently exhibited. The meaning of which, according to this writer, was this, that though Oanes was really a man, yet he was typically esteemed an animal of the sea; and on that account they represented him with the skin and scales of a cetus or fish. All these characters were originally taken from hieroglyphics in Babylonia; they relate to the same history, and to one particular person who had escaped the waters when the earth was overflowed; and through whom arts and sciences were supposed to have been renewed in the world. Semiramis, whom the generality of historians have represented as a great princess who reigned in Babylon, is described by other writers as a deity. Thus Athenagoras (*Legatio*, p. 307.) says, that "the Syrians worship Semiramis;" and he adds, "that she was esteemed the daughter of Derectus, and the same as the Suria Dea." Diodorus also (l. ii. p. 92.) makes her the daughter of Derectus by Surus; but Surus, says Bryant, was the sun, and the Dea Suria was Dea Solaris. Hence, many have considered Rhea, Isis, Astarte, Atergatis, and Semiramis, as one deity. Lucian (*De Suria Dea*, vol. ii. p. 885.) tells us, that they were so esteemed by the Syrians of Hieropolis. According to Bryant, they were all different symbols relating to the same object. See SEMIRAMIS. It has been also supposed, that the Atergatis, or Derectus, of the proper Palestine in general, or of Ascalon in particular, was the Babylonian or Assyrian Venus. To this purpose Strabo (l. xvi. p. 748.) says, that Atergatis was worshipped at Hieropolis, and he makes her the same with the Syrian goddesses. Others are of the same opinion (Plin. H. N. l. v. c. 23.); and among them Macrobius (in Saturn. i. c. 23.), who styles her the mother of the gods, Astarte, and the Hieropolitan or Assyrian goddess. Upon the whole, we may observe, that Atergatis was Venus, Juno, Minerva, Astarte the Syrian goddess, and consequently the celestial Venus of the Assyrians. So that we see her the same goddess transported from the banks of the Euphrates, into which she is said first to have plunged herself, in order to escape the inexorable Typhon (*Man. Astron.* iv.); and but just varied so far as to leave room for each particular country to claim her origin. The Syrians, who seem to have received her first, and who were nearest to the place of her native abode, preserved her, it is likely, in the most genuine form; the Phœnicians, who were next, altered her no farther than to make her a Phœnician; and

the Philistines, or Ascalonites, who were a little farther off that they too might make her their own, converted her into a monster, woman upwards and fish downwards; they allowing her to have been in subordination to some other goddess, who had such power over her as to chastise her by a metamorphosis from her just shape. It appears, then, that the worship paid to this goddess was originally derived from Assyria and Babylonia, and was established in other countries by the prevailing power of these two empires. We may also conclude, that the celestial Venus of the Assyrians, Astarte of the Phœnicians, and the Derectus or Atergatis of the later Philistines, were all derived from Semiramis, the first real or reputed foundress of Babylon; who seems to have been translated into the queen of heaven the moon, as Belus or Pal, the first Assyrian monarch, was changed into the sun; that all the Jupiters and Junos, and the rest who are supposed to have been once mortal, or converted on earth, are derived from this source; and that, on this Assyrian or Babylonian foundation, the whole superstructure of the Greek polytheism and idolatry was erected. For the Greeks had their religion from the Phœnicians partly, and partly from the Egyptians, who derived theirs originally from the banks of the Euphrates and Tigris, as may be gathered from the religious state of the countries on either side of the Euphrates, in the days of Abraham. The Egyptians, indeed, seem in process of time to have erected a system of their own, though not very widely different from the Babylonians; and the Phœnicians, who had equally communication with the two nations, seem to have mixed both systems. See IDOLATRY, and POLYTHEISM.

ATERION, in *Ancient Geography*, a town of Sicily. Steph. Byz.

ATERRIUS, a town of Italy, in Samnium, belonging to the Marrucini, situate on the sea coast at the mouth of a river of the same name, now called *Pesicora*.

ATERRIMA, in *Conchology*, a species of NERITA, figured by Chemnitz. The shell is thick, opaque, globose, very black, with coloured lines; within white; exterior lip glabrous, inner one tuberculated. Gmel. &c. This kind is very minutely striated, and its habitat unknown.

ATERRINA, in *Entomology*, a species of BLATTA, of a black colour, and destitute of spots; the tarsi of the legs are white, knees brown, shanks spinous. Herbst. This inhabits India.

ATERRIMA, a new British species of CHRYSOMELA, described by M. Marshall, Ent. Brit. It is black and shining; thorax highly glossy; wing-cases striated; legs rather ferruginous.

ATERRIMUS, a species of CURCULIO, very common in Europe. This is black, with the wing-cases shining. Linn. Fn. Sv. Fabr. &c. Gmelin has also another species of Curculio under the same name; this is of an oblong form, and black colour, with rufous antennæ. It inhabits Europe, and it is presumed may be only a variety of Curculio chloropus.

ATERRIMUS, a species of CARABUS, entirely of shining black, with a rounded thorax; wing-cases faintly striated, with four excavated dots near the suture. Herbst. About half an inch in length.

ATERRIMUS, a species of ELATER, found in the north of Europe. The thorax is glossy black; wing-cases black and striated. Fabr. This is elater ater, thorace opaco punctato elytris striatis of Linn. Faun. Succ.; and elater totus niger nitidus of Geoffroy.

ATERRIMUS, a species of CIMEX, (*Rotundatus* Sec.) that inhabits Spain. This insect is deep black, with half the wing-cases transparent. Forst. Nov. Inf.

ATERRIMUS, a species of *SCARABÆUS* (*Cervina*). It is of a dull black, with obscure rufous spots on the wing-cases. Fabricius. It inhabits the cape of Good Hope.

ATERRIMUS, in *Ornithology*, the specific name of the great black Cockatoo of New Holland, a bird of a black colour, with a large and paler crest, and red naked cheeks. Gmel. This kind of *Psittacus* is called by Buffon kakatoès noir; and is the great black Cockatoo of Edwards, *Glean.* t. 316.

ATESIE, *ESTE*, in *Ancient Geography*, a Roman colony settled to the south-west of Patavium in the Venetian territory.

ATTIEH, or **ETTIEH**, in *Geography*, a burgh of Egypt, on the east coast of the Nile, 35 miles south of Cairo. It is situated at the foot of a mountain, upon a narrow canal, formed by a pretty large island. Some geographers have supposed that this town or village occupies the site of the ancient city of Venus, or *Aphroditopola*. N. lat. 20° 28'. E. long. 31° 8'.

ATFLOW, EDWARD, in *Biography*, studied at New College Oxford, where he took his degree of Doctor in Medicine in 1566, and was in much repute as a physician, particularly among those of the Romish persuasion. He was imprisoned several months, Am. Wood says, for corresponding with Mary queen of Scotland. The time of his death is not known.

ATH, **ΑΘΑ**, or **ΑΘΗ**, among our *Anglo-Saxon Antiquaries*, signifies an *orb*, especially that taken by way of purgation. In this sense we meet with breaking of *ath*, privilege of *ath*, *atka*, and *oraleth*.

ATH, in *Geography*. See **ΑΕΘΗ**.

ATHABASCA, RIVER, LAKE, and COUNTRY, lie in the north-west part of North-America, in about N. lat. 58° 40'. and W. long. 111° 40'. The ELK river is commonly called by the white people the Athabasca river, in N. lat. 56° 42'. In the territory that lies between the Peace river and the lake of the hills, as far as the Elk river which is formed by the quantity of earth and mud that is carried down by the stream of these two great rivers, there are several lakes; the Lake Clear Water, which is the deepest, lake Vassieu, and the Athabasca lake, which is the largest of the three, and whose denomination in the Knistimeaux language implies a flat, low, swampy country, subject to inundations. The two last lakes are now so shallow, that, from the cause just mentioned, there is every reason to expect, that in a few years they will have exchanged their character, and become extensive forests. This country is so level, that at some seasons it is entirely overflowed; and this circumstance accounts for the periodical influx and reflux of the waters between the Lake of the Hills and the Peace river. Till the year 1782, the people of Athabasca sent or carried their furs regularly to Fort Churchill, Hudson's Bay; and some of them have since that time repaired thither. The present trading establishment is situated on an high bank on the north side of the river La Pluie, in N. lat. 48° 37', where the people from Montreal meet those from the Athabasca country, and exchange trading with them. The traffic to fort Churchill is now in a great measure discontinued, as the Chippewyans were obliged to expend in the course of their journey that ammunition which was its most alluring object. See **CHIPPETYAN**. Mackenzie's *Voyages*, introd. p. 56—91.

ATHABASCA is by some called **ARATHAPESCOU**, and **ATHAPESCOU**, and **ATHAPUSCOU**.

ATHABOLI, or **ΑΓΑΘΟΡΟΛΙ**, a town of European

Turkey, in the province of Romania, 68 miles north-east of Adrianople.

ATHAMADULET, or **ATHAMADAULET**, the prime or chief minister in the Persian empire.

The athamadulet is much the same with the grand vizier in Turkey, except that he has not the command of the army, which the vizier has.

The athamadulet is great chancellor of the kingdom, president of the council, superintendent of the finances; and has the charge of all foreign affairs. He is in effect vic-roy or administrator of the kingdom; he issues the king's mandates, or orders, in this style: "Beude degra ali dhan etmadulet," that is, "I who am the support of the power, the creature of this post, the highest of all posts, &c."

ATHAMANIA, in *Ancient Geography*, a country of Greece, at the source of the river Achelous, in Achaia, according to Pliny; but in Illyria, according to Steph. Byz. Some have made it a part of Thessaly, and others of Epirus. According to Ptolemy, it was divided from Epirus by the bay of Ambracia; and according to Strabo, from Ætolia by the river Achelous. M. D'Anville places Athamania between the chain of the Pindus to the east, and a parallel chain to the west. In the midst of this valley ran the river Avas. To the south of this country were the Molossi and Aperantes, to the east the Perrhebi, and its capital was Argythæa. At their commencement the Athamanians were a very inconsiderable people; but they appeared with distinction in the wars of the Romans and Ætolians against Macedonia, towards the year 197, B. C. Livy relates that the Ætolians chose Aminander, king of the Athamanians, for their mediator in their contests with Philip, and that the Romans solicited his succour against this same Philip. Their dominion extended over the whole chain of the mountains of Epirus; and they seem to have subsisted at least a century before the war of Troy.

ATHAMANTIA, in *Botany* (named from Athamas in Thessaly). *Len. Gen.* 338. *Schreb.* 471. *Juss.* 223. *Oreofelinum*, *Tournef. Clafs.* *pentandria digynia*. *Nat. Order of umbellate*. *Generic Char.* Cal. umbel universal, manifold, spreading; partial has fewer rays; involucre universal, many-leaved, linear, a little shorter than the rays; partial linear, equal with the rays; perianth proper, obscure. *Cor.* universal, uniform; floscules all fertile; proper with five petals, inflex-emarginate, a little unequal. *Stam.* filaments five, capillary, the length of the corolla; anthers roundish. *Pist.* germ inferior; styles two, distant; stigmas obtuse. *Pist.* none; fruit ovate-oblong, striated, bipartite. *Seeds*, two, ovate, convex on one side, striated; on the other flat.

Ess. Gen. Char. Fruit ovate-oblong, striated. *Per.* inflex, emarginate.

Species, 1. *A. Jilantia*, mountain spignel, or stone-parsley. *With. Smith. Brit. Reliq. Cantab.* t. 113. *Eng. Bot.* 138. *A. Oreofel.* *Hudf.* "Leaves bipinnate, flat; umbel hemispherical; seeds hirsute." Root perennial, spindle-shaped, woody; stem about two feet high, erect, rather branched, smooth, angular and furrowed, leafy; leaves bipinnate, alternate; leaflets sessile, opposite, pinnatifid, flat, acute, veined, pale on the under side, a little hirsute; petioles dilated at the base with a membranous margin; umbels erect, hemispherical, close, and sometimes proliforous; involucre and involucre patent-deflex, beset with hairy leaves; flowers white, small, uniform, and regular; fruit pubescent; styles persistent, purple, divaricate. It grows on Gogmagog hills, Cambridgehire, and flowers in August. It is common in many parts of Sweden, Denmark, &c. 2. *A. arvensis*, broad-leaved spignel, or black hart-root. *Jacq.*

Aust. r. t. 69. "Leaves pinnate, decussated, gash-angled; seeds naked." Root perennial; stem five feet high, firm branching; leaves glaucous, smooth, with black veins underneath, and six pairs of pinnas. Most of the leaves are sessile, elliptical, acuminate, toothed; corolla white, with a purple outside. A native of the mountains of France, Switzerland, Germany, &c. 3. *A. sibirica*, Siberian spignel. Gmel. Sib. 1. 185. n. 3. t. 40. f. 1, 2. "Leaves pinnate, gash-angled." The descriptions of this plant by Linnæus, Gouan, and Scopoli, are so widely different, that we cannot suppose they mean the same plant. 4. *A. condensata*, close-headed spignel. "Leaves subbipinnate; leaflets imbricate downwards; umbel lens-form." Root perennial; stem simple, a foot high, angular, furrowed; leaflets alternately pinnatifid; umbel very close, convex on both sides, placed on branches arising at the axils. A native of Siberia. Introduced in 1773, by the earl of Bute. 5. *A. Oreofelinum*, Divaricate d spignel; "leaflets divaricate." Root perennial; leaves very large, firm, smooth, triply pinnate, divided at right and even obtuse angles; divisions broadish, not toothed, but two or three lobed; stem two feet high; petals white, with a blush of rose colour. A native of Germany, Sweden, France, &c. 6. *A. scutula*, flix-weed-leaved spignel. "Lower leaves shining, primordial umbels subsessile; seeds hairy." Root perennial; stems nearly three feet high. The umbels at their first appearance are very compact, but afterwards spread open and divide into several small umbels. The flowers are white, and succeeded by oblong woolly fruit. A native of Sicily. Cultivated in England in 1713. 7. *A. cretensis*, Cretan spignel or candy carrot, Jacq. Aust. 1. 62. "Leaflets linear, flat, hirsute; petals two-parted; seeds oblong, hirsute." The whole plant in its wild state is villose; when cultivated it becomes succulent, brittle, and very shining; stem streaked; leaves tripinnate; pinnules deeply two or three-parted. The universal involucre consists of five, the partial of from four to seven leaflets; petals white. A native of the south of Europe, flowering in June. The seeds have been medicinally employed for the same purposes as those of wild carrot (see *DAUCUS*). 8. *A. annua*, annual spignel. "Leaves many-parted, divisions linear, roundish, acuminate." It is a native of Candia or Crete, and was introduced in 1770, by Monf. Richard. 9. *A. chinensis*. "Seeds membranaceous, striate; leaves superdecoumpound, peltate, multifid." Stem angular, smooth; leaves like those of chærophyllum, and smooth; umbel not much expanded. A native of China. 10. *A. rupestris*, Villars Dauph. 2. 648. "Leaflets brittle-shaped, recurved, smooth; all the flowers fertile." Stem eighteen inches high; branching finely streaked; leaves bipinnate; universal involucre two, partial many-leaved; petals white; seeds downy. A native of Carniola and Dauphiné. Villars supposes this to be a variety of the seventh species.

Propagation and Culture. All these plants are propagated by seeds, which should be sown in a bed of light dry ground in autumn, and in the following autumn planted at a foot distance in a bed of light sandy earth, where the roots will continue several years, except the eighth species, which is an annual. The ninth has not yet been cultivated in England, and will probably require shelter.

ATHAMANTA Meum. See *ÆTHUSA Meum*.

ATHAMAS, in *Entomology*, the name given to a species of *PAPILIO* in Drury's Inf. that inhabits India and South America. It is *PAPILIO Pyrrhus* of Linnæus and Fabricius. See *PYRRHUS*.

ATHAMAS, in *Ancient Geography*, a mountain of Greece,

in Thessaly. Pliny.—Also, a plain of Bœotia, between Acrephnia and the lake Cephalus. Pausan. l. ix. Bœotic. c. 24.

ATHANÆ, a town of Arabia Felix. Pliny.

ATHANAGIA, a town of Hispania citerior, and the capital of the Ilorgeti, according to Livy, who relates the manner in which this town was subdued by Scipio.

ATHANASIA, among the *Ancient Physicians*, an epithet given to a kind of antidotes supposed to have the power of prolonging life, even to immortality.

In the Augustan dispensatory we still find a medicine under the appellation of *athanasia magna*, commended against dysenteries and hæmorrhages.

ATHANASIA, in *Botany*. Lin. g. 943. Schreb. 1279. Juss. 185. Gærtu. t. 165. Class, *syngenesia polygamia equalis*. Nat. Order, *compositæ discoidæ*. Gen. Char. *Cal.* common, imbricate, ovate; scales lanceolate, pressed close. *Cor.* compound, uniform, longer than the calyx; corollules hermaphrodite, equal, numerous; proper funnel-form; border five-cleft, acute, crested. *Stam.* filaments five, capillary, short; anthers cylindrical, tubular. *Pist.* germ oblongish; style filiform, a little longer than the stamens; stigma bifid, obtuse. *Per.* none; calyx unchanged. *Seeds*, solitary, oblong; down chaffy, of very short bristles. *Rec.* chaffy; chaffs lanceolate, longer than the seed.

Ess. Gen. Char. *Cal.* imbricate; down chaffy, very short; recept. chaffy.

Species, 1. *A. squarrosa*, cross-leaved athanasia, *rethania squarrosa*, L'Herit. Angl. n. 1. t. 29. "Peduncles one-flowered, lateral; leaves ovate, recurved." An undershrub. Leaves alternate, sessile, pointed, smooth; peduncles axillary, longer than the leaves; chaffs linear, the length of the florets. Introduced in 1774, by Masson. 2. *A. sessiliflora*, sessile-flowered athanasia, *Rel. lateriflora*, L'Herit. 60. "Peduncles one flowered, shorter than the leaf; leaves linear, hairy." A very small plant, found at the Cape by Thunberg. 3. *A. pumila*, dwarf athanasia; *Rel. pedunculata*, L'Herit. l. c. "Peduncles one flowered, longer than the leaf; leaves linear, hairy." This is also a small cape plant, discovered by Thunberg. 4. *A. crenata*, notch-leaved athanasia; "flowers solitary, terminal; leaves linear." Stem shrubby; leaves alternate, obscurely three-cornered; one terminal flower. 5. *A. uniflora*, one-flowered athanasia; *Rel. cucinata*, L'Herit. l. c. "Flowers solitary, terminal, sessile; leaves obovate, imbricate, smooth." A native of the Cape, discovered by Thunberg. 6. *A. capitata*, hairy athanasia; "flowers terminal, subsessile; leaves lanceolate, hirsute." This has the appearance of *bupthalmum capense*, but the leaves are alternate; the flowers are discoid and flosculose. A native of the Cape, and introduced in 1774, by Masson. 7. *A. maritima*. (See *SANTOLINA Maritima*.) 8. *A. genistifolia*, broom-leaved athanasia; *Rel. genist.* L'Herit. 60. "Corymbs simple; leaves lanceolate, undivided, naked, crowded." Stem undershrubby; leaves sessile, marked with very short lines, smooth, somewhat keeled, bluntish; corymbs small, with three or four subsessile flowers. 9. *A. pubescens*, villose-leaved athanasia; "corymbs simple; leaves lanceolate, undivided, villose." This rises six or seven feet high. Flowers yellow. 10. *A. annua*, annual athanasia; "corymbs simple, contracted; leaves pinnatifid, toothed." Root annual; stem about nine inches high, branched at the top; leaves smooth, cut into segments like those of buck's horn plantain; flowers of a bright yellow, large. Cultivated by Miller in 1768. (β.) *Achillea inodora*, Lin. Sp. Pl. 11. *A. trifurcata*, triid-leaved athanasia; "corymbs simple; leaves three-lobed, cuneiform." Shrubby; five or six feet high; leaves

leaves flat, glaucous, cut at the extremity into three segments; flowers of a bright yellow colour. Cultivated here in 1714. 12. *A. crithmifolia*, samphire-leaved athanasia; fantolina, Mill. fig. t. 227. f. 2. "Corymbs simple; leaves semitrid, linear," divided, more than half their length into three or five narrow segments; flowers yellow. Cultivated in 1726 by Miller. 13. *A. linifolia*, flax-leaved athanasia; "corymb simple; leaves linear." Stem round, smooth, like that of flax; leaves alternate, perfectly simple, linear, or sulcate, flowers in a terminal corymb ovate and smooth. Found at the Cape by Masson, and introduced in 1774. 14. *A. dentata*, tooth-leaved athanasia. (2.) *A. levigata*, Lin. Spec. 1181. "Corymbs compound; leaves recurved, the lower linear, toothed, the upper ovate-ferrate." Shrubby, three feet high, with pale yellow flowers. Introduced in 1780, by the countess of Strathmore. 15. *A. parviflora*, small-flowered athanasia; tanacetum crithmifol. Lin. Spec. 1182. Mill. Dict. N^o 6. "Corymbs compound; leaves pinnate, linear." Stem thick, shrubby, seven or eight feet high. The leaves sit close to the branches, which are terminated by roundish bunches of bright yellow flowers. It was introduced in 1774 by Masson. 16. *A. pinnata*. "Corymbs dense, compound; leaves pinnate, linear, tomentose." Stem proliferous, shrubby, tomentose; leaves covered with five or seven pinnae; calyxes villose. 17. *A. pedunculata*. "Corymb compound; leaves pinnate, smooth." Found at the Cape by Thunberg. 18. *A. dentata*. "Corymb compound; leaves lanceolate toothed, ferrate." Found at the Cape by Thunberg. This differs from the 14th, though it has the same name. 19. *A. filiformis*. "Corymb compound; leaves linear, smooth, spreading." This also was discovered at the Cape by Thunberg. 20. *A. cinerea*, lavender-leaved athanasia. "Corymb compound; leaves linear, tomentose, entire." Introduced by Masson in 1774. All the above species are natives of the cape of Good Hope, except the seventh, and they are all perennial except the tenth.

Propagation and Culture. These plants, with the exception of the annual sort only, may be propagated by cuttings or slips during the summer months, and planted in pots or upon an old hot-bed closely covered with glasses, shading them during the heat of the day, and occasionally refreshing them with water; they will put out roots in five or six weeks, and in two months they may be taken up and planted in pots filled with light earth, and placed in a shady situation until they have taken new root. After this they should be removed to a sheltered situation, mixing them with other exotic plants, where they may remain till the middle or end of October, when they are to be placed in a dry stove or glass case, where they are to be allowed as much free air as possible, but secured from frost. The annual species is to be propagated by seeds sown on a moderate hot-bed the latter end of March, and as soon as they are advanced enough to remove, they should be transplanted to another gentle hot-bed, at the distance of three inches from each other, observing to shade them till they have taken new root. About the end of May they will be strong enough to be transplanted into the open air, and some may be planted in pots to place among other exotics. The British species should be protected from the cold in severe winters. See Martyn's Miller's Dict.

ATHANASIAN CREED. See CREED.

ATHANASIUS, SAINT, in *Biography*, a celebrated Christian bishop, flourished in the fourth century, and was a native of Egypt, probably of Alexandria. History has transmitted to us no records of his parentage, nor of the precise time and place of his birth. The attention of his early years seems to have been principally devoted to theo-

logy; and having engaged in the service of the church, he was ordained a deacon by Alexander, bishop of Alexandria, whom he served as secretary, and accompanied to the council of Nice, and whom he succeeded in the year 326, in consequence of his special nomination, and by the general suffrage of the people. At this time he was probably about 30 years of age, for he speaks of the persecution of Maximin as an event which he had been informed of by his father, and he lived 46 years after his episcopal ordination. Having distinguished himself at the Nicene council, though then only a deacon, by a violent speech against Arius, he was no longer advanced to the prebey than he became a more zealous and powerful advocate in the cause of the Catholics against the Arians. Not content with reviling them and their opinion in the most opprobrious terms (see ARIANS), he employed his talents and influence in restraining and suppressing them. The Arians, on the other hand, were equally assiduous and active in counteracting the hostile efforts of the orthodox prelate, in reproaching his character, and in subverting his episcopal authority. As Athanasius could be induced, neither by the requisition of the emperor Constantine, nor by the menaces of Eusebius bishop of Nicomedia, to acquiesce in the re-admission of Arius to the communion of the catholic church, from which he had been excluded, the friends of the latter used all the means they could devise for disgracing and removing their adversary. Accordingly, in the year 331, they brought several accusations against him before the emperor. The prelate, after much hesitation and reluctance, was at length obliged to obey the emperor's peremptory commands, and to appear before a council of 60 bishops summoned at Tyre, in 335. Some of the charges that had been alleged against him were satisfactorily confuted; but others were confirmed. During the progress of the inquiry and trial, some members of the synod received Arius into communion at Jerusalem; and Athanasius himself seized an opportunity that occurred of sailing for Constantinople, to intreat an audience of the emperor. In consequence of this audience, the members of the council were summoned to appear before Constantine, that the cause might be fairly examined; but when they arrived, instead of renewing their former accusations, they produced a new charge, alleging that Athanasius had attempted to detain at Alexandria the ships which supplied Constantinople with corn, of which they were then in want. Upon this the emperor, from resentment, confusion, or policy, consented to his degradation; and the council pronounced against him a sentence of deposition and banishment. The place of his exile was Treves in Gaul; and here he remained, according to the most probable account, about 18 months. Upon the death of Constantine, Athanasius was restored by an honourable edict of Constantius to his country and to his episcopal see. This proceeding was reprobated by the Arians as an offence against synodical authority; and a council of 90 bishops was held at Antioch in 341, by whom the former deposition of Athanasius was confirmed, and Gregory of Cappadocia, one of their own party, placed in the see of Alexandria. The young emperor confirmed the nomination, and Athanasius was constrained to fly for protection and support to Julius, bishop of Rome. At the end of three years he was sent to Milan by the emperor Constantius, who was disposed to favour the Catholic party. A new council was appointed to be held at Sardica in Illyricum in the year 347, to settle the subjects in dispute. The eastern and western bishops disagreed and separated; the latter, who were the partisans of Athanasius, remained at Sardica; and the former assembled at Philippopolis. (See

party regarded him as a saint; and the other represented him as a wicked disturber of the peace of the church. Constantius, however, was intent upon restoring him, and peremptorily demanded it of his brother Constantius, threatening him with war in case of non-compliance. Constantius submitted, and solicited the return of the exiled prelate to take possession of the Alexandrian see, which was now become vacant by the death of Gregory. The bishop's zeal for the Catholic doctrine of the trinity was not in the least abated by all the reverses of his condition; for in his progress through the various cities that lay in his way to Alexandria, he admonished the people to avoid the Arians, and to admit into their communion none but those who adopted in their creed the word "consubstantial." In the year 350, he arrived at Alexandria, and was welcomed by his old friends and adherents with every expression of joy; and from this time he enjoyed a short interval of repose. The death of the emperor Constantius, and of pope Julius, to whom he was chiefly indebted for his restoration, threatened him with new dangers. Constantius was his determined enemy, and he summoned a general council at Aries, in the year 353; and in this council the Arian party prevailed, and all the bishops present, with one exception, signed the condemnation of Athanasius. As Liberius, the successor of pope Julius, was dissatisfied with the proceedings of this council, another was held at Milan in the year 355. Here the emperor exercised his utmost influence, and at length a majority of 300 bishops concurred in the condemnation of Athanasius, and those who refused were exiled by the authority of the emperor. The sentence of these councils, however, was cautiously executed by Constantius. The prelate was persuaded voluntarily to abdicate his see; but he remained inflexible, notwithstanding all the measures that were used for this purpose. During this suspension, a body of soldiers appeared in the midst of Alexandria, and at midnight they invaded the church in which the bishop and his attendants were performing their devotions preparatory for the communion. In this moment of confusion and terror, the prelate remained firm and intrepid, calmly expecting death, and animating the piety of his flock by ordering a psalm of praise to be sung. At length the congregation dispersed, and the bishop was conveyed through the tumultuous crowd to a place of safety. The see of Alexandria was bestowed by the emperor upon George of Cappadocia, a strenuous supporter of the Arian cause; and Athanasius was proscribed, with the promise of a large reward to any one who should produce him dead or alive. The persecuted prelate disappeared, and remained for six years in impenetrable obscurity. The place of his retreat was the desert of Thebais; and among monks or hermits anxious to preserve him from the search of his enemies, he found an unmoletted asylum. From this seclusion as he is said to have sometimes extended his excursions in disguise to visit his confidential friends at Alexandria. Hence he also addressed his enemies with invectives, and his friends with consolatory admonitions by his writings. The accession of Julian, who succeeded Constantius in 361, and the death of George, bishop of Alexandria, who was in the same year killed in a tumult, opened the way for a third return of Athanasius to the see of Alexandria. With unabated zeal for the Catholic faith, and particularly for the doctrine of the trinity, he summoned a council at Alexandria, at which it was determined, that Arian bishops, who recanted their errors, and signed the Nicene creed, might be admitted to the communion of the church, and restored to their sees. However, Athanasius's repose and influence were of short duration. The emperor Julian regarded him

with peculiar aversion; and in order to avoid the threatened tokens of his displeasure, the prelate was obliged again to seek an asylum in the monasteries of the desert. Whilst with this view he was sailing up the Nile, his enemies followed him; but as soon as the prelate was informed that they had orders to apprehend him, and knowing that he must soon be overtaken, he instructed the mariners to turn about the boat and meet his pursuers. Having no suspicion that Athanasius was on board, they prosecuted their voyage, and the prelate ascended to Alexandria, and concealed himself till the death of Julian in the year 363. Upon the accession of Jovian, Constantius once more resumed his episcopal function, and under the patronage of the emperor, the Nicene creed became the general formula of the churches. After the short reign of Jovian, Valens succeeded to the eastern division of the empire; and as he had adopted Arian principles, he issued edicts for banishing the bishops who had regained their sees under Jovian; and Athanasius was again in the number of those who were proscribed. The efforts of his friends at Alexandria were excited in his favour; but whilst they were preparing to defend him by force, he thought it most prudent to retire; and on this occasion, which has been denominated his sixth exile, he concealed himself for four months in the monument belonging to his family. The emperor relinquished the contest; and the venerable prelate closed his days in tranquility in the 46th, or as some say in the 48th year of his prelacy, and in the year of Christ 373.

It is not easy to form a just estimate of the talents, learning, and character of Athanasius, amidst the adulation of his friends, and the reproaches of his enemies. "The immortal name of Athanasius," says Mr. Gibbon, "will never be separated from the Catholic doctrine of the trinity, to whose defence he consecrated every moment and every faculty of his being."—"Amidst the storms of persecution, he was patient of labour, jealous of fame, careless of safety; and though his mind was tainted by the contagion of fanaticism, Athanasius displayed a superiority of character and abilities which would have qualified him, far better than the degenerate sons of Constantine, for the government of a great monarchy. His learning was much less profound and extensive than that of Eusebius of Caesarea, and his rude eloquence could not be compared with the polished oratory of Gregory of Basil; but whenever the primate of Egypt was called upon to justify his sentiments or his conduct, his unpremeditated style, either of speaking or of writing, was clear, forcible, and persuasive. He has always been received in the orthodox school as one of the most accurate masters of the Christian theology; and he was supposed to possess two profane sciences which are adapted to the episcopal character, the knowledge of jurisprudence, and that of divination. Some fortunate conjectures of future events, which impartial reasoners might ascribe to the experience and judgment of Athanasius, were attributed by his friends to heavenly inspiration, and imputed by his enemies to infernal magic. But as Athanasius was continually engaged with the prejudices and passions of every order of men from the monk to the emperor, the knowledge of human nature was his first and most important science."—"Athanasius was capable of distinguishing how far he might boldly command, and where he must dexterously insinuate, how long he might contend with power, and when he must withdraw from persecution; and while he directed the thunders of the church against heresy and rebellion, he could assume, in the bosom of his own party, the flexible and indulgent temper of a prudent leader. The election of Athanasius has not escaped the reproach of irregularity and precipitation; but the propriety of

of his behaviour conciliated the affections both of the clergy and of the people. The Alexandrians were impatient to rise in arms for the defence of an eloquent and liberal pastor. In his distress he always derived support, or at least consolation, from the faithful attachment of his parochial clergy; and the hundred bishops of Egypt adhered with unfeigned zeal to the cause of Athanasius. In the modest equipage which pride and policy would affect, he frequently performed the episcopal visitation of his provinces, from the mouth of the Nile to the confines of Ethiopia; familiarly conversing with the meanest of the populace, and humbly saluting the faints and hermits of the desert. Nor was it only in ecclesiastical assemblies among men whose education and manners were similar to his own, that Athanasius displayed the ascendancy of his genius; he appeared with easy and respectful firmness in the courts of princes; and on the various turns of his prosperous and adverse fortune, he never lost the confidence of his friends, or the esteem of his enemies."

The works of Athanasius were numerous, and consisted chiefly of apologies for himself, or invectives against his enemies, or controversial treatises against Arianism. His style is clear, easy, and not destitute of dignity and ornament. In his reasonings he is sufficiently copious; and in his attacks upon the Arians more than sufficiently arduous. The more valuable of his genuine writings are his first book "Against the Gentiles;" "Apologies;" "Letter to those that lead a Monastic Life;" "Letters to Serapion;" "Two books on the Incarnation;" "Conference with the Arians;" "The life of St. Antony;" and "The abridgment of the Holy Scriptures." The latter of these pieces contains an enumeration of all the canonical books of the Old and New Testament, with a summary of their contents, and an account of their respective authors; and it treats particularly of the four gospels. This "Abridgment or Synopsis of the Holy Scriptures" has been reckoned genuine by some; but it is supposed by others to have been falsely ascribed to him, and in the Benedictine edition of his works, it is rejected. His "Festal or Paschal Epistle," which is generally allowed to be genuine, contains several valuable testimonies in favour of the sacred books now received as canonical. Dupin, and also Cave, have distinctly enumerated both the genuine and spurious works of Athanasius. For an account of the creed that has been called Athanasius's, see *CRISTO*. The works of Athanasius were first printed only in a Latin translation, and in an imperfect state by Cassianus, at Vicenza, in 1482; and enlarged editions appeared at Paris, in 1520; at Rome, in 1523; at Cologne, in 1532; at Paul, in 1558; and at Paris, in 1608. The Greek text was first published in 2 vols. fol. by Commelinus, at Heidelberg, in 1601; and at Paris, in 1627. The best edition was printed in 3 vols. fol. by a learned Benedictine, Bernard de Montfaucon, at Paris, in 1698. This was reprinted with improvements, and an additional volume, at Padua, in 1774, 4 vols. fol. Socrates, E. H. Sozomen, E. H. Cave *Hist. t. i. p. 138.* &c. Dupin. *Fabr. Bib. Græc. l. v. c. 2.* Gibbon's *Hist. vol. iii. p. 322—356. vol. iv. p. 131—228—267.* Lardner's *Works, vol. iv. p. 280, &c.*

ATHANATI, an order of soldiers among the ancient Persians.

The word is Greek, and signifies *immortal*; being compounded of the privative *a*, and *θανάτος*, *death*.

The athanati were a body of cavalry, consisting of ten thousand men, always complete, because when any one of them died another was immediately put into his place.—It was for this reason that they were called "athanati" by the Greeks, by the Latins "immortales."

ATHANOR, sometimes corruptly written **ACANOR**, is a term derived from the Greek *Αθανορ*, *andyns*, and was applied by the ancient chemists to a species of furnace provided with a magazine of fuel, by which a long-continued heat might be kept up without the necessity of constant attendance. Some say that the word athanor is borrowed from the Arabs, who call an oven *tannour*, from the Hebrew *תנור*, *tannour*, an oven or furnace; whence with the additional particle *al*, *אלתנור*, *athanor*, &c. This apparatus was particularly used in those tedious alchemical processes which were deemed necessary, in order to convert the inferior metals into gold: hence it is not unfrequently described by the name *figæ harrivæ*. The patience of modern chemists being inferior to that of their predecessors, or rather being no longer upheld by the hope of riches, the most powerful, and at the same time, the basest of all motives, revolted from the idea of commencing experiments that demand weeks, and even whole months for their completion. Hence it is, that perpetual lamps and furnaces are now become obsolete.

The body of the athanor may be varied at pleasure, according to the particular purpose which it is intended to serve, but it is connected by the top, or one of the sides, with a hollow perpendicular tower communicating freely by one or more openings at its base, with the fire place. This tower is furnished with a moveable cover, which fits accurately, so as to be nearly air tight, into the top.

When the athanor is to be used, the fire place must be filled with the proper quantity of lighted charcoal, and then as much unlighted charcoal, in moderate sized pieces, as the tower will hold, is to be poured in by the top, which is afterwards to be carefully closed by its cover. In proportion as the fuel in the grate is consumed, the deficiency is supplied by that of the tower, which falls through the holes at the base, which while in the tower, having no communication with the external air, can only burn when it arrives at the grate below. The combustion is thus kept up till all the charcoal in the tower or magazine is consumed.

Although this furnace might still be advantageously applied in certain cases which require a long and moderate, rather than a short and violent heat, yet it is not without some inconveniences: the charcoal often sticks fast in the tower, and the fire goes out for want of a regular supply, or it falls irregularly, and by large quantities at a time, and beats the lighted charcoal through the grate into the ash-pit.

ATHAPUSCOW, in *Geography*, a large lake in the north-west parts of North America. Mr. Hearne, who traversed these parts in 1770, describes it as full of islands covered with tall trees, which appeared like masts. According to the report of the natives, it was 120 leagues long from east to west, and twenty wide. It is stored with a great number of fish, as pike, trout, perch, babbet, and two sorts called by the natives *tilamog* and *mathy*. The northern shore consists of confused rocks and hills, but the southern is level and beautiful; and there are many wild cattle and moose deer; the former, particularly the bulls, being larger than the English black cattle. The centre of this lake is placed by Mr. Hearne in N. lat. 62° and W. long. 125°. It is probably the same with the Slave Lake of Mackenzie, in the same latitude, but in longitude 115°. The Athapuscow River, which Mr. Hearne found about two miles in breadth, is the Slave River of Mackenzie. See *Slave Lake* and *River*.

ATHAR, in *Scripture Geography*, a city of Palestine, in the tribe of Simeon. *Josh. xix. 7.*

ATHAROTH, a town of Judæa, in the tribe of Gad.

given by Moses to the Israelites, on account of its excellent pasturage. Numb. xxxii. 54.—Also, a town of Samaria, in the tribe of Ephraim, four miles north of Sebaste or the city of Samaria; called by Jerome, Atharus;—and another on the frontiers of Ephraim, between Janobah and Jeneho, Josh. xvi. 7. probably the same with Ataroth-Addar, men-Josh. xvi. 5. xviii. 13.

ATHARRHABIS, a town of Egypt. Steph. Byz.

ATHBOY, in *Geography*, a market and poll town in the county of Meath, and province of Leinster, in Ireland, which, before the union, sent two members to the Irish parliament. At its weekly market, there has been a good deal of corn sold of late years; some yarn and merchandise for the peasantry. It has also four fairs, chiefly for cattle. It is situate twenty-eight Irish miles N. W. of Dublin. Thompson's Statistical Account of Meath.

ATHEE, in *Geography*, a town of France, in the department of the Mayenne, and chief place of a canton in the district of Craon, three miles north of Craon.

ATHEIST, derived from the privative *a*, and *θεος*, *God*, a person who does not believe the existence of a God, nor a Providence; and who has no religion, true or false.

In general, a man is said to be an atheist, who owns no being superior to nature; that is, to men, and the other sensible beings in the world.

In this sense, Spinoza may be said to be an atheist, and it is an impropriety to rank him, as the learned commonly do, among deists; since he allows of no other God beside nature, or the universe, of which mankind makes a part; and there is no atheist but allows of the existence of the world, and of his own existence in particular. See SPINOZA.

Plato distinguishes three kinds of atheists. Some, who deny, absolutely, that there are any gods; others, who allow the existence of gods, but maintain that they do not concern themselves with human affairs, and so deny a Providence; and others, who believe there are gods, but think they are easily appeased, and that they may remit the greatest crimes for the smallest supplication.

The learned Cudworth (*Intellectual System*, b. i. c. 3. vol. i. p. 104—178.) reduces the ancient atheism of the Greek philosophers into four different forms, comprehending the two classes of hylozoics or hylopathii, and atomici or atomists, under the denominations of Anaximandrian, Democritical, Stratonical, and Stoical. The Anaximandrians attempted to solve the phenomena of nature by having recourse to the unmeaning language of qualities and forms. These were contained actually or potentially in that infinite chaos of matter, destitute of all understanding and life, which was the first principle or only real nomen of Anaximander; and by their fortuitous secretion and segregation, they produced, first, the elements of earth, water, air, and fire, and then the bodies of the sun, moon, and stars, and both the bodies and souls of men and other animals; and, lastly, innumerable or infinite such worlds as these, as so many secondary or native gods. (Plato *De Leg.* l. x. p. 666.) See ANAXIMANDER, and ANAXIMANDRIANS. Some have called this scheme of atheism, which deduces all things from matter by means of qualities and forms, Peripatetic or Aristotelic, because Aristotle used this kind of language in his physiology. But as Aristotle cannot be justly denominated an atheist, Cudworth distinguishes this form of atheism by the appellation of Anaximandrian. Democritus and Leucippus new-modelled atheism from the Anaximandrian and Hylopathian into the atomic form, and derived the original and production of all things from atoms, devoid of all forms and qualities, and possessing only,

as first principles, magnitude, figure, life, and motion; and as they conceived that life and understanding, and other qualities, could be only accidental and secondary results from certain fortuitous concretion and contextures of atoms, they excluded a deity, and every thing like counsel and design from the formation of the universe. The Epicureans borrowed many of their notions from Democritus, and framed a system very much resembling the atomical or Democritical. See DEMOCRITUS, and EPICURUS. The Stratonical atheism was of the hylozoic kind; and was so called from Strato Lampiacenus, who acknowledged no other deity than a certain stupid and plastic life, belonging to all the parts of matter, by means of which they arranged and framed themselves, without reflection. See STRATO. The Stoical, or Pseudo-Stoical, or cosmoplastic atheism, adopted by several of the Stoics, supposed a certain kind of plastic and spermatic, or methodical and artificial nature, without sense or conscious understanding, to preside over the whole world, and to dispose and preserve all things in that regular order which they assume and maintain. Some of the Stoics conceived that this plastic nature, or spermatic principle, was subordinate to a sentient and intellectual nature, or corporeal soul and mind of the universe, that presided over it; and this seems to have been the genuine doctrine of Heraclitus and Zeno; whilst others rejected the latter principle, and maintained, that the plastic or spermatic nature, devoid of all animality or conscious intelligence, was the highest principle in the universe. All the ancient atheists agreed in this, viz. that there was nothing but matter or body in the universe; whilst some thought it animate, and were called hylozoics; and others thought it inanimate, and were denominated atomici. Hobbes seems to have inclined to the opinion of the Stratonici; for he supposes (*Phys.* c. 25. § 5.) that all matter, as matter, is endued not only with figure and a capacity of motion, but also with an actual sense or perception, and wants only the organs and memory of animals to express its sensation. Sir William Temple, according to the account given of him by bishop Burnet (*Hist. Time.* vol. i. p. 531, 8vo.) thought that the present system of things is necessary and eternal. The Chinese have been represented as a nation of atheists. Accordingly Burnet (*ubi supra*) states it as the opinion of sir W. Temple, that Confucius and his followers are to be reckoned among those who were atheists themselves, and left religion to the people. But Couplet maintains, that Confucius and the earlier teachers among the Chinese, were votaries to pure religion. Confucius, however, says little of those duties that relate immediately to God; and though he speaks of the great spirits in heaven and earth, what he says coincides merely with the notion of a plastic power, similar to that maintained by some of the Grecian philosophers.

Some distinguish *speculative* atheists, or those who are so from principle and theory—from *practical* atheists, whose wicked lives lead them to believe, or rather to wish, that there were no God.

Dr. Clarke (*Demonstration of the Being of a God*, p. 2. 8vo.) says, that atheism arises either from stupid ignorance, or from corruption of principles and manners, or from the reasonings of false philosophy; and he adds, that the latter, who are the only atheistical persons capable of being reasoned with at all, must of necessity own, that, supposing it cannot be proved to be true, yet it is a thing very desirable, and which any wise man would wish to be true, for the great benefit and happiness of man, that there was a God, an intelligent and wise, a just and good being, to govern the world. Whatever hypothesis these men can possibly frame, whatever

whatever argument they can invent, by which they would exclude God and Providence out of the world; that very argument or hypothesis, will of necessity lead them to this concession. If they argue, that our notion of God arises not from nature and reason, but from the art and contrivance of politicians; that argument itself forces them to confess, that it is manifestly for the interest of human society, that it should be believed there is a God. If they suppose that the world was made by chance, and is every moment subject to be destroyed by chance again; no man can be so absurd as to contend, that it is as comfortable and desirable to live in such an uncertain state of things, and so continually liable to ruin, without any hope of renovation; as in a world that were under the preservation and conduct of a powerful, wise, and good God. If they argue against the being of God, from the faults and defects which they imagine they can find in the frame and constitution of the visible and material world; this supposition obliges them to acknowledge, that it would have been better the world had been made by an intelligent and wise Being, who might have prevented all faults and imperfections. If they argue against Providence, from the faultiness and inequality which they think they discover in the management of the moral world; this is a plain confession, that it is a thing more fit and desirable in itself, that the world should be governed by a just and good Being, than by mere chance or unintelligent necessity. Lastly, if they suppose the world to be eternally and necessarily self-existent, and consequently that every thing in it is established by a blind and eternal fatality; no rational man can at the same time deny, but that liberty and choice, or a free power of acting, is a more eligible state, than to be determined thus in all our actions, as a stone is to move downward, by an absolute and inevitable fate. In a word, which way soever they turn themselves, and whatever hypothesis they make, concerning the original and frame of things, nothing is so certain and undeniable, as that man, considered without the protection and conduct of a superior Being, is in a far worse case; than upon supposition of the being and government of God, and of men's being under his peculiar conduct, protection, and favour. Nevertheless, absurd and joyless as is the system of atheism, Diagoras and Theodorus among the ancients, and Vanini among the moderns, have been reckoned martyrs for it. Mr. Bayle has pretended to prove, that it is better to be an atheist than an idolater; or in other words, that it is less dangerous to have no religion at all than a bad one. "I had rather," said he, "it should be said of me, that I had no existence, than that I am a villain." This, as Montelquieu (Sp. of Laws, vol. ii. p. 145.) justly observes, is only a sophism, founded on this, that it is of no importance to the human race to believe that a certain man exists, whereas it is extremely useful for them to believe the existence of a God. From the idea of his non-existence, immediately follows that of our independence; but if we cannot conceive this idea, that of disobedience. To say that religion is not a restraining motive, because it does not always restrain, is equally absurd as to say that the civil laws are not a restraining motive. It is a false way of reasoning against religion, to collect in a large work a long detail of the evils it has produced, if we do not give at the same time an enumeration of the advantages which have flowed from it. Was it of no advantage for subjects to have religion, it would still be of some if princes had it, and if they whitened with foam the only rein which can restrain those who fear not human laws. A prince who loves and fears religion is a lion, who stoops to the hand that strokes, or the voice that appeases him. He who fears and hates religion is like the

savage beast that growls and bites the chain which prevents his flying on the passenger. He who has no religion at all is that terrible animal, who perceives his liberty only when he tears in pieces, and when he devours. The question is not to know, whether it would be better that a certain man or a certain people had no religion, than to abate what they have; but to know which is the least evil, that religion be sometimes abused, or that there be no such restraint as religion on mankind.

Cicero represents it as a probable opinion, that they who apply themselves to the study of philosophy believe there are no gods.—This must, doubtless, be meant of the academic philosophy, to which Cicero himself was attached, and which doubted of every thing: on the contrary, the Newtonian philosophers are continually recurring to a Deity, whom they always find at the end of their chain in natural causes. Some foreigners have even charged them with making too much use of the notion of a God in philosophy, contrary to the rule of Horace—

"Nec Deus interit, nisi dignus vindice nodus."

Among us, the philosophers have been the principal advocates for the existence of a Deity. Witness the writings of sir Isaac Newton, Boyle, Ray, Cheyne, Nieuwentyt, &c. To which may be added divers others, who, though of the clergy (as was also Ray, yet have distinguished themselves by their philosophical pieces, in behalf of the existence of a God; e. g. Derham, Bentley, Whiston, Samuel and John Clarke, Fenelon, &c. So true is that saying of lord Bacon, that though a matter of philosophy may lead a man into atheism, a deep draught will certainly bring him back again to the belief of a God and Providence. See GOD, PROVIDENCE, and RELIGION.

ATHELING, among our Saxon ancestors, was a title of honour properly belonging to the eldest son of the reigning prince, or the presumptive heir of the crown.

The word is formed from the Saxon *atheling*, of *athel*, noble. It is sometimes also written, *adeling*, *edling*, *ethling*, and *etheling*.

King Edward the Confessor, being without issue, and intending to make Edgar, to whom he was great uncle by the mother's side, his heir, first gave him the honourable appellation of *atheling*.

Antiquaries observe, that it was frequent among the Saxons to annex the word *king*, or *ing*, to a Christian name, to denote the son, or younger; as *Edmundking*, for the son of Edmund; *Edgaring*, for the son of Edgar; and, accordingly, some have thought *atheling* might primarily import the son of a nobleman, or prince; and sir Henry Spelman observes, that all noblemen had anciently been called *Atlingi*; however, from a passage in the laws ascribed to Edward the Confessor, it appears, that in his times, and for at least a century afterwards, this word was appropriated to the royal family by the English. In reality, *atheling*, when applied to the heir of the crown, seems rather to denote a person endowed with noble qualities than the son of a nobleman; and corresponds to the *nobilis* among the Romans.

ATHELNEY, *Isl. of. in Geogr.*, a spot of rising ground, on the north side of *Stannool*, in the county of Somerset, about one mile E. N. E. of Taunton, founded on the north-west by the river Tone; over which is a wooden bridge, still called *Atldrey bridge*. The name given by the Saxons to this island was *Athelninga iges*, or the isle of nobles, whence was derived, by contraction, *Athelney*. It was formerly surrounded by almost impassable marshes and morasses, and will be for ever memorable for the retreat of king Alfred from the fury of the Danes, when they had overrun the eastern part of his dominions. Having bravely

encountered his enemies for nine successive years, according to the statement of the regiller of Athelney, he was at length reduced to the necessity of seeking refuge from their violence in this little island. After he had left this retirement, and his enemies were totally defeated, he founded a monastery for Benedictine monks, on the spot which had given him shelter, and dedicated it to the honour of St. Saviour and St. Peter the apostle, and endowed the establishment with the whole isle of Athelney (amounting to about two acres of firm land), exempt from taxes and all other burdens. In process of time other privileges and benefactions were conferred on the monks, and confirmed by different kings and nobles.

ATHELSTAN, in *Biography*, king of England, was of illegitimate birth, and yet, being of mature age and capacity, succeeded his father Edward the Elder, in preference to his lawful children, in the year 925. Soon after his accession, he marched to Northumberland in order to quell some commotions among the Danes, and conferred the title of king on Sithric, a Danish nobleman: but, upon the death of Sithric, when his two sons Anlaf and Godfrid, or Guthfert, assumed the regal authority without his consent, he expelled them both; one taking refuge in Ireland, and the other in Scotland. The protection afforded to the latter by Constantine, king of Scotland, brought on a war, which terminated so much to the disadvantage of Constantine, that he was obliged, for the preservation of his crown, to do homage to Athelstan. Hostilities, however, were renewed; and a confederacy was formed by Constantine, Anlaf, and some Welch princes, whose united forces were totally defeated by Athelstan, at Brunanburgh in Northumberland, A. D. 938. In consequence of this victory, the king of England enjoyed his crown without molestation; and having governed the kingdom with great ability, he died at Gloucester in 941, after a reign of sixteen years, and was succeeded by his brother Edmund. In this reign commerce was greatly encouraged, and a law was passed, conferring the rank ofthane on every merchant who had made three sea-voyages on his own account. Athelstan, with a view of further facilitating and promoting commerce, established a mint, or mints, in every town in England that had any considerable foreign trade, so that the merchants might have an opportunity of converting the bullion which they brought home for their goods into current coin, without much expence or trouble. These towns were London, Canterbury, Winchester, Rochester, Exeter, Lewes, Hastings, Chichester, Southampton, Wareham, and Shaftesbury. By these and similar regulations the shipping and seamen of England were so much increased, that Athelstan maintained the dominion of the sea, and obliged the Danish and Norwegian princes to court his friendship. Hume's Hist. vol. i. p. 102, &c. Henry's Hist. vol. iii. p. 94, &c. vol. iv. p. 225, &c.

ATHEMON, in *Entomology*, a species of PAPILIO. (*Pleb. rur.* Linn.; *Hesperia* Fabr.) The wings are entire and brownish.

ATHENA, in the *Ancient Physic*, a plaster or liniment, commended against wounds of the head and nerves, of which we find descriptions given by Oribasius, Ælius, and Ægineta.

ATHENÆ, in *Ancient Geography*. See ATHENS.

ATHENÆ is also a name given to various other places: as, a town of Arabia. Pliny.—Also, a place at the eastern extremity of the Euxine sea, where was a temple of Minerva. Arrian.—Also, a town of the Peloponnæsus, in Laconia. Steph. Byz. and Suidas.—Also, a place of Asia Minor, in Caria. Steph. Byz.—Also, a town of Greece, in Bœotia, situate on the river Triton, overwhelmed, according to

Strabo, by an inundation.—Also, a town of Acarnania; another of Liguria: another of Italy: and another of Sicily. Steph. Byz.

ATHENÆA, in *Antiquity*, a feast of the ancient Greeks, held in honour of Minerva, who was called *Aθην*. These were afterwards called PANATHENÆA.

ATHENÆA, in *Botany* (probably from Athenæus). Schreb. 661. Iroucana. Aubl. Guian. 127. Class, *ostandria monogynia*. Gen. Char. *Cal.* perianth one-leaved, colour'd, five-parted; parts oblong, acute, erect, spreading at top. *Cor.* none. *Stam.* filaments eight, filiform, erect; of which five are of the length of the calyx, the three alternate ones a little shorter; anthers sagittate; eight plumose bristles, shorter than the filaments, growing together with the filaments to a gland surrounding the germ. *Pist.* germ superior, ovate, surrounded at the base by an annular gland; style fetaceous, longer than the filament; stigma depressed, five-parted. *Per.* capsule globose, one-celled, three-valved; valves somewhat fleshy; seeds three to five, rounded, covered with a pulpy-coloured membrane, affixed to the receptacle in the bottom of the capsule.

Ess. Gen. Char. *Cal.* coloured, five-parted. *Cor.* none; bristles eight, feathered, between the filaments; stigma five-parted; capsule globose, one-celled, three-valved. *Seeds*, three to five.

Species, *A. guianensis*. Iroucanaguianensis. Aubl. l. c. t. 12. This is a branching shrub with a stem four or five inches in diameter, covered with a wrinkled gray bark; leaves alternate, ovate, smooth, toothed, deciduous, four inches long; petioles very short, having a small sharp stipule on each side of the base; flowers in bundles, from the axils, and upon the tubercles of the stem and branches, each on a peduncle; calyx white; there is no corolla; seeds covered with a viscid membrane, of a scarlet colour; the bark, leaves, and fruit are sharply aromatic; the lail, by the Creoles, is called *Caffè diable*. A native of Cayenne, and the neighbouring continent of Guiana, growing in a sandy soil, about half a mile or more from the shore.

ATHENÆUM, in *Antiquity*, a public place wherein the professors of the liberal arts held their assemblies, the rhetoricians declaimed, and the poets rehearsed their verses.

The word is derived from Athens, a learned city, where many of these assemblies were held; or from the name of Minerva, *Aθην*, goddess of polite arts and sciences; intimating, that Athenæum was a place consecrated to Minerva, or rather set apart for the exercises over which she presides.

The Athenæa were built in form of amphitheatres; and were all encompassed with seats, which Sidonius calls *cunei*.

The three most celebrated Athenæa were those at Athens, at Rome, and at Lyons; the second of which, according to Aurelius Victor, was built by the emperor Adrian, for the accomodation of the professors of the liberal arts, and of those who wanted to read their writings before a considerable number of people. It appears from the beginning of Juvenal's Satires, that this manner of reading in public was very common; and that Fronto lent the use of his house and gardens to the poets, who had occasion to recite their verses before a numerous audience. This was done by others; but as it belonged to the person, who wished to read his compositions, to furnish the room, and to pay the charge of the seats, it is probable, that the emperor Adrian, for the encouragement of works of taste and science, constructed the Athenæum with a view of obviating this inconvenience. Hence the name has been applied to all kinds of buildings or colleges intended for teaching the sciences and languages.

ATHENÆUS, in *Biography*, a Greek grammarian, was born at Naucratis in Egypt, and flourished in the third century. Suidas has erroneously referred him to the time of Antoninus Pius; but it appears from his own work (*Deipnosophist.* l. xii. p. 537. ed. Casaub.), that he wrote after the death of Commodus, and after the time of Oppian the poet. (*Ib.* l. ii. p. 13.) He was one of the most learned men of the age in which he lived; and, for the extent of his reading, and tenaciousness of his memory, he has not been improperly called the Varro, or Pliny, of the Greeks. The only work of this author extant is a valuable compilation from various writings, to which we have now no access, entitled *Δειπνοσοφισταί*, “*Deipnosophistæ*,” or “*The Table Conversation of the Sophists*.” In this work the author has introduced a great number of learned persons of all professions, and represented them as conversing together on a variety of subjects at the table of Larensius, a citizen of Rome. It contains a large collection of facts and anecdotes, forming a rich treasure of antiquities, which serve more to amuse the reader than to supply correct information. The author has interspersed with his several narrations many satirical reflections and scandalous stories, which tend to asperse and degrade the characters of the philosophers of whose names and writings he has given an account; and, therefore, the work, copious as it is in useful instruction, must be perused with caution. It consists of fifteen books; but of the two first, part of the third, and also of the last, we have merely an abridgment. Few works have suffered more from the carelessness of transcribers, and the negligence of editors. The first edition was published by Aldus Manutius, in Greek, at Venice, in 1514, fol.; and at Basil, in 1535, with a bad Latin translation by Natalis Comes. Dalechamp devoted his leisure hours, for thirty years, to the translation of Athenæus, which was published with annotations, by Casaubon, in folio, at Leyden, in 1583, 1597, 1612, and 1657. This work was also translated into French by Marolles in 1680. Casaubon mentions an abridgment of this work by an unknown author, and at a period which he could not precisely ascertain, though he supposes it to have been made before the time of Eustathius. *Præf.* Casaub. in *Athen.* Suidas. *Gen. Dict.* Fabr. *Bibl. Græc.* l. iv. c. 20. § 5—8. t. iii. p. 631, &c.

ATHENÆUS, a popular orator and Peripatetic philosopher, was born at Seleucia in Cilicia, had a share in the government, and was for some time a demagogue in his own country. In the time of Augustus he came to Rome, and became an intimate friend of Murena. He was charged with being concerned in his conspiracy; but the emperor not finding him guilty, set him at liberty. Upon his return to Rome after his flight on this occasion, he repeated to his friends these words of Euripides:

“*Ἦκον νεκρῶν κευθμῶνας καὶ σκόβη πύλας Λιπῶν.*”

“From death’s dread seats and gloomy gates I come.”

The manner of his death was tragical, as he was crushed by the fall of his house. Strabo, l. xiv. t. ii. p. 987.

ATHENÆUS, a mathematician, flourished about 200 years before Christ; but his country is unknown. His Greek treatise “*On Machines of War*,” dedicated to Marcellus, who took Syracuse in the 142d Olympiad, 212 B. C., is contained in the Collection of Ancient Mathematicians, published in folio at Paris, in 1693. Fabr. *Bibl. Græc.* l. iii. c. 24. § 1. t. ii. p. 587.

ATHENÆUS, born at Attalia, in Cilicia, in the 9th year of our æra, as M. Goulin conjectures, was the principal of the sect of pneumatics. Galen, who gives a particular account of the doctrines of these philosophers, says, they esteemed the qualities of cold and heat, moisture and dryness, as four

elements, entering into the composition of all bodies. To these a fifth was added, called spirit, to which Athenæus attributed the motion of the pulse. Spirit was also supposed to pervade and give life and energy to body. Galen represents Athenæus as a voluminous writer; no part, however, of his works remains, except some chapters preserved by Oribasius, which throw very little light on the manner in which he applied his doctrine to practice. Le Clerc, *Hist. de Med.*

ATHENAGARUM, in *Ancient Geography*, a district of India; supposed by major Rennell, from its situation, to be Oude.

ATHENAGORAS, in *Biography*, a Christian philosopher, was a native of Athens, and flourished towards the close of the second century. His youth was spent among the philosophers of his time; and removing from Athens to Alexandria, he became a convert to Christianity. The manner of his conversion, according to Philip Sidetes, a writer of the fifth century held in no high estimation, was as follows. Proposing to write against the Christians and desirous of rendering his work the more complete, he read the scriptures, and was thus converted. Philip adds, that he was the first president of the catechetical school of Alexandria, and master of Clement who wrote the Stromata. Little upon which we can rely is said concerning Athenagoras by the ancients, and his character and opinions are chiefly deduced from his own works. The principal of these was his “*Apology for Christians*,” addressed to Marcus Aurelius Antoninus, and Lucius Aurelius Commodus, whose names are prefixed to it, says Fabricius, in all the manuscripts; and probably written about the year 177 or 178. In this work he repels the calumnies of the pagans against the doctrines and manners of the Christians. He also explains the notions of the Stoics and Peripatetics, concerning God and divine things, and exposes with accurate and strong reasonings their respective errors. He discovers much partiality for the system of Plato, and supports his arguments by the authority of this philosopher, and hence he has been ranked among the Platonising fathers. In what he advances concerning God and the Logos, or divine reason, he evidently blends the doctrines of Paganism with the doctrines of Christianity. According to Athenagoras, God is undivided, indivisible, and distinct from matter; there are middle natures between God and Matter; from the beginning, God, the eternal mind, being from eternity rational, had the Logos within himself; the son of God is the reason of the Father in idea and energy; for since the father and son are one, by him and through him all things are made; the Logos was produced, that the ideas of all things might subsist, and they are contained in his spirit. On the imperfect and untractable nature of matter, on angels, demons, and other natures compounded of matter and spirit, and on other philosophical topics, Athenagoras reasons with all the subtlety of the Grecian schools, so that in every page he is seen to have been by profession a philosopher; and indeed he is said to have retained the name and habit of a philosopher with a view of gaining greater credit to the Christian doctrine among the unconverted heathens. In moral philosophy, he adopted the common austerities, particularly with respect to marriage. He represents celibacy as meritorious, and second marriages as legalised adultery. In Athenagoras’s “*Discourse of the Resurrection of the Dead*,” probably written after the “*Apology*,” he argues rather from reason than scripture, in order to prove the possibility and truth of a resurrection. His writings, upon the whole, manifest an happy union of Attic elegance with philosophical penetration; so that he is reckoned a polite writer, and his Greek is Attic, though his style is rendered less agreeable

by frequent parentheses. The two treatises of Athenagoras have been usually printed together, in Greek and Latin. They were published in 4to. at Paris, in 1541; by H. Stephanus, at Paris, in 8vo. in 1557; by Rechenberg, at Leipzig, in 1682, in 2 vols. 8vo.; by Fell, bishop of Oxford, with notes, at Oxford, in 1682, 12mo.; and with various notes by Becham, from the same Sheldon press, in 1706, 8vo. The romance under the name of Athenagoras, said to be a translation from a Greek MS. brought from the east, and published in 1599, and in 1612, in French by M. Fumée, intitled "True and Perfect Love, written in Greek by Athenagoras an Athenian philosopher, containing the discourses of Theognus and Charides, of Phereides and Melargenis," is a fiction; and was probably written in imitation of the Theognus and Charicles of Heliodorus, after the overthrow of Greece by Alaric, or the destruction of the Greek empire by the Turks. Cave, H. L. t. 1. p. 79. Lardner's works, vol. ii. p. 180. &c. Fabr. Bibl. Græc. t. v. c. 1. t. v. p. 85—91. Gen. Dict. Brucker's Hist. Philof. by Enfeld, vol. ii. p. 297.

ATHENATORIUM, among *Chemists*, a thick glass cover, placed on a cucurbit, having a slender umbo or prominent part, which enters like a stopple within the neck of the cucurbit.

ATHENIANS, in *Ancient Geography*. See **ATHENS**, and **ATTICA**.

ATHENIENSIVM PORTUS, or the port of the Athenians, was a harbour of Greece, between the port Bucephalon and the promontory of Spireum, on the eastern side of the Argolide, in the Saronic gulf.

ATHENION, in *Biography*, a Greek historical painter, who flourished in the year 300 before Christ.

ATHENIPPUM, in the *Ancient Physic*, a collyrium, commended against divers diseases of the eyes; thus denominated from its inventor Athenippus.

Its description is given by Scribonius Largus, and by Gorræus after him.

Galen mentions another athenippum, of a different composition, by which it appears, this was a denomination common to several collyriums.

ATHENIS, in *Biography*, a famous Grecian statuary, who flourished at Chio, about 538 years before Christ. See **BUPALE**.

ATHENODORUS, a Stoic philosopher, was a native of Cana, near Tarsus, in Cilicia, and the preceptor and friend of Augustus. During his residence at Rome, he was much respected by the emperor on account of his wisdom and probity, admitted into his confidence, and allowed to give him free and faithful counsel. Augustus, being addicted to gallantry, indulged a criminal passion for the wife of a senator, who was a friend of Athenodorus, and who communicated to him his distress. The philosopher availed himself of this opportunity of impressing upon the mind of the emperor a sense of the danger to which he exposed himself by such practices. Accordingly, he dressed himself in woman's clothes, and, providing himself with a poignard, put himself into the chair in which the lady was to have been conveyed. When he appeared before Augustus in this disguise, he said to him, "See, sir, to what danger you expose yourself! An enraged husband may arm himself in this manner, and revenge with your blood the injury you offer him." The admonition is said to have produced its designed effect; the emperor received it with deference; and he became more circumspect for the future. Zosimus (l. i. c. 6.) attributes the mild plan of government adopted by Augustus to the influence of the counsels of Athenodorus. Before he left the court of Augustus, he is said by Plutarch (*Apophthegm. Oper. t. 2. p. 207.*) to have warned the emperor against excess of passion, and, as a preservative,

to have advised him to rehearse the twenty-four letters of the alphabet, before he allowed himself to say or do any thing. Upon this, Augustus took him by the hand, saying to him, "I want your assistance still longer," and kept him for another year. Such was his interest with Augustus, that he obtained for his fellow citizens, the inhabitants of Tarsus, relief from some of the taxes which oppressed them; and on this account he was honoured by them with an annual festival. At an advanced age the emperor permitted him to return to his native country; and finding it distracted by factions, which had been excited by Boethus, whom Antony had invested with power, he exerted himself with prudence and firmness, in order to restrain and suppress them. By recruiting the exhausted funds of Tarsus, correcting the abuses which threatened its ruin, and introducing a new code of municipal law, he contributed to the revival and permanence of its prosperity. Having served his country faithfully during a prolonged life, he closed it with honour, and with the regret of his fellow-citizens, at the advanced age of eighty-two years. He was a considerable writer; and several of his works are cited by the ancients. Strabo says, (l. i. p. 6.) that he wrote concerning the ocean and its tides; and Stephanus (art. *Αθηνοδορος*) informs us, that he wrote the history of his own country; but none of his works are now extant. This Athenodorus is not the same who is mentioned by Suetonius (in Claud. c. 4.), as having been entrusted by Augustus with the charge of the education of Claudius Nero, afterwards emperor. Fabricius, however, asserts that they were the same person. Gen. Dict. Strabo, l. 14. t. ii. p. 991. Brucker's Hist. Phil. by Enfeld, vol. ii. p. 117. Fabr. Bib. Græc. l. iii. c. 15. t. ii. p. 391.

ATHENODORUS Cordylis, a Stoic philosopher of Tarsus, was probably a native of Pergamus, lived about 50 years before Christ, and was the intimate friend and companion of Cato of Utica. He was keeper of the public library at Pergamus; and having refused several solicitations to leave this retreat, he was at last prevailed upon by Cato, who visited Asia for this purpose, to join him in the war which he had undertaken for the restoration of Roman liberty. Cato is said to have valued himself upon the success of his application to Athenodorus, more than if he had shared the conquests of Lucullus or Pompey. Strabo says, that he lived and died with Cato. Fabricius suggests, that this Athenodorus was the author of a work against the Categories of Aristotle, mentioned by Porphyry, Simplicius, and Stobæus. Plat. in Vit. Caton. Oper. t. i. p. 665. Diog. Laert. Strabo, l. xiv. t. i. p. 991. Fabr. Bib. Græc. l. iii. c. 15. t. ii. p. 371.

ATHENODORUS, a famous ancient sculptor, who was born at Rhodes. According to Pliny, he was a scholar of Polyctetus, who flourished about the eighty-seventh olympiad, or 432 years before Christ. He was one of the three who jointly executed the famous group of Laocoon: the other two were Agelander and Poldore.

ATHENOPOLIS, in *Ancient Geography*, a town of Gallia Narbonensis, on the coast of the Massilians, between port Citharista and Forum Julii, according to Pliny. Its precise situation is not now known.

ATHENRY, in *Geography*, a borough town of the county of Galway, in Ireland, which gives name to a barony. Within an extensive circuit of dilapidated walls, and their ruinous towers, the remains of castles and abbeys, that are intermixed with the cottages of a now small village, present a monument of its former consequence. There are also many ruins of castles and churches in its neighbourhood. At this town was fought a battle between Fedlin O'Connor, prince of Connaught, an associate of Edward Bruce, and an English army under William de Burgo and Richard de Bermingham

Birmingham, in which, after a desperate engagement, the Irish were defeated with the loss of their prince and eight thousand men. This event happened in the year 1316. Distance from Dublin nearly 92 miles. W. Long. $8^{\circ} 40'$ $30''$. N. lat. $53^{\circ} 14'$. Bermsfort. Leind.

ATHENS, in *Ancient Geography and History*, a celebrated city, called by way of eminence $\alpha\theta\eta\nu\alpha$, or $\alpha\tau\eta$, the city, was the capital of Attica, and the seat of the Grecian empire. It was founded by Cecrops, about 1556 years before Christ, and from him called "Cecropia." It afterwards, as some say, in the reign of Erichthonius, about 1487 years B. C., or according to others, in the reign of Erichtheus, about 1397 years B. C. assumed the name of Athens, from Minerva, denominated by the Greeks $\alpha\theta\eta\nu\alpha$, and considered as the protectress of the city. Cecropia was seated upon a hill or rock in the midst of a spacious and fertile plain, partly with a view of securing it against piratical invaders, and partly to prevent its being overwhelmed by inundations, which were much dreaded in those ancient times. In process of time, as the number of inhabitants increased, the whole plain was covered with buildings, which were denominated from their situation, "the lower city," and Cecropia was called "Acropolis," or "the upper city." See ACROPOLIS. The old city, or citadel, was sixty stadia, or about $2\frac{1}{2}$ leagues in circuit; it was fenced with wooden pales, and as some say, set about with olive-trees; and it was also fortified with a strong wall, partly built by Cimon, the son of Miltiades, out of the spoils of the Persian wars, and situate on the south side of the citadel; and partly on the north side, by Agrolas and Hyperbius, who, according to Pausanias (in Attic. l. i. c. 28. p. 67.), migrated from Sicily to Acarnania, and denominated from them, who were called Pelasgi, the Pelasgic wall. The only entrance into the citadel was by one gate on the south-west, constructed at a great expence by Pericles, and denominated Propylæum. See PROPYLÆUM. The inside of the citadel was adorned with innumerable edifices, statues, and monuments, all of which it would be too tedious to recount. The most remarkable are the following.—At the entrance was a temple dedicated to Victory, adorned with paintings which were principally the work of Polygnotus, and constructed of white marble. Within the citadel were an immense number of statues erected by religion or gratitude, on which the chiefs of Myron, Phidias, Mecamenes, and other artists of renown, seem to have bestowed animation. Of these statues some were those of famous Athenian generals, such as Pericles, Phormion, Iphicrates, and Timotheus; and others, those of the gods. About the middle of the citadel were the magnificent temple of Minerva, denominated Hecatompedon, and Parthenon (see PARTHENON); and the temple of Minerva Polias and Neptune Erechtheus, one part of which was consecrated to the former, and the other to the latter.—On one side was exhibited the olive-tree which sprang out of the earth at the command of the goddess, and which so greatly multiplied in Attica; and on the other, the well, whence they pretend that Neptune caused the water of the sea to gush out. Thus these divinities are said to have contended for the honour of conferring their names on the rising city; but the gods decided in favour of Minerva, and the Athenians for ages preferred agriculture to commerce. Here, however, they have erected one common altar, which is called the altar of oblivion. Before the statue of the goddess was suspended a golden lamp, the work of Callimachus, which was supplied with oil once a year, the wick of which was made of amaranthus, and which burned night and day. The columns of the front of the temple of Neptune are

standing, together with the architrave; and also the screen and portico of Minerva Polias, with a portion of the cell retaining traces of the partition wall. The order of this building is Ionic. The portico is now used as a powder magazine, and near it is a battery commanding the town. The Turks use it to give notice of their ramazan and hafam, and on other public occasions. Contiguous to this temple was the Pandroseum. (See PANDROSEUM). Behind Minerva's temple was the public treasury, called ΟΡΘΟΘΡΟΝΟΣ, surrounded by a double wall.

The lower city comprehended all the buildings that surrounded the citadel, together with the harbours of Phalerum, Munychia, and the Piræus. The whole circuit of the city in its most flourishing state was no less, according to Anillides, than a day's journey; or, according to more exact computation, 178 stadia, or about 22 Roman miles. The port of Phalerum was connected with the city by a wall 35 stadia, or 14 league in length, built by Themistocles, of stones, faced by iron and lead, and forty cubits high; and that of Piræus was joined to it by a wall 20 stadia or 14 league long, and erected by Pericles. These were almost closed at their extremity by a third wall of 60 stadia; and they inclosed not only these two harbours, and also that of Munychia, which lay between them, but also a multitude of houses, temples, and monuments of every kind; so that the entire circumference of the city has been estimated at nearly 200 stadia, or above $7\frac{1}{2}$ leagues. In the wall that encompassed the city there were several gates, the principal of which were those of Ægeus, of Diocaris, of the Diomians, of Melite, of Acharna, of Hippades, of Thriaia, or Dipylon, of Itonia, sacred gate, and that of the Piræus. The streets of Athens were in general irregular, and the houses small and incommodious. Besides the rock of the museum, close to the citadel on the south-west, separated by a valley from the hill on which the Areopagus stood, other eminences contributed to render the city extremely uneven. In these hillocks they had several springs of water, but not sufficient, without additional wells and cisterns, for the supply of the inhabitants. The city was encompassed by the rivers Ilissus and Cephissus, which joined their streams in the marsh of Phalerum, and near the banks of which were several public walks, and also public and private buildings. The three harbours of Athens were the PHALERUM, MUNYCHIA, and PIRÆUS; for an account of which see the articles. The principal edifices and places of note in and about the city are the following:—Without the gate of Piræus is a cenotaph, erected by the Athenians in honour of Euripides, who died in Macedonia, on which is inscribed "the glory of Euripides has all Greece for a monument;" and within this gate is a stately building, called Pompeion, in which are kept the sacred utensils used at festivals, and from which commence the processions of young persons exhibited on occasions of this kind. In an adjoining temple dedicated to Ceres are admirable statues of that goddess, Proserpine, and young Iacchus, executed by Praxiteles. In the street leading from the Piræus to the citadel, are numerous porticoes, some of which stood detached, and others contiguous to buildings, to which they gave a vestibule. To the left of this street is the quarter of the Pnyx, which was very populous; and contiguous to this was that of the Ceramics, or pottery ground, so called from the earthen ware formerly fabricated there. This extensive space was divided into two parts; one without the walls, where the acclivity was situated; and another within, in which was the great square or forum. In the royal portico, where the council of the arens held his tribunal, and where the arens presided

sometimes assembled, were several statues, such as those of Pindar, Conon, Timotheus, and Evagoras king of Cyprus. Near the royal portico was that of Jupiter Liberator, where Euphranor the painter had represented in a series of pictures the twelve gods, Theseus, the people of Athens, and an engagement of the cavalry, in which Gryllus, the son of Xenophon, attacked the Thebans commanded by Epaminondas. The Apollo of the adjoining temple was the work of the same master. From the royal portico two streets branch out, and terminate in the forum: that on the right was decorated by a number of *Hermæ*, or heads of Mercury supported by pedestals, erected for recording some glorious achievements, or for inculcating some lessons of wisdom. This street is terminated by two porticoes that front the forum; the one, that of the *Hermæ*; the other, and the most handsome, is called the *Pœcile*, at the gate of which was the statue of Solon. The walls within the *Pœcile* were covered with bucklers taken from the Lacedæmonians and other nations, and enriched with the works of Polygnotus, Micon, Panœus, and other celebrated painters. The forum, which was extremely spacious, was decorated with buildings destined to the worship of the gods, or the service of the state, or as places of asylum to the wretched; and statues of kings or individuals who had merited well of the republic. An adjoining square contained a temple in honour of the mother of the gods, with a statue of her by Phidias; and the palace in which the senate assembled. In the temple of Mars, at a small distance, was a statue of that god, executed by Alcamenes, a pupil of Phidias.

In the middle of the city, between the forum and the citadel, was the temple of Theseus, built by Cimon some years after the battle of Salamis; it was smaller than that of Minerva, but built after the same model; like that, it was of the Doric order, and an elegant structure. It was enriched by the labours of skilful painters; and the remains of it are to be seen at this day. It was allowed the privilege of being a sanctuary for slaves, and for all persons of mean condition who fled from the persecution of men in power; in honour of Theseus who, whilst he lived, was the protector of the distressed. Near to the temple of Theseus, Pausanias places the temple of the Dioscuri, or of Castor and Pollux; and above this temple was the grove of Aglaurus, situate under the Acropolis. Near to this grove, north of the Acropolis, was the Prytaneum, where citizens who had rendered signal services to the state, were maintained at the public expence. See *PRYTANEUM*. Beyond this building, on the north-east side of the citadel, was the street of the Tripods, or the street of triumphs, in which were temples and houses containing tripods of brass, which were dedicated by those who had been victorious in the contests that subsisted among the poets, musicians, and dancers. In one of these edifices was the famous satyr, called by the Greeks *Περίφορος*, esteemed by Praxiteles himself one of the finest of his productions, and ranked by the public among the master-pieces of art. The street of the Tripods led to the theatre of Bacchus, where the people sometimes assembled to deliberate on affairs of state, or to be present at the representation of tragedies or comedies; and opposite to this theatre was the temple of Bacchus, one of the most antient temples of Athens; it was situated in the quarter of *Limnæ*, or Marshes, and was opened only once a year. Between the street of the Tripods and the theatre of Bacchus was the Odeum, built by Pericles for musical competitions. (See *ODEUM*.) In the quarter of the marshes, south of the citadel, was the temple of the Olympian Jupiter, begun by Pisistratus, continued by several succeeding governors,

and finished in the time of Adrian. The ruin of this temple consists of very large and beautiful columns of the Corinthian order, fluted, about six feet in diameter and sixty in height. The temple of the Pythian Apollo lay to the north-west of that of Jupiter Olympius, and nearer to the citadel; and near to the Propyleum, at the bottom of the citadel, on the north side, is the temple of Apollo and Pan, in a grotto or cave, where Apollo is said to have despoiled Creusa, daughter of king Erichtheus. Besides these there were several other temples, such as the temple of Diana, that of the Eight Winds, and the Pantheon dedicated to all the gods. (See *PANTHEON*.)

Without the city, between the wall and the river Ilyssus, was the *dromos* or stadium (see *STADIUM*, and *CYNOSARGES*). Beyond the Ilyssus, and to the east of the Stadium, was mount Hymettus, and the district called *Agæ*, in which were the temples of Ceres, and of Diana Agrotera, or the huntress. Above this were the Gymnasia of the Lyceum (see *LYCEUM*), and of the Cynosarges. To the north-west, in the Ceramicus that lay without the city, and distant from it about six stadia, was the Academy. (See *ACADEMY*.) Beyond the Academy was a hill called *Colonus*, on which Sophocles laid the foundation of his *Œdipus Colonus*. The river Cephissus enriched this district with its waters, though in summer this stream, and also the Ilyssus, were occasionally dry.

The topography of ancient Athens, given by Pausanias, so far corresponds to those remains, whose names and situations have been described by modern travellers, as to afford a strong presumption of its accuracy; and it affords a kind of standard by which the correctness of other descriptions may be estimated. In order to form a just notion of his plan, it is necessary to consider the stations from which his routes commenced; and these will appear to be in a natural order, and to have embraced in the most comprehensive manner the whole of the city of Athens. His two principal stations were the Ceramicus and the Prytaneum; and his routes from the former station noticed those parts that lay to the north-west, and those from the latter such as were situated to the north, east, and south of the Acropolis. Having arrived at Athens from the Piræus, and passing through the outer Ceramicus and the city gate, he entered the inner Ceramicus, which was his first station. On the right hand, he says, is seen the royal porch, and he there enumerates among other objects, the temple of the mother of the gods; the senate-house of five hundred; the *Thelus*; the temple of Mars; the Odeum; the fountain called *Enneakrounos*; the temple of Ceres and Proserpine; and another. Pausanias having finished his first route, without describing any objects in returning, commences his second, which appears to be very short; remarking only the temples of Vulcan, and of Venus Urania, above the Ceramicus, and which may be supposed to have been northward of the gate Dipylon. He then proceeds to say, that the traveller, directing his course to the *Pœcile* or *Poikile*, will observe the several objects in the following order: besides others, the Market place, the Gymnasium, the temple of Theseus, the temple of the Dioscuri, and the grove of Aglaurus: the temple of Theseus still remains. According to the order of Pausanias, we must look for the *Poikile*, the Market place or forum, and the Gymnasium, between the gate Dipylon and the temple. According to Pausanias, the temple of the Dioscuri was near to that of Theseus; and above the temple of the Dioscuri was the grove of Aglaurus; and as this grove was under the Acropolis, it must have been between that place and the temple of Theseus, or nearly between the
Acropolis

Acropolis and the hill of the Areopagus. Near to the grove of Aglaurus was the Prytaneum, north of the Acropolis, and this was the second station of Pausanias. The first route from this station is explained as descending from the Prytaneum to the lower parts of Athens; and it includes the temple of Serapis, of the goddesses Lucina, of the Olympian Jupiter, and the Delphinian Apollo, the Gardens, the Lyceum, the river Illyssus, the temple of Diana the huntress, and the Stadium. Without describing any objects in his return from the Stadium to the Prytaneum, Pausanias commences his second route from that station by the way called Tripodes, in which, he says, there are temples, tripods, and other works deserving notice; and, in the following order he mentions the temple of Dionysius, the temple of Bacchus, the imitation of the tent of Xerxes, the theatre of Bacchus, the wall called Southern, the tomb of Calus, the temples of Æsculapius, of Themis, of Earth, and of Virid Ceres; and then enters the Propylea of the Acropolis. Within the Acropolis, he describes, among other objects, the Parthenon, the temples of Erectheus, Polias, and Pandrosus; and his descriptions agree so exactly with the remains found there, that this part of his topography affords an evidence of his precision in other respects. He then passes from the Acropolis over the Areopagus, thence to the tombs, and to the Academy; and this route is in the order of their situation; for he had before passed under the north-east side of the Areopagus, in his route from the temple of Theseus to the Prytaneum. The tombs, which are in the neighbourhood of the Museum, according to Dr. Chandler, were evidently in the situation to which Pausanias alludes; and the academy is known to have been to the west of the walls of the city. It has been the uniform opinion of antiquaries, that the old city of Athens was built on the northern side of the Acropolis; and the inscription of Adrian's arch is a confirmation that the addition to the city, built by that emperor, and called after him Adrianople, was on the southern side. Mr. Stewart, however, in his "Antiquities of Athens" (vol. iii.), conjectures, that the ancient city was on the south side of the Acropolis; but it has been alleged, that there are no remains which countenance this supposition; and, besides it should be recollected, that the Pelasgi, who fortified the Acropolis, were permitted to dwell beneath the walls: they were afterwards accused by the Athenians of way-laying their daughters, as they went from the city to fetch water from the Illyssus: this could not possibly have happened, without supposing that the ancient city was on the north side of the Acropolis, and that the part inhabited by the Pelasgi was on the south side: for no other part would correspond to the account of the Pelasgi being in a situation between the city and the river. The Pelasgi were afterwards driven out of Attica; the spot on which they dwelt was execrated; and the Delphic oracle advised, that it should be kept rough and uncultivated. It is, however, well known, that this spot, in after times, was inhabited; but it is somewhat singular, that, except the theatre and some few monuments, immediately under the walls of the Acropolis, the whole of the plain between the Acropolis and the Illyssus, contains no remains of ancient works, besides one solitary column. This furnishes a strong argument against the supposition of the ancient city being erected in this situation; for undoubtedly the chief monuments of their grandeur would be contained within the city. This circumstance also accounts for Pausanias passing by, without describing any thing as situated there: it was sterile in antiquities, and therefore furnished no object deserving his notice. For these observations, we are indebted to an anonymous writer.

See Monthly Review enlarged, vol. xvii. p. 56. For the plans of Athens, annexed to the travels of Anacharsis, see the Maps of this work.

ATHENS, and the Athenians, *History of*. It has been already observed, that the city of Athens was founded by Cecrops about 1556 years B. C. This prince reigned fifty years. Under the reigns of his successors, various circumstances combined to determine the character and situation of the nation. The succession of princes appears, with few exceptions, the succession of improvement. Under the reign of Erichthonius, the colony of Cecrops accustomed hordes, already docile to the bit, to draw wheel carriages; and profited by the labour of bees, which useful race of insects they carefully preserved on mount Hymettus. Under Pandion, they made new progress in agriculture; but a long drought having destroyed the hopes of the husbandman, the harvests of Egypt supplied the wants of the colony, which thence contracted a taste for commerce. Erichtheus, his successor, rendered his reign illustrious by useful institutions, and the Athenians dedicated a temple to him after his death. A considerable portion of barbarism still remained; the country, very imperfectly cultivated, maintained great numbers of savage animals, and still more savage men. The Grecian woods and mountains abounded in lions, bears, and other fierce animals, that often roamed from their haunts, and spread terror and desolation among the adjoining vallies. The vallies themselves teemed with men of brutal strength and courage, who availed themselves of the weakness of government, to perpetrate horrid deeds of violence and cruelty. About the year 1300. B. C. the first worthies of Greece, animated rather with the daring and useful, than with the romantic spirit of chivalry (Plutarch's Theseus), set themselves with one accord to remedy evils which threatened the existence of society. These travelled over Greece, and freed it from the violence both of kings and individuals: they appeared to the Greeks as beings of a superior order; and that infant people, no less extravagant in their gratitude than fears, rewarded the exploits with so much glory, that the honour of protecting them became the first ambition of noble minds. Of these, one of the most eminent was Theseus, the son of Egeus king of Athens, who was ardently desirous of rivalling the exploits of Hercules. The Pallantides, a powerful family of Athens, having attempted to wrest the sceptre from the aged hands of Egeus, young Theseus, now approaching to man's estate, overwhelmed the projects of the conspirators. (Plutarch's Theseus.) Marathon, the second city in Attica, had its environs infested by a ferocious bull; the heroic prince subdued this terrible animal (Plutarch's Theseus); and the Athenians regarded his success with astonishment and admiration. But his countrymen had soon after a call for their wonder and gratitude in a much more signal achievement, and more momentous benefit. Minos, king of Crete, accused them of having put to death his son Androgeus, and compelled them by force to deliver him, at stated intervals, a certain number of youths and maidens. These were to be chosen by lot, and their destiny was death or slavery. (Plutarch's Theseus.) It was now the third time that the pledges of their affections were to be torn from their unhappy parents. All Athens was in tears, but Theseus revived her hopes. He undertook to free the city from this odious tribute; and, to accomplish the noble project, voluntarily enrolled himself in the number of the victims, and embarked for Crete. The adventures of Theseus in Crete, exhibited by the inventive and often fanciful poetry of the Greeks, contain a great portion of the marvellous, through which a skilful and discerning reader may

may discover the probable. According to the tale which the Athenians relate, it was the cruel practice of Minos to shut up his tributary victims, the moment he received them, in a labyrinth, where they were soon after devoured by the minotaur, a monster half a man and half a bull, the offspring of the infamous amours of Pasiphae, queen of Crete: they add, that Theseus, having slain the minotaur, brought back the young Athenians, and was accompanied on his return by Ariadne, daughter of Minos, who assisted him in escaping from the labyrinth, and whom he abandoned on the shores of Naxos. The Cretans, on the contrary, allege, that the Athenian hostages were destined to the victors in the celebrated games in honour of Androgeus; that Theseus, having obtained permission to enter the lills, overcame Taurus, general of the troops of Minos; and that this prince had the generosity to do justice to his valour, and pardon the Athenians.

Minos had established an excellent system of government, which equally secured the authority of the prince and the liberty of the people, and connected religious with political influence. (Aristotle's Politics.) The advantages of this system Theseus discerned, and having returned and ascended the throne of Attica, vacant by the decease of his father, he resolved to improve the government of his country. The twelve towns, founded by Cecrops, were become so many republics, each of which had its particular magistrates and chiefs almost independent, whose interests clashing continually, produced frequent wars; and though imminent dangers sometimes obliged them to have recourse to the protection of the sovereign, the succeeding calm soon awakened their ancient jealousies. The royal authority, fluctuating between despotism and degradation, alternately inspired terror and contempt; and the people, by the vice of a constitution, the nature of which was not exactly understood either by prince or subjects, had no means whatever to defend themselves against the extremity of slavery, or the excess of licentiousness. Theseus formed his plan; and, superior even to minute obstacles, took upon himself its execution in detail. He traversed the different districts of Attica, and endeavoured every where to insinuate himself into the favour of the people, who with ardour received a project which seemed to restore to them their primitive liberty; but the wealthier class, fearing to lose the authority they had usurped, and apprehensive of seeing a kind of equality established between all ranks of citizens, murmured at an innovation which diminished the royal prerogative: not daring, however, openly to oppose the will of a prince, who was endeavouring to obtain by persuasion, what he might exact by force, they consented, but with a secret determination to protest against the measure when circumstances might be more favourable. It was now determined that Athens should be the metropolis and centre of the state; that the senates of the cities should be abolished; that the legislative power should reside in the general assembly of the nation, divided into three classes, the nobles, the husbandmen, and the artificers; that the first magistrates, chosen out of the former, should have the superintendance of the sacred rites, and be the interpreters of the laws; that the different orders of citizens should form a mutual balance, the first, having in its favour the splendor of dignities: the second, the importance of services; and the third, the superiority of number. (Plutarch's Theseus.) It was determined in fine, that Theseus, placed at the head of the republic, should be the defender of the laws it might enact, and the general of the troops destined to its defence. He erected tribunals for the magistrates; enlarged the capital, and embellished it as far as the imperfection of the arts

at that time would permit. Strangers, invited to become citizens, flocked thither from all parts, and were incorporated with the ancient inhabitants. He added the territory of Megara to the country; he placed a column on the isthmus of Corinth, as a boundary between Attica and Peloponnesus; and revived, near this pillar, the Isthmian games, in imitation of those lately instituted by Hercules at Olympia. Every thing now seemed favourable to his views: he governed a free people, retained in obedience, by his moderation and his bounties; he dictated laws of peace and humanity to the neighbouring nations, and enjoyed a foretaste of that profound veneration with which succeeding ages gradually honour the memory of great men. Theseus also engaged in new undertakings of valour, some of them very unjustifiable (see THESEUS, HERCULES, and PIRITHOVS), and all of them prejudicial to his country, by occupying that time which might have been employed in the farther improvement of the state. But with these exceptions, Theseus was a very great and beneficial sovereign, and his reign was a very important epoch in Athenian history. For several ages, however, Athens was only a secondary power: in the time of Homer, that state sent but fifty ships, whereas several other countries sent eighty, and Mycene a hundred. The compliment of men to each, being 120, the troops amounted to about 6000.

Full fifty more from Athens stem the main,
Led by Menestheus thro' the liquid plain;
No chief like thee, Menestheus! Greece could yield,
To martial armies in the dusty field,
Th' extended wings of battle to display,
Or close th' embodied host in firm array.
Nestor alone, improv'd by length of days,
For martial conduct bore an equal praise.

See Pope's Homer's Iliad, l. ii.

At the time of the Trojan war, B. C. 1184. Athens, like other states of Greece, was subjected to a limited monarchy, but not strictly hereditary. Menestheus succeeded Theseus, in preference to the son of that monarch. Menestheus was succeeded by Demophoon, who distinguished himself at the siege of Troy, and on his return was eminent for political improvement. By him was erected the famous court of the ΕΡΗΤΕΛΕ, for trying wilful murder by a tribunal to which the British jury bears a considerable analogy. By this court, the king himself afterwards submitted to be tried, for having accidentally killed one of his subjects. He reigned thirty-three years, and was succeeded by his son Oxyntes, who reigned twelve years. Oxyntes was succeeded by his son Aphydas, who was murdered by Thymetes, the bastard son of Oxyntes. Thymetes demonstrated himself very unworthy to reign, and was at length dethroned to make room for a man who had distinguished himself in the following manner. There happened to arise a contest between the king of Bœotia and the Athenians, about a frontier town. The hostile prince challenged Thymetes to determine their dispute by a single combat. The Athenian sovereign chose to decline, but Melanthus, an exile from Messenia, who then resided at Athens, accepted the challenge. When they encountered, Melanthus demanded of his adversary, why, contrary to articles, he had brought a second into the field? He turned about to see who the alleged second was, whereupon Melanthus ran him through the body. Delighted with this victory, the Athenians did not regard the means by which it had been obtained, and appointed the conqueror their king. Melanthus was succeeded by his son Cœdrus: this prince was attacked by the Heraclide: having heard that the oracle promised the victory to that army which should lose its general in the battle, he voluntarily devoted himself

to death; a sacrifice which so animated his troops, that they entirely defeated their enemies. Codrus was the last king of Athens; and on his death, the government became republican, by the establishment of Archons; B. C. 1070; an office which was at first hereditary, and little inferior, in point of power, to royalty itself. Medon, the son of Codrus, first held the office of ARCHON. His brothers Neleus and Androclus, probably dissatisfied with these transactions, determined to leave their country. This design was approved by the Achaean and Messenian refugees, and by many Athenian citizens, who complained that Attica was too narrow and barren to maintain the increasing numbers of its inhabitants. The restless spirits in Phocis, Bœotia, and other neighbouring provinces, eagerly joined the emigrants. They sailed to Asia Minor, B. C. 1075, expelled the ancient inhabitants, a mixed race of Lydians, Carians, and Pelasgi, and seized the central and most beautiful portion of the Asiatic coast. (Herodotus, Clio.) Their colonies were gradually diffused from the banks of the Hermus, to the promontory of Poseidon. They afterwards took possession of Chios and Samos: and all these countries were united by the common name of Ionia, to denote that the Ionians composed the most numerous division of the colony. See IONIANS.

The government of the Archons, after several changes, at length became annual, and their number was nine. Peloponnesus being now involved in the long and bloody wars between the Messenians and the Spartans, the Spartans being in great danger, applied for assistance to the Athenians, who sent them aid on one occasion, and were instrumental to the reduction of the Messenians, and the aggrandisement of the Spartans, destined to become formidable rivals to themselves. During the first ages of Archontic government, Athens was little occupied by foreign wars, but very greatly by dissensions and seditions. They had no written laws, and were perpetually disagreeing on points of religion and government. The inhabitants of Attica were separated into three factions, each of which had at its head one of the most ancient families of Athens. Divided as they all were by interest, diversity of character, and situation, it was impossible for them to agree in the choice of a form of government. The poorest and most independent, confined to the adjacent mountains, favoured a democracy; the wealthiest, dispersed over the plain, wished for an oligarchy; while the inhabitants of the coasts, engaged in maritime and commercial affairs, were for a mixed government, which might secure their possessions, without proving injurious to public liberty. To this source of divisions, each party united the inveterate hatred of the poor against the rich. Obscure citizens, overwhelmed with debts, had no resource but that of selling their liberty, or that of their children, to merciless creditors; and the greatest part of them had determined to abandon a country which held out only ineffectual labour to some of them; and eternal slavery, and the sacrifice of every sentiment of nature, to the remainder. From the growth of knowledge, new sources of industry, new necessities and vices, were diffused through society. Licentiousness was either passed over with impunity, or reprobated by arbitrary punishments. The life and fortune of individuals were left at the discretion of magistrates, who, subjected to no certain limitations, were but too much disposed to listen to their prepossessions or their interests. In this confusion, which menaced the state with immediate destruction, Draco was chosen, B. C. 624, with full powers to exercise the whole of legislation, in its most extensive or circumstantial views. The particulars of his private life are little known to us; but he has left the reputation of a

man of worth, possessed of real knowledge, and sincerely attached to his country. Other strokes of character might perhaps embellish his eulogium, but are not necessary to his memory. Like all preceding and subsequent legislators, he formed a code of laws and morals; he took the citizen at the moment of his birth, prescribed the manner of his early education, followed him through the different stages of his life, and, connecting these partial views with the main objects, flattered himself he should be able to form free men, and virtuous citizens: but he only produced malecontent, and his regulations excited so many murmurs, that he was compelled to take refuge in the island Ægina, where he soon after died.

His laws were strongly impressed with the peculiarity of his character; they were as severe as his manners had ever been rigid. Death was the chastisement he inflicted on idleness, and the only punishment he decreed for the slightest offences, as well as for the most atrocious crimes; he was accustomed to say, that he knew of none milder for the former, and could devise no other for the latter. It seems as if his powerful mind, virtuous even to excess, was incapable of any indulgence for crimes at which it revolted, or for those weaknesses over which it triumphed without an effort. As he had not attempted any change in the form of government, the intestine divisions augmented from day to day. One of the principal citizens, named Cylon, formed the project of seizing on the sovereign authority; he was besieged in the citadel, where he had long defended himself, and at length, wanting provisions, and destitute of every hope of succour, eluded, by flight, the punishment due to his crime. His followers took refuge in the temple of Minerva; from which asylum they were enticed by the promise of life, and instantly massacred. Some of these unfortunate men were murdered even on the altars of the awful Eumenides. The indignation excited by this action was universal; the people at once execrated the perfidy, and shuddered at the impiety of the victors; and the whole city expected that some dreadful calamity would be immediately inflicted by celestial vengeance. Amidst this general consternation, news was brought that the city of Nisæa and the isle of Salamis had fallen by the arms of the Megarensians. To this melancholy intelligence succeeded, soon after, an epidemical distemper. The public imagination, already agitated, was suddenly seized with panic terrors, and haunted by a thousand terrifying chimeras. The augurs and oracles being consulted, declared that the city, polluted by the profanation of the holy places, must be purified by the ceremonies of expiation. The Athenians, therefore, sent to Crete for Epimenides, B. C. 612, considered as a man who had an intercourse with the gods (Pausanias, l. i.), and who saw into fatality. He really appears to have been a reformer endued with talents and knowledge to engage confidence in his opinions, and austerity of manners to command respect. The first years of his youth he passed in solitary places, and seemed wholly absorbed in the study of nature, forming his imagination to enthusiast, by fasting, silence, and meditation, without any other ambition than by making himself acquainted with the will of the gods, to secure his dominion over the minds of men. His success surpassed his hopes, and he acquired such a reputation for wisdom and sanctity, that, in times of public calamity, nations intrusted from him the favour of purifying them by rites, which, as they alleged, he could render more acceptable to the divinity. Athens received him with transports of hope and fear. He directed that new temples and new altars should be built to immolate the victims he had chosen, and that these sacrifices should

should be accompanied by certain hymns. As while speaking he seemed agitated with a divine inspiration, his impetuous eloquence was irresistible. He availed himself of the ascendancy he had acquired, to effect several changes in the religious ceremonies, and in the manners of the people; and by various useful regulations, he endeavoured to bring the Athenians to the two principles of social union and justice. But the reform of Epimenides, though beneficial as far as it extended, was very inadequate to the evils. The people were still suffering under combined anarchy and oppression; the magistrates plundered the treasury and the temples; and often betrayed for bribes the interests of their country: the rich tyrannised over the poor, the poor continually alarmed the safety of the rich: the rapacity of creditors knew no bounds; they compelled the insolvent debtors to cultivate their lands like cattle, to perform the service of beasts of burden (Gillies, v. ii. 107.), and to transfer to them their sons and daughters, whom they exported as slaves to foreign countries. In such a distressed situation, there arose for their relief the illustrious Solon, B. C. 594. This celebrated sage first distinguished himself by military policy and warlike efforts. The Athenians had been long engaged in a war against the Megarensians, concerning the island of Salamis; fatigued and broken by tedious and arduous hostilities, they abandoned the enterprise in despair, and even made a law enacting the punishment of death against any one who should propose the capture of that island. Solon, aware of the importance of a possession that commanded the coasts of Attica, and deeming the national despondence inglorious as well as impolitic, ardently desired to rouse his countrymen to more vigorous counsels; but the new penal law restrained his efforts. At length he devised an expedient for patriotically transgressing the pusillanimous law, and avoiding the punishment. He accordingly counterfeited insanity, and caused his family to report that he was actually mad (Plutarch's Solon); the rumour being spread and generally believed, he composed a poem, describing the advantages of Salamis, and inciting the Athenians to renew the war. His verses, strong and impressive, produced the desired effect. The people were roused, an expedition was undertaken, and Solon is, by Plutarch, said to have devised the following stratagem for cutting off the Megarensians, who then occupied Salamis. With his friend Pistratus he sailed at the head of an armament to Colias, there finding a number of women sacrificing to Ceres, he sent a confidential person to Salamis, instructed to profess himself a deserter, and to tell the Megarensians, that if they desired to seize the chief Athenian women, to make all sail to Colias. The Megarensians, taking the story for truth, presently manned a ship; and Solon deserying this ship just as it put off from the island, commanded the women to be gone, and ordered some beardless youths, dressed in these women's clothes, their shoes and mitres, and privately armed with daggers, to dance and wanton near the shore, till the enemies had landed, and the ship was in their power. Things being thus ordered, the Megarensians were allured with the appearance, and, coming near the shore, strove who should leap out first, as it were only to seize the women; but were so warmly received, that not one of them escaped. The Athenians sailed for the island, thus deprived of its defenders, and annexed Salamis to the territories of Athens. The fame which Solon thus acquired, he soon increased by his policy and conduct with regard to another subject of foreign policy.

The Criseans were a flourishing state, not far from Delphi, and, commanding the approaches to that rendezvous of Grecian superstition, derived considerable emolument from the expenses of the devotees. But with these advan-

tages they were not satisfied; they began to exact vexatious and exorbitant duties from the merchants who came to expose their wares in the sacred city; which, on account of the great concourse of profligate pilgrims from every quarter, soon became the seat, not of devotion only, but of dissipation, vanity, and licentious pleasure. It was in vain for the merchants to exclaim against these unexampled impositions; the taxes were continually increased; the evil admitted not the expectation of either remedy or relief; and the strangers, familiarised to it by custom, began to submit without murmur; and perhaps endured the hardship with greater patience, when they perceived that they drew back the tax in the increased price of their commodities. Encouraged by this acquiescence in their tyranny, the Criseans levied a severe impost on the pilgrims, whether Greeks or Barbarians, who visited the temple of Apollo; a measure directly inconsistent with a decree of the Amphictyons, which declared that all men should have free access to the oracle, as well as extremely hurtful to the interest of the Delphians, who soon felt a gradual diminution of their profits from the holy shrine. The Criseans, totally regardless of the sentiments of religion, plundered the temple of Delphi, with many circumstances of aggravating atrocity. Solon roused his countrymen to avenge the sacrilege; and to his ingenuity and skill it was chiefly owing that the Criseans were vanquished (Gillies, vol. i. 221.), but Solon was destined to render himself, by legislation, most beneficial to his country. The general opinion of his genius and virtues, joined to the experience of his military talents, success in wars, and political address, had procured him distinguished influence over the people. His experienced ability, and above all, his approved wisdom and equity, pointed him out for the noblest and most sublime employment of humanity, that of regulating the laws and government of a free people. Such, at least, the Athenians may be considered, when their unanimous suffrage rendered Solon the absolute umpire of their whole constitution and policy. When he undertook the reform of the state, tyranny and disorder prevailed; the wretched populace, deriving courage from despair, had determined no longer to submit to such multiplied rigours; and, before the wisdom of the lawgiver interposed, they had taken the resolution to elect and follow some warlike leader, to attack and butcher their oppressors, establish an equal partition of lands, and institute a new form of government. But the numerous clients and retainers, who, in a country little acquainted with arts and manufactures, depended on the wealthy proprietors of the lands and mines of Attica, rendered this undertaking alike dangerous to both parties; so that both became willing rather to submit their differences to law, than to decide them by the sword. The impartiality of Solon merited the unlimited confidence of his country. He maintained the ancient division of property, but abolished debts: he established the rate of interest at 12 per cent. at which it afterwards remained; but forbade that the insolvent debtor should become the slave of his creditor, or be compelled to sell his children into servitude. After these preliminary regulations, which seemed immediately necessary to the public peace, Solon proceeded, with an impartial and steady hand, to new model the government; on this generous, but equitable principle, that a few ought not, as hitherto, command, and the many obey; but that the collective body of the people, legally convened into a national assembly, were entitled to decide, by a plurality of voices, the alternatives of peace and war; contract or dissolve alliances with foreign states; enjoy all the branches of legislative or sovereign power; and elect, approve, and judge the magistrates or ministers entrusted, for a limited time, with the executive authority. Strangers,

and all those who could not ascertain their Athenian descent, both in the male and female line, were totally excluded from the assembly and courts of justice. The regulations of Solon marked the utmost attention to preserve the pure blood of Athens unmixed and uncorrupted; nor could any foreigner, whatever merit he might claim with the public, be admitted to the rank of a citizen, unless he abandoned for ever his native country, professed the knowledge of some highly useful or ingenious art, and, in both cases, had been chosen by ballot, in a full assembly of six thousand Athenians. The numbers of this convention, and still more their impetuosity and ignorance, must have proved inconsistent with good government, if Solon had not secured the vessel of the republic from the waves of popular frenzy, by the two firm anchors of the senate and the areopagus; tribunals originally of great dignity, and of very extensive power, into which men of a certain description only could be received as members. Solon divided the Athenians into four classes, according to the produce of their estates. The first consisted of those whose lands annually yielded five hundred measures of liquid, as well as dry commodities, and the minimum of whose yearly income may be calculated at sixty pounds sterling, which is equivalent, if we estimate the relative value of money by the price of labour, and of the things most necessary to life, to about six hundred pounds sterling in the present age. The second class consisted of those whose estates produced three hundred; the third two hundred; the fourth, and by far the most numerous class of Athenians, either possessed no landed property, or at least enjoyed not a revenue in land equal to twenty-four pounds sterling, or, agreeably to the above proportion, two hundred and forty pounds of our present currency. All ranks of citizens were alike admitted to vote in the public assembly, and to judge in the courts of justice, whether civil or criminal, which were properly so many committees of the assembly. But the three first classes were exclusively entitled to sit in the senate, to decide in the areopagus, or to hold any office of magistracy. To these dignities they were elected by the free suffrages of the people, to whom they were accountable for their administration, and by whom they might be punished for malversation or negligence, although they derived no emolument from the diligent discharge of their duty. The senate of four hundred, which, eighty-six years after its institution, was augmented to five hundred by Clisthenes, enjoyed the important prerogatives of convoking the popular assembly; previously examining all matters before they came to be decided by the people, which gave them a negative before debate in all public resolutions; and of making laws, which had force during a year, without requiring the consent of the populace. Besides this general superintendence and authority, the senate was exclusively invested with many particular branches of the executive power. The president of that council had the custody of the public archives and treasury; the senate alone built ships, equipped fleets and armies, seized and confined state criminals, examined and punished several offences, which were not expressly forbidden by any positive law. The weight of such a council, which assembled every day, except festivals, infused a large mixture of aristocracy into the Athenian constitution; this, as we shall immediately explain, was still farther increased by the authority of the AREOPAGUS.

The principal magistrates in Athens were the nine archons. (See ΑΡΧΟΝ.) These nine archons, or presidents of the several courts of justice, like all other Athenian magistrates, were, at the expiration of their annual office, accountable to the people; and when their conduct, after a severe scrutiny, appeared to merit public approbation and

gratitude, they were received, and remained for life, members of the areopagus, a senate invested with a general inspection over the laws and religion, as well as over the lives and manners of the citizens; and which, in dangerous emergencies, was even entitled to assume dictatorial power. See Lysias, Isocrates, Anacharsis, vol. i. and Gillies's Greece, vol. ii. Thus did the senate of the areopagus, and that of the four hundred, become two counterpoises sufficiently powerful to secure the republic against the storms from which all states are incessantly in danger (see Plutarch, in Solon.); the former, by repressing the enterprises of the rich by its general censure; and the latter, by restraining by its decrees and its presence the excesses of the multitude. New laws were enacted in support of these regulations. The constitution might be attacked either by the general factions which had so long agitated the different orders of the state, or by the ambition and intrigues of certain individuals. To guard against these dangers, Solon denounced punishments against those citizens who, in time of public commotion, refused openly to declare for one of the parties. (Plutarch, in Solon.) His view, in this admirable institution, was to rouse men of merit and integrity from a state of fatal inactivity, to oppose them to the factious, and save the republic by the courage and ascendancy of virtue. By a second law, every citizen convicted of having attempted to make himself master of the sovereign authority, was condemned to death. Lastly, in the case of an attempt to erect another government on the ruins of the popular form, this wise legislator could imagine but one method to reanimate the nation; and that was by obliging the magistrates to resign their employments; and hence this stern and menacing decree:—it shall be lawful for every citizen, not only to put to death a tyrant and his accomplices, but any magistrate who shall continue to exercise his functions after the destruction of the democracy. Such is the great outline of the constitution established by Solon, according to which every Athenian citizen enjoyed the inestimable privilege of being judged by his peers, and tried by laws to which he himself had consented. Although the legislative and judicial powers were thus lodged with the people, men of property and ability were alone entrusted with the administration of government; and as power in some measure followed property, the same expedient which served to maintain a due distinction of ranks in society, tended also to promote the industry and frugality of the multitude, that they might thereby become entitled to share those honours and offices to which persons of a certain estate only could aspire. (See Gillies, vol. ii. p. 114.) Conformable to this constitution was the code of laws which was framed by this illustrious legislator. As a system of jurisprudence, the institutions of Solon possess extraordinary excellence. They have the merit of easily coalescing with great variety and dissimilarity of political systems, and are indeed well adapted to any limited government. Transfused into the Roman law, they have, in the forcible and eloquent language of Dr. Gillies, served after an interval of above sixteen hundred years, to abolish the barbarous practices of the Gothic nations, and to introduce justice, security, and refinement among the modern inhabitants of Europe. The laws of Solon consider the citizen in the various relations of domestic, civil, and political society. They accurately mark the duties belonging to these relations, and prescribe the rules for directing and enforcing the performance of them, and for preventing their violation. To form the citizen early to the habits most beneficial to the community, the laws of Solon describe the plan of his education. They recommend the exercises corporeal, intellectual, and moral, which tend

should be accompanied by certain hymns. As while speaking he seemed agitated with a divine inspiration, his impetuous eloquence was irresistible. He availed himself of the ascendancy he had acquired, to effect several changes in the religious ceremonies, and in the manners of the people; and by various useful regulations, he endeavoured to bring the Athenians to the two principles of social union and justice. But the reform of Epimenides, though beneficial as far as it extended, was very inadequate to the evils. The people were still suffering under combined anarchy and oppression; the magistrates plundered the treasury and the temples; and often betrayed for bribes the interests of their country; the rich tyrannised over the poor, the poor continually alarmed the safety of the rich: the rapacity of creditors knew no bounds; they compelled the insolvent debtors to cultivate their lands like cattle, to perform the service of beasts of burden (Gillies, v. ii. 107.), and to transfer to them their sons and daughters, whom they exported as slaves to foreign countries. In such a distressed situation, there arose for their relief the illustrious Solon, B.C. 594. This celebrated sage first distinguished himself by military policy and warlike efforts. The Athenians had been long engaged in a war against the Megarensians, concerning the island of Salamis; fatigued and broken by tedious and arduous hostilities, they abandoned the enterprise in despair, and even made a law enacting the punishment of death against any one who should propose the capture of that island. Solon, aware of the importance of a possession that commanded the coasts of Attica, and deeming the national dependence inglorious as well as impolitic, ardently desired to rouse his countrymen to more vigorous counsels; but the new penal law restrained his efforts. At length he devised an expedient for patriotically transgressing the pusillanimous law, and avoiding the punishment. He accordingly counterfeited insanity, and caused his family to report that he was actually mad (Plutarch's Solon); the rumour being spread and generally believed, he composed a poem, describing the advantages of Salamis, and inciting the Athenians to renew the war. His verses, strong and impressive, produced the desired effect. The people were roused, an expedition was undertaken, and Solon is, by Plutarch, said to have devised the following stratagem for cutting off the Megarensians, who then occupied Salamis. With his friend Pisistratus he sailed at the head of an armament to Colias, there finding a number of women sacrificing to Ceres, he sent a confidential person to Salamis, instructed to profess himself a deserter, and to tell the Megarensians, that if they desired to seize the chief Athenian women, to make all sail to Colias. The Megarensians, taking the story for truth, presently manned a ship; and Solon desecrating this ship just as it put off from the island, commanded the women to be gone, and ordered some beardless youths, dressed in these women's clothes, their shoes and mitres, and privately armed with daggers, to dance and wanton near the shore, till the enemies had landed, and the ship was in their power. Things being thus ordered, the Megarensians were allured with the appearance, and, coming near the shore, strove who should leap out first, as it were only to seize the women; but were so warmly received, that not one of them escaped. The Athenians sailed for the island, thus deprived of its defenders, and annexed Salamis to the territories of Athens. The fame which Solon thus acquired, he soon increased by his policy and conduct with regard to another subject of foreign policy.

The Criseans were a flourishing state, not far from Delphi, and, commanding the approaches to that rendezvous of Grecian superstition, derived considerable emolument from the expences of the devotees. But with these advan-

tages they were not satisfied; they began to exact vexatious and exorbitant duties from the merchants who came to expose their wares in the sacred city; which, on account of the great concourse of profligate pilgrims from every quarter, soon became the seat, not of devotion only, but of dissipation, vanity, and licentious pleasure. It was in vain for the merchants to exclaim against these unexampled impositions; the taxes were continually increased; the evil admitted not the expectation of either remedy or relief; and the strangers, familiarised to it by custom, began to submit without murmur; and perhaps endured the hardship with greater patience, when they perceived that they drew back the tax in the increased price of their commodities. Encouraged by this acquiescence in their tyranny, the Criseans levied a severe impost on the pilgrims, whether Greeks or Barbarians, who visited the temple of Apollo; a measure directly inconsistent with a decree of the Amphictyons, which declared that all men should have free access to the oracle, as well as extremely hurtful to the interest of the Delphians, who soon felt a gradual diminution of their profits from the holy shrine. The Criseans, totally regardless of the sentiments of religion, plundered the temple of Delphi, with many circumstances of aggravating atrocity. Solon roused his countrymen to avenge the sacrilege; and to his ingenuity and skill it was chiefly owing that the Criseans were vanquished (Gillies, vol. i. 221.), but Solon was destined to render himself, by legislation, most beneficial to his country. The general opinion of his genius and virtues, joined to the experience of his military talents, success in wars, and political address, had procured him distinguished influence over the people. His experienced ability, and above all, his approved wisdom and equity, pointed him out for the noblest and most sublime employment of humanity, that of regulating the laws and government of a free people. Such, at least, the Athenians may be considered, when their unanimous suffrage rendered Solon the absolute umpire of their whole constitution and policy. When he undertook the reform of the state, tyranny and disorder prevailed; the wretched populace, deriving courage from despair, had determined no longer to submit to such multiplied rigours; and, before the wisdom of the lawgiver interposed, they had taken the resolution to elect and follow some warlike leader, to attack and butcher their oppressors, establish an equal partition of lands, and institute a new form of government. But the numerous clients and retainers, who, in a country little acquainted with arts and manufactures, depended on the wealthy proprietors of the lands and mines of Attica, rendered this undertaking alike dangerous to both parties; so that both became willing rather to submit their differences to law, than to decide them by the sword. The impartiality of Solon merited the unlimited confidence of his country. He maintained the ancient division of property, but abolished debts: he established the rate of interest at 12 per cent. at which it afterwards remained; but forbade that the insolvent debtor should become the slave of his creditor, or be compelled to sell his children into servitude. After these preliminary regulations, which seemed immediately necessary to the public peace, Solon proceeded, with an impartial and steady hand, to new model the government; on this generous, but equitable principle, that a few ought not, as hitherto, command, and the many obey; but that the collective body of the people, legally convened into a national assembly, were entitled to decide, by a plurality of voices, the alternatives of peace and war; contract or dissolve alliances with foreign states; enjoy all the branches of legislative or sovereign power; and elect, approve, and judge the magistrates or ministers entrusted, for a limited time, with the executive authority. Strangers, and

and all those who could not ascertain their Athenian descent, both in the male and female line, were totally excluded from the assembly and courts of justice. The regulations of Solon marked the utmost attention to preserve the pure blood of Athens unmixed and uncorrupted; nor could any foreigner, whatever merit he might claim with the public, be admitted to the rank of a citizen, unless he abandoned for ever his native country, professed the knowledge of some highly useful or ingenious art, and, in both cases, had been chosen by ballot, in a full assembly of six thousand Athenians. The numbers of this convention, and still more their impetuosity and ignorance, must have proved inconsistent with good government, if Solon had not secured the vessel of the republic from the waves of popular frenzy, by the two firm anchors of the senate and the areopagus; tribunals originally of great dignity, and of very extensive power, into which men of a certain description only could be received as members. Solon divided the Athenians into four classes, according to the produce of their estates. The first consisted of those whose lands annually yielded five hundred measures of liquid, as well as dry commodities, and the minimum of whose yearly income may be calculated at sixty pounds sterling, which is equivalent, if we estimate the relative value of money by the price of labour, and of the things most necessary to life, to about six hundred pounds sterling in the present age. The second class consisted of those whose estates produced three hundred; the third two hundred; the fourth, and by far the most numerous class of Athenians, either possessed no landed property, or at least enjoyed not a revenue in land equal to twenty-four pounds sterling, or, agreeably to the above proportion, two hundred and forty pounds of our present currency. All ranks of citizens were alike admitted to vote in the public assembly, and to judge in the courts of justice, whether civil or criminal, which were properly so many committees of the assembly. But the three first classes were exclusively entitled to sit in the senate, to decide in the areopagus, or to hold any office of magistracy. To these dignities they were elected by the free suffrages of the people, to whom they were accountable for their administration, and by whom they might be punished for malversation or negligence, although they derived no emolument from the diligent discharge of their duty. The senate of four hundred, which, eighty-six years after its institution, was augmented to five hundred by Clisthenes, enjoyed the important prerogatives of convoking the popular assembly; previously examining all matters before they came to be decided by the people, which gave them a negative before debate in all public resolutions; and of making laws, which had force during a year, without requiring the consent of the populace. Besides this general superintendence and authority, the senate was exclusively invested with many particular branches of the executive power. The president of that council had the custody of the public archives and treasury; the senate alone built ships, equipped fleets and armies, seized and confined state criminals, examined and punished several offences, which were not expressly forbidden by any positive law. The weight of such a council, which assembled every day, except festivals, infused a large mixture of aristocracy into the Athenian constitution; this, as we shall immediately explain, was still farther increased by the authority of the AREOPAGUS.

The principal magistrates in Athens were the nine archons. (See ΑΡΧΟΝ.) These nine archons, or presidents of the several courts of justice, like all other Athenian magistrates, were, at the expiration of their annual office, accountable to the people; and when their conduct, after a severe scrutiny, appeared to merit public approbation and

gratitude, they were received, and remained for life, members of the areopagus, a senate invested with a general inspection over the laws and religion, as well as over the lives and manners of the citizens; and which, in dangerous emergencies, was even entitled to assume dictatorial power. See Lyfias, Hecrates, Anacharhis, vol. i. and Gillies's Greece, vol. ii. Thus did the senate of the areopagus, and that of the four hundred, become two counterpoises sufficiently powerful to secure the republic against the storms from which all states are incessantly in danger (see Plutarch, in Solon.); the former, by repressing the enterprises of the rich by its general censure; and the latter, by restraining by its decrees and its presence the excesses of the multitude. New laws were enacted in support of these regulations. The constitution might be attacked either by the general factions which had so long agitated the different orders of the state, or by the ambition and intrigues of certain individuals. To guard against these dangers, Solon denounced punishments against those citizens who, in time of public commotion, refused openly to declare for one of the parties. (Plutarch, in Solon.) His view, in this admirable institution, was to rouse men of merit and integrity from a state of fatal inactivity, to oppose them to the factions, and save the republic by the courage and ascendancy of virtue. By a second law, every citizen convicted of having attempted to make himself master of the sovereign authority, was condemned to death. Lastly, in the case of an attempt to erect another government on the ruins of the popular form, this wise legislator could imagine but one method to reanimate the nation; and that was by obliging the magistrates to resign their employments; and hence this stern and menacing decree:—it shall be lawful for every citizen, not only to put to death a tyrant and his accomplices, but any magistrate who shall continue to exercise his functions after the destruction of the democracy. Such is the great outline of the constitution established by Solon, according to which every Athenian citizen enjoyed the inestimable privilege of being judged by his peers, and tried by laws to which he himself had consented. Although the legislative and judicial powers were thus lodged with the people, men of property and ability were alone entrusted with the administration of government; and as power in some measure followed property, the same expedient which served to maintain a due distinction of ranks in society, tended also to promote the industry and frugality of the multitude, that they might thereby become entitled to share those honours and offices to which persons of a certain estate only could aspire. (See Gillies, vol. ii. p. 114.) Conformable to this constitution was the code of laws which was framed by this illustrious legislator. As a system of jurisprudence, the institutions of Solon possess extraordinary excellence. They have the merit of easily coalescing with great variety and dissimilarity of political systems, and are indeed well adapted to any limited government. Transfused into the Roman law, they have, in the forcible and eloquent language of Dr. Gillies, served after an interval of above sixteen hundred years, to abolish the barbarous practices of the Gothic nations, and to introduce justice, security, and refinement among the modern inhabitants of Europe. The laws of Solon consider the citizen in the various relations of domestic, civil, and political society. They accurately mark the duties belonging to these relations, and prescribe the rules for directing and enforcing the performance of them, and for preventing their violation. To form the citizen early to the habits most beneficial to the community, the laws of Solon describe the plan of his education. They recommend the exercises corporeal, intellectual, and moral, which tend

most powerfully to invigorate the bodily constitution; to enlarge, refine, and direct the understanding; to form, strengthen, and liberalize the heart. They strongly reprobate idleness, and recommend industry, pointing out the objects, private and national, for which it would be most usefully and honourably exerted. They forcibly inculcate temperance, and censure the contrary as a principal source of misconduct. Although the Athenian law was transfused into the Roman on many subjects; in several there is a very considerable difference. In Athens, the institutions regarding women, and the relations in which they are concerned, were much more liberal than those of Rome, although they fall greatly short of those in modern times, when men respect the natural equality of the sex. Solon considers marriage as an engagement of mutual love and affection, the ends of which are to give happiness to the family, and useful citizens to the state. He does not consider the wife, as the Romans afterwards did, as only part of the family property, which the husband, the proprietor, was to use as he pleased. He regards her as the domestic companion of her husband, nearly equal to him in the care of the children: he rigorously punishes those who violate the obligations of the married state: he permits divorce, not according to the caprice of the husband, but after a discussion before a magistrate; he permits women to separate from their husbands on the same ground as men from their wives. His law for the protection of unmarried women was highly equitable. Whoever seduced a woman of before unimpeached conduct, was, if unmarried, obliged to atone to her by marriage for the injury. On this law hinge the plots of most of Terence's plays. The married destroyer of virgin innocence was punished with a salutary rigour. The reciprocal duties of parent and child Solon did not leave to the mere operation of natural affection, but added positive laws. These enjoined parents to bestow such pains on the education of their children as might enable them to perform their various duties as men and citizens. They oblige children to maintain their parents in declining years, two cases excepted; e. g. if the children had been born of a courtesan, or had been educated to no profession. In the first case, they supposed that children owe nothing to parents who had begotten them to disgrace; in the second, who destined them to uselessness and dependence. Domestic tribunals were not permitted by Solon's laws. A citizen could only be judged by his peers, and by them only deprived of property, liberty, or life. The magistrates civil, military, and ecclesiastical, were by Solon's laws entitled to respect and obedience, whilst they acted agreeably to the end of their office. (See Anacharsis, Gillies, and Aristotle's Politics.) There are a few of the outlines of the provision made by Solon's laws for maintaining what judge Blackstone styles the *rights of persons*. The laws of Solon respecting property were founded on principles of pure ethics, and regarded moral conduct as well as the preservation of property and political expediency. They considered private virtue as well as private right and public tranquillity; they not only provided that one man should not injure another, but endeavoured to prevent such motives from existing as tend to produce injury. Thus by the Athenian law, the next heir is incapable of being guardian to a minor, because it might be apprehended that such a guardian might be more desirous of appropriating the inheritance than of promoting the good of the ward. That regulation therefore considers moral motives, and withholds temptations. All the institutions of Solon respecting successions and testaments united the two considerations of regard to property and to moral principle. Solon allowed the citizen to dispose of his pro-

perty at pleasure; at the same time by his regulations he guards against the arts of legacy hunters; and thus while he respects property, withholds motives to injustice. In that part of his code which treats of what the civilians termed *actions*, and judge Blackstone *private wrongs*, Solon's description of injuries, and measures of redress, are nearly the same as in the Roman and English law. They all proceed upon a plain and obvious principle in ethics, that every injury done must be redressed. The injuries which may be done to an individual, affect either his liberty, property, character, or person, and are in general nearly the same in all countries. On this principle (says Gibbon, speaking of that branch of law), the civilians of every country have erected a similar jurisprudence, the fair conclusion of universal reason and justice. In that part which the civilians style penal law, and Blackstone *public wrongs*, Solon differs very considerably from the Roman law, and agrees with the English. This difference is partly in the description of crimes, and partly in the mode of cognizance. Public wrongs are either such actions or conditions as tend to affect the tranquillity and happiness of a state. The same actions therefore must be wrong in very different degrees in different states and circumstances. The perfection of a penal code depends on the connection in the description of laws, between crimes and public injuries in the first place; and in the second, between crimes and punishment. If every action which generally hurts the public, is by the laws a crime, and if the punishment be exactly in proportion to the crime, and be not inflicted without certain proof of the commission, that must be a good penal code. A wise lawgiver apportions punishment to crime, but does not consider *punishing justice* only, he also takes *preventive* into his consideration. One of the many great excellencies of our English law is, that it has adopted efficacious means for preventing crimes. To this branch of legislation Solon also had paid considerable attention. The prevention of crimes depends chiefly on two things: first, vigilance in observing the conduct of those who, either from their general character, or from particular circumstances, may be supposed most likely to commit them; secondly, on the previous care bestowed on the morals of the people. This last is undoubtedly the surest way of preventing crimes from being general. As a great source of criminal conduct is idleness, Solon enacted a law which obliged every citizen to exercise some trade or profession. "None," says the learned and ingenious Drummond, "among the various institutions of Solon has been more deservedly celebrated than that which obliged every citizen to exercise some trade or profession. In countries where the climate naturally disposes men to sloth and inactivity, every law which incites the mind to exertion, or which rouses the latent energy of its faculties, must necessarily be attended with the most salutary effects." This law had a tendency not only to prevent the negative evil of sloth, but the positive evil of active criminality. By the institutions of Solon, extravagance, intemperance, and debauchery underwent a severe animadversion. Magistrates were empowered to watch the buddings of noxious practices which might, if not crushed, ripen into crimes. Solon's description of the various kinds and measures of crimes is very accurate, and the annexed punishment is generally proportionate. No action of pernicious tendency is by the Athenian laws exempted from penal animadversion. By the Roman law, suicide (according to the just and striking description of Blackstone, "the pretended heroism, but real cowardice of the Stoic philosophers, who destroyed themselves to avoid those ills which they had not the fortitude to endure") was not only not punished, but

was encouraged. By Solon's laws, the self-murderer was branded with public infamy, and exposed to what, according to the religious notions of his countrymen, constituted public punishment. Solon describes the various species of fraud, theft, robbery, and homicide with the greatest accuracy. Of the last in particular, the different shades from what our laws call chance medley, to paricide, are delineated with a most discriminating precision. It is not only the description of crime, and the annexation of punishment, that is of importance in penal cases, but also the tribunal which is to take cognizance of the case. By Solon's laws, every Athenian citizen had a right to be tried by his peers; the Athenian law was in this superior to the Roman, which, in many cases, admitted domestic tribunals. The father took cognizance of the crimes of his own family. Thus at Rome, the accused frequently was not tried by a tribunal of his peers, bound to act according to a fixed law, but by an arbitrary judge, whose own will was his only rule. Solon, like every wise lawgiver, endeavoured to extend the influence of religion over the minds of his countrymen. He enjoined a profound veneration for divinities, and described actions as pleasing or displeasing to them, according to the intention of the agent combined with the known tendency of the act: aware that the internal sentiments of religion are strengthened and confirmed by external rites, he strictly enjoined the regular performance of rites and ceremonies.

Such was the code of Solon, such the civil and political institutions which contributed so powerfully to render this small territory so very great a state. The laws of Solon were to continue in force only for a century. Conceiving that conduct depends chiefly upon habits, he thought that the practice of a hundred years would confirm the Athenians in the habitual observance of such beneficial rules. But the restrictions being contrary to the licence of strong passions, appeared to many encroachments upon natural liberty; and they wished for modifications which might admit fuller scope to their desires. When the first novelty was worn off, Solon was surrounded by a crowd of importunate citizens, who overwhelmed him with questions, advices, commendations, or reproaches. Some pressed him for an explanation of particular laws, capable, according to them, of different interpretations; others proposed a variety of things to be added, modified, or suppressed. Solon having exhausted his patience, and tried every conciliatory method in vain, was sensible that time alone could perfect and give strength to his work; he therefore departed, after requesting permission to absent himself for ten years (see Plutarch, in Solon), and binding the Athenians by a solemn oath, not to make any alteration in his laws during his absence. (See Herodotus, Clio.) The adventures of Solon during his peregrination, belonging to himself individually, and not to the Athenians, will be seen under the articles SOLON, CROESUS, &c. The object of his travels being, as Herodotus informs us, to view mankind; after having, like Ulysses, traversed many countries, and seen many men, he returned to his native country to behold the operation and effects of his institutions. He found that much time is required before men, who have been either the slaves of despotism or the sharers in licentiousness, can be reconciled to just and equitable laws. The Athenians were ready again to sink into anarchy. (See Plutarch's Life of Solon.) The three parties, which had so long rent the republic, seemed to have suspended their hatred during the legislation only to vent it with more violence in his absence; in one point alone were they united, in desiring a change in the constitution, without any other motive than a secret restlessness, or any object

but vague hopes. Solon, received with the most distinguished honours, wished to avail himself of these favourable dispositions to calm dissensions too frequently reviving. At first, he thought himself powerfully seconded by Pisistratus, who was at the head of the popular faction; and who, apparently eager to maintain equality among the citizens, declared himself an irreconcilable enemy to every innovation which might lead to its destruction; but he soon discovered that this profound politician concealed the most insidious ambition under the mask of an affected moderation. Never did a man unite more qualities to captivate the minds of the people: he was of an illustrious birth, and possessed of great wealth, acknowledged wealth (see Herodotus, in Terpsichore, lib. 5th book), a commanding figure, a persuasive eloquence, to which the natural tone of his voice lent new charms; and a mind enriched with the talents bestowed by nature, and the information procured by study. No man was a greater master of his passions, or knew better how to turn to advantage those virtues he really possessed, and those of which he had only the appearance. His success has proved, that in projects of tedious execution, nothing can bestow a more decided superiority than industry and flexibility of character. With such or such advantages, Pisistratus, accessible to the lower citizens, bestowed on them those consolations and favours, which dry up the source, or palliate the bitterness of justice. Solon, attentive to his proceedings, penetrated his intentions; and whilst he was employed in designing means to spread against their consequences, Pisistratus appeared in the forum covered with wounds he had artfully procured, imploring protection of the people whom he had so frequently protected. (See Herodotus, Clio.) The assembly being immediately convoked, he accused the senate and the chiefs of the other factions of attempting his life; and displaying his still bleeding wounds: "Behold!" he exclaimed, "the reward of my love for the democracy, and of the zeal with which I have defended your rights." At these words only murmuring exclamations were heard on all sides: the principal citizens kept silence in astonishment, or took to flight. Solon, filled with indignation at their cowardice and the insatiation of the people, in vain attempted to reanimate the courage of the former, and to disperse the frenzy of the latter; his voice, enfeebled by years, was easily overpowered by the clamours excited by pity, rage, and apprehension. The assembly concluded by voting Pisistratus a strong guard for the defence of his person (B. C. 560). From this moment all his projects were accomplished; he presently employed his force to take possession of the citadel, and after disarming the multitude, seized without opposition on the supreme authority. But though Pisistratus by this usurpation destroyed for a time the political liberty of Athens, his power eventually gave stability to the laws which Solon had introduced. That extraordinary tyrant, for so the Greeks styled him, was not more distinguished by the loftiness of his genius, than the humanity of his disposition; and had not the violence of contending factions, and the fury of his enemies, inflamed his natural love of power, the name of Pisistratus would stand the foremost in the list of Grecian patriots and heroes. His valour and conduct were signalized in the conquest of Nisæa, Salamis, Naxos, Delos, and Sigeum; and if he displayed boldness and address in acquiring sovereignty, he displayed still more moderation and virtue in administering it. He assumed, indeed, the royal dignities of prince and general, and took care that the chief offices of magistracy should be filled by his partisans; but he maintained the regular course of law and justice, not only by his authority, but by his example; having appeared in per-

son to answer an accusation in the areopagus. He not only enforced the laws of Solon against illnefs, but endeavoured to give them more efficacy, by introducing new arts and manufactures into Attica. He was the first who brought into that country the complete collection of Homer's poems, which he commanded to be sung at the Panathenæan festival; nor can we suppose that he would have been zealous to diffuse the liberal and manly sentiments of that divine poet, if his government had not resembled the moderation and equity of the heroic ages, rather than the despotism of tyrants. (See Gillies's Greece, vol. ii. 117.) His son Hipparchus imitated and surpassed the mild virtues of his father; and, amidst the turbulence of the later democracy, it was acknowledged with a sigh by the Athenians, that their ancestors were indeed happy under Solon and Pisistratus, but that the reign of the tyrant Hipparchus brought back on earth the golden days of Saturn. The father had required a tenth part of the produce of Attica, to support his guards, and the other appendages of royalty: his more generous son remitted one half of this imposition. While he alleviated the burdens, yet encouraged the industry of his subjects, by building the temple of Olympian Jupiter, he was solicitous to dispel their ignorance and barbarity, by erecting pillars in every part of the city, engraved with elegiac verses, containing lessons of wisdom, and precepts of morality. He collected the first library in Athens; and his liberal rewards, and still more his agreeable manners and winning affability, attracted to that city the most distinguished poets of the age. The murder of Hipparchus exasperated the temper of his brother and successor Hippias; but notwithstanding the calamities which the latter inflicted and suffered, it must be allowed that the government of Pisistratus and his family, which, with various interruptions, lasted sixty-eight years, increased the strength and promoted the refinement of Athens. (See Gillies's Greece, vol. ii. 118.)

Hipparchus, in particular, was fond of letters. Anacreon and Simonides, invited to his court, met with a most flattering reception: the first being loaded with honours, and the second with presents. He deserves also to participate with his father in the glory of extending the fame of Homer. He may be reproached, as well as his brother, with too freely abandoning himself to pleasures, and with inspiring the Athenians with a taste for luxury. Fortunate, nevertheless, if in the midst of these excesses he had not committed an act of injustice, of which he was the first victim! Two young Athenians, Harmodius and Aristogiton, united in bonds of the tenderest friendship, having received from this prince an affront it was impossible to forget, conspired his destruction, and that of his brother. Some of their friends entered into this conspiracy, and its execution was fixed for the solemnity of the panathenæa: they hoped that the crowd of Athenians, who, during the ceremonies of this festival, were permitted to bear arms, would second their efforts, or at least protect them against the fury of the guards who attended on the sons of Pisistratus. With this view, after covering their poignards with branches of myrtle, they repaired to the place where the princes were arranging a procession, which they were to precede to the temple of Minerva. When they arrived, they saw one of the conspirators in familiar conversation with Hippias, and concluded themselves betrayed; but resolving dearly to sell their lives, retired for a moment, and finding Hipparchus, plunged a dagger in his heart. Harmodius instantly fell beneath the redoubled blows of the prince's guards. Aristogiton, seized almost at the same instant, was put to the torture; but far from naming his accomplices, he accused the most faithful parti-

fans of Hippias, who ordered them to be dragged to instant punishment. "Hast thou still other wretches to discover?" exclaimed the tyrant, transported with fury. "There are none left but thee," replies the Athenian; "I die, and enjoy in death the satisfaction of having deprived thee of thy best friends." From that moment Hippias abandoned himself to the perpetration of every kind of injustice (Thucydides b. 6. c. 59.); but the yoke he laid heavy on the Athenians was broken three years after. (B. C. 510.) Clisthenes, chief of the Alcmæonidæ, a powerful house of Athens, at all times inimical to the family of Pisistratus, collected all the malecontents about his person; and having obtained the assistance of the Lacedæmonians, by means of the Pythia of Delphi, whom he had gained over to his interest, marched against Hippias, and forced him to abdicate the tyranny. No sooner had the Athenians recovered their liberty, than they rendered the highest honours to the memory of Harmodius and Aristogiton. Statues were erected to them in the forum; it was enacted that their names should be forever celebrated at the festival of the panathenæa, and should, on no pretext whatever, be given to slaves. The poets eternized their glory by poems and songs, and very extensive privileges were granted in perpetuity to their descendants. Clisthenes, who had so greatly contributed to the expulsion of the Pisistratidæ, had still to struggle for many years against a powerful faction; but at length obtaining in the state the authority to which he was entitled by his great talents, he confirmed the constitution established by Solon, which the Pisistratidæ had never attempted entirely to subvert. (Anacharsis's Travels, vol. i. p. 174.) The power of Athens was great in ancient times; but it became incomparably greater after the re-establishment of freedom. So advantageous to the powers of the human mind is the enjoyment of liberty, even in its least perfect form, that in a few years after the expulsion of Hippias, the Athenians acquired an ascendancy in Greece, which was fatal to their enemies, painful to their rivals, and even dangerous to themselves. They chastised the insolence of the islanders of Eubœa and Ægina, who contended with them in naval power; and humbled the pride of Thebes, which rivalled them in military glory. Favoured, as they fondly believed, by the protection of their tutelary Minerva; and animated, as they strongly felt, by the possession of an equal freedom; they adorned their capital with the richest spoils of their vanquished enemies. Their influence soon extended over the northern parts of Greece; and the fame of their power, still greater than their power itself, alarmed the fears and jealousy of the Peloponnesians. The Spartans, in particular, who had assisted them in restoring the democracy, now perceived the error of which they had been guilty, in promoting the greatness of an ambitious rival. In order to prevent the dangerous consequences of their folly, they summoned to a congress all their allies in Peloponnesus, that their united wisdom might concert proper measures for resisting, ere it was too late, the encroachments of the Athenians, which threatened the liberties of all Greece. Their allies readily obeyed the welcome summons, and the deputies of the several states, having assembled in the Spartan forum, eagerly listened to the speakers appointed to explain the intentions of that republic. The Lacedæmonian orators acknowledged the mistaken policy of their country, in expelling from Athens the family of Pisistratus, and delivering the government of that city into the hands of an ungrateful populace, who had since treated them with much indignity. But why (they proceeded) should we relate private injuries? Have they not insulted all their neighbours? Does not their pride daily increase with their power? And is there not

reason

reason to dread, that their growing ambition may endanger, and at length destroy, the public safety? In order to prevent this evil, we have recalled Hippias from banishment. And let us, therefore, by our united efforts, re-estate the son of Pisistratus in that power and authority of which we most injudiciously deprived him. The speech of the Lacedæmonians produced not the intended effect. The Peloponnesians, however jealous of the Athenian greatness, were still more jealous of the power of tyrants; and many of them, who had experienced the haughtiness of Sparta, were not dissatisfied with beholding a rival to that republic in the northern division of Greece. The other deputies expressed their dissent by silent disapprobation; but Sophicles, the Corinthian, declared his sentiments at great length, in a speech which alike marks the manly character of the age, and the youthful vigour of Grecian eloquence. "Then finely, Lacedæmonians, will the heavens sink below the earth, and the earth rise sublime in the air; men will inhabit the depths of the sea, and fishes will take possession of the land; when you, formerly the bulwarks of liberty, shall demolish the popular governments of Greece, and establish tyrannies in their room, than which nothing can be more unjust or more pernicious." After this pompous enunciation, the Corinthian proceeded to describe and exaggerate the calamities which his own countrymen had suffered from the usurpation of Cypselus, and his son Periander. Having related, at great length, the proud, cruel, and despotic actions of those princes; "Such," added he, "are the genuine fruits of absolute power; but I adjure you by the Grecian gods! attempt not to re-establish it in Athens. The Corinthians were seized with astonishment when they heard that you had sent for Hippias; I myself was amazed at beholding him in this assembly; yet we never suspected that you proposed to restore him, in triumph, to his much injured city. If you still persist in this fatal resolution, know that the Corinthians disavow all part in a design equally unjust and impious." The other deputies listened with pleasure to the boldness of Sophicles, who expressed the sentiments which they themselves felt, but which their respect for the Lacedæmonians obliged them to conceal. Hippias alone opposed the general voice of the assembly, attacking the same gods which his opponent had invoked, and prophesying, that at some future time the Corinthians would repent of their present conduct, and regret their cruel injustice to the son of Pisistratus, when their own citizens, as well as the rest of Greece, should fatally experience the dangerous ambition of Athens. This remonstrance, which was so fully justified in the sequel, produced no immediate effect in the assembly; the Lacedæmonians finally yielded to the general request of their confederates, and abstained from their intended innovation in the government of a Grecian city.

The dethroned prince, finding his cause abandoned by the Greeks, sought the protection of Artaphernes, the Persian governor of Sardis: having acquired the confidence of this magistrate, he represented to him the insolence, ingratitude, and perfidy of his countrymen, and the severest reproaches with which he loaded their character gained ready belief with the Persian. The Athenians, who were informed of these intrigues, sent ambassadors to Sardis, in order to counteract Hippias; but the resolution of Artaphernes was already taken; and he told the ambassadors, that if they consulted their safety, and would avoid the resentment of Persia, they would reinstate Hippias on the throne of his father. This answer had been reported to the Athenians, and the assembly had finally settled to oppose the powers of the greatest empire upon earth, rather than admit within their walls the declared enemy of their liberties.

(See Herodotus, book v.) Precisely at this juncture (B. C. 501.) Aristagoras arrived at Athens, explained the revolt of the Asiatic Greek from the government of Artaphernes, and solicited the assistance of the Athenians, in defending their own colonies against the oppressive violence of the common foe. Many arguments were not necessary to make the people of Athens adopt a measure which gratified their own passions. The eloquent Miltiades, however, described the wealth and extent of Persia, the grandeur and populousness of its cities, and above all, the stultical effeminate and pusillanimous weakness of their inhabitants, who, unable to support the ponderous shield, or to poise the manly lance, invited as an easy prey, the victorious arms of a more warlike invader. The speech of Aristagoras was well fitted to excite the ambition and avarice of Athens. The assembly immediately decreed that assistance should be sent to Ionia. Twenty ships were fitted out with all convenient speed, which reinforced by five more belonging to Eretria, a town of Eubœa, rendezvoused in the harbour of Miletus. Aristagoras spent not long time in his embassy to the other states of Greece, and soon met the Athenian allies at the place appointed. It was here determined, that while the commander in chief regulated the civil affairs of the Ionians, his brother Charopius should conduct a military expedition against the wealthy capital of Lydia. The Athenians, desirous of testifying their resentment against the common enemy, and still more desirous of plunder, eagerly engaged in this undertaking. The united fleets left the harbour of Miletus, and sailed to Ephesus, where the troops were disembarked; and, in three days, accomplishing a journey of seventy miles, appeared before the walls of Sardis. The Persian governor little expected such a visit; his soldiers were not prepared to take the field; and the extensive walls of the city could not be defended on all sides against the besiegers; and the Greeks, without opposition, entered Sardis, in order to plunder the accumulated wealth of that ancient capital. But an accident prevented them from reaping the fruits of their success. The resentment of a rapacious soldier disappointed of his prey, set fire to the house of a Lydian, situate on the skirts of the town, which consisted for the most part of very combustible materials, the houses being all roofed, and many of them walled with cane; a mode of building doubly dangerous in that arduous climate. The flames readily communicated from one house to another; and, in a short time, the whole circumference of the place was surrounded with a wall of fire. Sardis was built in the Grecian, not in the Eastern fashion, having on the banks of the Pactolus, which intersected the town, a spacious square, which commonly served for the marketplace. Thither the Persians, driven from the extremities, betook themselves to refuge against the fury of the flames.

Darius was extremely enraged against the Greeks, and especially the Athenians, for having abetted revolt among his subjects. The proud monarch of the East, when informed that the citizens of Athens had co-operated with the Ionians, in the taking and burning of Sardis, discovered evident marks of the most furious resentment; shooting an arrow into the air, he prayed that heaven might assist him in punishing the audacious insolence of that republic; and every time he sat down to table, an attendant reminded him of the Athenians, lest the delight of Eastern luxury should seduce him from his fell purpose of revenge. The execution of his design was entrusted to Mardianus, a Persian nobleman of the first rank, whose personal as well as hereditary advantages had entitled him to the marriage of Artazoutra, daughter of Darius; and whose youth and inexperience were compensated, in the opinion of his master, by his superior

superior genius for war, and insatiate love of glory. In the second spring after the cruel punishment of the Ionians, Mardonius approached the European coast with an armament sufficient to inspire terror into Greece. The rich island of Thafus, whose golden mines yielded a revenue of near three hundred talents, submitted to his fleet; while his land forces added the barbarous province of Macedonia to the Persian empire. But having steered southward from Thafus, the whole armament was overtaken and almost destroyed by a violent storm, while endeavouring to double the promontory of mount Athos, which is connected with the Macedonian shore by a narrow neck of land, but forms a long and lofty ridge in the sea. Three hundred vessels were dashed against the rocks; twenty thousand men perished in the waves. This disaster totally defeated the design of the expedition; and Mardonius having recovered the shattered remains of his fleet and army, returned to the court of Persia, where by flattering the pride, he averted the resentment of Darius; while he represented, that the Persian forces, invincible by the power of man, had yielded to the fury of the elements. The address of Mardonius rescued him from punishment; but his misfortunes removed him from the command of Lower Asia. Two generals were appointed in his room, of whom Datis, a Mede, was the more distinguished by his age and experience, while Artaphernes, a Persian, was the more conspicuous for his rank and nobility, being descended of the royal blood. That his lieutenants might appear with a degree of splendor suitable to the majesty of Persia, Darius assembled an army of 500,000 men, consisting of the flower of the provincial troops of his empire. The preparation of an adequate number of transports and ships of war occasioned but a short delay. The maritime provinces of the empire, Egypt, Phœnicia, and the coasts of the Euxine and Egean seas, were commanded to fit out, with all possible expedition, their whole naval strength; the old vessels were repaired, many new ones were built; and in the course of the same year in which the preparations commenced, a fleet of six hundred sail were ready to put to sea. This immense armament the Persian generals were ordered to employ in extending their conquests on the side of Europe, in subduing the republics of Greece, and more particularly in chastising the insolence of the Eretrians and Athenians, the only nations which had conspired with the revolt of the Ionians, and assisted that rebellious people in the destruction of Sardis. With respect to the other nations which might be reduced by his arms, the orders of Darius were general, and the particular treatment of the vanquished was left to the discretion of his lieutenants; but concerning the Athenians and Eretrians, he gave the most positive commands that their territories should be laid waste, their houses and temples burnt or demolished, and their persons carried in captivity to the eastern extremities of his empire. Secure of effecting this purpose, his generals were furnished with a great number of chains for confining the Grecian prisoners; a haughty presumption (to use the language of antiquity), in the superiority of man over the power of fortune, which on this, as on other occasions, was punished by the just vengeance of heaven. (B. C. 490.) The Persian fleet enjoyed a prosperous voyage to the isle of Samos, from whence they were ready to proceed to the Athenian coast. The late disaster which befel the armament commanded by Mardonius, deterred them from pursuing a direct course along the shores of Thrace and Macedonia; they determined to steer in a direct line through the Cyclades, a cluster of seventeen small islands lying opposite to the territories of Argos and Attica. The approach of such an innu-

merable host, whose transports darkened the broad surface of the Ægean, struck terror into the unwarlike inhabitants of those delightful islands. The Naxians took refuge in their inaccessible mountains. The natives of Delos, the favourite residence of Latona and her divine children, abandoned the awful majesty of their temple, which was overshadowed by the rough and lofty mount Cynthus. Paros, famous for its marble; Andros, celebrated for its vines; Ceos, the birth place of the plaintive Simonides; Syros, the native country of the ingenious and philosophic Pherecydes; Ios, the tomb of Homer; the indolent Amorgos; as well as all the other islands which surrounded the once sacred shores of Delos, either spontaneously offered the usual acknowledgment of earth and water as a testimony of their friendship, or submitted, after a feeble resistance, to the Persian arms. The invaders next proceeded westward to the isle of Eubœa, where, after almost a continued engagement of six days, their strength and numbers, assisted by the perfidy of two traitors, finally prevailed over the valour and obliquity of the Eretrians. Hitherto every thing was prosperous; but a more difficult task remained, in the execution of which the Persians (happily for Europe) experienced a fatal reverse of fortune. After the reduction of Eubœa, the Athenian coasts separated from that island only by the narrow strait of Euripus, seemed to invite the generals of Darius to an easy conquest. They readily accepted the invitation, as the punishment of Athens was the main object which their master had in view when he fitted out his seemingly invincible armada. The measures which they adopted for accomplishing this design appear abundantly judicious; the greater part of the army was left to guard the islands which they had subdued; the useless multitude of attendants were transported to the coast of Asia: with a hundred thousand chosen infantry, and a due proportion of horse, the Persian generals set sail from Eubœa, and safely arrived on the Marathonian shore, a district of Attica, about thirty miles from the capital, consisting chiefly of level ground, and therefore admitting the operations of cavalry, which formed the main strength of the barbarian army, and with which the Greeks were very poorly provided. Here the Persians pitched their camp, by the advice of Hippas the banished king of Athens, whose perfect knowledge of the country, and intimate acquaintance with the affairs of Greece, rendered his opinion on all occasions respectable. To combat this mighty force, the Athenians could not bring the twelfth part of the number, but their handful breathed the spirit of freedom, which was paramount to a countless multitude, the tools of despotism. It was first deliberated whether they ought to await the Persians in the city, or meet their foes in the field. There are emergencies in which the most adventurous boldness is the fittest wisdom; happily for the Athenians they had citizens able both to discover and apply this maxim. Three men then flourished in Athens, qualified and destined to give new energy to the state. These were Miltiades, Aristides, and Themistocles. Their characters will best display themselves in the narrative of their actions. Miltiades had long carried on war in Thrace, where he acquired a splendid reputation; Aristides and Themistocles, younger than himself, had from their infancy manifested a rivalry, which would have been the ruin of the state, had they not sacrificed it on all emergencies to the public welfare. The example and harangues of these three illustrious citizens kindled the flames of the noblest heroism in the minds of the Athenians. Levies were immediately made. Each of the ten tribes furnished a thousand foot soldiers, with a commander at their head.

No sooner were the troops assembled, than they marched out of the city into the plain of Marathon, where the inhabitants of Platea sent them a reinforcement of a thousand infantry. Scarcely were the two armies in sight of each other, before Miltiades proposed to attack the enemy; Aristides, and several of the commanders, warmly opposed this measure; but the rest, terrified at the excessive preparation of the armies, were desirous of waiting for reinforcements from Lacedæmonia. Opinions being divided, they had recourse to that of the shoemaker, or chief of the militia, who was consulted on such occasions to put an end to the equality of suffrages. Miltiades addressed himself to him with the ardour of a man deeply impressed with the importance of present circumstances: "Athens (said he) is on the point of experiencing the greatest of vicissitudes; ready to become the first power of Greece, or the theatre of the tyranny and fury of Hippias; from you alone, Callimachus, the now awaits her destiny. If we suffer the ardour of the troops to cool, they will shamefully bow beneath the Persian yoke; but if we lead them on to battle, the gods and victory will favour us. A word from your mouth will now precipitate your country into slavery, or preserve her Liberty." (See Herodotus, l. vi. c. 109.) Callimachus gave his suffrage, and the battle was resolved. To ensure success, Aristides, and the other generals after his example, yielded to Miltiades the honour of the command which belonged to them in rotation; but, to secure them from every hazard, he preferred waiting for the day which of right placed him at the head of the army. When that day arrived, Miltiades drew up his troops at the foot of a mountain, on a spot of ground scattered over with trees, to impede the Persian cavalry. The Plateans were placed on the left wing; Callimachus commanded the right; Aristides and Themistocles were in the centre of the battle, and Miltiades everywhere. (See Herodotus, l. vi.) At the first signal, the Greeks advanced over this space running. The Persians astonished at a mode of attack so new to both nations, for a moment remained motionless; but to the impetuous fury of the enemy, they soon opposed a more ferate and not less formidable fury. After an obstinate conflict of some hours, victory began to declare herself in the two wings of the Grecian army. The right dispersed the enemy in the plain, while the left drove them back on a morass that had the appearance of a meadow, in which they stuck fast and were lost. Both these bodies of troops now flew to the succour of Aristides and Themistocles, ready to give way to the flower of the Persian troops, placed by Darius in the centre of his battle. From this moment the rout became general. The Persians, repulsed on all sides, found their only asylum in the fleet, which had approached the shore. The conquerors pursued them with fire and sword, and took, burnt, or sunk, the greater part of their vessels; the rest escaped by dint of rowing. The banished tyrant of Athens fell in the engagement; two Athenian generals, and about two hundred citizens, were found among the slain; the Persians left six thousand of their best troops in the scene of action. The joy excited among the Athenians by a victory, which not only delivered them from the dread of their enemies, but raised them to distinguished pre-eminence among their rivals and allies, is evident from a remarkable incident which happened immediately after the battle. As soon as fortune had visibly declared in their favour, a soldier was dispatched from the army to convey the welcome news to the capital. He ran with incredible velocity, and appeared, covered with dust and blood, in the presence of the senators: excess of fatigue conspired with the transports of enthusiasm to exhaust the vigour of his frame: he had

only time to exclaim in two words: "Rejoice, Athens, for I have saved you!" and immediately expired. The Athenians could find nothing to censure in the conduct of Miltiades in the battle. His honorable funeral was followed on the plain of Marathon. In the interval between them were erected trophies to the arms of the Persians. An accident of omission complicated the circumstances of the battle in one of the most important particulars of the city: Miltiades was there reproached at the head of the generals, and in the act of exhorting the troops to fight for their country. The highest praises were bestowed upon Miltiades, and he was appointed commander of an expedition against the Persian garrison. The first operations of the Athenian armament were crowned with success. Several islands were subdued, and considerable sums of money collected. But the fleet arriving before Paros, every thing proved adverse to the Athenians. The Persians made a very vigorous defence; their strength, however, began to decline, and they must have been overpowered, but for a fortunate accident. An extensive grove, happening to be let on fire in a neighbouring island, was observed by the sailors to indicate the approach of a Persian fleet. The same opinion gained ground among the Parosians, who determined by their utmost efforts to preserve the place until they should be relieved by the assistance of their protectors. Miltiades had received a dangerous wound during the siege; and the weakness of his body impairing the faculties of his mind, he gave orders to draw off his victorious troops, and returned with the whole fleet to Athens. The Athenian citizens, and particularly the more eminent and illustrious, had universally rivals and enemies. The competitors for civil offices, or military command, occasioned eternal animosities among these jealous republicans. Naxippus, a person of great distinction, and father of the celebrated Pericles, who, in the succeeding age, obtained the first rank in the Athenian government, eagerly seized an opportunity of depressing the character of a man which had so long surpassed that of every competitor. He was accused of suffering himself to be corrupted by Persian money, and notwithstanding the solicitations of the most virtuous citizens, was condemned to be thrown into the dungeon in which malefactors are left to perish. The magistracy opposing the execution of this infamous decree, his punishment was commuted into a fine of fifty talents; and as he was unable to pay this sum, Athens saw the vanquisher of Darius expire in chains of the wounds he had received in the service of the state.

But the glory of Miltiades survived him; and the Athenians, however unjust to his person, were not unmindful of his fame. At the distance of half a century, when the battle of Marathon was painted by order of the state, they directed the figure of Miltiades to be placed in the fore ground, animating the troops to victory; a reward which, Dr. Gillies observes, "during the virtuous simplicity of the ancient commonwealth, conferred more real honour than all that magnificent profusion of crowns and statues, which, in the later times of the republic, were rather extorted by general fear, than followed by public admiration." "The jealousies (continues the same author), resentments, dangers, and calamities, which often attend power and pre-eminence, have never yet proved sufficient to deter an ambitious mind from the pursuit of greatness." The rivals of Miltiades were animated by the glory of his destination, not depressed by the example of his fall. His successor, Naxippus, though he had acted the principal part in removing this favourite of the people, was not deemed worthy to succeed to his power.

Two candidates appeared for the public confidence and esteem, who alternately outstripped each other in the race of ambition, and whose characters deserve attention even in Athenian history, as they had a powerful influence on the fortune of Athens. (See Dr. Gillies's History of Greece, vol. i. p. 407.) The character of Aristides has been already seen in biographical detail (see article ARISTIDES); here it is to be viewed merely in its combination with events and with characters which affect the history of Athens.

The character of Themistocles was of a more doubtful kind. The trophy, which Miltiades had raised at Marathon, disturbed his rest: he was inflamed with a desire to emulate the glory of this exploit; and while he enabled Athens to maintain a superiority in Greece, he was ambitious to acquire for himself a superiority in Athens. His talents were well adapted to accomplish both these purposes; eloquent, active, enterprising, he had strengthened his natural endowments by all the force of education and habit. Laws, government, revenue, and arms, every branch of political and military knowledge, were the great objects of his study. In the courts of justice he successfully displayed his abilities in defence of his private friends, or in accusing the enemies of the state. He was forward to give his opinion upon every matter of public deliberation; and his advice, founded in wisdom, and supported by eloquence, commonly prevailed in the assembly. Yet with all these great qualities, his mind was less smitten with the native charms of virtue, than captivated with her splendid ornaments. Glory was the idol which he adored; he could injure, without remorse, the general cause of the confederacy, in order to promote the grandeur of Athens; and history still leaves it as doubtful, as did his own conduct, whether, had an opportunity offered, he would not have sacrificed the happiness of his country to his private interest and ambition. The discernment of Aristides perceived the danger of allowing a man of such equivocal merit to be entrusted with the sole government of the republic; and on this account, rather than from any motives of personal animosity, he opposed every measure that might contribute to his elevation. In this patriotic view, he frequently solicited the same honours which were ambitiously courted by Themistocles, especially when no other candidate appeared capable of balancing the credit of the latter. A rivalry thus began, and long continued between them; and the whole people of Athens could only decide the much contested pre-eminence. The interest of Themistocles so far prevailed over the authority of his opponent, that he procured his own nomination to the command of the fleet; with which he effected the conquest of the small islands in the Ægean, and thus completed the design of Miltiades. While he acquired fame and fortune abroad, Aristides increased his popularity at home. The opposition to his power, arising from the splendid eloquence and popular manners of his rival, was now fortunately removed, and he became the chief leader of the people. His opinion gave law to the courts of justice; or rather such was the effect of his equity and discernment, he alone became sovereign umpire in Athens. In all important differences he was chosen arbitrator, and the ordinary judges were deprived of the dignity and advantages formerly resulting from their office. This consequence of his authority, offending the pride of the Athenian magistrates, was sufficient to excite their resentment; which, of itself, might have effected the ruin of any individual. But their views on this occasion were powerfully promoted by the triumphant return of Themistocles from his naval expedition. The admiral had acquired considerable riches; but wealth he despised, except as an instrument of ambition. The spoils

of the conquered islands were profusely lavished in shows, festivals, dances, and theatrical entertainments, exhibited for the public amusement. His generous manners and flowing affability were contrasted with the stern dignity of his rival; and the result of the comparison added great force to his insinuation, that since his own necessary absence in the service of the republic, Aristides had acquired a degree of influence inconsistent with the constitution; and, by arrogating to himself an universal and unexampled jurisdiction in the state, had established a silent tyranny, without pomp or guards, over the minds of his fellow-citizens. Aristides, trusting to the innocence and integrity of his own heart, disdained to employ any unworthy means, either for gaining the favour, or for averting the resentment, of the multitude. The contest, therefore, ended in his banishment for ten years, by a law intitled the Ostracism (from the name of the materials on which votes were marked), by which the majority of the Athenian assembly might expel any citizen. However inoffensive or meritorious had been his past conduct, who, by his present power and greatness, seemed capable of disturbing the equality of republican government. This singular institution, which had been established soon after the Athenians had delivered themselves from the tyranny of Hippias, the son of Pisistratus, was evidently intended to prevent any person in future from attaining the same unlawful authority. At Athens, even virtue was proscribed, when it seemed to endanger the public freedom; and only four years after the battle of Marathon, in which he had displayed equal valour and wisdom, Aristides, the justest and most respectable of the Greeks, became the victim of popular jealousy; an example of cruel rigour, which will for ever brand the spirit of democratical policy. The banishment of Aristides exposed the Athenians still more than formerly to the danger which they hoped to avoid by this severe measure. The removal of such a formidable opponent enabled Themistocles to govern without control; army, navy, and revenue, all were submitted to his inspection. It happened, indeed, most fortunately for the fame of this great man, as well as for the liberty of Athens, that his active ambition was called to the glorious task of subduing the enemies of his country. The smaller islands in the Ægean were already reduced to obedience; but the possession of them was uncertain while the fleet of Ægina covered the sea, and bid defiance to the Athenians. This small island, or rather this rock, inhabited time immemorial by merchants and pirates, and situate in the Saronic gulph, which divides the territories from the northern shores of Peloponnesus, was a formidable enemy to the republic; the jealousy of commerce and naval power embittered their mutual rivalry; and as the inhabitants of Ægina, who were governed by a few leading men, had entered into an alliance with the Persians, there was every circumstance united which could provoke to the utmost the hatred and resentment of the Athenians. A motive less powerful than the excess of republican antipathy could not probably have prevailed on them to embrace the measure which they now adopted by the advice of Themistocles. There was a considerable revenue arising from the silver mines of mount Laurium, which had been hitherto employed in relieving the private wants of the citizens, or dissipated in their public amusements. This annual income Themistocles persuaded them to destine to the useful purpose of building ships of war, by which they might seize or destroy the fleet of Ægina. The proposal was approved, an hundred galleys were equipped, the naval strength of Ægina was broken, and success animated the Athenians to aspire at obtaining the unrivalled empire of the sea. Coreya formed the only remaining obstacle to their ambition. This island,

which,

which, under the name of Phœacia, is celebrated by Homer for its amazing riches and fertility, had been still further improved by a colony of Corinthians. It extends an hundred miles along the western shores of Epirus, and the natural abundance of its productions, the convenience of its harbours, and the adventurous spirit of its new inhabitants, gave them an undisputed advantage over their neighbours in navigation and commerce. They became successively the rivals, the enemies, and the superiors of Corinth, their mother country; and their successful cruises infested the coasts, and disturbed the communication of the islands and continent of Greece. It belonged to Athens, who had so lately punished the perfidy of Ægina, to chastise the insolence of the Coreyceans. The naval depredations of these islanders made them be regarded as common enemies; and Themistocles, when, by seizing part of their fleet, he broke the sinews of their power, not only gratified the ambition of his republic, but performed a signal service to the whole of the Grecian confederacy. Victorious by sea and land, against Greeks and Barbarians, Athens might now seem entitled to enjoy the fruits of a glorious security. It was generally believed in Greece, that the late disaster of the Persians would deter them from invading a second time the coasts of Europe. But Themistocles, who, in the words of Thucydides (lib. i.), was no less sagacious in seeing the future, than in managing the present, regarded the battle of Marathon not as the end of the war, but as the prelude to new and more glorious combats. He continually exhorted his fellow-citizens to keep themselves in readiness for action; above all, to increase, with unremitting assiduity, the strength of their fleet; and, in consequence of this judicious advice, the Athenians were enabled to oppose the immense armaments of Xerxes (of which the most formidable tidings soon arrived from every quarter), with two hundred galleys of a superior size and construction to any hitherto known in Greece. (See Gillies's Greece, vol. i. p. 414.)

Meanwhile the reduction of revolted provinces had given employment and lustre to the Persian arms. Nine years after the battle of Marathon, and in the fourth year of his reign (B. C. 481.), Xerxes found himself uncontrolled master of the East, and in possession of such a fleet and army as flattered him with the hopes of universal empire. The three last years of Darius were spent in preparing for the Grecian expedition. Xerxes, who succeeded to his sceptre and to his revenge, dedicated four years more to the same hostile purpose. Amidst his various wars and pleasures, he took care that the artificers of Egypt and Phœnicia, as well as all the maritime provinces of Lower Asia, should labour with unremitting diligence, in fitting out an armament adequate to the extent of his ambition. Twelve hundred ships of war, and three thousand ships of burthen, were at length ready to receive his commands. The former were of a larger size and firmer construction than any hitherto seen in the ancient world: they carried on board, at a medium, 200 seamen, and thirty Persians who served as marines. The ships of burthen contained, in general, eighty men, fewer being found incapable of rowing them. The whole amounted to 4200 ships, and about 500,000 men, who were ordered to rendezvous in the most secure roads and harbours of Ionia. We are not exactly informed of the number of the land forces, which were assembled at Susa. It is certain, however, that they were extremely numerous, and it is probable that they would continually increase on the march from Susa to Sardis, by the confluence of many tributary nations, to the Imperial standard of Xerxes. The Persian army consisted of 1,700,000 infantry, and 80,000 cavalry, besides 20,000 Arabians, riders of camels, and Libyan charioteers: when to

these were added sailors and marines, the number amounted to 2,317,610: this was the number of fighting men whom Xerxes brought from Asia, exclusively of attendants and slaves. Besides, there were immense numbers of women and eunuchs, who, according to eastern luxury and debauchery, followed the camp, in all the ostentatious pageantry and feeble magnificence of despotic pomp: so that, to use the word of the animated Barthelemi, 5,000,000 had been torn from their native homes, and were preparing to destroy whole nations, to gratify the ambition of an individual named Mardonius. In Europe he was joined by 300,000 of Thracians, Macedonians, and northern Greeks, who manly deserted their brave countrymen of Sparta and Athens; so that the whole exceeded 2,600,000 men. (This account is translated from Herodotus, l. vi.) The number of this army, as recorded by the first Greek historian, has never been equalled by any of ancient or modern times, from Herodotus to his literary descendant Gillies. But little availed the bodies of Asiatic slaves, against the souls of European freemen. Having wintered at Sardis, he sent ambassadors to demand earth and water, as a mark of submission, from all the Grecian states except Athens and Sparta, whom he presumptuously reserved for the severest punishment. (B. C. 480.) The slow march of his immense army, and, still more, its tedious transportation across the seas which separate Europe from Asia, ill suited the rapid violence of his revenge. Xerxes therefore ordered a bridge of boats to be raised on the Hellespont, which, in the narrowest part, is only seven stadia, or seven eighths of a mile in breadth. Here the bridge was formed with great labour; but whether owing to the awkwardness of its construction, or to the violence of a succeeding tempest, it was no sooner built than destroyed. The great king ordered the directors of the work to be beheaded; and, proud of his tyrannic power over feeble men, displayed an impotent rage against the elements. In all the madness of despotism, he commanded the Hellespont to be punished with 300 stripes, and a pair of fetters to be dropped into the sea; adding these frantic and ridiculous expressions:—"It is thus, thou salt and bitter water, that thy master punishes thy unprovoked injury; and he is determined to pass thy treacherous streams, notwithstanding all the insolence of thy malice." After this absurd ceremony, a new bridge was made of a double range of vessels, fixed by strong anchors on both sides, and joined together by cables of hemp and reed, fastened to immense beams driven into the opposite shores. The decks of the vessels, which exceeded 600 in number, were strewed with trunks of trees and earth, and their surface was still farther smoothed by a covering of planks. The sides were then railed with wicker work, to prevent the fear and impatience of the horses; and upon this singular edifice the main strength of the army passed in seven days and nights, from the Asiatic city of Abydos, to that of Sestos in Europe. The army began its march, divided into three bodies, one of which followed the sea shore, and the two others proceeded at stated distances, through the interior part of the country. (See Herodotus, l. vii.) The measures that had been adopted, procured them certain means of subsistence. Three thousand vessels laden with provisions kept along the coast, regulating their motions by those of the army. The Egyptians and Phœnicians had previously stored many of the maritime towns of Thrace and Macedonia, and the Persians at every station were fed and provided with every thing by the inhabitants of the adjacent countries, who, long apprised of their arrival, were prepared for their reception. But before this general transportation, a considerable part of the forces had been already sent to

the coast of Macedonia, in order to dig across the isthmus which joins to that coast the high promontory of Athos. The disorder which befel the fleet commanded by Mardonius, in doubling the cape of this celebrated peninsula, was still present to the mind of Xerxes. The neck of land, only a mile and a half in breadth, was adorned by the Grecian city of Sana; and the promontory being rich and fertile, was well inhabited both by Greeks and Barbarians. The cutting of this narrow isthmus, by a canal of sufficient width to allow two galleys to sail abreast, was a matter not beyond the power of a potentate who commanded the labour of so many myriads; but it is observed by Herodotus, to have been a work of more ostentation than utility, as the vessels, according to the custom of the age, might have been conveyed over land with greater expedition, and with less trouble and expence. The Persian forces were now safely conducted into Europe; and the chief obstacle to the easy navigation of their fleet along the coasts of Thracia, Macedonia, and Thessaly, to the centre of the Grecian states, was removed by the dividing of mount Athos. Through the fertile plains of Lesser Asia, the whole army had kept in a body; but the difficulty of supplies obliged them to separate into three divisions in their march through the less cultivated countries of Europe. Before this separation took place, the whole fleet and army were reviewed by Xerxes, near Doriscus, a city of Thracia, at the mouth of the river Hebrus. This celebrated muster we shall narrate in the words of Dr. Gillies. "Such an immense collection of men assembled in arms, and attended with every circumstance of martial magnificence, gave an opportunity for seeing, or at least for supposing, many affecting scenes. The ambition of the great king had torn him from his palace of Susa, but it could not tear him from the objects of his affection, and the ministers of his pleasure. He was followed by his women, and by his flatterers, and all the effeminate pride of a court was blended with the pomp of war. While the great body of the army lay every night in the open air, Xerxes and his attendants were provided with magnificent tents. The splendor of his chariots, the mettle of his horses, which far excelled the swiftest racers of Thessaly, the unexampled number of his troops, and above all, the bravery of the immortal band (a body of 10,000 Persian cavalry, so named because their number was constantly maintained from the flower of the whole army), seemed sufficient, to the admiring crowd, to raise the glory of their sovereign above the condition of humanity; especially since, among so many thousands of men as passed in review, none could be compared to Xerxes in strength, in beauty, or in stature. But amidst this splendor of external greatness, Xerxes felt himself unhappy. Having ascended an eminence to view his camp and fleet, his pride was humbled with the reflection, that no one of all the innumerable host could survive an hundred years. The haughty monarch of Asia was melted into tears. The conversation of his kinsman and counsellor, Artabanus, was ill calculated to console his melancholy. That respectable old man, whose wisdom had often moderated the youthful ardour of Xerxes, and who had been as assiduous to prevent, as Mardonius had been to promote, the Grecian war, took notice that the misery of human life was an object far more lamentable than its shortness. In the narrow space allotted, has not every one of these in our preference, and indeed the whole human race, often wished rather to die than to live? The tumult of passions disturbs the best of our days; diseases and weakness accompany old age; and death, so vainly dreaded, is the sure and hospitable refuge of wretched mortals." (See Gillies, vol. i. p. 424.) Xerxes often conversed with Demaratus, an exiled king of Sparta, who had taken refuge with the Persian monarch, and their dialogues, detail'd by Herodotus, admirably illustrate the opposite circumstances and characters of the Persians and Greeks. The following is nearly the substance. "Do you imagine," said the despot, "that the Greeks will dare resist my forces?" Demaratus, having obtained permission to speak the truth, replied, "The Greeks are to be feared, because they are poor and virtuous. Without pronouncing the eulogium of the other states, I shall only speak to you of the Lacedæmonians. They will scorn the idea of slavery. Should all Greece submit to your arms, they will be but the more ardent in defence of their liberty. Inquire not the number of their troops; were they but a single thousand, nay, were they still fewer, they would present themselves to the combat." The Persian king, at hearing this, laughed aloud; and after comparing his forces with those of the Lacedæmonians: "Do you not see," said he, "that the greatest part of my soldiers would take to flight, were they not retained by menaces and blows? As a similar dread cannot operate on those Spartans, who are represented to us as so free and independent, it is evident that they will never unnecessarily brave certain death; and what is there to constrain them to it?" "The law," replied Demaratus; "that law which has more power over them, than you have over your subjects; that law which saith to them, behold your enemies; the question is not to number them; you must conquer or die." Xerxes was rather amused than instructed by this discourse. His hopes of success seemed built on too solid principles to be shaken by the opinion of a prejudiced Greek. Every day messengers arrived with the submission of new nations. He proceeded on his march, till he arrived at the pass of Thermopylæ. This is a defile situated at the foot of mount Oeta, between Thessaly and Phocis; a pass no more than ninety feet broad, and the only one by which the host of Xerxes could penetrate into Achaia. Thither the Grecian army, not exceeding 11,000, directed its course: of these 4,000 only were more immediately destined to defend the passage. But finding himself mistaken, and being informed by Demaratus, that a handful of men might at this place stop for a considerable time all his forces, he endeavoured to corrupt Leonidas by magnificent presents, and the most tempting promises, even that of making him supreme lord of Greece. But Leonidas having rejected all his temptations with disdain, Xerxes thereupon commanded him by a messenger to send him his arms. "Let your king come and take them," answered Leonidas. Then the Medes advanced against the Greeks; but being unable to sustain their attack, were obliged to retreat. The troop of Persians, distinguished by the name of *immortal*, next charged the Greeks, and fought with great valour, so that the pass was checked up with the dead. While the best troops of Xerxes were thus sacrificed to the Spartan valour, an inhabitant of the country having discovered to the Persians a secret path conducting to an eminence that commanded the pass, a large detachment was immediately sent to take possession of it. Leonidas receiving intelligence that the tops of the rocks forming the pass were occupied by 20,000 Persian troops, whose darts must soon overwhelm him and his small party, intreated the greater part of his men to retire, and reserve themselves for a more advantageous opportunity of serving their country; while he himself with about 300 Spartans and a few Thespians, would maintain the pass till the last. The rest having accordingly departed, "Come my friends," said Leonidas, "let us dine cheerfully, in the hope of supping together in the other world." His brave companions, encouraged by the example of their chief,

thought

thought of nothing now but to sell their lives as dearly as possible; believing it incumbent on them, as the leading people of Greece, to devote themselves to certain death, thereby to convince the Barbarians how much it must cost them to reduce a free people to slavery. In the dead of night, this heroic troop advancing directly forwards to the tent of the king, penetrated to the middle of the Persian camp, cut off all that came in their way, and found the most dreadful conflagration among the enemy. But delight at last discovering them distinctly to the Persians, they were immediately surrounded, and being rather overwhelmed than conquered, breathed their last above heaps of slaughtered enemies; leaving to after ages an example of intrepidity before unknown, and hardly to be paralleled in history. The Persians are said to have lost upwards of 20,000 men in this engagement, and, among the rest, the two brothers of Xerxes. To the memory of these brave defenders of Greece, a superb monument was afterwards erected, bearing two inscriptions; the one in honour of all those who had served on that occasion; importing, that an army of four thousand Peloponnesian Greeks had there stopped the progress of the whole Persian force; the other in honour of Leonidas and his 300 Spartans, expressed, in a few simple words, to this effect: "Go, passenger, tell at Sparta, that we died here in obedience to her laws." This famous action at Thermopylae, in the opinion of Diodorus Siculus, contributed very highly to the subsequent advantages obtained by the Greeks; for the Persians, astonished at so striking an instance of desperate valour, thence concluded, that it was hardly possible to subdue a nation of such undaunted resolution; and the Greeks likewise perceived, from the same example, that valour and discipline are capable of vanquishing the greatest multitude; and that therefore it was possible to overcome the Persians.

But the principal defence of Greece rested with the Athenians. The very day that Leonidas fell at Thermopylae, the Athenian fleet, commanded by Themistocles, having discovered, while cruising off Artemisia, a promontory of Euboea, a detachment of the enemy's fleet amounting to two hundred vessels, attacked them in the night, and sunk more than thirty of them, and the rest were that same night wrecked on the coast of Euboea by a storm that succeeded the engagement. The Athenians receiving next day a reinforcement of fifty-three ships more, attacked those of the Cilicians, and sunk many of them. A general engagement ensued the same day, in which both parties fought with great bravery; and though neither could boast of the victory, yet the loss was most considerable on the side of the Persians. From the event of these several actions, the Athenians learned, that victory is not always determined by the greater number of ships. Hearing, in the mean time of what had passed at Thermopylae, the Greeks thought it advisable to retire nearer home, and therefore set sail for Salamis, a small island not far from Attica. Xerxes having now advanced into Phocis, after marking his march all along with the effects of his resentment, the Peloponnesians resolved to fortify themselves within the isthmus. The Athenians, therefore, seeing themselves on the eve of being crushed under the whole weight of the Persian power, sent, in this extremity, to consult the oracle; who told them, "that the only means of preserving their city were wooden walls." These wooden walls, pointed out by the oracle, were interpreted by Themistocles to be their ships; and he told his countrymen, that the sole means of preservation left was, to abandon the city, and to betake themselves to their fleet. This advice was not at all relished by the people, who shuddered at the thoughts

of deserting their gods, and the tombs of their ancestors. Themistocles, however, succeeded at last in persuading them, that the existence of Athens depended neither on its houses nor its temples, but on the lives of its citizens; and that the gods themselves had, by the mouth of the oracle, plainly declared it to be their pleasure, that the Athenians ought to leave their city for a while. The people at last, convinced by his eloquence, consented to go on board of their ships. It is difficult to say, whether we are more affected on this occasion by the melancholy situation of the Athenians, thus compelled by a barbarous prince to desert their native country; or by the heroic resolution of these Athenians, to go in this manner into a sort of voluntary banishment, rather than submit to their oppressors. The Athenians conveyed their women, children, and the greater part of their old men, to Trazene, a small town on the coast of Peloponnesus, where they were received with all the marks of humanity which their situation required. But many of their eldest men were left in the island, being unable, by reason of their great age and infirmities, to undergo the fatigue of transportation. Xerxes in the mean time approaching towards Athens, sent a detachment of his army to plunder the temple of Delphos, which contained immense riches. But Herodotus and Diodorus Siculus tell us, that most of the soldiers sent on this errand perished in a violent tempest. The Persian army arriving at Athens, found nothing but silence and solitude within the walls. They attacked the citadel, which, after a brave resistance by its feeble garrison, was taken by storm, and all within it were put to the sword; Xerxes ordered the rest of the city to be set on fire. In the mean time differences were likely to arise in the Grecian fleet commanded by Eurybiades; one half of them being of opinion that they ought to advance towards the isthmus of Corinth, to be at hand to support their army; and the other, that they ought by no means to quit the advantageous post at Salamis. The latter opinion was supported by Themistocles, who, on this occasion, gave another proof of his extraordinary moderation and coolness of temper. For while he was maintaining his opinion with some warmth against Eurybiades, who was a man of a choleric disposition, the latter flew in a passion, and lifted up his cane to strike him; Themistocles called out to him, "strike, but hear me." His eloquence and firmness at last prevailed, and the Greeks saw that, being extremely inferior to the enemy in the number as well as in the size of their ships, it was of the highest importance to avoid themselves of their present situation, and to give battle in such a narrow strait as that of Salamis, where the enemy could not bring all their fleet into action. They resolved, therefore, to prepare to fight the Persians in this strait. The Persians determined to give battle, contrary to the opinion of queen Artemisia, who represented to them, that the loss of a sea fight must inevitably be attended with the destruction of their army on land. But her advice, though the most prudent, was rejected, Xerxes having himself declared his sentiments for their coming to action. Themistocles, in the mean time, to put it entirely out of the power of his countrymen to retire from Salamis, contrived to have false intelligence conveyed to Xerxes of their intending to decline the engagement, and to make their escape, and therefore advising him to order his fleet instantly to advance and block them up. This stratagem he communicated to Aristides, who undertook to exhort the rest of the commanding officers with whom he was in great credit, not to be dismayed at seeing themselves hemmed in, but to behave with their usual intrepidity. The stratagem had the desired effect;

and the Greeks seeing no other possibility of escaping, except by fighting their way through the midst of the enemy, prepared for the engagement. Xerxes, who was on shore, being desirous of seeing the battle, ordered a superb throne to be erected for him on an eminence. The fleet of the Greeks consisted of three hundred and eighty sail. Themistocles, who that day commanded it, waited for the rising of a wind, which regularly began to blow at a certain hour, in a direction exactly in the face of the enemy. The Persians began the attack with great bravery; but the small fleet of the Greeks, acting by the skill of its commanders under every advantage, soon threw the enemy's first line into confusion, and sunk the Persian admiral. Those that followed him, intimidated by his fate, partly betook themselves to flight, and partly were sunk. On the wings, however, the action continued very warm and obstinate; but the wind being against the Persians, the unwieldy size of their ships rendered them very difficult to be managed, and their great number rather embarrassing than availing them in such a narrow strait, they could not long sustain the impetuosity of the Athenians, but fell into a general disorder. The Ionians, mindful of their Grecian extraction, were the first that fled; and they were quickly followed by the rest of the Persian fleet, which soon appeared scattered up and down in flight and confusion. Queen Artemisia signalled herself by a courage far above her sex. In the height of the battle, perceiving herself to be on the point of falling into the hands of the Greeks, she immediately hung out Grecian colours, and attacking one of the Persian galleys, sunk it. The Greek that pursued her, deceived by this stratagem, believed her to be one of his own party, and quitted the pursuit. The victory cost the Greeks forty ships; but of the Persians two hundred were either taken or sunk. This engagement, one of the most memorable recorded in ancient history, entailed immortal fame on the Grecian wisdom and courage. The renowned Cimon, though yet but a young man, distinguished himself highly on that occasion, and gave evident marks of his future greatness. But as the principal glory belonged to Themistocles, the eyes of all the Greeks were fixed on him, and the highest honours were conferred on the deliverer of Greece. At this time every sentiment of jealousy was overlooked, and none exceeded the Lacedæmonians in their encomiums on Themistocles, whom they crowned with laurel, the reward of wisdom and valour. When he appeared at the Olympic games, the whole assembly rose up to give him place; every eye was fixed on him alone; and that day was the most glorious of his life.

The Persians and Greeks were in expectation of a new battle; but Mardonius was by no means satisfied with the orders given by Xerxes; he read in the soul of that prince nothing but the meanest sentiments combined with projects of revenge, to which he possibly might fall a victim. "My lord," said he, approaching him, "deign to recal your courage; your expectations were not founded on your fleet, but on that formidable army with which you have entrusted me. The Greeks are no more able to resist you now than heretofore; nothing can shelter them from the punishment due to their ancient offences, and the fruitless advantage they have lately gained. If we determine on a retreat, we shall for ever be the objects of their derision; and the opprobrium that has fallen on the Phœnicians, the Egyptians, and other nations who fought on board your vessels, will recoil on your faithful Persians. Suffer me to propose another method to save their glory and your own; I would advise you to lead back the greater part of your troops to Persia, and leave me three hundred thousand men,

with whom I shall be able to reduce all Greece." (See Herodotus, l. viii.) Xerxes, who in his own mind was rejoiced at the proposal, assembled his council, admitted to it Artemisia, and requested her opinion on the project of Mardonius. The queen discovering the real sentiments of Xerxes, gave an advice which she knew would be pleasing. "Leave," she said, "to Mardonius, the care of completing your work. If he succeeds, yours will be all the glory; if he perishes, or is defeated, your empire will not, on that account, be shaken, nor Persia consider the loss of a battle as any great misfortune, when you shall have secured your person." When the Greeks had leisure to examine the extent and completeness of their success, they determined, in the first emotions of triumph and resentment, to pursue the shattered remains of the enemy. That no Barbarian might escape, they proposed immediately to sail westward, to destroy the Persian bridge over the Hellespont, and thus to intercept their return. This design was recommended, and chiefly supported by the Athenians, who, having experienced the greatest share of the danger, felt most sensibly the joys of deliverance. But upon more mature deliberation, it occurred that the Persians were still sufficiently numerous to afford just grounds of terror. To their cowardice and inexperience, not to their want of strength, the Greeks owed all their advantages over them; but should the impossibility of retreat be added to their other calamities, they might derive courage from despair, and, by efforts hitherto unexerted, repair the consequences of their past errors and misfortunes. These considerations, first suggested, it is said, by Eurybiades the Spartan, were adopted by Themistocles, who convinced his countrymen that the jealousy of the Grecian gods, unwilling that one man should be lord of Europe and Asia, rather than their own prowess, had given them the victory over Xerxes; a prince of such folly and madness, that he had treated with equal irreverence things human and divine, destroyed the sacred temples, overthrown the venerable altars and images, and impiously insulted the gods of the Hellespont with stripes and fetters. That it was the duty of the Athenians, after having gloriously repelled the common enemy, to provide for the subsistence of their wives and families, to sow their lands, rebuild their houses, and thus to repair, by the most industrious activity, the dreadful ravages committed on their territories. (See Gillies, vol. i. p. 482.) Themistocles had no sooner persuaded the Athenians to embrace his opinion, than he secretly dispatched his confidant Sicinnus to acquaint the great king with the danger which he had so nearly escaped, and to advise him to pursue his journey with all possible expedition. Xerxes readily believed a piece of information, which agreed with the suggestions of his own timidity. The rapidity of his march, conspired with other circumstances above mentioned, in proving fatal to the lives of his followers; and the crafty Athenian, who knowing the insatiable affections of the multitude, wished to deserve the gratitude of a king, gained the double advantage of dispelling sooner than could otherwise have happened, that destructive cloud of Barbarians which hovered over his country, and of convincing their leader that he was in part indebted for his safety to that very man whose counsels, rather than the arms of Greece, had occasioned his affliction and disgrace.

Mardonius (B. C. 479), after wintering in Thessaly, took the field, and began his operations by making very advantageous offers to the Athenians, to detach them from their confederacy with the other states; promising not only to rebuild their city, and to give them a vast sum of money, but to set them at the head of all Greece. Aristides, then archon,

archon, answered the messengers of Mardonius, that all the gold in the world was insufficient to corrupt the Athenians, or to induce them to desert the defence of the common liberty of their country; that while the sun continued to light the world, the Athenians would remain the mortal enemies of the Persians, and would revenge, to the utmost of their power, the mischief they had brought upon their country, and the burning of their houses and temples. As soon as Mardonius received the answer of the Athenians, and thence saw that no motive could induce them to break their engagements, he ordered his army to march towards Attica. The Athenians, on the approach of the Persian army, left their city a second time, and retired to Salamis. Mardonius thereupon sent new deputies to them, with terms still more advantageous than the former: but the Athenians were so far from accepting them, that they stoned to death one Lycidas, only for saying that they ought to give an audience to the deputies. The Persian general, provoked at the contempt with which the Athenians treated all his proposals, entered Athens, and burnt every thing that had formerly escaped the fury of Xerxes. In this situation, the Athenians complained to the Lacedæmonians of their not having sent them the stipulated succours: the latter were then solely intent on maintaining their ground within the Peloponnese, and defending the entry of the isthmus; but in compliance with the requisition of the Athenians, who made a great outcry against the slowness of their proceedings, they sent to their assistance five thousand Spartans, each of whom was attended by seven helots. These forces, joined with those of the Athenians and Peloponneseans, formed altogether an army of about 70,000 men; which, after assembling at Eleusis, followed Mardonius into Bœotia, and encamped at the foot of mount Cithæron. Pausanias, son of Cleombrotus, and viceroys of Sparta, commanded the Lacedæmonian troops, and Aristides those of the Athenians; the Persian army then amounted to 300,000 men. Pausanias, in the mean time, advanced towards Plataea, with his forces drawn up in battle array; the Athenians being on the right wing, and opposed to the Persian troops, and the Lacedæmonians on the left, opposed to the Greek troops in the service of the Persians. The Megareans, who were encamped on the plain, having been attacked by the Persian cavalry, were, after a very brave and long resistance, on the point of giving way, when three hundred Athenians ran to their relief. The battle then became more obstinate than before; but Magistius, who commanded the Persian cavalry, being slain, his men betook themselves to flight. The death of this officer, who was reckoned the ablest in the Persian army, spread universal consternation through all their troops. Ten days intervened between this action and the general engagement. Artabazus was of opinion, that the Persians ought to avoid a general battle; but Mardonius, a man of a violent fiery disposition, thought otherwise. Pausanias and Aristides, informed of the design of the Persians to attack them, drew up their army in order of battle near to the city of Plataea, which Mardonius perceiving, changed the intended order of his attack. But the Greeks, finding themselves straitened for water in their present situation, resolved to decamp. Mardonius believing this movement to be a flight, immediately advanced with his men, uttering loud shouts, and charged the rear of the Greek army, composed of the Lacedæmonians, who, forming themselves into a column, opposed the enemy with their usual valour, and falling on the Persians with the greatest fury, made a dreadful slaughter. Mardonius fell in the beginning of the action. The main body of the Greek army advancing in the mean time

to the charge, in separate detachments, completed the overthrow of the Persians. In another quarter of the field, the 40,000 Greeks in the Persian service, who were engaged with the troops commanded by Aristides, hearing of the flight of the Barbarians, followed their example, and retreated likewise, but rallied in their camp, and there entrenched themselves. The Lacedæmonians, however, supported by the Athenians, attacked and forced their entrenchments; after which, nothing was to be seen but a general massacre, for the Persians being too numerous to be made prisoners, received no quarter, and were all put to the sword. Artabazus, after distinguishing himself both as a faithful and as a brave soldier, collected the scattered remains of the Persian army, amounting now to no more than 44,000 men, and returned with all possible expedition towards Persia. The loss of the Greeks in this engagement was about 10,000 men. The Greeks, as a monument of this memorable victory, erected a statue to Jupiter in the temple of Olympia, inscribed with the names of all the states of Greece who had fought at Plataea. It came next under consideration, whether the prize of valour ought to be adjudged to the Athenians or to the Lacedæmonians. But to avoid all controversy on this head, whereby the general joy arising from the victory might be disturbed, the question was, by the influence of Aristides, referred to the determination of the other Greeks, who, to prevent any jealousy between those rival states, adjudged it to belong to the Plataeans. Then, after sending a tripod of solid gold to the temple at Delphos, and setting apart a tenth of the spoil, as an offering to the gods, to be applied to religious purposes, they divided with great justice the rest of the spoil, which was so immense, that Justin is of opinion it was the first great cause of the corruption of the Grecian manners. By the persuasion of Aristides, the Greeks passed a solemn decree, obliging all the states to send deputies to Plataea, to offer sacrifices to *Jupiter the deliverer*, instituting public games at that place every fifth year; and ordering a fleet of a hundred ships, and an army of 10,000 foot, and as many horse, to be kept always on foot, for making continual war on the Barbarians. The Plataeans were appointed to celebrate the anniversary of all those who had fallen in this battle, which they regularly performed with much pomp and ceremony. The Persian fleet, having, in the mean time, sailed towards Samos, that of the Greeks, under the command of Leotychides the Lacedæmonian, and Xantippas the Athenian, advanced as far as Delos, upon the earnest entreaty of the inhabitants of Chios, who begged to be delivered from their subjection to the barbarians; and likewise in consequence of secret intelligence received by them of the intention of the Ionians to revolt. The Persians, hearing of the approach of the Greeks, retired to Mycale in Asia Minor, where they drew their vessels on shore, and surrounded them with a deep ditch. The Greeks, however, pursued them thither, and with the assistance of the Ionians, attacked them. The battle was at first bravely fought on both sides; but the Milesians and Samians, followed by the rest of the Asiatic Greeks, having deserted from the Persians, the latter were vanquished, and 40,000 of them cut in pieces. The Athenians took possession of the enemy's camp, burnt the Persian fleet, and returned to Samos with a vast deal of plunder. This engagement happened on the same day with that of Plataea. Thus did that memorable day for ever free the Greeks from any future Persian invasions, and deliver them from those innumerable armies of Barbarians, which like clouds of locusts had consumed their country for two whole years. These grievous defeats were never forgotten by the Persian monarchs; and they

they entirely cured Xerxes of all desire of making any other enterprises of the same kind. He thought no more of executing vengeance on the Greeks; and to efface all remembrance of his past disasters, he gave himself wholly up to every sort of voluptuousness and debauchery. His court became one general scene of the most fruitful excesses, murder and incest succeeding each other in a perpetual round. This weak licentious prince was at length put to death by his own subjects. The severe effects of tyranny, formerly experienced by the Athenians, had excited in them such a strong desire of liberty, that to preserve it, they boldly hazarded the greatest dangers. Their bravery, however, was admirably supported and conducted by the wisdom and skill of their generals, who were particularly attentive to choose such a situation for giving battle, that the enemy could not much avail themselves of their vast superiority in point of number.

Thus by their vigorous efforts, and the wisdom of their leaders, delivered from the Persian invasion, the Athenians brought back their wives and children to Athens, of which they rebuilt the walls, and considerably increased the extent. The Lacedæmonians taking umbrage at this, from an apprehension lest Athens should become too powerful, represented to the Athenians, that it was the general interest of Greece to have no fortified place without the Peloponnese, because in case of a fresh invasion, it might serve for a retreat and warlike magazine to the enemy. Themistocles having procured himself to be named ambassador to Lacedæmon, there to justify the conduct of his countrymen, maintained in open senate that it was as much for the common advantage of the allies, as for that of the Athenians, that the latter had fortified their city with good walls; that besides, it was but equitable that they, as well as the rest, should take proper measures for their own safety; and in fine, that they were able to defend themselves either against foreign or domestic enemies. In the next place, Themistocles, solely intent on increasing the power of the republic, fortified Piræus (B.C. 477), the famous harbour of Athens, in the same manner as he had done the city, and persuaded the Athenians to augment their fleet yearly with twenty ships. The object of this skilful politician was to deprive the Lacedæmonians of the superiority hitherto possessed by them over the other states of Greece. But it must be confessed that he was not very scrupulous with regard to the means employed by him for that purpose. An instance of this was his project of burning the Grecian fleet in the harbour of Pegazus, whither it had retired to winter after the defeat of Mardonius; or, according to some authors, that part of it only which belonged to the Lacedæmonians. But not daring openly to propose this scheme, he was desired by the people to communicate the matter privately to Aristides, who having been accordingly informed of it, declared to the people, that though the project of Themistocles was indeed highly useful, yet at the same time it was most unjust. Themistocles was therefore prohibited from putting it in execution.—How becoming, thus to see a whole state prefer what was just to what was useful! and what a high idea of the justice of Aristides must we not conceive, when we see him chosen singly by a whole people, to determine whether a project of the utmost general importance was just or unjust! At the same time, the allies prepared to retire to their freedom the Grecian cities in which the Persians had left garrisons. A numerous fleet, under the command of Pausanias and Aristides, obliged the enemy to abandon the isle of Cyprus; and the city Byzantium, situated on the Hellespont. The conduct of Pausanias in this expedition was so insolent, as to disgust

the allies, who refused any longer to obey the Spartans, and thereforward to fight under the orders of the Athenians. (B.C. 476.) The farther proceedings of the Lacedæmonian general, and his fate, will be found under the articles PAUSANIAS, and SPARTA. The Spartans, with a praise-worthy moderation, yielded to the Athenians the command of the sea. About this time, Themistocles experienced the vicissitude of fortune, and the transitory nature of popular favour. The civil administration of this illustrious Athenian was no less eminent and successful than his political and military efforts. By yielding more protection to strangers than they enjoyed in neighbouring cities, he augmented not only the populousness, but the wealth of Athens; as that description of men paid an annual contribution in return for their security. This, together with other branches of the revenue, he employed in building annually about sixty galies, the addition of which to the Athenian navy abundantly compensated such losses as were sustained by the accidents of the sea in foreign parts. Notwithstanding the envy and malice of worthless demagogues, who infested the Athenian assembly and courts of justice, Themistocles was still advancing to the attainment of the same authority at home which Aristides enjoyed abroad, when complaints arrived from Sparta, that he had conspired with Pausanias to betray the public liberty. The known resentment of the Spartans against this extraordinary man sufficiently explains the reason why they, who were so dilatory in their proceedings against Pausanias himself, should be so eager to bring to punishment his supposed accomplice. But it is not easy to conceive how the Athenians could admit such an accusation against a citizen, whose singular valour and conduct had gained the decisive victory at Salamis; whose counsels and address had fortified their city with impregnable strength; whose foresight and activity had procured them a fleet which no nation in the world could resist; and whose abilities and patriotism had not only saved his country from the most formidable invasion recorded in history, and which was principally directed against Athens, but amidst the terrors of this invasion, the treachery of false friends, and the violence of open enemies, had so eminently contributed to raise his republic to the first rank in the Grecian confederacy. Yet such, on the one hand, was the effect of that envy which in republics always accompanies excellence; and such, on the other, the influence of Spartan bribery and intrigues, that Themistocles was banished by the ostracism, a punishment inflicted on men whose aspiring ambition seemed dangerous to freedom, which required not the proof of any particular delinquency, and which had effect only during a term of years. (Gillies, vol. ii. p. 65.) This illustrious man retired into Persia, where his treatment and death will be seen under the article THEMISTOCLES.

Aristides also died about the same time (B.C. 467 or 471.); and the conduct of the Persian war was devolved on his colleague Cimon, who united the integrity of that great man to the valour of Miltiades his father, and the decisive boldness of Themistocles. But as he felt an ambition for eminence which disdains late imitation, he not only reflected the most distinguished excellencies of his predecessors, but improved and adorned them by an elegant liberality of manners, an indulgent humanity, and candid condescension; virtues which long secured him the affections of his fellow citizens; while his military talents and authority, always directed by moderation and justice, maintained an absolute sway over the allies of the republic. His first operations were employed against the coast of Thrace, which the taking of Byzantium seemed to render an easy conquest. The only places in that country fitted to make an obstinate resistance, were the

the towns of Eion and Amphipolis, both situated on the river Strymon; the former near its junction with the Strymonic gulph, the latter more remote from the shore, but entirely surrounded by an arm of the gulph, and the principal branches of that copious river. Amphipolis, however, was taken, and planted by a numerous colony of Athenians. But Eion still opposed a vigorous resistance; Boges, the Persian governor, having determined rather to perish than surrender. After long baffling the efforts of the besiegers, by such persevering courage and activity as none of his countrymen had displayed in the course of the war, this fierce barbarian was at length not tamed but exasperated by hunger. His companions and attendants, equally desperate with their leader, followed his intrepid example; and mounting the ramparts with one accord, threw into the middle stream of the Strymon their gold, silver, and other precious effects. After thus attesting their implacable hatred to the assailants, they calmly descended, lighted a funeral pile, butchered their wives and children, and again mounting the walls, precipitated themselves with fury into the thickest of the flames. After this, Cimon subdued the other states in that country, drove from Syrops the pirates that infested the Aegean sea, established an Athenian colony in their place, and made himself master of Naxos. Cruising along the coasts of Asia, he reduced all the maritime cities of Caria and Lycia, and left not the Persians in possession of a single inch of ground between Ionia and Pamphylia. Hearing that the Persian fleet lay at anchor at the mouth of the river Eurymedon, waiting for a reinforcement of Phœnician ships, that they might attack him with their united forces; he immediately sailed against the former to prevent their junction; charged them with such vigour, that they were obliged, in spite of their great superiority, to run their ships a-ground; and took more than a hundred of them. Without giving his men time to breathe after their victory, he instantly landed them, and attacked the army of the enemy, which was drawn up on the banks of the Eurymedon. The Persians sustained the first charge of the Greeks with great firmness. But the troops of Cimon, animated by their late success, broke them at last, put them fairly to flight, made a great number of them prisoners, and got a vast booty. Cimon crowned his victories with the capture of the Phœnician fleet which was coming to the assistance of the Persians, and by that means gave a fatal blow to the Persian naval power. The rich spoil of the Barbarian camp rewarded the enterprize and celerity of the Greeks, who, loaded with wealth and glory, returned home during winter, and piously dedicated to Apollo a tenth of the plunder acquired by these ever memorable achievements. A considerable portion of the remainder was employed in strengthening the fortifications of Athens. Agreeably to the Grecian custom, the general was entitled to a valuable share. Cimon received it as a testimony of the public esteem, and expended it for the public use, embellishing his beloved native city with shady walks, gardens, porticoes, schools of exercise, and other works of general pleasure and utility. (See Gillies, vol. ii. p. 74.)

While Cimon was extending the power, glory, and influence of the Athenians abroad, a man of very great talents acquired the direction of affairs at home. This was Pericles, one of the most extraordinary men that even Athens herself produced. His mind naturally of the first capacity and vigour, was enriched by extensive and useful knowledge, adorned by elegant literature, and fortified by the soundest philosophy. Damon, professedly a teacher of rhetoric, but really master of history, politics, and all the learning of the times, was his tutor. Anaxagoras instructed him in philosophy. That

wife man had made it his chief study to confirm the most important and pleasing doctrine, that a Being of supreme intelligence and benevolence governs the world, reward the virtuous, and punish the vicious. "From him," says Dr. Gillies, "Pericles early learned to control the temptations of youthful passions, which so often blast the promising hopes of youth; to preserve an unshaken constancy in all the vicissitudes of fortune, since all are the varied dispensations of the same wise Providence." Fertile in means for the attainment of his objects; skilful in the varied application of them, according to the variation of circumstances; having the ready and complete command of his own great intellect and extensive information, both in forming and executing plans; courageous, temperate, versatile, yet steady; decisive, yet cautious; bold, yet prudent; enterprising, yet circumspect; he excelled in politics, in war, and in every pursuit which required combined genius and conduct. His eloquence united plenitude of information, force of genius, and nervousness of style: it was either convincing or persuasive, according to the objects he had in view; at one time, its majesty commanded the hearers; at another, its softness and delicacy insinuated themselves into their hearts. The superior talents of this celebrated statesman greatly increased the prosperity of the country, and his policy was peculiarly beneficial in improving the advantages that had been acquired in war by his predecessors, or his cotemporary Cimon. He promoted agriculture and manufactures, and greatly extended the commerce and maritime power of his country. Riches flowed in from all quarters to Athens, and were in a considerable degree employed in strengthening and adorning the city. He encouraged the fine arts, literature, and philosophy. Under him flourished Polygnotus, Parrhasius, and Phidias, those ingenious artists, who so happily made painting, sculpture, and statuary, the vehicles of sentiment and character, as well as of external feature and figure. Respected by him, lived Anaxagoras, the father of moral philosophy; and Euripides, who, in the garb of fiction, exhibits the just and elevated reasoning, the pure and virtuous sentiments of both. Taste, genius, and philosophy, were never more prevalent than at Athens in the age of Pericles. But with the many advantages which were conferred upon the Athenians by Pericles, there were mixed several disadvantages, but rather in ultimate effect than in immediate appearance. There were two parties at Athens, the aristocratical and democratical. Cimon, by blood and affinity was connected with the former, and by his dispositions and character was fitter for gaining an ascendancy over the chief people in the state, than for courting the multitude. With all the powers and accomplishments which could form a patriotic and beneficial statesman and soldier, he wanted the dexterous versatility which conciliates the favour of the multitude. Pericles, with genius and strength of mind that must have rendered him a leader in any class of men, in any age or country, chose popularity as the road to the gratification of ambition, and indulged the inclinations of the populace, as well as pursued the interest of the state. With this view he promoted luxury, licentiousness, and profusion. The firm and rigid virtue of Cimon was adverse to such a pernicious waste of the treasures which his exertions had acquired. Between two such great men, embracing opposite principles and parties, rivalry naturally arose. Foreign politics, as well as domestic, sustained their differences. Cimon, aristocratical in his own principles, was attached to the Spartans, and wished amity to subsist between Sparta and Athens. The Athenian multitude, elated with their signal successes, and wishing to domineer over all Greece, was hostile to Sparta, which would be the

most powerful obstacle to the accomplishment of their designs. The Spartans, on the other hand, were extremely jealous of the progress of the Athenians, and of the formidable power they had acquired. Cimon endeavoured to appease, Pericles to promote, this hostile spirit between the two chief nations of Greece; and his schemes appeared to be the more successful. But their animosity, before it broke out into action, was diverted by a calamity equally sudden and unforeseen. In the year four hundred and sixty-nine before Christ, Sparta was overwhelmed by an earthquake. Taygetus and the neighbouring mountains were shaken to the foundation, and twenty thousand Lacedæmonian citizens or subjects perished in this dreadful disaster. Amidst the ruins of Sparta, one description of men beheld the public misfortunes not only without horror, but with a secret satisfaction. The oppressed Spartan slaves, known by the appellations of Helots and Messenians, assembled in crowds from the villages in which they were cantoned, and took measures for delivering themselves, during the cruelty of the elements, from the not less inexorable cruelty of their unfeeling tyrants. The prudent arrangements of king Archidamus, who, foreseeing the revolt, had summoned the citizens to arms, prevented them from getting immediate possession of the capital; but they rendered themselves matters of the ancient and strong fortrefs of Ithomé, from which they continued many years to infest the Lacedæmonian territories. Cimon earnestly seconded the application of the Spartans, and the Athenians were prevailed on to send them the required assistance, and the combined forces proceeded to the siege of the fortrefs. The besiegers, however, met with so little success, that the Spartans dismissed their Athenian auxiliaries, on pretence indeed that their help was no longer necessary, but in reality, from a suspicion that they favoured the interest of the rebels. The Athenians were greatly offended by this caprice, and Pericles instructed his partisan Ephialtes to remind the people that Cimon was the chief promoter of sending assistance to the Spartans. The illustrious captain was accused, and a farther charge laid against him that by presents from the Macedonians he was prevailed upon to let slip a manifest opportunity of enlarging his conquests, after taking from the Persians the gold mines of Thrace. To this accusation Cimon replied, that to the utmost of his power he had prosecuted the war against the Thracians and other enemies of the state of Athens; but that it was true he had not made any inroads in Macedonia, because he did not imagine that he was to act as a public enemy to mankind, and because he was struck with respect for a nation modest in their carriage, just in their dealings, and strictly honourable in their behaviour towards him and the Athenians; that if his countrymen looked upon this as a crime, he must abide their judgment; but, for his part, he could never be brought to think such conduct amiss. His defence however was unavailing, and he was banished for ten years. (B. C. 460.)

Pericles, thus free from the control of Cimon, confirmed his own credit with the people, and made innovations on the established form of government. He deprived the Areopagus of the power of judging in the most important questions that had formerly belonged to their jurisdiction; he rendered the other courts of justice subservient to his pleasure; and he became so absolute in Athens, that under this republican government he possessed a power almost despotic. To secure the permanency of his power, while he promoted industry and beneficial action, he gratified their love of pleasure. The city now (to use the language of Dr. Gillies) afforded a perpetual scene of triumph and festivity. Dramatic entertainments, to which they were passionately ad-

dicted, were no longer performed in slight unadorned edifices, but in stone or marble theatres, erected at great expence; and embellished with the most precious productions of nature and of art. The treasury was opened not only to supply the decorations of this favourite amusement, but to enable the poorer citizens to enjoy it without incurring any private expence; and thus at the cost of the state, or rather of its tributary allies and colonies, to feast and delight their ears and fancy with the combined charms of music and poetry. The pleasure of the eye was peculiarly consulted and gratified in the architecture of the theatres and other ornamental buildings; for as Themistocles had strengthened, Pericles adorned his native city; and unless we had the concurring testimony of antiquity, as well as the immortal remains of the Parthenon or temple of Minerva, which still excite the admiration of travellers, it would be difficult to believe that in the space of a few years there could have been created those inestimable wonders of art, those innumerable temples, theatres, statues, altars, baths, gymnasia, and porticoes, which, in the language of ancient panegyric, rendered Athens the eye and light of Greece. Sums earned in honourable contests with the Persians, or extorted from dependant allies, were expended in multiplying theatres, in giving gratuitous admission to the poorer citizens to these, and also to feasts and revellings, in procuring parasites, dancers, and buffoons, to flatter and gratify the coarse taste of the carousing populace, in importing the delicacies of distant countries, in preparing them with all the refinements of cookery to gratify their palates, in encouraging the reception of beautiful courtezans, in costly perfumes and splendid dresses, in delighting the ears and fancy with the charms of music; in short, in gratifying the senses and the vanity of the multitude, without the exertion of their own labour. Meanwhile Pericles anxiously and ably promoted the supremacy of Athens over the rest of Greece. Stimulated and assisted by the Spartans, the Thebans made war upon the Athenians; but the active vigilance of Pericles sent an army to Bœotia; the valour and conduct of Myronides the Athenian general obtained a decisive victory near the walls of Tanagra. Pericles placed Athenian garrisons in several Bœotian fortresses; he made the neighbouring republics of Corinth and Megara feel and acknowledge the superiority of Athens, and after sending Themidas, a commander endued rather with an impetuous than well-regulated courage, to ravage the coast of the Peloponnesus, he sailed thither next year in person, and made the Lacedæmonians and their allies deeply regret, that they had too soon discovered their animosity against a republic alike capable to protect its friends, and take vengeance upon its enemies. While the Athenians were thus triumphing over the states of Greece, they found an inducement to undertake an expedition against the territories of the Persian king. Egypt taking advantage of the successive defeats of the Persian monarch, revolted, and headed by Inarus a Libyan chief, expelled the Persians. Inarus in order to strengthen his interest by foreign alliance, dispatched an embassy to Athens, craving the assistance of that victorious republic against its most odious and inveterate enemy. The application was successful, and the Athenians sent an army to Egypt. On their junction with the king of Libya, they gave battle to the Persians, put them to flight, and got possession of a part of Memphis. Next year however the scene was greatly altered; for after several fruitless assaults, they were at last obliged to raise the siege of that city on the approach of the enemy, and to retire to Biblis, an island in the Nile. In this place they withstood an eight months siege. But their fleet happening to lie at anchor in the Nile, the Persians by changing the

the course of the river, rendered the ground round the ships dry, took every one of them, and put the greatest part of their crews to the sword. The army being thus disabled from opposing the enemy any longer, partly perished and partly dispersed. During these misfortunes the Athenians became sensible of the injustice of their treatment of Cimon, and recalled him after five years banishment. Soon after his return, that great man succeeded in bringing about a peace between his countrymen and the Lacedæmonians (B.C. 455); and with a view of diverting the Athenians, grown presumptuous by their late good fortune, from making war on their neighbours, he resolved to find occupation for their arms abroad. Departing, therefore, for Cyprus with a fleet of a hundred and forty vessels under his command, and being there joined by sixty more from Egypt, he attacked Artabazus, the admiral of Artaxerxes, and took a hundred of his ships; he next made a descent upon Cilicia, and totally defeated Megabazus, another officer of that prince; he then returned to Cyprus to form the siege of Citium. In the course of the siege, Cimon fell sick: perceiving his end approaching, he beseeched his men to keep his death a secret. They followed his advice, and, proceeding with their operations, obtained a signal victory, in which they took a hundred of the enemy's ships, and then sailed back in triumph to Attica. Artaxerxes, finding his inability to contend with the Athenians, sent deputies to Athens to solicit peace. His ambassadors were favourably heard in the Athenian assembly by those who were more solicitous about confirming their usurpations over their allies and colonies, than ambitious of extending their Asiatic conquests. Cimon, who invariably maintained the contrary system, was now no more. A peace, therefore, was concluded on the following conditions: that all the Greek colonies in Lower Asia should be declared independent of the Persian empire; that the armies of the great king should not approach within three days journey of the western coast; and that no Persian vessel should appear between the Cyanean rocks and the Clalidonian isles; that is, in the wide extent of the Ægean and Mediterranean seas, between the northern extremity of the Thracian Bosphorus and the southern promontory of Lycia. On such terms the Athenians and their allies stipulated to withdraw their armament from Cyprus, and to abstain thenceforward from molesting the territories of the king of Persia. Such was the conclusion of this memorable war, which, since the burning of Sardis, the first decisive act of hostility, had been carried on with little intermission, during fifty-one years. The same magnanimous republic which first ventured to oppose the pretensions of Persia, dictated to that haughty empire the most humiliating conditions of peace; an important and illustrious æra in Grecian history, which was often celebrated with pompous panegyric during the declining ages of Athenian glory.

Having terminated the war against the Asiatic foe with such honour and advantage, the Athenians directed more constant and undivided efforts to render themselves paramount in Greece; and, during twenty years, various contests arose between the Athenians and neighbouring states. Without pursuing the detail of these contentions, and the various truces by which they received a temporary suspension, we shall merely mention the result, which was extremely favourable to Athens, so that the republic rose to unprecedented power. With her prosperity the pride of Athens rose in proportion, until her neighbours, both apprehensive and envious of her power, and farther inflamed to resentment by her insolence, formed for her humiliation a confederacy which brought on the Peloponnesian war.

Jealousy of an overgrown potentate, and what in modern language is called the balance of power, was the chief and ultimate political cause of that celebrated war; rivalry, resentment, and pride, inflamed the differences on both sides; but the proximate and incidental cause was a dispute between the Corinthians and the Coreyans, a colony from Corinth; the contest was inflamed into a war. (The details of the dispute belong to the articles COREYRA, and CORINTH). The Coreyans were first successful, and gained a great naval victory; the Corinthians formed a confederacy with neighbouring states of the Peloponnesus (B.C. 434), to combat the power to which they were themselves unequal. Alarmed at this combination, the Coreyans applied (B.C. 433) for assistance to the Athenians; and urged that an alliance between Athens and Coreyra would be advantageous to both parties; that of its benefits the Athenians would become immediately sensible, if they reflected that the people of the Peloponnesus being equally hostile to both (the open enemies of Coreyra, the secret and more dangerous enemies of Athens); their country must derive a vast accession of strength by receiving, without trouble or expence, a rich and warlike island, which, unassisted and alone, had defeated a numerous confederacy, and whose naval force, augmenting the fleet of Athens, would for ever render that republic sovereign of the seas. If the Corinthians complained of the injustice of receiving their colony, let them remember that colonies are preserved by moderation, and alienated by oppression; that men settle in foreign parts to better their situation, not to surrender their liberties; to continue the equals, not to become the slaves of their less adventurous fellow-citizens. Ambassadors from the Corinthians endeavoured to counteract the eloquence of the Coreyans, contested their propositions concerning the independence of colonies, affirmed that the mother-country always retained a supremacy over its emigrated descendants, and appealed to the interests of the Athenians, as powerfully inducing them practically to support their doctrines concerning the relative duties of colonies. These insanders (they said) acknowledged themselves a colony of Corinth, but pretended that settlements abroad owe nothing to those who established them, to those whose fostering care reared their infancy, from whose blood they sprung, by whose arms they have been defended. We affirm, on the contrary (and appeal to you, Athenians! who have planted so many colonies), that the mother-country is entitled to that authority which the Coreyans have long spurned, to that respect which their insolence now refuses and disdains; that it belongs to us, their metropolis, to be their leaders in war, their magistrates in peace; nor can you, Athenians! oppose our just pretensions, and protect our rebellious colony, without setting an example most dangerous to yourselves. The Athenians did not implicitly listen to the arguments of either side, but were more favourable to the Coreyans, and entered into a defensive alliance with that state. Before the Athenians dispatched a fleet to support the objects of their new engagement, the Corinthians attacked the squadron of their enemies, and gained a signal victory; but the arrival of the Athenian armament (B.C. 432) prevented them from reaping any decisive advantage from their late success. To divert the force of the Athenians, the Corinthians stirred up revolt among colonies which the Athenians had planted along the coasts of Thessaly, Macedonia, and Thrace. But these were not their only measures; aware of the jealousy and alarm with which Sparta and her allies regarded the Athenians, they tried to kindle the combustible particles into a conflagration, which they trusted would overwhelm Athens. They easily succeeded

in an application so very agreeable to the dispositions of those whose co-operation they desired, and a general confederacy was formed, consisting of all the seven republics of the Peloponnese (B.C. 431), except Argos and Achaia; the first of which from ambition, and the second perhaps from moderation, preserved, in the beginning of the war, a suspicious neutrality. Of the nine northern republics, Acarnania alone declined joining the allies, its coast being particularly exposed to the ravages of the Cerean fleets. The cities of Naupactus and Plataea, for reasons that will soon appear, were totally devoted to their Athenian protectors; whose cause was likewise embraced by several petty princes of Thessaly. But all the other states beyond the isthmus longed to follow the standard of Sparta, and to humble the aspiring ambition of their too powerful neighbour. While they were preparing for this concert, the Peloponnesians sent hostile embassies and manifestoes to the Athenians, requiring them to grant independence to the colonies, and announcing the force by which the requisition would be supported. Alarmed by this menacing combination, the Athenian populace were filled with rage against Pericles, whom they accused of having caused this confederacy by his general conduct, and especially by a decree which he procured against the inhabitants of Megara, which had revolted from the authority of Athens, and imputed his enmity to that city to the private pique of his favourite mistress Aspasia; and with the petty suspicion of a vulgar mob, conceived him to have appropriated to his own use great portions of the national treasure. Though the transcendent virtues of Pericles were not unalloyed, yet his were not the vices of common minds; avarice made no part of his composition: he proved that his private expences were justly proportioned to the measure of his patrimony; many instances were brought of his generous contempt of wealth in the service of his country; and it appeared, after the strictest examination, that his fortune had not increased since he was entrusted with the exchequer. He contended that the situation of the republic did not justify despondence or submission to the dictates of an imperious rival. Their financial resources, military and political strength, and above all the spirit of the people, enabled them to resist with effect the efforts of their banded enemies, and by a detail of the various constituents of Athenian greatness contrasted with those of their rivals, illustrated his proposition. He therefore proposed that the answer to their demands should disclaim their right to interfere, disavow every intention of commencing hostilities, but declare the readiness and ability of the Athenian republic to repel force by force. Such an answer, in the relative disposition of the parties, was deemed tantamount to a declaration of war.

The war which now ensued, is celebrated in Grecian history by the name of the Peloponnesian war. It lasted for twenty-seven years; twenty-one of which are the subject of the history of Thucydides; but death having prevented that illustrious author from pursuing it to its termination, its continuation and conclusion was reserved for Xenophon.

Hostilities were begun by the Thebans, who attacked Plataea, a city of Bœotia, in alliance, as we have just mentioned, with Athens. All Greece was immediately in motion. The Lacedæmonians march towards the isthmus of Corinth, a narrow neck of land about six miles broad, which joins the Peloponnese to the country properly called Greece. Archidamus, one of the Spartan kings, before advancing farther, dispatches an ambassador to the Athenians, to require of them to relinquish their pretensions. But the Athenians command the messenger to retire, without deigning even to give him an audience.

The Lacedæmonians thereupon advanced with an army of 60,000 men, while that of the Athenians amounted to no more than 13,000; but, to make up the odds, the latter had a fleet of 300 galleys. On the approach of the Lacedæmonian army, the inhabitants of the country abandoned their habitations, and carrying away every thing they could, took refuge in Athens. The plan of operations pursued by the Athenians, on the suggestion of Pericles, was to weary out the enemy by protracting the war. The Lacedæmonians entering Attica, laid siege to Enoe, but being obliged after a few fruitless assaults, to relinquish that attempt, they advanced still nearer to Athens, and encamped within half a league of the city. Unwilling while so much inferior in point of numbers, to hazard the fate of the republic in a general battle, Pericles found it difficult to prevent the Athenians, exasperated at the sight of the ravages committed on their country, from falling forth upon the enemy. But by means of his admirable art in managing the multitude, he kept both the senate and the people from assembling to deliberate, though at the expence of numberless insults from his enemies; in spite of which he persisted in his plan, unmoved either by threats or entreaties. In the mean time he dispatched a fleet of one hundred ships to ravage the coasts of the Peloponnese; which being joined by that of the allies, made a descent upon Laconia, and laid waste the territories of Sparta. The Lacedæmonians finding all their endeavours to draw the Athenians out of their city ineffectual, and receiving intelligence of the ravages committed in Laconia by the Athenian fleet, found themselves under the necessity of withdrawing from Attica. On the setting out of the expedition against the coast of Laconia, an extraordinary eclipse of the sun happened just as Pericles was going on board of his gally. Pericles perceiving the Athenians to be terrified at this phenomenon, which they considered as an unlucky presage, threw his cloak over the face of the pilot, and asked him if he saw? the pilot having answered in the negative, Pericles explained to the by-standers, that the body of the moon, being in like manner interposed at that instant between their sight and the sun, prevented them from seeing his light. When the Lacedæmonians retired out of Attica, the Athenians appropriated a hundred talents of money, and a hundred of their best ships, for the more immediate defence of their country, in case of a fresh invasion, prohibiting any person, under pain of death, from proposing a different application of those resources. They then expelled from the island of Egina its present inhabitants, whom they regarded as the principal cause of the war; and they divided that island by lot among the citizens of Athens. They made an alliance with the kings of Macedon and Thrace; subdued the island of Cephalonia; laid waste the territory of Megara; and took the harbour of Nisæum; this concluded the first campaign. The Athenians next celebrated funeral rites to the memory of those who had fallen since the beginning of the war. For this purpose, a large tent was constructed, wherein they exposed the bones of the slain, which were covered with flowers and perfumes. Then the bones were carried with much pomp and solemnity to a suburb of the city called Ceramicus, where they were deposited in a monument destined to be the tomb of those who fell in war, and lastly, one of the citizens pronounced a funeral oration in their praise; a charge which on this occasion was undertaken by Pericles himself. Though always superlatively eloquent, he at this time seemed to outdo himself; and in pronouncing the eulogium on those who were no more, he omitted no argument that might inflame the courage of the survivors. Thucydides has preserved

this famous oration, of which the beautiful expressions and lofty sentiments are equally admired. The army of the Lacedæmonians and their allies returned into Attica, and laid every thing waste with fire and sword. But the plague, which then raged among the Athenians, was still more pernicious to them, depriving them of their best citizens and bravest soldiers; and Athens exhibited nothing but a melancholy scene of sickness and death. Of this dreadful scourge, an awfully striking account is exhibited in the energetic description of Thucydides. Without dwelling on the corporeal symptoms which the historian presents in his affecting narrative of this scourge, we shall merely give the substance of its moral effect. At the beginning of this dreadful calamity, sublime examples of filial piety and generous friendship were displayed; but as the consequences were almost always fatal to the children and friends, they were but rarely repeated afterwards. Then the most respectable ties were broken; the eyes about to close for ever, beheld on all sides only the most profound solitude, and death no longer produced a tear. This callous insensibility gave birth to an unbridled licentiousness. The death of so many worthy men, mingled without distinction in the same tomb with villains; the destruction of so many fortunes, become suddenly the inheritance or prey of the lowest citizens, made a lively impression on those who have no other principle but fear. Persuaded that the gods no longer protected or regarded virtue, and that the vengeance of the laws would not be so prompt as the death impending over them, they imagined that the instability of human possessions pointed out the use that they should make of them, and that having but a few moments to live, they were justified at least in passing them in the midst of pleasures.

Notwithstanding the distresses in which Athens was involved, the elevated soul of Pericles, with unbroken fortitude, planned the extrication of his country, as far as it was practicable by human means. A numerous family fell successive victims to the rapacious pestilence. Though a tenderly affectionate father, he bore the disaster with magnanimous serenity. At the funeral of the last of his sons, he dropped, indeed, a few reluctant tears of paternal tenderness; but ashamed of this momentary weakness, he bent his undaunted mind to the defence of the republic. Having collected an hundred Athenians, together with fifty Chian and Lesbian vessels, he sailed through the Saronic gulph, and ravaged the unprotected coasts of Ebus, Argos, and Laconia. The plague breaking out in the fleet, defeated the success of the expedition, and revisiting Athens with redoubled fury, almost desolated the city. Maddened by their accumulated sufferings, the Athenians imputed their miserable situation to Pericles: they deprived him of his authority, and condemned him to a fine; but they soon acknowledged their folly and injustice. He was again prevailed on to resume the reins of administration, and his last efforts were employed to stimulate his country to that vigour of counsels and of conduct which only could preserve her power, honour, and independence: temporary disaster might assail, but in the nature of things its duration could not be long; Athens would ultimately triumph, if she was true to herself. "Of the two elements," he said, "declined for the use of men, the sea and the land, we absolutely command the one, nor is there any kingdom, or republic, or confederacy, that pretends to dispute our dominion. Let this consideration elevate our hopes, and personal afflictions will disappear at the view of public prosperity. Let us bear, with resignation, the strokes of Providence, and we shall repel with vigour the assaults of our enemies. It is the hereditary and glorious distinction of our republic,

never to yield to adversity. We have defied danger, expunged treasure and blood, and amidst obdurate and formidable wars, augmented the power, and extended the fame of a city, unrivalled in wealth, populousness, and splendor, and governed by laws and institutions worthy of its magnificence and renown. If Athens must perish, (as what human grandeur is not subject to decay?) let her never fall at least through our pusillanimity; a fall that would cancel the merit of our former virtue, and destroy at once that oblique of glory which it has been the work of ages to rear. When our walls and harbours are no more, when the terror of our navy shall have ceased, and our external magnificence have fallen to decay, the glory of Athens shall remain. This is the prize which I have hitherto exhorted, and still exhort you to defend, regardless of the clamours of sloth, the suspicions of cowardice, or the persecutions of envy." These were the last efforts of this illustrious man; he was soon after seized with the plague which proved fatal. On his death bed, retaining his understanding, his chief comfort was, not the splendor of his genius and achievements, but the recollection of his well-spent life. When he was about to yield his last breath, the leading men of Athens assembled around his bed, were soothing their affliction by recounting his victories, and the number of his trophies. "These actions," said he to them, raising himself up with difficulty, "are the works of fortune, and common to myself with other generals; the only eulogium I merit is, that I have never been the cause that any citizen should wear mourning." (Gillies.)

After the death of Pericles, two persons contended for the direction of affairs; Cleon, a turbulent and impudent demagogue, devoid of talents, or of any moral qualities which carried him to pre-eminence, but a great favourite with the lower populace; and Nicias, a man of solid ability, prudence, and integrity; and for several years the war was successful or unsuccessful accordingly as the one or the other predominated.

About this time the Peloponnesians invaded Plataea, a city in alliance with Athens. This siege is not only remarkable for the obdurate resistance of the besieged, but for being the first recorded in history which was conducted with any sort of regularity. Both parties here made use of mounds of earth, the one to attack, the other to defend. The Peloponnesians burnt a part of the town by means of bundles of sticks, to which they set fire. On the other hand, the besieged neglected no expedient to frustrate the various attempts of the enemy. But the most surprising circumstance of all is, that so small a place as Plataea, which contained no more than four hundred inhabitants, and eighty Athenians, was capable of making so vigorous a resistance against a powerful army. The enemy at last changed the siege into a blockade, and surrounded the town with two ditches. The Bœotians were left to guard these intrenchments, and the bulk of the army marched away. The besieged having lost all hope of succour, resolved to attempt to make their escape out of the town; which about one half of them effected by a very daring stratagem, suggested and executed by despair. The remaining half dismayed at the dangers attending the attempt, continued in the town. But finding themselves unable to defend it any longer, they were at last obliged to surrender at discretion: eight Spartans went to decide their fate; the miserable Plataeans pleaded in vain that they had been forced, through necessity, to side with the Athenians, in order to obtain their protection against the Thebans, by whom they were grievously oppressed. They were all murdered in cold blood; their wives were carried into slavery; and their town was razed to the ground. Such was the melancholy

melancholy fate of the Plataeans, who, during the Persian war, had rendered the most signal services to Greece. (B. C. 428.) In the fourth year of the war, the Peloponnesians, agreeably to their general plan, invaded Attica by land, whilst the Athenians as before sent a naval force to devaluate the coasts of their enemies. Between two parties, of which the one was evidently superior by land, and the other by sea, if both skilfully employed their resources, there must be an alternation of victory and defeat, which by reciprocal diminution of resources through the evils of war, demonstrated peace to be mutually beneficial. This year, however, threatened a blow to the naval power of Athens that might materially effect the equilibrium. The maritime strength of Athens depended in a considerable degree upon her foreign settlements and dominions. As her treatment of these was frequently imperious, and even oppressive, her dependencies did not bear her supremacy without repining. Availing themselves of the present difficulties, all the inhabitants of Lesbos, except those of Methymne, resolved to separate from Athens. The Athenians, sensible how great a loss the defection of this island must be, sent out a fleet of forty galleys to attack that of the Mitylenians, who finding themselves repulsed, proposed terms of accommodation; which were listened to by the Athenians. A suspension of hostilities being agreed on, the Mitylenians dispatched ambassadors both to Athens and to Lacedæmon at the same time. The ambassadors were told by the Lacedæmonians, that they should be fully heard at the approaching Olympic games, where the other allies would have an opportunity of assisting at the conference. Thucydides has transmitted to us the import of what was urged by these ambassadors; from which we see, that they admitted the treaty anciently concluded between the Lesbians and Athenians, and assigned the ambition of the latter, not their present misfortunes, as the reason that induced them now to relinquish that treaty. The allies were satisfied with their reasons, and admitted them into their confederacy. Informed of these preparations, the Athenians fitted out a fleet of a hundred sail, appeared unexpectedly off the promontory of the isthmus of Corinth, and made a descent upon the Peloponnesus, while another fleet protected the coasts of Attica. Never had they raised so formidable an armament before; and it so overawed the Lacedæmonians, that they hurried back to the defence of their own country. The Athenians, in the mean time, pushed on the siege of Mitylene, whither they sent a detachment of a thousand soldiers, and the town was blocked up both by sea and land. The inhabitants receiving no assistance from the Lacedæmonians, and being pressed by famine, were obliged to surrender at discretion. The authors of the revolt, to the number of more than a thousand, were conveyed to Athens, and there put to death. Orders were at the same time issued to massacre the rest of the inhabitants, by way of example. But the people shocked at such horrible cruelty, caused the decree to be revoked, and dispatched counter orders; which luckily arrived at the instant they were proceeding to put the list in execution. (Thucydides.) Then the town was dismantled, and the whole territory of the island, except Methymne alone, was divided by lot among the inhabitants of Athens. The fifth (B. C. 427) year of the war was principally distinguished by the sedition of Corcyra. In the course of hostilities, the Corinthians had captured a considerable number of those islanders, and wisely treated them with a gentleness and kindness which gained their affections. Having brought them to this disposition, they earnestly persuaded them, when they should return to their country,

to employ their efforts for reconciling the children with the parent country, and detaching their fellow citizens from Athens, the tyrant over her allies. The Corcyreans were dismissed, and arriving at home, endeavoured to reconcile their countrymen to the Peloponnesians. The aristocratical party very readily agreed, and formed a conspiracy for massacring the leaders of the democratic party. The commons applied to the Athenians, who sent a fleet to assist their partisans. The Peloponnesians also sent a squadron to support the nobles: but the Athenians preserving their maritime superiority, their enemies retired, and the democrats were paramount. Their cruelty was so signal, as from that time to give the name of Corcyrean to every sedition of uncommon atrocity. The following account, in the elegant language of Dr. Gillies, contains an awful monument of the dreadful effects of intestine dissension.

“The unhappy prisoners were first confined in a dungeon. Dragged successively from thence, in parties of twenty at a time, they were compelled to pass in pairs, their hands tied behind their backs, between two ranks of their enemies, armed with whips, prongs, and every instrument of licentious and disgraceful torture. The wretches left in prison were long ignorant of the ignominious cruelty inflicted on their companions: but, as soon as they learned the abominable scenes transacted, they refused to quit their confinement, guarded the entrance, and invited, with one consent, the Athenians to murder them. But the Athenians wanted either humanity or firmness to commit this kind cruelty. The Corcyrean populace ventured not to force a passage from despair. They mounted the prison walls, uncovered the roof, and overwhelmed those below with stones, darts, and arrows. These weapons were destructive to many, and furnished others with the means of destroying themselves, or each other. They laid down their heads, opened their breasts, exposed their necks, mutually soliciting, in plaintive or frantic accents, the fatal stroke. The whole night (for night intervened) was spent in this horrid scene; and the morning presented a spectacle too shocking for description. The obdurate hearts of the Corcyreans were incapable of pity or remorse; but their relenting eyes could not bear the sight; and they commanded the bodies of their fellow citizens, now breathless or expiring, to be thrown on carts, and conveyed without the walls.” Thus ended the sedition of Corcyra; but its consequences were not soon to end. The contagion of that unhappy island, engendered a political malady, which spread its baneful influence over Greece. The aristocratical, and still more, the popular governments of that country, had ever been liable to faction, which occasionally blazed into sedition. But this morbid tendency, congenial to the constitution of republics, thenceforth assumed a more dangerous appearance, and betrayed more alarming symptoms. In every republic, and almost in every city, the intriguing and ambitious found the ready protection of Athens, or of Sparta, according as their selfish and guilty designs were screened under the pretence of maintaining the prerogatives of the nobles, or asserting the privileges of the people. A virtuous and moderate aristocracy, an equal impartial freedom, these are the colourings which served to justify violence, and varnish guilt. Sheltered by the specious coverings of fair names, the prodigal assassin delivered himself from the impertunity of his creditor. The father, with unnatural cruelty, punished the licentious extravagance of his son; the son avenged, by parricide, the stern severity of his father. The debates of the public assembly were decided by the sword. Not satisfied with victoriously, men thirsted for blood. This general disorder overwhelmed laws human and divine. The ordinary course

of events was reversed: sentiments lost their natural force, and words their usual meaning. Dullness and stupidity triumphed over abilities and refinement; for while the crafty and ingenious were laying fine spun snares for enemies, men of blunter minds had immediate recourse to the sword and poignard. Hitherto the war had been carried on without any material advantage to either party. The following year, (B. C. 426.) more critical events took place: Demosthenes, a general of merit and enterprise, commanded the Athenian forces at Naupactus, which had been bestowed on the unfortunate Messenians; by whose assistance, together with that of the Athenian allies in Acarnania, Demosthenes undertook to subdue Ætolia. The Messenians being continually harassed by the Ætolians, persuaded Demosthenes that it would be easy to overrun their country, before the inhabitants, who lived in scattered villages, widely separated from each other, could collect their force, or attempt resistance. In pursuance of this advice, Demosthenes entered Ætolia, took and plundered the towns, and drove the inhabitants before him. During several days he marched unresisted; but having proceeded to Ægition, the principal, or rather only city in the province, he found that his design had by no means escaped the notice of the enemy. Living in a country abounding in defiles, and involved in woods, the Ætolians, though irregular and desultory in their warfare, yet employing a species of bush fighting not unlike to that which, two and twenty centuries afterwards, has been used by the American Indians, defeated the regularly disciplined heroes of Athens, and Demosthenes was obliged to take refuge in Naupactus. The Athenian general, however, soon found means to irritate those Barbarians to venture a contest in the plains, and, with great ease, obtained a signal victory. Elevated with this success, Demosthenes undertook an expedition to the western shore of Peloponnesus, and seized Pylus. The Spartans eager to recover this important post, attempted to dislodge the enemy, but were defeated, and obliged to take refuge in Sphacteria, a small island upon the coast; and the Athenians, being masters of the sea, surrounded their retreat, and cut off all supplies of provisions. Anxious to save those troops, the Spartans sent ambassadors to Athens with proposals of peace. The ambassadors frankly owned the extreme necessity that had obliged the Lacedæmonians to submit to so humiliating a step, put the Athenians in mind of the uncertain fate of arms, and exhorted them to embrace this opportunity of restoring tranquillity to Greece. But the Athenians grown presumptuous by their good fortune, as well as by the flattering oration of their favourite demagogue Cleon, required, as a preliminary condition, that the troops confined in the island should lay down their arms, and be conducted to Athens, upon the promise of the Athenians to set them at liberty as soon as the Lacedæmonians had delivered up the places conquered by them, from the Athenians. The Lacedæmonians refused to comply with this condition, and both parties prepared themselves for war. The Athenians, in the mean time, were very vigilant to prevent any provisions from passing into the island of Sphacteria. The Lacedæmonians, on the other hand, engaged the whole country round to contribute their utmost efforts to relieve the besieged troops, and promised to set free all the slaves who should succeed in carrying them provisions; which many did, at the extreme hazard of their lives. In the mean time, the Athenians in Pylus began, on their part, to be straitened for provisions. Cleon persuaded the people, that the slowness of the siege was owing to the inactivity of their commanders; and maintained, that a little vigour must very soon reduce the island, which he

offered to accomplish himself. Having been accordingly sent thither, and having joined Demosthenes, they landed together in Sphacteria, and beat the enemy to the extremity of the island. The Lacedæmonians, however, took possession of a fortification, and defended, with the most desperate courage, the only passage by which they could be attacked. But the general of the Messenians, having discovered a difficult path that led to the fortification, marched that way, and appearing unexpectedly on the rear of the Lacedæmonians, called aloud to them to lay down their arms. The Lacedæmonians exhausted with heat and fatigue, obeyed the summons, by laying their shields on the ground; and, after a short conference, they surrendered at discretion. The Athenians, after erecting a trophy, re embarked on board of their fleet. This siege continued sixty-two days. Cleon is said to have caused 128 of those unhappy Spartans, to be murdered. The rest were conveyed to Athens, and thrown into prison, till peace should take place; the Athenians threatening, at the same time, to put them all to death, if the Lacedæmonians made any more incursions into their country. Soon after happened the sedition of Megara. The inhabitants of that town, after expelling their magistrates, quarrelled among themselves, one party being for recalling their magistrates, the other, for delivering their town into the hands of the Athenians. Brasidas, in the mean time, the best officer the Lacedæmonians then had, having come before Megara, its gates are immediately thrown open to him. The exiled magistrates returning soon after, and resuming their authority, condemn to death one hundred inhabitants of the opposite faction. Brasidas advances into Thrace, subdues several cities, and lays siege to Amphipolis, a place of much importance to the Athenians, who thence got the greatest part of their wood. They therefore dispatched Thucydides, the famous historian, to its relief; but the place was taken before his arrival. His countrymen, however, imputed to him the loss of the place, and banished him at the instigation of Cleon. The Athenians having about the same time advanced into Bœotia, under the command of Demosthenes and Hippocrates, were defeated near Delium by the Thebans, who, after their victory, besieged and took that town. No decisive advantage had been hitherto obtained by either party. The Athenians and Lacedæmonians therefore agreed on a truce for a year; which Brasidas, who had been successful in all his enterprises, bore with great impatience. Cleon, on the other hand, who had acquired much authority in Athens by means of his bold and vehement eloquence, incited his countrymen to resume the war. Being more presumptuous than skillful in military operations, he resolved to attempt the retaking of Amphipolis, hoping to be assisted by a body of troops from Ptoleas king of Macedon. But Brasidas got the start of him, and threw himself into the town. To increase the presumption of Cleon, the Spartan general, who was well acquainted with his character, affected to be afraid of an encounter; but after making the proper dispositions, Brasidas sallied forth unexpectedly, and attacked the left wing of the Athenians, which, being the flower of their army, made a vigorous resistance. Brasidas, however, at last broke them, and killed six hundred, with very little loss on his own side. This attack disconcerted and terrified Cleon, who was killed by a Spartan soldier as he was flying from the battle. Brasidas was of the number of the slain on the side of the Lacedæmonians. He was an excellent officer, equally brave and prudent, and deserves to be ranked among the Lacedæmonian heroes. It was the mother of this general, who, on hearing the exploits of her son commended,

mended, answered, "It is true, my son was a brave man; but I doubt not that Sparta has many citizens as brave as he."

The battle of Amphipolis removed the principal obstacles to peace. There was not any Spartan general qualified to accomplish the designs of Brasidas; and the Athenians, dejected by defeat, and humbled by disgrace, wanted the bold imposing eloquence of Cleon, to disguise their weakness, and varnish their misfortunes. (Gillies.) With the disheartened remains of an enfeebled armament, they despaired of recovering their Macedonian possessions; and the greater part returned home, well disposed for an accommodation with the enemy. These dispositions were confirmed by the pacific temper of Nicias, who had succeeded to the influence of Cleon, and who fortunately discovered in the moderation of Pleistoanax, king of Sparta, a coadjutor extremely solicitous to promote his views. During winter, several friendly conferences were held between the commissioners of the two republics; and towards the commencement of the ensuing spring, a treaty of peace, and soon afterwards a defensive alliance, for fifty years, was ratified by the kings and ephori of Sparta on the one side, and by the archons and generals of Athens on the other. In consequence of this negotiation, which was intended to comprehend the respective allies of the contracting powers, all places and prisoners taken in the course of the war, were to be mutually restored; the revolted cities in Macedon were specified by name; but it was regulated that the Athenians should not require from them any higher revenue than that apportioned by the justice of Aristides. (See Thucydides.)

While the Athenians were thus engaged in wars, and often employed in injustice, their city produced a personage who taught his countrymen and mankind the purest ethics that ever flowed from a human source. Socrates was now in the full vigour of his genius, which he employed in simplifying practical philosophy to the comprehension of common minds, and to inculcate the necessary connection between piety and virtue and happiness. (See Xenophon's Memorabilia.) From the perfections of the supreme intelligence he deduced his just government of the universe, which implied the immortality of the human soul. But the great object of his research was to discover the general laws by which, even in this life, the superintending providence had variously dispensed to men good and evil, happiness and misery. These laws he regarded as the promulgated will of the gods, with which, when clearly ascertained, it became our duty invariably to comply; since nothing but the most short-sighted folly could risk incurring the divine displeasure, in order to avoid pain or poverty, sickness or death, far less to enjoy perishing gratifications, which leave a sting behind them. Reasoning on such principles, and taking experience only for his guide, he deduced with admirable perspicuity the interests and duties of nations and individuals in all the complicated relations of society. The actions of men furnished the materials, their instruction formed the object, their happiness was the end of his discourse. Wherever his lessons might be most generally useful, there he was always to be found, frequenting at an early hour the Academy, Lyceum, and other public gymnasia: punctually attending the forum at mid-day, the hour of full assembly; and in the evening, joining, without the affectation of austerity, in the convivial entertainments of his friends, or accompanying them in the delightful walks which adorned the banks of the Illyssus. As a husband, a father, a citizen, and a soldier, the steady practice of his duty continually illustrated his doctrines. The conversation

and example of this truly practical philosopher (and this is his highest praise) persuaded many of his fellow citizens sincerely to embrace a virtuous course of life; and even those who allowed the current of their passions to prevail over the conviction of their sober hours, were still charmed with the wonderful extent, as well as the singular accuracy, of his various knowledge, with the acuteness and penetration of his various arguments; the beauty, vivacity, and persuasiveness of his style, with which he assumed the tone of reason or of ridicule, surpassed whatever had been deemed most eloquent. Among the Athenian youth whom this sage attempted to form to virtue, was the celebrated Alcibiades, but a previously corrupted education rendered his task extremely difficult. The tender years of Alcibiades were committed to the illiberal discipline of mercenary preceptors; his youth and inexperience were beset by the destructive adulation of servile flatterers (Plutarch's Alcibiades), until the young Athenian, having begun to relish the poems of Homer, the admiration of which is congenial to every great mind (Ibid.), learned from thence to despise the pedantry of the one, and to detest the meanness of the other. From Homer, Alcibiades early imbibed that ambition for excellence which is the great lesson of the immortal bard. Having attained the verge of manhood, he readily distinguished, among the crowd of rhetoricians and sophists, the superior merit of Socrates. The sage, whose company was courted by his other disciples, himself courted the company of Alcibiades; and when the ungrateful youth sometimes escaped to his licentious companions, the philosopher pursued him with the eagerness of a father or master, anxious to recover a fugitive son or slave. See ALCI- BI-DES. But this favourite laboured under a defect which could not be compensated by the highest birth, the most splendid fortune, the noblest endowments of mind and body, and even the inestimable friendship of Socrates. He wanted an honest heart. This we are warranted to affirm on the authority of contemporary writers, Lysias and Xenophon, who acknowledge that first admiration, and then interest, was the foundation of his attachment to the illustrious sage, by whose instruction he expected to become not a good but an able man. Some inclination to virtue he might, in such company, perhaps feel, but more probably feign; and the nice discernment might mistake the real character of a man who could adopt at pleasure the most opposite manners; and who, as will appear from the subsequent events of his various life, could surpass the splendid magnificence of Athens, or the rigid frugality of Sparta; could conform, as interest required, to the laborious exercises of the Thebans, or to the voluptuous indolence of Ionia; assume the soft effeminacy of an Eastern prince, or rival the sturdy vices of the drunken Thracians. (Nepos's Alcibiades.)

The first specimen of his political conduct discovered the extraordinary resources of his versatile mind. He opposed the peace of Nicias, as the work of a rival whom he wished to disgrace. His ambition longed for war, and the Spartans deserved his resentment, having in all their transactions with Athens, testified the utmost respect for Nicias, while they were at no pains to conceal their want of regard for himself, though his family had been long connected with their republic by an intercourse of hospitality, and he had endeavoured to strengthen that connection by his personal good offices to the Lacedaemonians taken in Sphacteria. To gratify at once his resentment, his ambition, and his jealousy, he determined to renew the war with Sparta; a design by no means difficult at the present juncture. In compliance with the peace of

Nicias,

Nicias, the Spartans withdrew their troops from Amphipolis; but they would restore neither that city nor the neighbouring places in Macedonia, to the dominion of Athens. The Athenians, agreeably to the treaty, allowed the captives taken in Sphacteria to meet the longing embraces of their kinsmen and friends; but good policy forbade their surrendering Pylus, until the enemy had performed some of the conditions stipulated in return. Mutual unwillingness or inability to comply with the articles of peace, sowed the seeds of animosity, which found a favourable soil in both republics. The authority of those magistrates who supported the pacific measures of Nicias and Pleistoanax had expired. The Spartan youth wished, by new hostilities, to erase the memory of a war, which had been carried on without profit, and terminated with dishonour; but the wiser part perceived that better success could not be expected while the Athenians possessed Pylus. In their eagerness to recover that fortress, they renewed their alliance with the Thebans, from whom they received Panactum, which they hoped to exchange for Pylus; forgetting in this transaction an important clause in their treaty with Athens, "that neither of the contracting powers should, without mutual communication and consent, conclude any new alliance." The Thebans rejoiced in the prospect of embroiling the affairs of Athens and Sparta; and the Corinthians, guided by the same hostile views, readily concurred with the Thebans, and openly re-entered into the Lacedæmonian confederacy. The Peloponnesian war was renewed with various success. The address of Alcibiades prevailed on the Argives to join the Athenians; and though the Spartans gained a considerable victory at Mantinea, the Athenians were on the whole pre-eminent. Elated with success, the Athenians undertook the conquest of the island of Melos, a state that never had been dependent on Athens, nor ever interfered in the Peloponnesian war. The Athenians sent ambassadors to require the islanders to surrender. The conference between their deputies and the Melian statesmen is detailed by Thucydides, and is one of the most curious and interesting pieces recorded in ancient political history. It may indeed well be styled the moral creed of conquering adventurers, more openly promulgated than in modern manifestoes, but containing the same sentiments which dictated in our own times the partitioning scheme for the spoliation of Poland, with this difference, that modern robbers on a great scale, by some specious plea of right, do homage to the justice which they transgress; whereas the Athenian deputy did not shock common sense by such an unfounded pretext. He stated the real title to the seizure of other people's property, superior power; that the strong may use what freedom they please with the weak. There is not a single word said tending to prove either just right in the Athenians, or aggression in the Melians. The Athenian states the power of his country, and the miseries the Melians would suffer if they attempted resistance. The peroration to this celebrated discussion fully illustrates the principles on which the Athenians proceeded, and sums up the diplomatic reasoning: "You are determined," said the Athenian ambassador, "it seems, to learn by fatal experience, that fear never compelled the Athenians to desist from their designs, especially never to raise the siege of any place which they had once invested. For during the whole of this long conference, you have not mentioned a single particular capable of affording any just ground of confidence. Deceived by the splendor of words, you talk of honour and independence, rejecting the offers of a powerful state, whose arms you are unable to resist, and whose protection you might obtain at the expence of a moderate tribute. Left shame should have

any share in this dangerous behaviour, we shall leave you to consult privately, only reminding you once more, that your present deliberation may be the ruin of your country." The Athenian ambassadors retired, and shortly afterwards the Melians recalled them, and declared their unanimous resolution not to betray in one unlucky hour the liberty which they had maintained for seven hundred years; depending on the vigorous assistance of their Lacedæmonian allies, and trusting especially in that divine providence which had hitherto preserved them, and all the general confederates of Greece. But they entreated the Athenians to accept their offers of neutrality, and to abstain from any further violence. The ambassadors prepared for returning to the camp, leaving the commissioners with a forcible threat, "that of all men, in such a delicate situation, the Melians alone thought the future more certain than the past, and would grievously suffer for their folly, in preferring to the proposals of certain and immediate safety, the uncertain hopes, the instability of fortune, and the vain prospect of Lacedæmonian aid." The Athenians, irritated by opposition, invested without delay the capital of Melos, which was blocked up for several months by sea and land. The besieged, after suffering cruelly by famine, made several desperate sallies, seized the Athenian magazines, and destroyed part of their works. But towards the end of winter, their resistance was defeated by the vigorous efforts of the enemy, combined with domestic treason. The males above the age of fourteen were put to the sword; the women and children were subjected to perpetual servitude; and five hundred new inhabitants, drawn from the neighbouring colonies of Athens, were sent to occupy the vacant lands which had been cultivated and adorned for seven centuries by the labour of the exterminated Melians.

Successful injustice encouraged the Athenians to more arduous schemes of aggression and conquest, and they hoped to subjugate the whole course of the Mediterranean. Under these visionary fancies, they projected an expedition to Sicily, which proved so fatal to Athenian greatness. With the usual policy of conquerors, they maintained a close intercourse with the weaker states of a country which they projected to subdue. Since the death of Pericles, they had concluded a treaty with the Leontines, who being hard pressed by the Syracusans, applied for assistance to their new confederates; for this purpose they sent an embassy to Athens, at the head of which was the celebrated orator Gorgias, who pleaded the cause of the Leontines in an oration so elegant and pathetic, that the request of the ambassadors was granted; and the Athenians sent a fleet to Rhegium, to assist the Leontines. Next year (B. C. 415), they sent thither a more numerous fleet still, under pretence of assisting the towns oppressed by the Syracusans, but in fact to open to themselves a way to the conquest of Sicily. Alcibiades, by his harangues, incited the Athenians to do more and more to this undertaking, and talked of nothing less than extending the conquests of Athens over Africa and Italy. While the minds of the Athenians were filled with these mighty projects, ambassadors arrived from the Egyprians, to implore their assistance against the Sclimitians, who were supported by the Syracusans; offering at the same time to pay the troops that should be sent to their assistance. The Athenians, tempted by these promises, named Alcibiades, Nicias, and Lamachus, to command a fleet destined to succour the Egyprians. Nicias remonstrated against this expedition in the strongest terms, and painted out in the most lively colours what ruinous consequences might thence result to the republic. He represented to the Athenians, that they had but too many enemies on their hands already, with-

out going abroad to seek for more; and that though they were hardly beginning to recover from the misfortunes occasioned by the late war and plague, they were vainly exposing themselves to a greater danger still. Nicias, in this harangue, likewise reflected indirectly on the luxury of Alcibiades, who had now carried his extravagance to an incredible pitch. The expense of the furniture of his house, and of his retinue, was prodigious. His table was as sumptuous as that of any prince; and he contended at the Olympic games with seven different sets of horses. To support so expensive a life, it was absolutely necessary for him to possess vast funds; and Nicias no doubt meant to insinuate, that Alcibiades expected to have an opportunity by this expedition to repair his private fortune, which must have been greatly dissipated by such enormous expenses. Alcibiades answered the harangue of Nicias, by telling the audience, that his magnificence was intended to reflect honour on his country; he put them in mind of his services to the commonwealth; he assured them that the cities of Sicily were so weary of the oppression of their petty sovereigns, that they would instantly open their gates to the first power which should appear to deliver them from their present slavery; and he concluded with telling them, that to carry their arms abroad was the surest way to damp the courage of their enemies, and that the Athenians must always continue masters at sea, in spite of the Lacedæmonians. The Athenians, delighted with this flattering speech of Alcibiades, entirely disregarded that of Nicias, who was a man of a soft pusillanimous disposition, and of an irresolute temper. They therefore persisted in their resolution to undertake this expedition, and began to make the necessary preparations for it with the utmost dispatch. (Thucydides.) Just as the Athenian fleet was on the point of setting sail, several evil presages fell out that extremely perplexed the minds of the people. 1st. The feast of Adonis happened at this time, which was celebrated by the women uttering piteous groans and lamentations; and it was customary for all the inhabitants on that occasion to wear mourning. 2dly. The statues of Mercury, one of which stood before the entry of every house, were all maimed in the same night, and the author of this piece of sacrilege could not be discovered. The wild libertine character of Alcibiades exposed him to suspicions of having been concerned in this mischief. But the affection entertained for him by the soldiers and sailors, who declared that they would not proceed on the expedition, if the smallest violence was offered to his person, preserved him at present from any trouble on that account. Alcibiades demanded to be tried, that he might have an opportunity of justifying himself before his departure. But the people, impatient for the expedition proceeding, obliged him to set sail. The view of the fleet under sail attracted the admiration both of the citizens and of strangers; for never had a single city in the western world displayed so grand and magnificent an armament. It consisted of a hundred and thirty-six vessels, carrying six thousand two hundred and eighty soldiers, of whom the greater part were heavy armed. Besides these, there were thirty vessels loaded with provisions, and the whole was attended by one hundred barks, without including merchant ships, or the after augmentations of the fleet. Besides the sea forces, there was a body of troops for the land service, and among these a few cavalry. All the forces were equipped in the most complete manner; and upon the whole, there could hardly be a grander or more beautiful exhibition. (B. C. 414.) When the troops were embarked, the whole fleet on a signal given by a trumpet, weighed anchor, attended with a general shout of the spectators,

pouring out their most earnest vows for the success of their fellow-citizens. The fleet directed its course towards Rhegium, whither they dispatched some ships before the rest, to see that the money promised by the Egilians was ready; of which, however, they found no more than thirty talents provided. Nicias availed himself of this circumstance to enforce the reasons he had insisted on against the expedition, and advised to terminate the dispute between the Egilians and Selinontines in an amicable manner; to oblige the former to fulfil their engagements; and then to return to Athens. Alcibiades, on the contrary, said it would be disgraceful to return without performing some signal exploit with so powerful an armament; that they ought to endeavour to detach the Greeks in Sicily from their connection with Syracuse, to bring them over to their own party, and after obtaining from them reinforcements both of troops and provisions, to attack Syracuse. Lamachus advised to march immediately against Syracuse; but the opinion of Alcibiades prevailed. They therefore continued their course for Sicily, where Alcibiades reduced Catana. At Athens, the enemies of Alcibiades intent alone on gratifying their resentment, without regarding the public interest, took advantage of his absence to renew against him an accusation of having in a debauch profaned the mysteries of Proserpine and Ceres; and they prosecuted the accusation with the most inveterate malice and animosity. Many persons were accused, and thrown into prison, without being even permitted to be heard; and a vessel was dispatched to bring Alcibiades to stand trial before the people. To this he apparently consented, and went on board of the galley; but on arriving at Thurium, he disappeared. Not having therefore obeyed the summons within the limited time, he was condemned to death for contumacy, and his effects were confiscated. (Thucydides, l. vi.) The departure of Alcibiades spread apprehension through the army. Nicias, now chief commander, by his irresolute conduct, suffered the ardour of the Athenians to cool, and he spent the greatest part of the summer inactive at Catana. The Athenian soldiers, impatient of such dilatory proceedings, reproached their general, who, to please the army, resolved to besiege Syracuse. Though slow in counsel, yet vigorous in conduct, he conducted his attacks with so much ability, that the inhabitants were inclined to surrender. Already several states of Sicily and Italy had declared in his favour, when a Lacedæmonian general named Gylippus entered the besieged city, with a few troops which he had brought from Peloponnesus, or collected in Sicily. Nicias might have prevented him from landing in the island, but lost the opportunity; an irreparable fault, which proved the source of all his misfortunes. Gylippus revived the courage of the Syracusans, defeated the Athenians, and held them blocked up in their intrenchments. Athens sent to Sicily another fleet consisting of about seventy-three galleys, under the command of Demosthenes and Eurymedon, and a second army of five thousand men heavily armed, and some light troops. Demosthenes having lost two thousand men at the attack of an important post, and considering that the sea would soon be no longer navigable, and that the troops were wasting away by disorders, proposed to abandon the enterprise, or transport the army to some healthier situation. When they were on the point of setting sail, Nicias, terrified at an eclipse of the moon, which spread consternation through the camp, consulted the augurs, who directed him to wait twenty-seven days longer. Before the expiration of this time, the Athenians, vanquished by sea and land, no longer able to remain under the walls of Syracuse for want of provisions, nor to escape out of the harbour, the

mouth of which was shut up by the Syracusans, took the retreat to the sea on their camp, their sick, and their things, and were crowded into some town of Sicily. They brought the number to the number of forty thousand men, including not only the troops furnished them by the states of Italy and Sicily, but the crews of the galleys, the workmen, and slaves. The Syracusans, by seizing the galleys, and breaking down bridges, and other obstructions, impeded the retreat of the Athenians, while at every step they harassed their flank and rear. The retiring forces for eight whole days had to struggle against new obstacles continually increasing. But Demosthenes, who commanded the rearguard, composed of six thousand men, being way in his march, was pushed into a confined place, and after prodigies of valour, obliged to surrender on condition that his soldiers should have their lives granted them, and he spared the horrors of a dungeon. Nicias, having failed in a negotiation he had entered into, conducted the remainder of the army as far as the river Alinarus. On his arrival there, the greater part of the soldiers tormented by a burning thirst, rushed in confusion into the river, while others were driven into it by the enemy. Such as attempted to save themselves by swimming found on the opposite shore steep banks lined with dartmen, who made a terrible slaughter of them. Eight thousand men perished in the attack; till at length Nicias thus addressed Gylippus: "Dispose of me as you shall think proper; but shew mercy at least to these unhappy soldiers." Gylippus immediately put an end to the carnage. The Syracusans returned to their city, bringing back with them seven thousand prisoners, who were thrown into the quarries, where for many months they experienced inconceivable miseries. Numbers of them perished there, and others were sold as slaves. Nicias and Demosthenes were among the massacred. A few escaped both death and bondage through the charms of dramatic poetry, by reciting passages from the beautiful and pathetic tragedies of Euripides.

The discomfiture of the expedition to Sicily filled Athens with consternation and dismay, and she had reason to dread still greater calamities. Her allies were ready to shake off the yoke; the other states of Greece were conspiring her ruin; the Peloponnesians already thought themselves justified by her example in breaking the truce. Already she discovered in their operations, more skilfully planned and conducted, the spirit of vengeance, and the superior genius by which they were directed. Alcibiades enjoyed at Lacedæmon that respect and influence he every where obtained. It was by his advice that the Lacedæmonians adopted the resolution of sending succours to the Syracusans, renewing their incursions into Attica, and fortifying, at the distance of one hundred and twenty stadia from Athens, the post of Decelia, which held that city blocked on the land side. To annihilate the power of Athens, it was necessary to favour the revolt of her allies, and destroy her navy. Alcibiades repaired to the coasts of Asia Minor; and Chios, Miletus, and other flourishing cities, declared for the Lacedæmonians. By his accomplishments he captivated Tissaphernes, the governor of Sardis; and the king of Persia engaged to pay the fleet of Peloponnesus. This second war, conducted with more regularity than the former, would quickly have been terminated, had not Alcibiades, pursued by Agis, king of Lacedæmon, whose wife he had seduced, and by the other chiefs of the league, who took umbrage at his glory, at length considered that, after avenging himself on his country, it now only remained for him to protect it from inevitable ruin. With this view, he contrived to suspend the operations of Tissaphernes, and the departure of the

Persian succours, and re-establisht that it was the interest of the great king to suffer the nations of Greece mutually to enslave each other. The Athenians having soon after revoked the decree for his banishment, he put himself at their head, reduced the strong holds of the Hellas, forced out of the Persian governors to sign an advantageous treaty with the Athenians, and the Lacedæmonians to sue for peace. Their demand was rejected; for, deeming themselves invincible here forward under Alcibiades, the Athenians made a rapid transition from the most profound consideration to the most insolent presumption. The hatred with which they were animated against that general was quickly succeeded by the most extravagant gratitude, and the most unbounded affection. When he returned to his own country, his arrival, and the pains he took to justify his conduct, were a series of triumphs for himself, and of public rejoicings for the multitude. When, amidst the acclamations of the whole city, they saw him sail from the Piræus with a fleet of a hundred ships, no doubt was entertained but that his rapid victories would soon force the inhabitants of the Peloponnesus to submit to the law of the conqueror; the arrival of a courier was every moment expected with the news of the destruction of the enemy, and the conquest of Ionia. In the midst of these flattering expectations, they learnt that fifteen of the Athenian galleys had fallen into the hands of the Lacedæmonians. The engagement took place during the absence, and in contempt of the precise orders, of Alcibiades, who had been obliged to pass into Ionia to levy contributions for the subsistence of his troops. On the first intelligence of this check, he instantly returned, and offered battle to the victor, who did not venture to accept it. He had retrieved the honour of Athens; the loss was trifling, but it sufficed for the jealousy of his enemies. They exasperated the people, who stripped him of the general command of the armies with as much precipitation as they had manifested in investing him with that dignity. After the second exile of Alcibiades, the war continued for several years, the Spartans being now commanded by Lyfander, after Alcibiades, the first general of Greece. Till the twenty-seventh year of the war, the success was various, and operations were principally maritime. The great object of the Peloponnesians was the reduction of the Athenian colonies; and the northern parts of the Ægean sea were the chief scenes of warfare. In the twenty-seventh campaign, a large Athenian fleet was stationed at the mouth of the river Ægos. Considering themselves as incontrovertibly superior to the enemy, many of the Athenian soldiers left the ships, and were carelessly dispersed on shore. Alcibiades, being in that neighbourhood, and, though in banishment, anxious for the welfare of his country, warned the Athenian generals of their hazardous position, and the want of discipline among their soldiers and seamen; after representing to them the danger of their situation, on an inhospitable coast, without either harbours or cities to which they might retire in case of necessity, he offered to co-operate with them, by falling upon the enemy at land, with some Thracian troops, under his command. But the generals despised his advice, and refused, out of jealousy, to accept of his service. Lyfander, in the mean time, prepared to attack the Athenians when totally off their guard. Having learned from his scouts, that the enemy were struggling with even more than their usual carelessness, Lyfander embraced the opportunity, and bore down upon the ships thus deserted by the chief portion of the fighting men. The victory was complete, if that can be called a victory where there was scarcely any resistance. The vigilant activity of Conon endeavoured seasonably to assemble the strength of

the Athenians; but his advice was disdained by officers incapable and unworthy of command, and his orders were despised by seamen unaccustomed and unwilling to obey. At length they became sensible of the danger, when it was too late to avoid it. Their ships were taken, either altogether empty, or manned with such feeble crews as were unable to work, much less to defend them. The troops and sailors who flocked to the shore from different quarters, and with disordered precipitation, were attacked by the regular onset and disciplined valour of the Peloponnesians. Those who fought were slain; the remainder fled into the utmost recesses of the Chersoæsus, or took refuge in the Athenian fortresses, which were scattered over that peninsula. Out of a fleet of an hundred and eighty sail, only nine vessels had escaped, eight of which were conducted by Conon to the friendly island of Cyprus, while the ninth carried to Athens the melancholy news of a disaster equally unexpected and fatal. Lysander proposed to pursue his blow to the destruction of the Athenians, reduced all the colonies of Athens under the dominion of Sparta, and proceeded to the siege of Athens. While he invested this city by sea, a powerful army co-operated with him by land. The Athenians, having defended themselves for three months, were reduced to the extremity of distress, and at length this celebrated city was captured, dismantled, and rendered a dependency of Sparta. Such was the ruinous termination of the Peloponnesian war. (B. C. 404.) The conquerors placed the government in the hands of thirty persons, who, from their rapacity and cruelty, earned and acquired the name of the thirty tyrants. During their sway Athens had scarcely any political existence, and its history is only marked by domestic injustice and misery. The unhappy Athenians cast their eyes on Alcibiades, in the confidence that he could, and the hopes that he would, effect their deliverance. But Lysander, entertaining a similar idea of the powers and disposition of that illustrious exile, prevailed on Pharnabazus, the Persian satrap, to perpetrate his murder. The thirty tyrants, freed from the fear of such an avenger, proceeded to greater enormity than ever; until Thrasybulus, inheriting the magnanimous spirit of a free Athenian, put himself at the head of his injured countrymen, expelled the tyrants (B. C. 401), and favoured by the dissensions of the Spartan leaders, re-established a free government in Athens. Deprived, however, of her colonial, naval, and many of her commercial resources, Athens continued of little importance in the public transactions of Greece. The chief domestic event which distinguishes this part of Athenian history, is the fate of Socrates; but of the life as well as of the death of this extraordinary sage, a full account will be given under the appropriate article.

While the Athenians had thus lost not only pre-eminence but independence and political importance, they were still distinguished for good and bad qualities, which had shone so conspicuously in the days of their prosperity. Genius was still transcendent, though directed to different objects from those which had employed a Themistocles and a Cimon. Instead of active efforts for aggrandizing their country, Athenian talents were now chiefly employed in pursuits destined to delight and instruct all the enlightened world. Poetry, history, and philosophy by different means pursued the same end, the promotion of wisdom, virtue, and happiness. But as epic and dramatic excellence had been already carried to the highest conceivable perfection; the poetry of Athens at this period was less supereminent than her history and philosophy. Thucydides and Socrates being dead, Xenophon and Plato occupied the highest rank.

The overbearing insolence with which the Spartans exer-

cised their supremacy over the Grecian states, proved ultimately the means of their degradation, and enabled the Athenians to recover a certain portion of their political power, and their consequence among their neighbours. The confederacy which was formed against Sparta enabled the Athenians to defeat the Lacedæmonians at sea, to regain their naval superiority, and to rebuild their harbour and walls. (B. C. 394.) This revolution from dependency to maritime supremacy they owed to the courage and policy of the celebrated Conon. (See CONON). Thrasybulus seconded the exploits of Conon, and the Athenians resumed the command of maritime settlements, which had been wrested from them ten years before by the victorious Spartans. The reviving fortune of the Athenians recalled their military energies, and various commanders started up, not unworthy of the native country of Pericles and Alcibiades. Iphicrates, Chabrias, and Timotheus, gave glorious specimens of valour and conduct; but the peace of Antalcidas (B. C. 387.) suspended their exertions. For several years after this treaty, the Spartans endeavoured by stratagem and surprise to re-establish their predominancy; they seized the citadel of Thebes, and attempted to make themselves masters of the harbour of Athens, though nominally at peace with both countries. The Athenians joined with the Thebans in revenging this outrage: Chabrias repulsed the army of Sparta, while Iphicrates and Timotheus destroyed her fleets, and Athens rose to an equality with her rival. Peace being again concluded between the Spartans and Athenians, the latter were spectators of the contest between Sparta and Thebes, where the renowned Epaminondas gave at Leuctra (B. C. 371) such a blow to Spartan power; the Athenians were invited by the victors to join in an alliance for crushing their ancient enemies; but they regarded found policy more than resentment, and would not throw their weight into the Theban scale, already preponderant. The Theban hero having still farther reduced the Spartans, and invaded Laconia, the Athenians took active steps for rendering assistance to the now weaker party, and sent an army to defend Peloponnesus; but the battle of Mantinea (B. C. 363) arrested Epaminondas in the career of victory. After him no Theban arose fit for imitating his example, or executing his designs. The Thebans became languid; the Spartans on the other hand were exhauled. Athens did not fail to take advantage of the contests which had weakened her two successors in the dominion of Greece. Taught by experience, they did not attempt to subdue the territories of her warlike neighbours; but the numerous islands of the Ægean and Ionian seas, the remote coasts of Thrace and Asia, invited the activity of their fleet, which they might now employ in foreign conquests, fearless of domestic envy. It appears, that soon after the death of Epaminondas, Eubœa again acknowledged the authority of Athens, an event facilitated by the destruction of the Theban partisans belonging to that place, in the battle of Mantinea. From the Thracian Bosphorus to Rhodes, several places along both shores submitted (B. C. 360.) to the arms of Timotheus, Chabrias, and Iphicrates; men, who, having survived Agesilaus and Epaminondas, were far superior in abilities and in virtue, to the contemporary generals of other republics. The Cyclades and Coreyra secured the friendship of a people able to interrupt their navigation, and to destroy their commerce: Byzantium had become their ally; and there was reason to hope that Amphipolis would soon be reduced to subjection. Such multiplied advantages revived the ancient grandeur of Athens, which once more commanded the sea, with a fleet of near three hundred sail, and employed the best half of her citizens and subjects in ships of war or commerce. This tide

of prosperity, flowing so grateful after adversity and oppression, proved eventually the cause of their ruin. The populace abandoned themselves to idleness, dissipation, and sensuality; and to supply their extravagance, sought project of injustice and rapacity. To direct the formation, and head the execution of such schemes, a daring and profligate leader presented himself in Chares, whose soldier-like appearance, blunt address, and bold impetuous valour, masked his selfish ambition, and rendered him the idol of the populace. His person was gigantic and robust, his voice commanding, his manners haughty; he asserted positively, and promised boldly; and his presumption was so excessive, that it concealed his incapacity, not only from others, but from himself. Though an enterprising and successful partisan, he was unacquainted with the great duties of a general; and his defects appear the more striking and palpable when compared with the abilities of Iphicrates and Timotheus, his contemporaries, who prevailed as often by address as by force, and whose conquests were secured to the republic by the moderation, justice, and humanity with which they had been obtained, and with which they continued to be governed. Chares proposed a very different mode of administration; he exhorted his countrymen to supply the defects of their treasury, and to acquire the materials of those pleasures which they regarded as essential to their happiness, by plundering the wealth of their allies and colonies. This counsel was too faithfully obeyed; the vexations anciently exercised against the tributary and dependent states, were renewed and exceeded. The weaker communities complained and remonstrated against this intolerable rapacity and oppression; while the islands of Chios, Cos, Rhodes, as well as the city of Byzantium, prepared openly to revolt, and engaged with each other to repel force by force, until they should obtain peace and independence (B. C. 358). Chares, probably the chief instrument as well as the adviser of the arbitrary measures which had occasioned the revolt, was sent out with a powerful fleet and army to quash at once the hopes of the insurgents. He sailed towards Chios, with an intention to seize the capital of that island, which was supposed to be the centre and prime mover of rebellion. The confederates, informed of his motions, had already drawn thither the greatest part of their force; the city of Chios was besieged by sea and land; the islanders defended themselves with vigour; Chares found it difficult to repulse their sallies: his fleet attempted to enter their harbour without success; the ship of Chabrias alone penetrated thus far; and that able commander, whose valour and integrity merited a better fortune, though deserted by the fleet, yet forsook not the ship entrusted to him by the republic. His companions threw away their shields, and saved themselves by swimming to the Athenian squadron, which was still within their reach; but Chabrias, fighting bravely, fell by the darts of the Chians, preferring an honourable death to a disgraceful life. Encouraged by advantages over their enemy, who had at first affected to despise them, the insurgents augmented their fleet, and ravaged the isles of Lemnos and Samos. The Athenians, indignant that the territories of their faithful allies should fall a prey to the depredations of rebels, fitted out, early in the next year, a new armament under the command of Mneitheus, the son of Iphicrates, and son-in-law to Timotheus, expecting that the new commander would respectfully listen to the advice of those great men, who perhaps declined acting as principals in an expedition where Chares possessed any share of authority. That general had raised the siege of Chios, and now cruised in the Hellespont; where, being joined by Mneitheus, the united squadrons amounted to an hundred and twenty sail. It was imme-

diately determined to cause a diversion of the enemy's forces from Samos and Lemnos, by laying siege to Byzantium. The design succeeded; the allies withdrew from these islands, collected their whole naval strength, and prepared vigorously for defending the principal city in their confederacy. The hostile armaments approached each other with a resolution to join battle, when a sudden and violent storm arose, which rendered it impossible for the Athenians to bear up to the enemy, or even to keep the sea, without being exposed to shipwreck. Chares alone confidently insisted on commencing the attack, while the other commanders, more cautious and experienced, perceived the disadvantage, and declared the unequal danger. His impetuosity, thus overruled by the prudence of his colleagues, was converted into resentment and fury; he called the sailors and soldiers to witness their opposition, which he branded with every odious epithet of reproach; and, with the first opportunity, dispatched proper messengers to Athens, to accuse them of inactivity, cowardice, and total neglect of duty. The accusation was supported by venal orators in the pay of Chares; Timotheus and Iphicrates were tried capitally. The former trusted to his innocence and eloquence; the latter used a very extraordinary expedient to sway the judges, conformable, however, to the spirit of that age, when courts of justice were frequently instruments of oppression, governed by every species of undue influence, easily corrupted and easily intimidated. The mercenaries, or light infantry, who had been armed, disciplined, and long commanded by Iphicrates, enjoyed the fame reputation in Greece, which the "Fabian" soldiers afterwards did in Italy. They were called "Iphicratanian" troops, from the name of this commander, to whom they owed their merit and their fame, and to whose person (notwithstanding the strictness of his discipline) they were strongly attached by the ties of gratitude and esteem. The youngest and bravest of this celebrated band readily obeyed the injunctions of their admired general; surrounded, on the day of trial, the benches of the magistrates, and took care seasonably to display the points of their daggers. It was the law of Athens, that after preliminaries had been adjusted, and the judges assembled, the parties should be heard, and the trial begun and ended on the same day; nor could any person be tried twice for the same offence. The rapidity of this mode of procedure favoured the views of Iphicrates; the magistrates were overawed by the imminence of a danger which they had neither strength to resist nor time to elude; they were compelled to an immediate decision; but instead of the sentence of death, which was expected, they imposed a fine on the delinquents, which no Athenian citizen in that age was in condition to pay. This severity drove into banishment those able and illustrious commanders. Timotheus sailed to Chalcis, in Eubœa, and afterwards to the isle of Lesbos; both which places his valour and abilities had recovered for the republic, and which, being chosen as his residence in disgrace, sufficiently evince the mildness of his government, and his moderation in prosperity. Iphicrates travelled into Thrace, where he long resided; he had formerly married the daughter of Cotys, the most considerable of the Thracian princes, yet he lived and died in obscurity; nor did either he or Phocion's thenceforth take any share in the affairs of their ungrateful country. Thus did the social war destroy or remove Iphicrates, Chabrias, and Timotheus, the best generals whom Greece could boast; and, honest Phocion excepted, the last venerable remains of Athenian virtue. (See Gillies vol. iii. p. 484.)

Sunk in idleness, amusements, and vice, the Athenians wanted nothing to complete their destruction but an ambitious and enterprising foreign enemy. This they found in Philip

Philip king of Macedon, who first extended his power in countries not immediately connected with Greece, and at the same time increased the means of farther extension. Meanwhile a war broke out in Greece; first between the Thebans and Phocians, concerning lands annexed to the temple of Delphi, which afterwards involved the greater part of Greece, and among others the Athenians. Philip, taking advantage of these dissensions, marched towards the interior of Greece, knowing that the Athenians were the most immediately interested to oppose his progress, and the ablest, if they exerted themselves, to do it effectually; he directed a great part of his policy to the prevention of those exertions. He was aware that in a democracy the governors are the tools of the demagogues; by flattery, by caresses, and by bribery, he effectually procured the favour of those leaders of the populace. One patriot, however, he could never corrupt; Demosthenes exerted the whole force of his energetic eloquence (from B.C. 356 to 336) to rouse the Athenians to a sense of their danger, from the encroachments of Philip. (For the nature and character of Demosthenes's eloquence, see article DEMOSTHENES.) This powerful orator occasionally roused his countrymen from their lethargy, but never to such great exertions as he declared necessary, and as the circumstances required: on gaining some partial advantages, they returned to their indolence and licentiousness. Philip amused them by embassies, seduced them by their demagogues, and continued his encroachments: when they should have been sending powerful armaments, they sent ambassadors: these, Demosthenes excepted, Philip corrupted; and the interests of the Athenians were betrayed. In vain Demosthenes demonstrated the views of Philip, and treachery of the demagogues: he could not stimulate them to vigorous and persevering efforts, until Philip's power became too formidable for resistance. A combination of the states of Greece was at length formed against Philip; but too late to be successful. The allies were totally defeated at Chæronea (B.C. 338), and the Athenians became a dependency of Macedon. A popular writer (see Travels of Anacharsis, vol. i. p. 112.) observes, that the history of the Athenians, properly speaking, commences about 150 years after the first olympiad; and concluded at the battle of Chæronea, it contains scarcely more than 300 years. In this series of years it is easy to discover certain important intervals, which mark the rise, progress, and decline of their empire; and if these eras be distinguished by characteristic names, the first may be called the age of Solon, or of the laws; the second, the age of Themistocles and Aristides, or the age of glory; and the third, that of Pericles, or the age of luxury and the arts.

The Athenians after the battle of Chæronea never recovered their importance. During the contests of Alexander's successors, they followed the fortunes of different chieftains, but chiefly adhered to the side of Demetrius and his descendants, who established themselves on the throne of Macedon. When the intrigues of the second Philip with the renowned Hannibal provoked the Romans to invade Greece, the Athenians joined the invaders, and Athens became the dependent ally of the conquerors. In the Mithridatic war, Athens having been conquered by the Asiatic monarch, was besieged by Sylla (B.C. 87), who took and plundered their city, demolished its walls and fortifications, butchered its inhabitants, and reduced it to a state of desolation. When this storm subsided, Athens enjoyed profound tranquillity till the civil war broke out between Cæsar and Pompey, when it took part with the latter, and was reduced to great straits by Calpurnius, the lieutenant of Cæsar. Disappointed in their hopes of being relieved by

Pompey, the Athenians surrendered at discretion, and were more kindly treated than they expected; for Cæsar not only pardoned them, but took them under his protection, alleging, "that I spared the living for the sake of the dead." But availing themselves of their situation, they no sooner heard of Cæsar's death than they openly declared for his murderers; receiving Brutus and Cassius into their city, and even erecting statues to them, which were placed next to those of Harmodius and Aristogiton. After the defeat of Brutus and Cassius, they attached themselves to Antony, who restored them to their former privileges, and enlarged their dominions, by subjecting to Athens the islands of Cea, Scythus, Paphlagonia, and Ægina. Of this island, however, they were deprived by Augustus, and forbidden to sell the freedom of their city, as a punishment which he inflicted upon them for their ingratitude to Julius Cæsar. Towards the latter end of the reign of Augustus, they revolted, but were soon reduced to their former obedience. Germanicus, the adopted son of Tiberius, honoured them with the privilege of having a lictor, which was considered as a mark of sovereign power. This grant was confirmed to them by Tiberius and his successors, under whose protection they maintained their ancient form of government till the reign of Vespasian, who reduced Attica, with the rest of Greece, to a Roman province, saying, "that the Greeks knew not how to enjoy their liberty." But the emperor Adrian, who had been praetor of Athens before his accession to the imperial dignity, restored them to the full enjoyment of their former privileges. He repaired the two ports of the Piræus and Munychia, and added a whole district of new buildings to the old city. This quarter was called Adrianopolis, from Adrian, whom the Athenians styled the second founder of their city. The privileges granted by Adrian were confirmed and extended by his successors M. Antoninus Pius and M. Antoninus the philosopher. Severus abridged them of many privileges in revenge for an affront which he received at Athens, while he studied in that city. They were favoured by Valerian; but the city was taken and plundered by the Goths in the reign of Gallienus, or of Claudius (A. D. 267 or 268); but the invaders were soon obliged, by a precipitate flight, to abandon their new conquest. Constantine the Great was a peculiar patron and benefactor of the Athenians. He honoured their chief magistrate with the title of grand duke, an office at first annual, but afterwards hereditary; and granted them many privileges, which were confirmed and enlarged by Constantine, who also put them in possession of several islands in the Archipelago. In the time of Theodosius I. 380 years after Christ, the Goths laid waste Thessaly and Epirus; but Theodore, general of the Achaëans, preserved the cities of Greece from pillage; and a statue of marble was erected to him at Athens by order of the city. During the reigns of Arcadius and Honorius, the Athenians were cruelly harassed and pillaged by the Goths under Alaric (A. D. 396), who reduced all their itately and magnificent structures into heaps of ruins, and removed the invaluable treasures of antiquity. Syncellus, a writer of that age, says, that Athens resembled the bleeding and empty skin of a slaughtered victim. After Athens became only part of a Roman province, it still remained the central point in the republic of letters, and continued to be frequented by all who desired to acquire that atticism so highly valued by the ancients, and that standard taste which enabled them to estimate, with peculiar accuracy, the real beauties of every work of genius and art. Here too, and here only, were to be learned the true principles of eloquence. All therefore, who applied themselves to public speaking, and

Cicero in particular, repaired to Athens, to study under the ablest masters of oratory. Thither did the same Cicero send his son to hear the lectures of Cratippus; thither Horace was sent by his father; every Roman of any rank or consideration followed the same course; and Greek learning, according to the testimony of Plutarch, was accounted for requisite a branch of education among that judicious people, that a Roman, who did not understand the Greek language, never arrived at any high degree of estimation. When St. Paul visited Athens, it was the seat of philosophy; and we cannot enough admire the superior eloquence of that apostle, in his manner of addressing so intelligent an audience. He adapted his discourse to the character of his hearers, by the sublimity of its exordium; and he very properly mentioned the altar which he found there (see ALTAR); and his quotation from Aratus, one of their well-known poets, was particularly pertinent. Nor was Athens only celebrated for the residence of philosophers, and the instruction of youth; men of rank and fortune found pleasure in a retreat which contributed so much to their liberal enjoyment. The progressive state of literature and philosophy at Athens, is thus described by a popular historian:

“Athens, after her Persian triumphs, adopted the philosophy of Ionia and the rhetoric of Sicily; and these studies became the patrimony of a city, whose inhabitants, about thirty thousand males, condensed, within the period of a single life, the genius of ages and millions. Our sense of the dignity of human nature, is exalted by the simple recollection, that Isocrates was the companion of Plato and Xenophon; that he assisted, perhaps with the historian Thucydides, at the first representations of the Oedipus of Sophocles and the Iphigenia of Euripides; and that his pupils Æschines and Demosthenes contended for the crown of patriotism in the presence of Aristotle, the master of Theophrastus, who taught at Athens with the founders of the Stoic and Epicurean sects. The ingenious youth of Attica enjoyed the benefits of their domestic education, which was communicated without envy to the rival cities. Two thousand disciples heard the lessons of Theophrastus; the schools of rhetoric must have been still more populous than those of philosophy; and a rapid succession of students diffused the fame of their teachers, as far as the utmost limits of the Grecian language and name. Those limits were enlarged by the victories of Alexander; the arts of Athens survived her freedom and dominion; and the Greek colonies which the Macedonians planted in Egypt, and scattered over Asia, undertook long and frequent pilgrimages to worship the muses in their favourite temple on the banks of the Ilissus. The Latin conquerors respectfully listened to the instructions of their subjects and captives; the names of Cicero and Horace were enrolled in the schools of Athens; and after the perfect settlement of the Roman empire, the natives of Italy, of Africa, and of Britain, conferred in the groves of the academy with their fellow-students of the East. The studies of philosophy and eloquence are congenial to a popular state, which encourages the freedom of inquiry, and submits only to the force of persuasion. In the republics of Greece and Rome, the art of speaking was the powerful engine of patriotism or ambition; and the schools of rhetoric poured forth a colony of statesmen and legislators. When the liberty of public debate was suppressed, the orator, in the honourable profession of an advocate, might plead the cause of innocence and justice; he might abuse his talents in the more profitable trade of panegyric; and the same precepts continued to dictate the fanciful declamations of the sophist, and the

desfer by arties of historical composition. The systems which professed to unfold the nature of God, of man, and of the universe, engaged the curiosity of the philosopher student; and according to the temper of his mind, he might dispute with the Pythagoreans, or decide with the Stoics, sublimely speculate with Plato, or severely argue with Aristotle. The prize of the adverse sects had fixed an unattainable term of moral happiness and perfection; but the race was glorious and illustrious; the disciples of Zeno, and even those of Epicurus, were taught both to act and to suffer; and the death of Peterius was not less essential than that of Seneca, to render a tyrant by the due way of his impotence. The light of science could not indeed be confined within the walls of Athens. Her innumerable writers attracted themselves to the human race; the living masters emigrated to Italy and Asia; Berytus in later times, was devoted to the duty of the law; astronomy and physic were cultivated in the museum of Alexandria; but the Attic school of rhetoric and philosophy maintained their speed or reputation from the Peloponnesian war to the reign of Justinian. Athens, though situated in a barren soil, possessed a pure air, a free navigation, and the monument of ancient art. That sacred retirement was seldom disturbed by the bulwarks of trade or government; and the labours of the Athenians were distinguished by their lively wit, the purity of their taste and language, their social manners, and some traces, at least in discourse, of the magnanimity of their fathers. In the suburbs of the city, the academy of the Platonists, the lyceum of the Peripatetics, the portico of the Stoics, and the garden of the Epicureans, were planted with trees and decorated with statues; and the philosophers, instead of being immured in a cloyster, delivered their instructions in spacious and pleasant walks, which, at different hours, were consecrated to the exercises of the mind and body. The genius of the founders still lived in those venerable seats; the ambition of succeeding to the masters of human reason, excited a generous emulation; and the merit of the candidates was determined, on each vacancy, by the free voices of an enlightened people. The Athenian professors were paid by their disciples, according to their mutual wants and abilities; the price appears to have varied from a mina to a talent; and Isocrates himself, who derides the avarice of the sophists, required in his school of rhetoric, about thirty pounds from each of his hundred pupils. The wages of industry are just and honourable, yet the same Isocrates shed tears at the first receipt of a stipend; the Stoic might blush when he was hired to preach the contempt of money; and I should be sorry to discover, that Aristotle or Plato so far degenerated from the example of Socrates, as to exchange knowledge for gold. But some property of lands and houses was settled by the permission of the laws, and the legacies of deceased friends, on the philosophic chairs of Athens. Epicurus bequeathed to his disciples the garden which he had purchased for eighty mine or two hundred and fifty pounds, with a fund sufficient for their frugal subsistence and monthly festivals; and the patrimony of Plato afforded an annual rent, which, in eight centuries, was gradually increased from three to one thousand pieces of gold. The schools of Athens were protected by the wisest and most virtuous of the Roman princes. The library which Hadrian founded, was placed in a portico adorned with pictures, statues, and a roof of alabaster, and supported by one hundred columns of Phrygian marble. The public salaries were assigned by the generous spirit of the Antonines; and each professor, of politics, of rhetoric, of the Platonic, the Peripatetic, the Stoic, and the Epicurean philosophy, received an annual stipend of ten thousand drachmas, or more than three hundred

dred pounds sterling. After the death of Marcus, these liberal donations, and the privileges attached to the thrones of science, were abolished and revived, diminished and enlarged: but some vestige of royal bounty may be found under the successors of Constantine; and their arbitrary choice of an unworthy candidate might tempt the philosophers of Athens to regret the days of independence and poverty. It is remarkable, that the impartial favour of the Antonines was bestowed on the four adverse sects of philosophy, which they considered as equally useful, or at least as equally innocent. Socrates had formerly been the glory and the reproach of his country; and the first lessons of Epicurus so strangely scandalized the pious ears of the Athenians, that by his exile, and that of his antagonists, they silenced all vain disputes concerning the nature of the gods. But in the ensuing year they recalled the hasty decree, restored the liberty of the schools, and were convinced by the experience of ages, that the moral character of philosophers is not affected by the diversity of their theological speculations."

But the schools of Athens were suppressed by an edict of Justinian; an edict, which excited the grief and indignation of the few remaining votaries of Grecian science and superstition. Seven friends and philosophers, Diogenes and Hermias, Eulalius and Priscian, Damascius, Isidore, and Simplicius, who dissented from the religion of their sovereign, resolved to seek in a foreign land the freedom of which they were deprived in their native country. Accordingly the seven sages sought an asylum in Persia, under the protection of Chosroes; but disguised and disappointed, they hastily returned, and declared that they had rather die on the borders of the empire, than enjoy the wealth and favour of the barbarian. These associates ended their lives in peace and obscurity; and as they left no disciples, they terminate the long list of Grecian philosophers, who may be justly praised, notwithstanding their defects, as the wisest and most virtuous of their contemporaries.

From the time of Arcadius and Honorius, nothing memorable concerning the Athenian state has been recorded in history till the thirteenth century, when it was in the possession of Baldwin, as Nicetas informs us, and unsuccessfully besieged by Theodorus Lascaris, one of the generals of the Greek emperor. In the 252 years, from A. D. 1204. to A. D. 1456., that elapsed between the first and last conquest of Constantinople; the possession of Greece was disputed by a multitude of petty tyrants. However, in the partition of the empire, the principality of Athens and Thebes was assigned to Otho de la Roche, a noble warrior of Burgundy, with the title of great duke. Otho followed the standard of Boniface, the marquis of Montferrat; and the ample state which he acquired, was peaceably inherited by his son and two grandsons, till the family was changed by the marriage of an heiress into the elder branch of the house of Brienne. The son of that marriage, Walter de Brienne, succeeded to the duchy of Athens: but his family and nation were expelled by the Catalans, who seized possession of Attica and Bœotia. During fourteen years they were the terror of the Grecian states. Their factions drove them to acknowledge the sovereignty of the house of Arragon; and, during the remainder of the fourteenth century, Athens, as a government or an appendage, was successively bestowed by the kings of Sicily. After the French and Catalans, the third dynasty was that of the Acciaïoli, a family, plebeian at Florence, potent at Naples, and sovereign in Greece. Athens, which they embellished with new buildings, became the capital of a state, that extended over Thebes, Argos, Corinth, Delphi, and a part of Thessaly;

and their reign was finally determined by Mahomet the second, about the year 1455., who strangled the last duke, and educated his sons in the discipline and religion of the seraglio. This fatal catastrophe, which happened near 2000 years after the time of Pifistratus, brought Athens, together with the whole of Greece, under the despotic dominion of the Turks. In 1464, the Venetians landed at the Piræus, surprised the city, and carried off their plunder and captives to Eubœa. In 1687, it was taken, after a short siege, by the Venetians; and not many years after, retaken by the Turks, under whose yoke it has ever since continued.

"As to the present state of Athens, though no more than the shadow of its former self, it still contains about 8 or 10,000 inhabitants: of these, three fourths are Greeks in religion and language; and the Turks, who compose the remainder, have relaxed, in their intercourse with the citizens, somewhat of the pride and gravity of their national character. The olive-tree, the gift of Minerva, flourishes in Attica; nor has the honey of mount Hymettus lost any part of its exquisite flavour: but the languid trade is monopolized by strangers; and the agriculture of a barren land is abandoned to the vagrant Walachians. The Athenians are still distinguished by the subtlety and acuteness of their understandings: but these qualities, unless ennobled by freedom and enlightened by study, will degenerate into a low and selfish cunning: and it is a proverbial saying of the country, "From the Jews of Thessalonica, the Turks of Negropont, and the Greeks of Athens, good Lord deliver us!" This artful people has eluded the tyranny of the Turkish bashaws, by an expedient which alleviates their servitude and aggravates their shame. About the middle of the last century (the 17th), the Athenians chose for their protector the Kilar Aga, or chief black eunuch of the seraglio. This Æthiopian slave, who possesses the sultan's ear, condescends to accept the tribute of 30,000 crowns: his lieutenant, the Waywode, whom he annually confirms, may reserve for his own about five or six thousand more; and such is the policy of the citizens, that they seldom fail to remove and punish an oppressive governor. Their private differences are decided by the archbishop, one of the richest prelates of the Greek church, since he possesses a revenue of 1000l. sterling; and by a tribunal of the eight geronti or elders, chosen in the eight quarters of the city: the noble families cannot trace their pedigree above 300 years; but their principal members are distinguished by a grave demeanour, a fur-cap, and the lofty appellation of archon. By some, who delight in the contrast, the modern language of Athens is represented as the most corrupt and barbarous of the seventy dialects of the vulgar Greek: this picture is too darkly coloured; but it would not be easy, in the country of Plato and Demosthenes, to find a reader, or a copy of their works. The Athenians walk with supine indifference among the glorious ruins of antiquity; and such is the debasement of their character, that they are incapable of admiring the genius of their predecessors." Gibbon's Hist. vol. xi. p. 355, &c. For the modern account of Athens and the Athenians, see Spon, Voyage en Greece, t. ii. p. 79—199.; Wheeler's Travels into Greece, p. 337—414.; Stuart and Rivett's Antiquities of Athens, vols. i. ii. and iii. passim; and Chandler's Travels into Greece, p. 23—172. It is now called ATHINI, and SETINES; which see.

ATHENIANS, *Character and Manners of the.* These people were highly susceptible of lively and transient sensations, and, accordingly, they stand distinguished beyond all other nations for uniting the most discordant qualities, and such as were often perverted and made occasions of misleading them. History represents them to us (see the authorities

ties cited in the "Travels of Anacharsis," vol. ii. p. 260.), sometimes as an old dotard, who may be deceived with impunity; or as an infant, who requires continual amusement; and sometimes as displaying the discernment and sentiments of elevated minds; as passionately fond of pleasure and of liberty, of indolence and of glory; or intoxicated with flattery, and yet receiving merited reproach with applause; as possessing penetration to apprehend at a word the plans proposed to them, but too impatient to listen to the particulars, or to foresee their consequences; as making their magistrates tremble before them, and at the same moment pardoning their most bitter enemies; as passing with the rapidity of lightning from rage to compassion, from despondence to insolence, from injustice to repentance; as beyond conception sickle; and so frivolous, that in the most furious, and even the most desperate situation of their affairs, a single word spoken at random, a happy fall of pleasantries, the smallest object, the most trivial incident, provided it were unexpected, sufficed to dispel their fears, or to divert them from attention to their most important interests. As nothing was more easy than to excite and incline the passions of such a people, it was equally easy to acquire, and also to lose, their confidence. A popular leader, whilst in favour with them, might without difficulty persuade them to adopt good or evil measures with an equal degree of ardour. When guided by firm and virtuous men, they bestowed public offices of trust or power on those, who united great abilities with eminent virtue: at other times, they made a choice at which they ought to have blushed; and they were thus frequently the sport of flattering orators and ambitious tyrants. Such, however, was their inherent detestation of tyranny, that they were extremely jealous, on many memorable occasions, of their privileges, and both zealous and active in defence of their liberty, whenever they thought it attacked and violated by men in power. Indeed, an ardent love of liberty was their predominant quality, and the main spring of their government. They left, without hesitation, their cities and their houses, to fight at sea or by land the common enemy, who threatened them with the danger of servitude. It was a glorious day for Athens, when all her allies yielding to the advantageous offers of the king of Persia, the reply by Aristides to the ambassadors of that monarch; "that it was impossible for all the gold in the world to tempt the republic of Athens, and to prevail with her to sell her liberty, and that of Greece." By such sentiments, and a conduct actuated by them, the Athenians not only became the bulwark of Greece, but likewise guarded the rest of Europe from a Persian invasion. The Athenians, however, notwithstanding their attachment to the rights of their country, and the jealousy with which they watched over them, were volatile, capricious, and inconstant; and this disposition betrayed them into errors, incompatible with true patriotism. Whilst the Athenians indulged views of conquest that were extensive and astonishing, they were, in private life, and in their domestic arrangements and expenditure, frugal, simple, and unostentatious; but when the honour of the state required it, sumptuous and magnificent. Their conquests, their riches, and their connections with the inhabitants of Asia Minor, never betrayed them into luxury, pomp, and profusion. Xenophon observes, that a citizen was not distinguished from a slave by his dress: and it is remarked with approbation by Demosthenes, that in the best times of the republic, the houses of Themistocles and Aristides could not be distinguished from those of their neighbours. The wealthiest citizen, and the most renowned general, were not ashamed to go themselves to market. In the form and disposition of the several articles of dress, the men

were expected to study decency, and the women to unite elegance with taste. The latter, whenever they went out, wore a veil over their heads: and they painted their eye-brows with black, and applied to their faces a layer of ceruse or white lead, with deep tints of rouge. Their hair, which they crowned with flowers, was sprinkled over with a yellow-coloured powder. Shut up in their apartments, they never participated in the pleasures of the companies assembled by their husbands. In the day, the law permitted them to go out only on certain occasions, and never in the night time, but in a carriage, and with a flambeau to light them; but notwithstanding the restraint of this law, the women of the lower classes indulged themselves with greater liberty. In public festivals they were present at the spectacles as well as the ceremonies of the temple; but they were generally attended by eunuchs, or female slaves. At an early period the Athenians were so jealous, that they would not permit their women to shew themselves at the window; but this restraint was gradually relaxed, and severe laws were introduced to guard against seduction and infidelity. (See ADULTERY.) M. de Parry, in his "Recherches Philosophiques sur le Grec," on the authority of Athenæus and Plutarch, represents the Athenian matrons as addicted to drunkenness, and the most dissolute sensuality: he says that they were turbulent and quarrelsome, and that, notwithstanding all the concessions of their husbands, domestic peace was very seldom found in their habitations. It is certain, that the feasts of Bacchus, and some other religious institutions which the women claimed a right to celebrate, could not tend to inspire either gentleness of manners or purity of moral. Courtezans were protected at Athens by the laws, but the public manners were contaminated by this licence. Females of this description, however, were not allowed to appear in the streets with rich trinkets or jewels, nor were men in office permitted to appear with them in public. The Athenians were naturally abstemious; their chief food consisted of salt meat and vegetables. The necessities of the poor were supplied either from the public treasury, or other means. In Athens there were several societies, the members of which entered into a solemn engagement to assist each other in cases of judicial prosecution; and there was one society, whose only object was to observe and collect every species of ridiculous absurdity, and to divert itself with pleasantries and bon-mots. At Athens, a small number of citizens enriched themselves by commerce, and by silver mines which they possessed at Laurium. Others deemed themselves masters of a decent fortune when they possessed estates to the value of fifteen or twenty talents (the talent being equal to about 225 l. sterling), and when they were able to give their daughters a marriage portion of 100 mine, or about 375 l. sterling.

The taste of the Athenians for literature and science is well known. The inhabitants of Athens, says Cicero (De Orat. and Orat. pro Flacco), were the inventors of all learning, the men who invented and perfected eloquence, and from whom humanity, learning, religion, and laws were dispersed through the whole world; nevertheless, he adds, "they only knew what was right, but would not do it." When the Athenians, says the famous Mr. Harris (Philosophical Inquiries, part iii. c. 3.), had delivered themselves from the tyranny of Pisistratus, and after this had defeated the valiant efforts of the Persians under Darius and Xerxes, they may be considered as at the summit of their national glory; and for more than half a century afterwards, they maintained, without control, the sovereignty of Greece. As their taste was naturally good, arts of every kind soon arose among them, and flourish-

Valour had given them reputation; reputation gave them an ascendant; and that ascendant produced a security, which left their minds at ease, and gave them leisure to cultivate every thing liberal or elegant. It was then that Pericles adorned the city with temples, theatres, and other beautiful public buildings. Phidias, the great sculptor, was employed as his architect, who, when he had erected edifices, adorned them himself, and added statues and basso-relievs, the admiration of every beholder. It was then that Polygnotus and Myro painted; that Sophocles and Euripides wrote; and not long after that they saw the "divine" Socrates. And though their military strength and political sovereignty were impaired by the Lacedæmonians, humiliated by the Thebans under Epaminondas, and wholly crushed by Philip the Macedonian; yet, happily for mankind, their love of literature and arts did not sink along with it. Just at the close of their golden days of empire, flourished Xenophon and Plato, the disciples of Socrates, and from Plato descended that race of philosophers called the "Old Academy," which was succeeded by the "New Academy." (See ACADEMY.) With the study of philosophy was united that of rhetoric, upon which treatises were written by the ablest Greek philosophers. To this object they were incited by the intrinsic beauty of their language, as it was then spoken among the learned and polite. The same love of elegance which made them attend to their style, made them attend even to the places where their philosophy was taught. Such was the academy of Plato; the Lyceum of Aristotle; the portico or colonnade of Zeno, the walls of which were decorated by various paintings of Polygnotus and Myro; and the gardens of Epicurus. Their public institutions were called among the Greeks by the name of *Gymnasia*, in which were taught all those exercises, and all those arts, which tended to cultivate not only the body but the mind. Dr. Gillies, in his "History of Greece," has dwelt with a degree of enthusiasm on the advantages, both natural and moral, resulting from the gymnastic exercises and public games; but M. de Pauw (*ubi supra*), differs in opinion, asserting that nothing could be more pernicious, or tend more to enervate the human race, than these exercises. As to the moral advantages of these public games, it is not very easy to decide; but their physiological effect is much less questionable, and cannot be justly disputed.

ATHENS, Population of. From comparing the several accounts of the population of Attica in the time of Pericles, of Demosthenes, and of Demetrius Phalereus, M. de Pauw (*ubi supra*) conjectures, that the number of citizens was preserved nearly at the same level, in consequence of the adoption of strangers, to repair the extraordinary devastations of war and disease, and of emigrations, when the number exceeded that which the rules of policy had established; this was 20,000 men; and he supposes that there was an equal number of women. In the time of Demetrius Phalereus, the strangers settled in Attica amounted to 10,000, and the slaves to 400,000; so that the whole number may be estimated at 450,000 to about eighty-six square leagues of territory, or above 5000 on an average to each square league. This, he observes, is a much greater population than that of France, which, according to M. Necker's calculations, contains not more than 900 inhabitants to a square league.

The people of Athens were comprehended under the classes of freemen or citizens, *πολιται*; sojourners, or *μετοικαι*; and slaves, or *δουλοι*. Cæcrops distributed them into four *φωλαι*, or tribes, each tribe being subdivided into three parts, and each of these into thirty families. The names of the tribes

were different at different æras; and their number was increased by Chilhènes to ten; and they were afterwards augmented to twelve. These tribes had public feasts, at which they met to promote friendship and good neighbourhood. To each tribe belonged several little boroughs in Attica, called *Δημοι*; of these there were 174, besides other boroughs that belonged to no particular tribes. It was enacted, that all strangers who intended to live at Athens, should be compelled, after a short residence, to enroll their names among the free citizens, and that none but persons of eminent meritorious character should be citizens. This privilege was conferred by the popular assembly. It was also enacted, that none should reside as free citizens at Athens, except those who were banished from their own country, or who voluntarily settled there with their whole families. They were admitted to their rights by certain ceremonies, and enrolled in a certain tribe. Solon decreed, that none should be accounted free but such as were Athenians both by father and mother: this regulation was revived, after disuse, by Pericles, and at his motion repealed; and after the expulsion of the thirty tyrants, Solon's law was restored. In the Cynopargæ there was a court of judicature, to which causes of illegitimacy belonged; and great care was taken that none should be enrolled as citizens, whose title was not examined and approved.

The *Μετοικαι*, or sojourners, were those who came from a foreign country and settled in Attica, being admitted by the council of Areopagus, and publicly registered. Of these, several services were required; and both men and women paid an annual tax. Those who failed to pay it were seized and exposed to sale by the officers of the public revenue: such, according to Diogenes, was the fate of Xenocrates the philosopher; but those who rendered any service to the public, were exempted from the payment of all imposts, except such as were demanded of free citizens. Such persons as did not constantly reside at Athens, were called *ξενικαι*, or strangers.

The slaves were of two sorts; such as became so from poverty, the chance of war, or the perfidy of those who trafficked in them, and who were at liberty to change their masters, and to release themselves from servitude; and such as were at the absolute disposal of their masters. Slaves were not allowed to imitate freemen in their dress and manners. They were forbidden to wear long hair, and what is more astonishing, Solon prohibited them to love boys, as if this practice were honourable: they were not permitted to plead for themselves, or to be witnesses in any cause; confession was extorted from them by torture; nor were they allowed to worship certain deities, to be called by honourable names, and to bear arms. They were reduced to obedience, and punished by corporal severities; they were sometimes marked on the forehead, or stigmatized in any other part of the body. Nevertheless they were allowed at Athens to take refuge in the temple of Theseus, when they were oppressed, and it was sacrilege to force them from it. They were allowed to bring an action against their masters for ill treatment, and against those who injured them; and in various respects their condition was preferable to that of slaves in other places, as they might purchase their freedom, and were sometimes advanced to the dignity of citizens. In the first day of every month, the merchants, called *ανδραποδοκαπηλαι*, exposed them for sale in the slave market. In the time of Adrian, masters were prohibited from putting their slaves to death.

ATHENS, Magistrates and Government of. By the law of Solon, no man who had not a good estate, could bear the office of a magistrate; but by the law of Aristides, every man

man was admitted to a share in the commonwealth; but before he was admitted, he was obliged to give an account of his past life before judges in that part of the forum called Δικαστήριον. It was a capital crime for a person to enter on his office in debt. The magistrates of Athens were of three sorts, viz. *χρηστοὶ ἀνδρες*, who were elected by the people, and so called because chosen by holding up of hands; *ἐκλογεῖται*, who were promoted by lots drawn by the *Thestiothetæ*, in the temple of Theseus; and *Δίαιτα*, who were extraordinary officers appointed by particular tribes, to superintend public affairs. The magistrates entered on their office on the first day of the month Hecatombæon. The first and most important of these magistracies was that of the archons. (See ARCHON.) Among the inferior magistracies may be reckoned the NOMOPHYLACES, PHYLARCHI, PHYLOBASILES, PHRATRIARCHI, DIMARCHI, LIXIARCHI, TOXOTÆ, and NOMOTHETÆ, to whom were added the RHETORES; which see respectively. There were other magistrates who had the superintendance and regulation of the general assembly of the people called ECCLESIA; such as the EPISTATES, PRYTANES, and PRODRRI. (See also SENATE, and PRYTHANEUM.) The courts of justice, exclusive of the AREOPAGUS, were ten in number, of which four had cognizance of criminal, and six of civil causes. These courts were painted with various colours, and on each was engraven one of the ten first letters of the Greek alphabet; and hence they were denominated Alpha, Beta, &c. The names of those who were to hear and determine causes, and the names also of their father and borough, inscribed upon a tablet, were delivered to the *Thestiothetæ*, who returned it with another tablet on which was inscribed the letter of one of the courts according to the lots. These tablets were carried to the crier of the several courts directed by the letters, who gave to every man a tablet inscribed with his own name and the name of the court in which he was to sit; and having received a sceptre, the usual ensign of judicial power, they were severally admitted into the court. When their respective causes were determined, they returned the sceptre to the Prytanes, from whom they received their due reward, sometimes one obolus, and sometimes three oboli. No man was allowed to sit in more than one court in a day; and if they were convicted of bribery, they were fined. The first criminal court after the Areopagus was that of the ΕΡΗΤΗΛΕ; the second was called DELPHINIUM; the third PRYTHANEUM; and the last ΠΡΟΚΤΗΤΟΝ; see the respective articles. Of the judicatory courts for civil causes, the first was the ΠΑΡΑΒΟΥΤΟΝ; the second, the ΚΑΤΟΝ; the third, ΤΡΙΓΩΝΟΝ; the fourth, the court of ΛΥΚΟΝ; the fifth, that of ΜΕΤΙΧΘΗΣ; and the sixth, ΜΕΤΑΝΑ. All the Athenians who were free citizens were allowed to sit in these courts as judges; but they were previously obliged to take a solemn oath, by Apollo, Pallas, Ceres, and Jupiter the king, that they would pass a just sentence, and according to law, and to the best of their judgment. This oath was administered near the river Ilissus, in a place called "Ardettus" from a person of that name, who, in a public sedition united the contending parties, and engaged them to confirm their treaties of peace by mutual oaths in this place; whence common swearets were called *ἀρδῆται*. There were other courts of less consequence, where the *ἀρχαῖοι*, or *πρωτοδικαί*, or other magistrates, took cognizance of causes belonging to their several offices. Such were the courts at Cynolarges, Odelm, the temple of Theseus, Dinobum, &c. In the judicial process, the plaintiff delivered to the magistrate the name of the person against whom he brought his action, with an account of his offence; this was followed by an inquiry on the part of the magistrate, whether it be-

longed to his cognizance, and whether it ought to be tried, called "Anacrisis;" the plaintiff then, with permission of the magistrate, summoned his adversary to appear; but if he refused to appear, he was dragged by force. When both plaintiff and defendant were before the magistrate, he inquired of the former whether the witnesses were all ready, which was the second "Anacrisis;" when no plea was urged on the part of either plaintiff or defendant for putting off the trial, an oath was administered to both parties. These oaths, with those of the witnesses, and other matters relating to the action, were written upon tablets, and deposited in a vessel, which was delivered to the judges. The judges being appointed by lots, took their places at the assigned day in the tribunal. The magistrate then prosecuted the cause to them, and gave them authority to determine it. The public crier read the indictment containing the grounds of the accusation which were noted down by the judges. If the defendant did not appear, sentence was immediately passed against him; but if he presented himself within ten days, assigning reasons for his absence, the former sentence was reversed, and the trial was to be brought forward by the defendant within two months; but if it was not brought on, the former sentence was confirmed. Before trial, both parties deposited a sum of money in the hands of the magistrate who introduced their cause into the court, who, if the money was not paid, erased their cause from the roll. The deposit, which was 3 drachmas for a cause of the value of 100 drachmas to 1000; and 20 for more than 1000 and less than 10,000; was divided among the judges; and the person who lost his cause restored the money to his adversary, and paid the charges. The witnesses in the trial were to be free-born, and deservng of credit; and they were considered as infamous if they had forfeited their privileges by misconduct. The testimony was sometimes given aloud in open court, and sometimes in writing upon a tablet of wax. If the parties required it, they were allowed advocates, whose speeches were limited as to length of time, measured by a water glass. When the parties had finished, the crier was commanded by the presiding magistrate, to order the judges to bring in their verdict; and where the law had provided penalties, a verdict of guilty or not guilty was sufficient; but where the laws were silent, another sentence was necessary, determining the punishment due to the offence. When the laws were silent, the judges might limit the punishment; sentence was at first given by black and white shells called *σταθμοὶ*, or pebbles called *κέραι*; balls of brass were afterwards used, and then beans; the white beans were afterwards used, and used to acquit; and the black were bored through, to condemn. The cause which plaintiff was engaged on a tablet and exposed to public view, and hung up at the statue of the heroes named *Πρωτόδικα*. If the person convicted was guilty, he was delivered to the jail, to receive punishment; but if he was unable to pay the fine, or the fine paid; if unable to pay it, he was doomed to perpetual imprisonment. If the plaintiff had unjustly accused his adversary, he was sentenced to suffer that punishment which the law had set on the crime with which his adversary was accused. The plaintiff was called *καταγορεύων*, the cause itself *καῖσις*, and the accused *καταγορεύμενος*. After was the name of the indictment before conviction, and *καταγορεύμενος* after it. When the trial was ended, the judges went to the temple of Lyca, returned their slaves, and removed their money.

The Athenian judgments were of two kinds; public, concerning those crimes that affected the state, called *κοινὰ*, and all persons were encouraged by law to charge the public wrong, by bringing the criminal to punishment; and

private, concerning all controversies between private persons, called *δικαι*; and no one could prosecute an offender except he who was injured, or some of his family. The public judgments were murder, malicious wounding, a conflagration of the city, poison, conspiracy against the life of another, sacrilege punished with death, impiety, treason, fornication; whoredom, punishable by fine; celibacy; refusing to serve in war; and cowardice, punishable with infamy; desertion of the fleet and of the army, punished by fine; desertion from their post, as leaving the infantry for the cavalry; refusing to serve in the fleet, and losing their shield, punished with infamy; charging men with debts already paid, punished by fine; an action for false arrests, for beating a free man or reducing him to slavery, assault or frivolous accusation, punished by a fine; receiving bribes for any public affair, or perverting justice, fined ten times the value of what they received, and punished with the highest degree of infamy; for offering bribes for the perversion of justice, and particularly in causes relating to the freedom of the city; for erasing a name out of the public debt-book before the debt was discharged; digging a mine without the public knowledge, a twenty-fourth part of the metal belonging to the public; against magistrates who had neglected to surrender their accounts; for proposing a new law, and acting contrary to the established laws; against magistrates, ambassadors, and other public officers, who had misemployed the public money, or otherwise offended; against ambassadors who had forfeited their trust; against disaffected tumultuous persons; an action for debts due to the public, falsely charged upon those who had never paid the fines imposed upon them; for the discovery of any secret injury; and against such as exported corn from Attica, appropriated the public money or land, or for misapplying the property of orphans; against those who confessed their crimes without standing a trial; against those who protected murderers; and against such as had been guilty of certain state offences. Of private judgments, which were very numerous, the principal were against those who had done an injury punished with fine, an action of assault, a law-suit generally for the recovery of an estate, a suit concerning relationship, an action of divorce, an action by a master or patron against his clients who were freed slaves, and who refused to perform the services incumbent upon them, an action against sojourners who neglected to chuse a patron, an action of ingratitude, against those who had violated the chastity of women, or injured the persons of men, an action concerning nuisance, against those who would not divide their property among just claimants, for demanding rent, against guardians who had defrauded their wards, of slander, by which the criminal was fined 500 drachmas, against those who had suborned false witnesses, against thieves, an action claiming an estate against those who refused to restore that with which they were entrusted, against those who would not fulfil their contracts, and a suit between debtors and creditors.

The criminal punishments of the Athenians were *ατιμία*, infamy or disgrace; *θεραπειν*, a deep pit into which condemned persons were cast headlong (see BARATHRUM); *ξέροισ*, or the ignominious punishment of hanging or strangling; *αίτησις*, the punishment of fetters or imprisonment; *δουλεία*, servitude, by which a criminal was reduced to the condition of a slave; *ζύρις*, a peculiar fine laid upon the criminal, according to the nature of his offence; death, inflicted for various offences; *κρημνισ*, a precipice from which the malefactor was thrown headlong; *κίβητις*, a collar usually made of wood; *λιθοβολία*, lapidation, a common punishment for adultery; *ξίφος*, with which the criminal was beheaded;

fetters with five holes; *πυθιαστήρ*, a round instrument to confine the hand; a cross, consisting of two beams laid across one another, to which the malefactor was nailed; *στήλη*, a pillar, on which the crimes of the offender were engraved; *σημάτια*, marks impressed with a hot iron upon slaves; *πύταια*, or *πυθιαστήρ*, clubs, with which malefactors were beaten to death; *σχισία*, small cords, by which criminals were stretched upon the rack; *φορμύλλον*, poison, of which various sorts were used, but the most common was the juice of henlock; *δουλεία*, or banishment, of which there were several sorts; *χρυσή*, the fetters, in which the legs were fastened; *σάκος*, a piece of wood to which the criminal was bound; *καταπίπτεσις*, drowning in the sea; and *πυρ*, or burning. Public honours and rewards were *ατιμία* (see ΑΤΕΛΕΙΑ), or an immunity from taxes and other public duties; *ατιμία*, the honour of a statue erected in any public place; *προεδρία*, or the liberty of the first seats at public entertainments; *συναίμα*, an entertainment at the public expence, given to those who had deserved well of their country; and *τιμή*, crowns conferred by the vote of the people in the public assembly, by the senators in council, by the tribes to their own members, and by the demotai in their own *δημοί*, or borough.

As to the laws of the Athenians, it was a received opinion that they were taught the use of laws by Ceres; but it is certain that Theseus retained the privilege of making and preserving laws. Draco was the next law-giver, and his laws were called *δρακόν*; these were all, except those of murder, repealed by Solon, whose laws were distinguished by the term *νόμοι*. The thesmothetæ swore to the observance of them, on the penalty of dedicating a statue as large as life to the Delphian Apollo; and the people were bound to obey them for a hundred years. Pisistratus afterwards assumed for himself, and left to his sons, the authority of a law-giver; but the laws of Solon were in some degree enforced by Cleisthenes, who himself added new ones. These continued in force till the Peloponnesian war, when the government was altered by the four hundred, and afterwards by the thirty tyrants. The ancient laws were again restored by Euclides, and others by the influence of Diocles, Aristophan, and afterwards by Demetrius Phalerens; and these, with Æschylus and Thales, were the chief legislators of Athens. (Suidas.) The laws were annually revised; and a new law was to be proposed before an old one could be repealed. Solon, and other law-givers who succeeded him, committed their laws to writing. The laws of Solon were engraved on tablets of wood; and some affirm, that the original in his hand-writing were always kept in the citadel, and copies of them in the prytaneum. The laws were all engraven on the wall in the *βασίλικη σόα*, or royal portico, for the inspection of the public. This was the custom after the expulsion of the thirty tyrants.

ATHENIANS, Commerce of the. The harbour of Piræus was much frequented, not only by Grecian vessels, but also by those of the nations which the Greeks denominated Barbarians. But as the Athenians were actuated by the spirit of conquest, and aspired to the sovereignty of the sea, in order to obtain that of the land, they directed their attention to the navy with this view; and therefore their commerce was retained to the procuring from other countries the commodities and productions necessary to their subsistence. Nevertheless, the Athenians adopted a variety of regulations, and enacted many laws for extending commerce, and preventing as much as possible the litigations and obstacles which impeded its operations. They inflicted a fine of a thousand drachmas (about 37 l. 10 s.), and sometimes the punishment of imprisonment, on him who accused

a merchant of any crime which he was unable to prove. As Attica produced but little corn, the exportation of it was prohibited; and those who fetched it from foreign countries were forbidden, under rigorous penalties, to carry it to any other market but that of Athens. A great quantity was brought from Egypt and Sicily; and a greater quantity from Panticapæum and Theodosia, cities of the Cherfonefus Taurica, because the sovereign of that country, the master of the Cimærian Bosphorus, exempted the Athenian vessels from paying the duty which he levied on the exportation of that commodity. In consequence of this privilege, they traded in preference to the Cimærian Bosphorus, from which Athens received annually 400,000 medimni of corn. The Athenians also imported from Panticapæum, and the different coasts of the Euxine sea, timber for building, slaves, salt, honey, wax, wool, leather, and goat-skins; from Byzantium, and other parts of Thrace and Macedonia, salt-fish and wood; from Phrygia and Miletus, carpets, coverlets for beds, and the fine wool of which they made their cloths; from the islands of the Ægean sea, wines of the various kinds of fruits which they produce; and from Thracæ, Theffaly, Phrygia, and many other countries, a great number of slaves. Oil was the only commodity which Solon allowed them to exchange for foreign merchandize; the exportation of all other productions from Attica was prohibited; nor was it permitted to carry out of the country, without paying heavy duties, the timber of the fir, the cypress, the plane, and other trees which grow in the environs of Athens. In their silver mines the Athenians found a great resource for their commerce. As several states debased their coin, the money of Athens, in greater estimation than that of other countries, procured for them an advantageous exchange. In general, they purchased wine in the islands of the Ægean sea, or on the coasts of Thrace; for it was principally by means of this commodity that they trafficked with the people who inhabited the borders of the Euxine sea. The taste conspicuous in the works of their artists, rendered the productions of their skill and industry desirable; so that they exported to distant countries swords and arms of different kinds, cloths, beds, and various utensils. Books were with them also an article of trade. They maintained correspondents in almost all the places to which they were attracted by the hope of gain; and, on the other hand, many of the states of Greece appointed agents at Athens to superintend the interests of their trade. The Athenians for the most part employed their money in trade; but they were not allowed to lend it for any place but Athens. The lender had his security on the merchandize or goods of the borrower; and as the dangers of the sea were partly risked by the former, and the profit of the latter might be very considerable, the interest of money thus lent might rise as high as 30 per cent. more or less, according to the length and hazards of the voyage. The landed interest amounted to 12 per cent. per annum, sometimes to 16 per cent. monthly, and among the lower classes of the people, the quarter of the principal was exacted for daily interest. Commerce, by increasing the circulation of wealth, gave rise to the occupation of bankers, and thus its circulation was still more facilitated.

ATHENS, *Money of*, was of three sorts. Silver was first coined, afterwards gold, and lastly copper. The most common coins were those of silver, and they were of different value. Above the drachma (9d. English), consisting of six oboli, was the d. drachma, or double drachma, and the tetradrachma or quadruple drachma; below it were the pieces of 4, 3, and 2 oboli; after which were the obolus and semiobolus (i. e. 6d. ½d. 3d. 1½d. and ¾d. English). The

latter being found inconvenient for common use, copper money was coined about the beginning of the Peloponnesian war, and pieces of that metal were struck, which were not worth more than the eighth part of an obolus. The largest piece of gold weighed two drachmas, and was worth twenty silver drachmas (i. e. sixteen shillings English). Gold was very scarce in Greece; it was brought from Lydia and Macedonia, where the peasants collected the small pieces which the rains washed down from the neighbouring mountains. See MONEY.

ATHENS, *Revenues of*, sometimes amounted to the sum of 2000 talent or 450,000l. and these revenues were of two kind; the first which were raised in the country itself, and those that were drawn from the tributary cities and states. The first class comprehended the product of the houses, lands, and woods appertaining to the republic, and farmed out for a certain time; the twenty-fourth part reserved from the silver mines, payable by individuals who had permission to work them; the annual tribute received from freedmen and the 10,000 foreigners settled in Attica; the fines and confiscations, the principal of which went into the treasury of the state; the fifth levied on corn and other merchandise imported, and also on several commodities that were exported from the Piræus; which, during the Peloponnesian war, were farmed at thirty-six talents (81000l.); and a number of other taxes of less importance, yielded by commodities sold in the market, and levied on such as kept courtezans in their houses. Most of these duties were farmed; and the farmers remitted, before the ninth month of the year, the sum stipulated to the receivers of the revenue. The second and principal branch of the revenues of the state, consisted in the tributes which were paid by a number of cities and islands dependent upon it. Its claims of this kind were founded on the abuse of power. After the battle of Platea, the conquerors having resolved to revenge on Persia the insults offered to Greece, the inhabitants of the islands who had entered into the league agreed to set apart every year a considerable sum to defray the expences of the war. The Athenians collected in different places 460 talents (103,500l.); and by degrees, as their power increased, they changed the gratuitous contributions of the allied cities, into an humiliating exaction, imposing on some the obligation to provide ships whenever they should be called upon, and demanding of others the annual tribute to which they had formerly subjected themselves. In the same manner they taxed their new conquests, and the sum total of the foreign contributions amounted, at the beginning of the Peloponnesian war, to 600 talents (135,000l.); and towards the middle of the same war, to twelve or thirteen hundred. The conquests of Philip reduced this sum to 400 talents, and the Athenians flattered themselves they should again be able to advance it to 1200 (270,000l.) The 460 talents drawn annually from the states leagued against the Persians, and deposited by the Athenians in the citadel, at first amounted to the sum of 10,000 talents (2,250,000l.) according to Isocrates (i. i. p. 395.); or 9700 (2,182,500l.) according to Thucydides (i. i. c. 13.) Pericles, during his administration, had laid up 8000; but having expended 3700, either in the embellishment of the city, or the expences of the siege of Potæa, the 9700 were reduced to 6000 (1,350,000l.) at the beginning of the Peloponnesian war. This war was suspended by a truce, which the Athenians entered into with the Lacedæmonians, and the contributions which they had then received amounted to 12 or 1300 talents; and during the seven years of the truce, they placed 7000 talents (1,575,000l.) in the public treasury. These revenues, however considerable, were insufficient.

sufficient to defray the expences of the state; and recourse was frequently had to free gifts and forced contributions. Of all the branches of public expenditure, the maintenance of the navy was the most heavy; when an armament was to be fitted out, each of the ten tribes levied in its district the same number of talents as there were galleys to be equipped, and demanded them from the same number of companies, composed sometimes of fifteen persons liable to contribute. Demosthenes made an amendment in the mode of assessing this tax. The decree proposed by him for this purpose was as follows: every citizen, whose fortune amounted to ten talents, was to furnish the state with one galley; if he possessed twenty talents, with two; and however rich he might be, no more should be required of him than three galleys and a shallop. Those whose substance was less than ten talents were to join in contributing a galley.

ATHENIANS, Religion of the. From the earliest times the objects of religious worship multiplied among the Athenians. They received the twelve principal divinities from the Egyptians, and others from the Libyans and different nations; and they were so fearful of omitting religious worship, that they even erected altars to the unknown God. (Pausan. in Attic.) See ALTAR. In process of time a law was enacted, prohibiting, under pain of death, the introduction of any foreign worship, without a decree of the areopagus. It was an ancient practice, to consecrate, by monuments and festivals, the memory of kings, and other distinguished persons, who had rendered essential service to their country, or to mankind. To this class the Athenians referred Theseus, Erechtheus, such as deserved to have their names appropriated to the ten tribes, and many others, as Hercules, &c. But the worship of the latter differed from that of the gods, in the ceremonies that accompanied it, as well as in the object to which it was directed. Before the deity they prostrated themselves, imploring his protection, thanking him for his bounties, and acknowledging their dependence. In honour of the heroes, and as a memorial of their illustrious deeds, they consecrated temples, altars, and groves, and celebrated festivals and games. Incense was burnt on their altars, and libations were poured over their tombs to procure repose to their manes. The religion of the common people entirely consisted in prayers, sacrifices, and purifications. Individuals presented their prayers to the gods at the commencement of any undertaking; and they offered up their addresses in the morning, the evening, at the rising and setting of the sun and moon. Sometimes they repaired to the temple with downcast eyes and dejected countenances; they kissed the ground, offered their prayers standing, on their knees, and prostrate, and held branches in their hands, which they lifted up towards heaven, or stretched out towards the statue of the god, after applying it to their mouths. In addressing the infernal deities, they struck the earth with their feet or hands. Some pronounced their devout addresses in a low voice; but Pythagoras wished them always to be uttered aloud, that nothing might be asked which could excite a blush. At the seasons of worship, the space before the temple and the porticoes that surrounded it, were full of people; so justly has the apostle Paul characterized the Athenians, when he called them (Acts, xvii. 22.), *σεβαστρεῖς*, "too superstitious," as the common translation renders it, or perhaps as it might be rendered less offensively and more conformably to the conciliatory address, which the apostle would have used on such an occasion, and also to the frequent use of the term, "very devout." See Lardner's Works, vol. i. p. 197. The priests were the principal ministers of religion; and they were

next in precedence to the kings and chief magistrates. They obtained their office by inheritance, sometimes by lot, by the appointment of the prince, or by popular election; and they were required to be unmarried in body, chaste and uncontaminated by the pleasures of the world in their disposition and character, and in their habits devoted to retirement and piety. Of these priests there were several orders, and among them there was one, denominated *Ἀρχιερεὺς*, high priest, who had the superintendance of the rest. Some temples were served by priestesses, as particularly that of Bacchus in the quarter of the marines. The revenues assigned for the maintenance of the priests and temples were derived from different sources, as a certain part of the produce of penalties and confiscations, and of the spoils taken from the enemy, and the offerings of individuals. They formed, however, no separate and independent body; nor had the ministers of different temples any common interest; and in causes which respected them personally, they were amenable to the ordinary tribunals. Functions of inferior sanctity, that related to the service of the temple, were intrusted to lay officers: some of whom were guardians of the treasury, and others assisted as witnesses and inspectors at solemn sacrifices. Next to the priests, were the soothsayers and interpreters of omens. The worship of the Athenians was originally performed in the open air, upon the tops of mountains; and on these spots temples were afterwards erected, and dedicated to Jupiter, Apollo, and the other gods. Their altars, also, were constructed of various materials and of different dimensions, according to the variety of gods to whom they were consecrated. Both temples and altars were places of refuge or asylum for malefactors and criminals of all descriptions: and it was deemed an act of sacrilege to force them from their sanctuary. See ASYLUM. Their sacrifices also were of various kinds, as to their object and design, the materials of which they consisted, and the places in which they were offered, and the ceremonies that attended them. (See SACRIFICE.) As public worship was prescribed by one of the fundamental laws, and therefore closely connected with the constitution, it was impossible to attack religion, without endangering that constitution. It was consequently the duty of the magistrates to maintain it, and to oppose all innovations visibly tending to its destruction. Hence the poet Æschylus was accused of having, in one of his tragedies, revealed the doctrine of the mysteries; Diagoras under a similar charge, saved himself by flight; Prodicus was condemned to drink poison; Anaxagoras was imprisoned, and his life was preserved by the interposition and influence of Pericles; and the life of Alcibiades was endangered by a charge of his having been concerned in the mutilation of the statues of Mercury. See each of these biographical articles.

ATHENS, in Geography, a township of America, in Windham county, Vermont, thirty-two miles north-east from Bennington, and about six west from Connecticut river, having 150 inhabitants.

ATHERDEE. See ARDEE.

ATHERINA, or ATHERINE, in Ichthyology, one of the Linnæan genera of abdominal fishes; and distinguished by having the upper jaw rather flat, six rays in the gill-membrane, and a silvery stripe on each side of the body. Gmelin notices five species of this genus, viz. *Miepletus*, *Menidiæ*, *Sibama*, *Japonica*, and *Brownii*; which see respectively.

ATULRINOIDES, a species of CLUPEA, distinguished from the other fishes of the same genus by having a silvery lateral line. Gmelin observes, that this fish from its broad silvery

silvery line appears to belong to the genus *Atherina*; but having a compressed body, and small ventral fins, approaches nearer to the *Clupea* genus, in which he places it. This kind is a native of Surinam.

In the dorsal fin are twelve rays; fourteen in the pectoral fins; eight in the ventral fins; thirty-two in the anal fin; and eighteen in the tail.

ATHEROMA, in *Surgery*, is a soft, pulraceous, uninfamed tumor; generally contained within a cyst, or membranous bag. The cure of this swelling consists in its removal with a scalpel. See **TUMOR**, and **EXTRACTION**.

ATHERSTON, in *Geography*, a market town in the county of Warwick, situated upon the Watling Street way, consisting principally of one long street, excepting two small avenues or streets on the north side leading to the market-place and the chapel, the mother church being at Mancetter, now a small village about a mile to the south, on the road leading to Coventry. The liberty is bounded on the north by the river Anker, which separates it from Leicestershire. The market is on Tuesday. The trade consists principally in the hat manufacture, wool-combs, ribband weavers, and the cotton trade has been likewise lately introduced. It contains about 2600 inhabitants. Distance from London 108 miles.

ATHESIS. See **ADIPS**.

ATHIAS, in *Biography*, a Jew, was a famous printer of Amsterdam, in the seventeenth century; and in 1664, and 1667, he printed two editions of the Hebrew bible, in two volumes 8vo., for which he obtained of the States-general an honorary recompence of a m.d.l. and a chain of gold. He also printed the bible in Spanish, German, and English. He died in 1700. Dict. Hist.

ATHIE, in *Geography*, a town of France, in the department of the Somme, and chief place of a canton in the district of Peronne, two leagues S. S. E. of Peronne.

ATHINI, or **SEPTINES**, the modern **ATHENS**, is not inconsiderable, says Chandler (*Travels in Greece*), either in extent, or in the number of its inhabitants. It enjoys a fine temperature, and a serene sky; the air is clear and wholesome. The town itself is beneath the acropolis or citadel, and does not encompass the rock, as it formerly did, but spreads into the plain, chiefly on the west and north-west. The houses are mostly mean and squalid, with many large areas or courts before them. The water is conveyed to them in channels from mount Hymettus, and in the market-place is a large fountain. The Turks have several mosques, and public baths. The Greeks have convents for men and women, with many churches, in which service is regularly performed, and oratories or chapels, frequented on the anniversaries of the saints to whom they are dedicated. Besides the more stately antiquities, of which some notice has been taken under **ATHENS**, there are many detached pieces that have been found in the town, near the fountains, and also in the streets, the walls, the houses, and the churches. Among these are fragments of sculpture, a marble chair or two, which probably belonged to the gymnasium or theatres, a fun-dial at the cathedral or cathedral, inscribed, as it is said, with the name of Euclid; and at the archiepiscopal house, a curious vessel of marble, used as a cistern for receiving water, but once, probably, serving as a public standard or measure. Many columns, named statues, and pedestals, are scattered about; and also a fine marble *Herma*. The acropolis, or citadel, is now a fortress, with a thick irregular wall, standing on the brink of precipices, and inclosing a large area, about twice as long as broad. Some portions of the ancient wall remain, and it is repaired with patches of pieces of columns, and with marbles taken

from the ruins. The garrison consists of a few Turks, who reside there with their families, and are called by the Greeks "Guardians," or soldiers of the castle. Their houses overlook the city, plain, and gulf; but the situation is so airy and pleasant; the rock is lofty, abrupt, and inaccessible, except the front, which is towards the Pnyx; and on that quarter is a mountainous ridge, within cannon shot. The acropolis, furnished, says Chandler, an ample field to the ancient virtuosi. It was filled with monuments of ancient glory, and exhibited an amazing display of beauty, of opulence, and of art; each contending, as it were, for the superiority. Heliodorus, named Periegetes or the guide, employed in this place fifteen books. Polemio Periegetes, four volumes; and Strabo, in the Augustan age, affirms, that as many would be required in treating of other portions of Athens and of Attica. The number of statues, in particular, was prodigious. Tiberius Nero, who was fond of images, plundered the acropolis, as well as Delphi and Olynth; and yet Athens, and each of these places, had not fewer than 3000 remaining in the time of Pausanias. This banquet of the sense, continues this traveller, has long been withdrawn; and is now become like the tale of a vision. The spectator views with concern the marble ruins intermixed with mean flat-roofed cottages, and extant amid rubbish: the sad memorials of a nobler people. The antiquities of this city have been also described by Wheeler and Spon, who visited it in the time of Charles II; and by Mark Roy and many others. Mr. Stuart, however, who resided there between three and four years, has surpassed others in the accuracy and elegance of his plans and of his description. Spon, in speaking of Attica, says, that the road near Athens was pleasing, and the very peasants polished. Wheeler, his fellow-traveller, speaking of the civilization of the Athenians, observes, that even the shepherds bid them welcome, and wished them a good journey; and that their bad fortune had not been able to deprive them of that liberality of wit which they possessed by nature; and that, notwithstanding the barbarism that hath long prevailed, they seem to be much more polished in their manners and conversation than any others in those parts. Stuart confirms, with regard to the present Athenians, the account given by Spon and Wheeler of their ancestors; as he found among them the same address, and the same natural acuteness, though severely curbed by their despotic master. At their convivial meetings, it was a frequent custom for one of them to take a lyre, or a species of guitar, and after a short prelude on the instrument, to accompany the instrumental music with his voice; suddenly chanting some extempore verses, seldom exceeding two or three stanzas: this performer delivered the lyre to his neighbour; who, after he has done, delivers it to another; and thus the instrument circulated, till it had passed round the table. He adds, that, notwithstanding the various fortune of Athens as a city, Attica was still famous for olives, and mount Hymettus for honey. Thus "human institutions perish, but nature is permanent."

The present Athens, Athini, or Septines, is the capital of Livadia, a province of European Turkey, the see of an archbishop; and contains, as some say, 10,000, or, according to others, 15 or 16,000 inhabitants, chiefly Greeks. The chief articles of trade are silk, wool, and oil. It is a sea-port, and situated on the north-west coast of the gulf of Lige in the archipelago, with a safe and large harbour, narrow at the entrance, and commanded by the citadel. N. lat. 38° 5'. E. long. 23° 57'.

ATHIS, a town of France, in the department of the Oise, and chief place of a canton in the district of Domfront; thirteen miles south-west of Falaise.

ATHIS, in *Ancient Geography*, a town of Asia, situate on the western bank of the Euphrates, south-west of Nicephorium.

ATHLETÆ, in *Antiquity*, persons of strength and agility, disciplined to perform in the public games. The word is formed from *ἀθλος*, *certainly, combat*; whence also *εἰς θρονόν*, *the prize, or reward*, adjudged to the victor.

Under *athletæ* were comprehended wrestlers, boxers, runners, leapers, throwers of the disk, and those practised in other exercises exhibited in the Olympic, Pythian, and other solemn sports; for the conquerors in which there were established prizes.

From the five usual exercises, the *athletæ* were also denominated *πενταθλον*, and by the Latins *quinquertiones*; at least such as professed them all.

Those who were designed for this profession, frequented the *gymnasia* or *palestræ* from their youth; and they were obliged to submit to the most strict discipline and abstemious regimen. Their fare was coarse and scanty; they were prohibited the use of wine, and enjoined continence; and thus Horace (*Art. Poet.* v. 412.) describes them:

“ Qui studet optatam cursum contingere metam,
Multa tulit fecitque puer; sudavit et alsit;
Abstinuit venere, et vino.”

The apostle Paul, in his first epistle to the Corinthians (*ch. ix. 25.*) enforces temperance by an allusion to the *athletæ*; and Tertullian encourages the martyrs by the same reference. But when the privilege of being supported at the public expence, was granted to such of the *athletæ* as were victorious, they abandoned their habits of abstinence and exercise, and indulged themselves to a very shameful degree of indolence and of gluttony. Before their exercises, their bodies were rubbed with oils and various unguents, in order to render them supple and vigorous; and they practised a kind of noviciate in the *gymnasia* for several months, that by previous application and practice they might be fit for the contests in which they engaged. At first they made use of a belt, with an apron annexed to it, for the sake of decency; but they afterwards laid aside this covering, and engaged in several of the combats naked. To this insult on public decency, some of the best writers of antiquity have attributed that infamous passion, to the indulgence of which the Greeks were notoriously addicted. The women, indeed, were prohibited from approaching the places where these public games were celebrated. Before they were admitted to the combat, they were examined as to their birth, for none but Greeks were admitted; as to their condition, which was required to be free; and as to their manners, which were to be irreproachable. The name and country of each champion were registered, and a herald, before the commencement of the contest, proclaimed their names. They solemnly vowed not to employ any unfair means, and to conform to the established regulations by which the games were conducted.

ATHLETIC CROWN. See **CROWN.**

ATHLETIC Habit denotes a strong hale constitution of body, which was the object the *athletæ* aimed at, and to which their diet corresponded.

ATHLETIC Weight. See **WEIGHT.**

ATHLONE, in *Geography*, the most considerable town of the county of Wickmeath, in Ireland, situated on the river Shannon, over which it has a long bridge of many arches, so that it was formerly an important pass into the western province. It is partly in the county of Roscommon, and is the most central town in the island. Notwithstanding its advantageous situation for trade and improvement, it is said to be in many parts a poor, ruinous, dirty looking place. In the

middle of the bridge is a monument, with some figures, together with queen Elizabeth's escutcheon of arms, and some inscriptions declaring the time and founders of the building. The castle, which was on the Roscommon side, called the Irish town, was built by king John, on a high raised round hill resembling a Danish rath or fort, so as to command the bridge and the adjacent country. This was long the residence of the lord presidents of Connaught, who held in it their courts of justice. In the time of the civil war, it was strongly fortified on both sides of the river; and the English under the lord president stood a long siege in the castle, in 1641 and 1642. During the whole of this melancholy period, it was a place of great strength and importance, generally in the possession of the Irish or Catholic party; till, in 1651 it was taken by sir Charles Coote, at the head of the parliamentary forces. After the defeat of James the Second at the Boyne, his adherents remained at Athlone, and having destroyed the English town which was east of the Shannon, and broken the bridge, resolved to maintain the Irish district on the west. For this purpose they strongly entrenched themselves; and in the following year the general St. Ruth took his station with the main army behind the town. The English, under Ginckle, succeeded however in passing the river after many unsuccessful attempts, and by a surprising effort of valour got possession of the town and castle, which was in great measure to be attributed to the carelessness and confidence of St. Ruth, the French general. General Ginckle received a title from the town, which is still enjoyed by his descendants. W. long. 7° 49'. N. lat. 53° 21' 30".

ATHLOTHETA, in *Antiquity*, an officer appointed to superintend the public games, and adjudge the prizes.

The *athlotheta* was the same with what was otherwise called *athymeta*, *brabenta*, *agonarcha*, *agonotheta*, &c.

ATHNACH, the name of one of the principal of the Hebrew accents, which serves not only to regulate the voice, but to distinguish the members of a sentence, whence its name *athnach*, i. e. *respiratio*: on this account it is called *king*, and *pause*, and answers to our colon, and sometimes to a note of interrogation: it is marked under a letter thus (.)

ATHOL, in *Geography*, the most northern district of Perthshire, in Scotland; extending about 43 miles in length, and 30 in breadth, and bounded on the north by Badenoch, on the west by Lochaber, on the east and south-east by Mar and Gowrie, on the south by Strathern and Perth proper, and on the south-west by Braidalbane. It is mountainous, and contains part of the ancient Caledonian forest; but the mountains are interspersed with fruitful vallies. It has several villages, but no towns of any importance. The most famous places are Blair castle, seated on the river Tilt, near its influx into the Gurry, an agreeable stream that flows into the Tay, and belonging to the duke of Athol, whose title is derived from the district; and the pass of Gillieranky, memorable on account of the battle fought here in the beginning of king William's reign, between his general M' Kay, and the highlanders who adhered to king James.

ATHOL, a township of America, in Worcester county, Massachusetts, comprehending 16,000 acres of rocky land, and watered with streams and rivers, and containing 848 inhabitants; 35 miles north-west from Worcester, and 72 from Boston.

ATHOR, or **ATHYR**, in *Mythology*, the name of one of the most ancient divinities of Egypt; signifying in the Coptic language, "night." By this name the priests did not originally mean to denote the obscurity which is occasioned

fined by the disappearance of the sun, but the darkness which overspread chaos previously to the creation, and from which the Almighty Creator called forth into an habitable state the material universe. This mysterious night was in their opinion the origin of things. Orpheus, initiated in the mysteries of the Egyptians, communicated them to the Greeks, and recommended them by the harmony of his verses. Pausanias, when he visited Greece, saw at Megara "the oracle of the night," where every thing was taught that related to Athor. This symbolical deity, by which the Egyptians characterized the principle of things, becomes in the language of the Greek philosopher, the "Venus Cœlestis," or the mother of the world. Orpheus taught them this part of their theology in his hymn to the night, where he says, "I shall sing the night, mother of god and men, the origin of the creation, whom we shall call Nox." The poets soon took possession of this word, and as they must have a deity for emblematic of their poems, they made her spring from the froth of the sea, and represented her as animating the world, and giving life to every thing that breathed. See Ovid: *Fab. l. i. c. 91.* and Lucretius, *l. i. v. r. &c.* The Egyptian priests, who had painted night as a divinity, apprized that the minds of the vulgar required sensible objects, made another metamorphosis of night into the moon, the planet of the night, and the moon was represented by the cow, whose horns exhibited, as their imagination suggested, her first phases. The philosophers farther extended this doctrine; and they bestowed the name of night, Athor, and Venus, on the period during which the sun, having passed the equator, remains in the southern hemisphere, when the days are shortest and the nights longest. See Macrobin, *l. i. c. 21.* The following passage from Plutarch (*De Isis & Osir.*) proves that this opinion originated in Egypt. "In the month of Athyr (the third month of the Egyptian year), the Egyptians say that Osiris (or the sun), is dead. Then the nights become longer, the darkness increases, and the force of the light is diminished. On this occasion, the priests perform mournful ceremonies. They expose to the people a gilded ox covered with a black veil, in token of the grief of the goddess Isis (or the moon): for in Egypt the ox is the symbol of Osiris, and of the earth."

Athor had temples in Egypt. Herodotus mentions "Athor-Beki," the city of Athor, which Strabo (*l. 17.*) and Diodorus (*l. i.*) render by the name of Aphroditopolis, the city of Venus. Ælian (*De Anim. l. ii. c. 27.*) speaking of Chufas, a town of the Hermopolitan nome, says, that in this town they worship Venus; and that a peculiar worship was also paid to the cow. He also informs us, that Isis, or the moon, was represented by the horns of the cow. Jablonski, *Pantheon Ægypt. vol. i.* Savary's *Letters, vol. ii. p. 354—364.*

ATHOS, in *Geography*, a famous mountain of Greece, in the Chalcidian region of Macedonia, seated on a peninsula, the coasts of which form the Sinus Strymonicus, or gulf of Contessa, and the Sinus Singiticus, or gulf of Monte Sancto, and joined to the land by an isthmus about twelve leagues broad. The circuit of this peninsula, and of the base of mount Athos, is commonly reckoned to contain about forty leagues. N. lat. $40^{\circ} 10'$. E. long. $24^{\circ} 45'$. This mountain consists of a chain of eminences or summits, seven or eight leagues long, and three or four broad, one of which attracts particular attention on account of its height and habitations, and is denominatèd Athos, Agioforos or holy mountain, and Monte Sancto. Of its elevation very extravagant and incredible accounts have been given by some ancient writers. Mela reports, that it is so high as

to reach above the clouds. Martianus Capellus stated that it was six miles high; and it was believed that no rain fell upon it, as the animals on the stars erected near its summit remained dry and unperished. Plutarch and Pliny have asserted, that it projected its shadow, at the summer solstice, on the market-place of Myrina, the principal city of the island Lemnos. On this account, it is said, the inhabitants of the city erected a brazen cow at the termination of the shadow, on which was inscribed this verse:

"Αθὼς ὄρειναι, σκιάζουσι καὶ βοῶν."

"High Athos, call both Athos' shadow hide."

According to Pliny, the distance between the foot of mount Athos and the island of Lemnos was 8000 paces; and according to Belon (*Observ. l. i. c. 25.*), eight leagues. The Greek monks with the singular situation and towering height of the mountain, erected upon it so many churches, monasteries, and hermitages, that it became almost wholly inhabited by devotees; and this circumstance gave occasion to its being denominatèd "the Holy mountain," which it still retains, though many of the consecrated buildings are decayed. Among modern travellers, there is a considerable difference of opinion about its height: some make it thirty miles in circumference, and two in perpendicular elevation; and add, that it may be travelled over in three days, and seen at the distance of ninety miles: others state the altitude of its conical summit at 3300 feet. The cold on its summit is extreme; nevertheless it abounds with many different kinds of plants and trees, particularly the pine and fir, and it supplies a multitude of springs and streams. Its variety of monasteries and churches gives it a picturesque appearance. It is now inhabited by Calovers, a sort of Greek monks, of the order of St. Basil, who never marry, and fast hardly, as they abstain from flesh, and subsist chiefly on olives pickled when they are ripe. Their number is reckoned about 6000, and they inhabit several parts of the mountain, on which are twenty-four monasteries, raised to the height of five or six stories, and surrounded with high walls, flanked with towers, and guarded with artillery against the assaults of banditti and robbers. They are much respected by the Turks, and receive alms from them. They have the character of being very industrious, and they clothe themselves like hermits. They had formerly several valuable Greek manuscripts, and employed themselves in writing copies of the Greek Testament (see *ALEXANDRIAN Manuscript*); but they are now become so illiterate, that they can scarcely read or write.

As the sea on this coast is very tempestuous, and the Persian fleet had suffered shipwreck in doubling this promontory, Xerxes is said, for preventing a similar disaster, to have cut a passage through the mountain of sufficient width, to admit two galleys, with three banks of oars each, to pass in front: by these means he severed from the continent the cities of Dion, Olophysus, Acræthoon, Thyfus, and Cleone. Before he began his works, he is said to have written a letter, addressed to the mountain, in the following terms: "Athos, thou proud and aspiring mountain, that liftest up thy head to the skies, I advise thee not to be so audacious, as to put rocks and stones in the way of my workmen: if thou thus opposest me, I will cut thee entirely down, and throw thee headlong into the sea." Modern travellers inform us, that they perceive no traces of this work; and many of them are of Juvenal's opinion:

"Perforatus Athos, et quicquid Græcia mendax
Audet in historia."

Dinoerates, an architect in the suit of Alexander, proposed to this conqueror to perpetuate his memory by form-

ing a statue of this mountain, holding in one hand a city, and representing a river as flowing from the other. But the extravagant proposal was not accepted.

ATHOTIS, or THOT, in *Biography*, king of Thebes, and according to the practice of the early ages, priest and physician, is said to have cultivated, and written on anatomy. The precise time in which he lived is not known, though supposed to be about 2000 years before the birth of Christ.

ATHULIA, in *Entomology*, a very little species of *Papilio* (*Nymph. Phal. Gmel.*) found in the northern parts of Russia. The wings are fulvous, dotted with black, the lower ones white on the under side, dotted with black, and marked with two fulvous bands. This is *Papilio Phabe* of Esper, and belongs to the family *Satyri* in the Fabrician system. *Obs.* *Papilio Athulia* minor of Esper, *Pap. t. 89.* is a variety of the *Papilio Dictynna* of Fabricius.

ATHWART, in *Navigation*, is synonymous with across the line of the course.

ATHWART *the fore-shot*, is a phrase that denotes the flight of a cannon-ball from one ship across the course of another, to intercept the latter, and oblige her to shorten sail, that the former may come near enough to examine her.

ATHWART-*haul*, expresses the situation of a ship, when she is driven by wind or tide, or any other accident, across the fore-part of another.

ATHWART-*ships*, reaching across the ships from one side to the other.

ATHY, in *Geography*, a town of the county of Kildare, near the borders of the Queen's county, 32 miles from Dublin, at which the assizes are held alternately with Naas. It is situated on the river Barrow, which is navigable hence to the sea, and which a branch of the grand canal from Dublin to the Shannon meets at this town. It was founded in the twelfth century, on account of a ford over the river; and became of importance as a pass, and sometimes as a frontier town of the English pale, in the dissensions which harassed the country for many centuries, whilst the old towns of Ardree and Ardscull in its neighbourhood gradually decayed; and the position of either can now only be ascertained from a Danish rath, and some ruins. It was early granted the immunities of a merchant or market town, being mentioned as such in a statute of Henry VI.; and it was made a borough by James I. in 1615, in consequence of which two members were returned to parliament previously to the union, under the patronage of the duke of Leinster. Athy contained 550 houses in 1793, of which 160 were slated and built of lime and stone, and 390 thatched cabins; the population of which might be estimated at about 3300. There were at that time no manufactories which deserved the name, notwithstanding the advantages derived from the canal; and the unhappy state of that part of the country since gives too much reason to suppose that no improvement has yet taken place. The exports from the neighbouring country to Dublin, by the canal, consisted of coals, corn, flour, butter, and potatoes, to the amount of above 20,000 pounds per annum. N. lat. 52° 59'. W. long. 7° 1'. *Antholog. Hibern. vol. i.* Dr. Beaufort's Map and Memoir.

ATHYNA, a small town of Hungary, in Slavonia proper, and county of Possega, beyond the Drave.

ATI, or ATY, a small canton of Africa, in Guinea, upon the Golden Coast, north of Fanin, and to the east of Abramboe.

ATIA. See ODIO *et* ATIA.

ATIBAR, a name given by the inhabitants of the kingdom of Gago, in Africa, to gold-dust; from which word the Europeans, and especially the French,

have composed the word *tiber*, which also signifies gold-dust among those who trade in that commodity.

ATICHY, in *Geography*, a town of France, in the department of the Oise, and chief place of a canton in the district of Noyon, eight miles east of Compiègne.

ATICK-OOM-ASHISH, in *Ornithology*, the name by which the species of *LOXIA Hudsonica* is known in Hudson's bay. Latham. Sonnini, in his "Additions à l'Histoire Naturelle de Buffon," adopts the first part of this long denomination, Atick, as the name of this species. See HUDSONICA LOXIA.

ATIENÇA, in *Geography*, a town of Spain, in Old Castile, with an ancient castle, situate among the mountains called "Sierra d'Atiença," between Siguença and Borgo d'Osma.

ATIMIA, *infamy* or *disgrace*, in *Antiquity*, a punishment among the Athenians, inflicted for various crimes. A person suffered this punishment, when, retaining his property, he was deprived of some privilege, enjoyed in common with other citizens: and also, when he suffered a temporary deprivation of the privilege of free citizens, and his goods were confiscated. Those who were indebted to the public treasury, till their debts were paid, incurred this penalty. Also, when the criminal and his posterity were deprived of every right of a free citizen. This was incurred by those that were guilty of theft or perjury, or other similar offences. Infamous persons were not allowed to give evidence.

ATINGA, in *Ichthyology*, a species of *Diodon*, of an oblong form, and beset with rounded spines. Gmelin, &c. In *Mus. Ad. Fr.* it is described as ostracion diodon corpore spinis undique armato; and in *Amoen. Ac.* ostracion conico-oblongus, aculeis undique longis terctiformibus, in primis in lateribus. It is called by Maregraave *guanajacu atinga*, and is *l'aingue*, or *poisson armé* of French writers. In England it is known by the name of porcupine fish.

This species lives in the American seas, and about the cape of Good Hope: and keeps the shores for the sake of its food, which consists of crabs and testaceous vermes or shell-fish. The length rather exceeds twelve inches; the body is compressed at the sides, and bluish; the back rather broad, round, and dusky; belly broad, long, white, and spotted all over with black. The head is small, broad above, and rather compressed on the sides; eyes large, iris yellow; nostrils simple and tubular; mouth narrow; upper jaw rather longest, and angular in the middle; fins yellow, spotted with black; margin brownish, and the rays ramose. This creature has the power of dilating its body, and erecting its spines at pleasure. It is usually taken in nets, but will also take bait, which is commonly the tail of a crab, fastened on the hook. The flesh is eatable; but if the relation of Piso may be depended upon, it should be prepared for the table with the utmost caution; he tells us that the gall is very poisonous, and that should the flesh become impregnated with it (which must be the case if the gall-bladder burst in gutting of the fish), the most dangerous consequences might ensue to those who eat of it; the senses of the afflicted persons fail, their limbs become languid, and their tongue immoveable, cold sweats succeed, and in this state they die, unless some speedy remedy be applied.

Gmelin deems diodon holocanthus aculeis capitis colloque longioribus of Lin. Syst. Nat. and Liatrix alter of Willughby, to be a variety of the preceding species; it is distinguished by having the spines of the head and neck longer than in the other.

ATINGACU CAMUCU, in *Ornithology*, the name assigned by Maregraave in "The History of Brasil." Ray, Willughby,

Willughby, and others, to the bird described under the title of *cuculus cornutus* by Gmelin. Buffon calls it *atingaru du Brésil*, and Latham the *horned cuckoo*. See *CORSUTUS CUCULUS*.

ATINO, in *Geography*, a town of Italy, in the kingdom of Naples, and country of Lavora, once the see of a bishop, suppressed by Leo III.; three leagues north of Aquino. This was the ancient Atina or Atinum, situate in the north-east part of Latium, and south-east of Sora. It belonged to the Samnites; and Frontinus says, that Nero Claudius Cæsar established a colony in this place.

ATINTANES, in *Ancient Geography*, a people of Europe, who, according to Taucydides, inhabited the eastern part of Illyria. Their country, however, is joined, by Livy and Polybius, to Macedonia. They submitted to the Romans, commanded by Posthumius.

ATISIS, or **ATISO**, a river of Italy, in Infubria, which discharged itself into the lake Verbanus.

ATITLAN, in *Geography*, a lake of America, in Mexico, in the government of Guatimala, and the country of the Choutales. It is about ten leagues in circuit.

ATIZOE, in the writings of the *Ancient Naturalists*, a name of a stone used in the consecration and anointing of kings. Pliny describes it to have been of a lenticular figure, and of the size of three fingers, of a bright silvery colour, and of a pleasant smell. He says it was found in India, and in some other places. Agricola is of opinion it was a kind of bitumen.

ATKINS, RICHARD, in *Biography*, the descendant of a good family at Tuffleigh, in Gloucestershire, finished his education at Baliol college in Oxford. From thence he removed to Lincoln's Inn; and, after a short interval, during which he travelled into France, he became an accomplished courtier. In the civil war, he joined the king's party, and was a considerable sufferer. After the restoration, he was appointed one of the deputy lieutenants of the county of Gloucester. But being imprisoned in the Marshalsea gaol of Southwark for debt, he died there in 1677. He was the author of several pieces; and particularly of a treatise "Of the origin and growth of Printing;" in which he gives an extract from an old MS. chronicle, said to be preserved in the palace of the archbishop at Lambeth, containing an historical account of the introduction of this valuable art into our country. The authority of this chronicle has been much disputed by Mr. Palmer, in his "General History of Printing;" and also by Dr. Middleton; and vindicated by Mr. Bowyer, in the notes to his abridgment of Dr. Middleton's "Dissertation on the origin of printing in England." See *PRINTING*.

ATKINSON, in *Geography*, a township of America, in Rockingham county, New Hampshire, incorporated in 1767, and containing, in the year 1790, 479 inhabitants. It is distant from Portsmouth thirty miles; and has an academy, founded in 1789 by the hon. N. Peabody, and endowed with 1000 acres of land.

ATKYNS, SIR ROBERT, in *Biography*, an eminent and patriotic English lawyer, descended of an ancient family in Gloucestershire, and born in 1621, was the son of sir Edward Atkyns, one of the barons of the exchequer. Having finished his academical course of education at Baliol college Oxford, and entered for the study of the law at Lincoln's Inn, he afterwards became eminent in his profession. Distinguished by his professional reputation and his loyalty, he was soon after the restoration created a knight of the bath, and in 1672 appointed one of the judges of the court of common pleas. In 1679, disgusted by the arbitrary measures of the existing government, he resigned his post and retired into the country. On occasion of the trial of lord William Russell, he gave his advice, and afterwards wrote free re-

marks on this subject. He then avowed the maxim, "that there neither is, nor ought to be, constructive treason; it defeats the very scope and design of the statute 25 Edw. III. which is to make a plain declaration what shall be adjudged treason by the ordinary courts of justice. His argument in favour of sir William Williams, speaker of the commons' house of parliament, who was prosecuted by the crown for signing an order for the printing of Dangerfield's narrative concerning the popish plot, was afterwards printed under the title of "The power, jurisdiction, and privilege of parliament, and the antiquity of the house of commons asserted." In the reign of James II. his attachment to the constitution was manifested by an argument on the case of sir Edward Hales, which was printed under the title of "An Inquiry into the Power of dispensing with Penal Statutes." The doctrine of dispensations was further discussed in his "Discourse concerning the ecclesiastical jurisdiction in the realm of England. After the accession of king William III. this friend to the revolution was appointed, in 1689, lord chief baron of the exchequer. He then wrote two pieces in defence of the memory of lord Russell, whose attainder was reversed by parliament. In 1689, he was advanced to the office of speaker of the house of lords, and retained it till the year 1693. The last public act of his life was his memorable speech addressed to sir William Ashurst, lord mayor of London, on occasion of his being sworn into his office, in October 1693. This speech, referring to the alarming projects of Lewis XIV. and the designs of Charles II. and James II. to establish absolute power, and to introduce popery, was very favourably received; it passed through several editions, and was thought to have been eminently serviceable to the government. In 1695, he resigned his offices, and retired to his seat in Gloucestershire, where he died in 1709, at the age of 88 years. "He was a man of great probity, as well as of great skill in his profession; and a warm friend to the constitution, which he was ready to maintain against all opponents." "In whatever view we consider him," says his biographer, "in his private, or in his public station; as a gentleman, or as a judge; as an eminent lawyer, or a distinguished patriot: as a statesman, or an author; we shall find nothing but what is great and amiable, worthy of love and respect, and of that veneration which is due to virtuous men from posterity." Besides his valuable "Tracts," which were collected and published in one volume, he is said to have been the author of a treatise against the exorbitant power of the court of chancery. *Biog. Brit.*

His only son, sir Robert Atkyns, who was born in 1646, and died in 1711, differed from his father in his opinions, but inherited his prudence and probity, and was equally esteemed and beloved by men of all parties. As he preferred the character of a country gentleman, he is chiefly known as the author of a topographical work, intitled "The ancient and present State of Gloucestershire," which was published after his death. A great part of the copies of this work was destroyed by a fire in the printer's warehouse, so that those which remained became scarce and dear. *Biog. Brit.*

ATLANTA, in *Ancient Geography*, a town of Greece, in the country of the Locrii, destroyed by an earthquake before the birth of Plato.

ATLANTES, a people of ancient Libya, of whom no record now remains but the name.

ATLANTIC OCEAN, in *Geography*, a name given to the sea which separates Europe and Africa on the east from America to the west. Mr. Kirwan, conceiving that at the time of the deluge the waters of the great southern ocean below the equator, rushed on the northern hemisphere

describes the formation of the bed of the Atlantic, from lat. 20° south up to the north pole, to the confluence of these enormous masses of water. The bare inspection of a map, he says, is sufficient to shew that this vast space was hollowed by the impression of water: the protuberance from cape Trio to the river of the Amazons, or La Plata, in south America, corresponding with the incavation on the African side, from the river of Congo to cape Palmas; and the African protuberance from the straits of Gibraltar to cape Palmas, answering to the immense cavity between New York and cape St. Roque. The depression of such a vast tract of land cannot appear improbable, adds this author, when we consider the shock it must have received, and the enormous load with which it was charged. Nor are such depression and absorption unexampled, since we have had frequent instances of mountains swallowed up, and some very lately in Calabria. Irish Transf. vol. vi. p. 288. See OCEAN.

ATLANTIDES, in *Astronomy*, a denomination given to the Pleiades, or seven stars, sometimes also called *virgiliae*. They are thus called, as being supposed by the poets to have been the daughters either of Atlas, or his brother Heperus, who were translated into heaven. See ATLAS.

ATLANTIS, in *Antiquity*, an island spoken of by Plato, and many other writers, under some extraordinary circumstances; and rendered famous by a controversy among the moderns, concerning its place and existence. The Atlantis took its name from Atlas, Neptune's eldest son, who, they tell us, succeeded his father in the government of it.

The most distinct account of this celebrated country is given us in Plato's *Timæus* and *Critias*; which amounts, in a few words, to what follows. "The Atlantis was a large island in the Western ocean, situate before, or opposite to, the straits of Gades. Out of this island there was an easy passage into some others, which lay near a large continent, exceeding all Libya and Asia. Neptune settled in this island, which he distributed among his ten sons; to the youngest fell the extremity of the island called *Gadir*, which in the language of the country signifies *fertile*, or *abundant in sheep*. The descendants of Neptune reigned here from father to son, for a great number of generations, in the order of primogeniture, during the space of 9000 years. They also possessed several other islands; and passing into Europe and Africa, subdued all Libya as far as Egypt, and all Europe to Asia Minor. At length the island sunk under water; and, for a long time afterwards, the sea thereabouts was full of flats and shelves."

This island was 30,000 stadia in length, and 2000 in breadth; it was in a very high degree fertile and productive, abounding with pasture and arable, and in metals and trees. The northern part of it had various mountains, which were strewed with villages and magnificent habitations. The inhabitants were numerous and powerful, and distinguished both by arts and arms. It was governed by ten archons, who, in their respective districts, adhered to established customs, and were invested with the power of life and death over their subjects. This federative republic was established, according to Plato in a dialogue of which only a fragment remains, by a law derived from Neptune himself its first founder, engraved upon a column and placed in a temple. Assemblies were held alternately every five years, in which all public affairs were the subjects of deliberation. The offences of citizens were examined by the archons and punished according to the degree of their aggravation. Plato in this dialogue has recited several ceremonies which were ob-

served by the archons in the exercise of their legislative and judicial offices.

The actual existence and local situation of the Atlantic island has given occasion to many different opinions. The reality of Plato's Atlantis has had many advocates. Buffon (*Nat. Hist.* by Smellie, vol. i. p. 507.), after citing the passage relating to it from Plato's *Timæus*, adds; "this ancient tradition is not devoid of probability. The lands swallowed up by the waters, were, perhaps, those which united Ireland to the Azores, and the Azores to the continent of America, for in Ireland there are the same shells, the same shells, and the same sea-bodies, as appear in America, and some of them are found in no other part of Europe."

M. Bailly, in his "Lettres sur l'Atlantide de Platon, &c." published at Paris, in 1779, 8vo., maintains the existence of the Atlantides, and their island Atlantis, by the authorities of Homer, Sanchoniathon, and Diodorus Siculus, in addition to that of Plato. In proof of the opinion that Plato's account of the Atlantic island is not a fiction of his own devising, a late writer (see Taylor's translation of the *Cratylus*, *Phædo*, *Parmenides*, and *Timæus* of Plato, 1793) alleges the following relation of one Marcellus who wrote an history of Ethiopian affairs, according to Proclus in *Tim.* p. 55. "That such and so great an island once existed is evinced by those who have composed histories of things relative to the external sea; for they relate that in their times there were seven islands in the Atlantic sea sacred to Proserpine; and besides these, three others of an immense magnitude, one of which was sacred to Pluto, another to Ammon, and another, which is the middle of these, and is of a thousand stadia, to Neptune. And besides this, that the inhabitants of this last island preserved the memory of the prodigious magnitude of the Atlantic island as related by their ancestors, and of its governing for many periods all the islands in the Atlantic sea; and such is the relation of Marcellus in his Ethiopian history."

The learned Rudbeck, professor in the university of Upsal, in an express treatise, intitled, "Atlantica, sive Manheim," maintains, very strenuously, that Plato's Atlantis is Sweden and Norway; and attributes to his country whatever the ancients have said of their Atlantis or Atlantic island.

M. Bailly (ubi supra, letter 24.) after citing many ancient testimonies which concur in placing this famous isle in the north, quotes that of Plutarch, who confirms these testimonies by a circumstantial description of the isle of Ogygia, or the Atlantis, which he represents as situated in the north of Europe, and as having near it three islands more, in one of which the inhabitants of the country say, that Saturn is kept prisoner by Jupiter. These four islands may, as M. Bailly conjectures, be Iceland, Greenland, Spitzberg, and Nova Zembla, or some others nearer the Pole. He controverts the opinion of Rudbeck as not conformable with the account of Plato, who represents the Atlantis as an island, which Sweden is not. Adhering still to his system, M. Bailly, persuaded by a variety of plausible circumstances, which he has ingeniously combined, places that famous island among those of the Frozen ocean. In this he is strongly seconded by Plutarch, who tells us that the Atlantis is in a region where "the sun during a whole summer month is scarcely an hour below the horizon, and where that short night had its darkness diminished by a twilight." This, it may be said, is a palpable indication of a northern climate; but how is this situation reconcilable with the fertility of the soil, the mildness of the air, particularly the strait called the columns of Hercules, which Plutarch and Plato mention among the circumstances pertaining to the abode

abode of the Atlantis? how is it also possible to conceive astronomy cultivated in a frozen and cloudy region, where the observations of the heavenly bodies must have been inconvenient and impracticable? These difficulties, says our fanciful author, cannot be removed without supposing a change of air and climate in those regions by the gradual cooling of the earth, and its progressive motion towards universal congelation. Such is the "fairy tale" of this learned and ingenious author. Sir W. Jones, the learned president of the Asiatic Society, in his elaborate account of the Persians (*Asiatic Researches*, vol. ii. p. 31.), supposes that one may consider "Iran" as the noblest island, far to the Greeks and Arabs would have called it, or at least as the noblest peninsula in this habitable globe; and he adds, "if M. Bally had fixed on it as the Atlantis of Plato, he might have supported his opinion with far stronger arguments than any that he has adduced in favour of Nova Zembla. If the account indeed, of the Atlantes," says this writer, "be not surely an Egyptian or an Utopian fable, I should be more inclined to place them in Iran than in any region with which I am acquainted."

Others will have America to be the Atlantis; and hence infer that the new world was not unknown to the ancients: but what Plato says, does by no means support this supposition. America should rather seem to be the vast continent beyond the Atlantis, and the other islands mentioned by Plato.

Kircher, in his *Mundus Subterraneus*; and Beekman, in his *History of Islands*, chap. v. advance the most probable opinion, if the reality of this island be admitted.—The Atlantis, according to them, was a large island which extended from the Canaries to the Azores; and these islands are the remains thereof not swallowed up by the sea.

ATLANTIS, *Azra*, is the name of a fictitious, philosophic commonwealth, of which a description has been given by lord Bacon.

The New Atlantis is supposed to be an island in the South-sea, to which the author was driven in a voyage from Peru to Japan. The composition is an ingenious fable, formed after the manner of the Utopia of Sir Thomas More, or Campanella's City of the Sun. Its chief design is to exhibit a model or description of a college, instituted for the interpretation of nature, and the production of great and marvellous works, for the benefit of men, under the name of Solomon's house, or the college of the six days work. Thus much, at least, is finished; and with great beauty and magnificence. The author also proposes a frame of laws, or of the best state or mould of a commonwealth: but this part is not executed. *Bac. Works*, tom. iii. p. 235.

ATLAS, in *Biography* and *Mythology*, an ancient king of Mauritania, the son of Uranus and brother of Prometheus, who is said to have lived about the time of Moses, or about 1582 years B. C. He is represented as having been an excellent astronomer, as an observer of the stars, and as the inventor of the sphere. The poets have exhibited him as bearing the heavens on his shoulders, and thus he is seen in the famous statue at the Farnese palace in Rome; and one of them represents him as groaning under the burden, on account of the multitude of gods whom superstition had placed in this elevated mansion. He was metamorphosed into a mountain for his inhospitality to Perseus. His daughters, it is said, were transformed into stars, in complement to his astronomical talents and observations; seven of them forming the Pleiades, and the other seven the Hyades.

ATLAS, in *Geography*, a celebrated mountain or rather

chain of mountains, in Africa, which is so high, that it seems to bear the heavens. Hence the fable, in which Atlas, the king of this country, is said to bear the heavens on his shoulders.

The ancients, however, ascribed to this mountain a magnitude and an elevation to which it has no claim; as it can no where stand in competition with the Alps, or the Apennines. They seem to have considered it as one high mountain, not as a ridge. Thus Pliny (l. v. c. 13.) describes it as a detached mountain, rising from the sands to a great height on the shores of the ocean to which it gave its name; and yet, in the same chapter, he represents it as a range passed by Suetonius Paulinus on his progress to the Niger. Strabo (l. xvii.) mentions its being called Dyris, (see *Dyris*) by the ancients, and as being beyond the pillars of Hercules, on turning to the left or south. Dr. Shaw (*Trav.* p. 5.) represents it as a remarkable chain of eminences, which sometimes borders upon the Sahara, and sometimes lies within the Tell. He adds, "that if we conceive, in an easy ascent, a number of hills, usually of the perpendicular height of 4, 5, or 600 yards, with a succession of several groves, and ranges of fruit and forest-trees, growing one behind another, upon them; and if to this prospect we sometimes add a rocky precipice of superior eminence, and more difficult access, and place upon the side, or summit of it, a mud-walled Dakhrah of the Kabyles, we shall then have a just and lively picture of mount Atlas, without giving the least credit to the nocturnal flames, the melodious sounds, or lascivious revels of such imaginary beings, as Pliny, Solinus, and others, have in a peculiar manner attributed to it." According to some modern accounts, this ridge divides the kingdom of Algiers from Zaab and Biledulgerid, or its direction is south-west and north-east; and therefore it may be considered as extending from cape Geer in a north-east direction, and giving source to many rivers flowing north and south, till it terminates in the kingdom of Tunis. This main ridge in some places may present a double chain, and in others diverge its branches. Its structure towards the western extremity is granite and primitive. M. Lempriere, in his journey to Morocco, seems to have clearly ascertained the range of Atlas. The town of Santa Cruz stands near its furthest extremity; while Tarudant, to which he passes through an open plain, lies on the south of the Atlas. Hence it appears, that Cape Geer is its termination, or the great Atlas of Ptolemy, while the smaller Atlas is a branch extending towards Saffi or Cape Cantin; and another branch, now called the Lesser Atlas, reaches to Tangier. According to Chemier (Present State of Morocco, vol. i. p. 13.), Mount Atlas is the eastern boundary of all the western provinces of Morocco. He represents it as formed by an endless chain of lofty eminences, divided into different countries, inhabited by a multitude of tribes, whose ferocity permits no stranger to approach. He professes to be unable to describe these mountains accurately; but adds, that nothing would be more interesting to the curiosity of the philosopher, or conduce more to the improvement of our knowledge in Natural History, than a journey over mount Atlas. The climate, though extremely cold in winter, is very healthy and pleasant, the valleys are well cultivated, abound with fruits, and are diversified with forests and plentiful springs; the streams of which, uniting at a little distance, form great rivers, and lose themselves in the ocean. According to the reports of the Moors, there are many quarries of marble, granite, and other valuable stone, in these mountains; and it is probable, there are also mines, but the inhabitants have no idea

of these riches: they consider their liberty, which their situation enables them to defend, as the most inestimable of all treasures.

As the province of Morocco lies to the west of mount Atlas, part of the ancient Numidia, called the kingdom of Tafikt, situate in a sandy plain, lies to the east: and from Morocco to this province there is no way but by crossing one of the extremities of the Atlas, either by the side of the province of Sus, or by that of Fez; the latter road, being less sultry than the other, is most frequented.

ATLAS, in *Anatomy*, the name of the first vertebra of the neck, which supports the head. See VERTEBRA, and SKELTON.

ATLAS, in *Commerce*, a silk satin manufactured in the East Indies. It must be owned that the manufacture of these silks is wonderful, especially of the flowered attasses; in which the gold and silk are wrought together in such a manner, as no workman in Europe can imitate: yet they are far from having that fine gloss and lustre, which the French know how to give their silks.

In the Chinese manufactures of this sort, they gild paper on one side with gold leaf, then cut it into long slips, and weave it into their silks; which makes them with very little cost look very rich and fine. The same long slips are twisted or turned about silk threads so artificially, as to look finer than gold thread, though it be of no great value.

ATLAS, in *Entomology*, a species of PHALÆNA, belonging to the *Bombyx* tribe. The wings are falcated or hooked, yellow-brown and variegated; a transparent spot in the middle of each wing, with a smaller one next that on the anterior pair. Linn. Fabr. &c.

“Phalæna Atlas is the largest insect of the moth tribe hitherto discovered, and is indeed a gigantic creature. The species is common in China, but is not peculiar to that country, being found in other parts of Asia, and in America. The influence of climate may be easily traced in the varieties from different countries; that from Surinam is the largest, and of the deepest colours. The Chinese kind is the next in size; the colours incline to orange, and the anterior wings are more falcated or hooked at the ends; there are two other Asiatic varieties known, that are still smaller, and have the wings extremely falcated.

“The larva of Phalæna Atlas is figured by M. Merian in her *Insecta Surinamensia*, Plate 52.; it is about four inches in length, green, with a yellow stripe disposed longitudinally. Upon each segment are four distinct round tubercles, of a coral-like orange colour, which are surrounded with very delicate hairs. The pupa is large, and is inclosed in a web of an ochraceous colour. The silk of this web is of a strong texture, and it has been imagined, if woven, would be superior in durability to that of the common silk-worm. Scba has also represented the larva, (f. i. pl. 57. vol. iv.), in his *Theaurus Naturæ*. It is figured by him nearly six inches in length, and bulky in proportion; the Phalæna or Moth is also larger than that figured by Merian, which is a small specimen of the Surinam kind. According to Merian, there are three broods of this insect in a year; they are very common, and feed on the orange trees. Linnæus says, that they adhere so tenaciously to the leaves, that they can scarcely be taken off. An opinion has been long prevalent, that the web of this insect might easily be manufactured into a very durable silk; and it certainly admits of doubt whether the Chinese do not actually rear the moth for this purpose. Silk is an important article in China, and other Eastern countries, where the use of linen is little known; the Jesuit missionaries mention several sorts in use among the Chinese, some

of which is admired for its beauty, and others for durability; these kinds are probably the produce of different insects, and Phalæna Atlas may be of that number. Lefser and Lyonet, in their “*Theologie des Insectes*,” say, that at this day there are to be found in China, in the province of Canton, silk worms in a wild state, which, without any care being taken of them, make in the woods a kind of silk, which the inhabitants afterwards gather from the trees; it is grey, without lustre, and is used to make a very thick and strong cloth, named there Kien Tchecoa; and by some European naturalists, it is imagined to be the product of this very species? Vide Donov. *Inf. China* (Atlas). We shall again resume this subject under the articles PHALÆNA, SILK-WORMS, &c. in treating of those analogous creatures which produce a silk of such strength or beauty as to be useful, or promise to become so, in the concerns of man: a subject this that highly merits consideration; and which we shall endeavour to elucidate as copiously and accurately, as the magnitude and importance of the articles demand.

ATLAS, a species of SCARABÆUS, found in South America. The thorax is armed with three horns, the middle one of which is very short; horn on the head recurved. Linn. and Fabr. *Ent. Syst.*

ATLAS *Amboinensis* (*Papilio f.*), a name given by some Entomological writers to the Linnæan *Papilio Priamus*. *Mus. petrop.* 644, &c.

ATLAS is also a title given to books of universal geography, containing maps of the known parts of the world; as if they were viewed from the top of that celebrated mountain, which the ancients esteemed the highest in the world; or rather on account of their holding the whole world like Atlas. The same name is given to maps of the stars.

ATLENBURG, or ATTELNEURGH, in *Geography*, a town of Germany, in the circle of Lower Saxony, and duchy of Lauenburg, on the Elbe; four miles west of Lauenburg.

ATLITA, in *Entomology*, a species of PAPHIO found in the East Indies. This butterfly is indented, brown, glossed with blue; beneath fulvous, with undulated glaucous streaks, and five blind-eye shaped spots. Fabricius and Donov. *Inf. India*. Gmelin has overlooked this species in his *Syst. Nat.*

ATLITES, a name under which the species of PAPHIO LAOMEDIA, was at first described in *Amoen. Acad.* 6. p. 407. 72.

ATMOSPHERE, formed of *ἀήρ*, vapour, and *σφαῖρα*, a sphere, an appendage of our earth; consisting of a thin, fluid, elastic substance, called air, which surrounds the terraqueous globe to a considerable height, gravitates towards its centre, on its surface, is carried along with it round the sun, and partakes of all its motions both annual and diurnal.

By atmosphere is understood the whole mass, or assemblage of ambient air: though among some of the more accurate writers, the atmosphere is restrained to that part of the air next the earth, which receives vapours and exhalations, and refracts the rays of light.

The farther or higher spaces, though perhaps not wholly destitute of air, are supposed to be possessed by a finer substance called ether, and are hence called *etherial regions*.

For the nature, constitution, properties, and different states and uses of the atmosphere, see AIR, the sequel of this article, EUDIOMETER, and EUDIOMETRY; where this subject will be treated of at large as its importance requires.

A late eminent author considers the atmosphere as a large chemical

chemical vessel, wherein the matter of all the kinds of sublimary bodies is copiously floating; and thus exposed to the continual action of that immense furnace the sun; whence proceed innumerable operations, sublimations, separations, compositions, digestions, fermentations, putrefactions, &c.

We have a large apparatus of instruments, contrived for indicating and measuring the state and alterations of the atmosphere; as ANEMOMETERS, BAROMETERS, EUDIOMETERS, HYGROMETERS, MANOMETERS, THERMOMETERS, &c.

ATMOSPHERE, *Electricity of the*. Beside those large quantities of the electric matter, with which the clouds are charged in a thunder-storm, it has been observed, first by M. Monnier in 1752, and afterwards repeatedly and with peculiar attention by others, particularly by the abbé Mazeas in 1753, and Mr. Kinnerley, that the atmosphere is never wholly destitute of the electrical fluid. A person electrified negatively may satisfy himself of this, by extending his arm in the open air, and presenting a long sharp needle with its point upwards; for the electric matter collected from the remoter air will appear luminous, as it converges to the point of the needle. Mr. Canton's balls are likewise an excellent contrivance for the same purpose, and may be made use of, not only for determining the electricity of the atmosphere in general, but the positive or negative quality of it. According to this ingenious philosopher, delectated atmospheric air, when heated, becomes negatively electric; and when cooled, the electricity is of the positive kind, even when the air is not permitted to expand or contract; and the expansion or contraction of atmospheric air occasions changes in its electrical state. But no electrician, in the earlier stage of this science, conducted his observations in this way with greater accuracy and farther pursued them, than S. Beccaria. (See "Beccaria's Essay on Atmospheric Electricity, annexed to the English translation of his Artificial Electricity," p. 421, &c.) From him we learn, that the atmosphere discovers no signs of electricity in windy and clear weather, nor in moist weather without rain, nor when the sky is covered with distinct and black clouds with a slow motion; but he always observed a moderate, though interrupted electricity, for the most part of the positive kind, in a clear sky, when the weather was calm; and in rainy weather without lightning, a little before the rain fell, and during the continuance of it, till the rain was almost over. The electricity of the atmosphere, according to Beccaria, was always positive, during the day and in dry weather, but always negative, when a bright or serene atmosphere succeeded dark and moist weather. The quantity of atmospherical electricity was found to increase after the rising of the sun, and during his progress; and its augmentation was the more considerable, as the moisture of the air was diminished; but it decreased in the evening. In days equally dry, the degree of electricity at noon was proportional to the degree of heat; and in a serene atmosphere, with little wind, a considerable quantity of the electrical matter commonly arose after sun-set, during the precipitation of dew. Thick fogs were observed, during their ascent into dry air, to carry with them a considerable quantity of the electric matter. And the electricity was stronger, as his rods were higher, and the strings, which were extended and insulated in the open air, were longer.

Mr. Cavallo (Complete Treatise on Electricity, vol. ii. p. 42. ed. 4.) deduces the following conclusions from his experiments and observations on this subject; viz. that there is in the atmosphere at all times a quantity of electric matter:—that the electricity of the atmosphere, and of fogs, is always positive:—that, in general, the strongest electricity

is observable in thick fogs, and also in frosty weather; and the weakest, when it is cloudy and warm, and rain approaches:—that it does not seem to be less by night than in the day:—and that the electricity is stronger in places more elevated than in those that are lower; and therefore, according to this rule, if it may be extended to any distance from the earth, the electricity in the higher regions of the atmosphere must be exceedingly strong. Mr. Read, in his "Summary View of the Spontaneous Electricity of the Earth and Atmosphere," observes, that the electricity of the atmosphere in moderate weather, was always found to be positive; in storms and disturbed states of the air, frequently negative; and suddenly and repeatedly changing from one state to the other. Warm small rain was found to be very slightly electric; large drops, strongly; hail showers, the most intensely of all. In an easterly wind of long continuance, and reckoned unhealthy, the electricity was so faint, as to require the nicest of all known tests for discovering its existence. The vapour of water, as soon as it had attained the height of five or six inches of insulation in the air, was found to be positively and positively electrified; and the surface from which it evaporated, negatively. Vapour has a greater capacity for electricity, or absorbs and requires more of this fluid, than water in its dense state; and therefore rarification must diminish, and condensation increase, the sensible electric charge of the vapour. Hence, in serene weather, the atmosphere is subject to a regular flux and reflux, or increase and diminution of electricity, twice in every twenty-four hours, depending on the action of the sun, and the consequent evaporation and state of the vapours. This diligent observer and judicious reasoner further observes, that a limited portion of the earth's surface is often sensibly electrified; over it, there is always a proportionate quantity of the contrary electricity in the atmosphere; and when an electrified cloud is carried forward by wind, an equal and opposite electric charge keeps pace with it on the earth, till the two charges, becoming more augmented, or approaching nearer to one another, or meeting with some conducting eminence, rush together, and produce an explosion.

The subject of atmospherical electricity has engaged the particular attention of M. Sauffure; and few persons have had more favourable opportunities for observing the phenomena that attend it, or possessed a more extensive acquaintance with meteorology in general, for enabling him to illustrate these phenomena by apposite observations, than this author. He confirms the fact noticed by others, and previously known, that aerial electricity varies according to the situation, being generally strongest in elevated and insulated situations, and not observable under trees, in streets, houses, or inclosed places. But it is not so much the height, as the situation of the places, which determines the degree of electricity: for the projecting angle of a high hill will often exhibit a stronger electricity than the plain at the top of the hill, as there are fewer points in the former to deprive the air of its electricity. The intensity of the atmospherical electricity is subject to a great variety of changes, of which some depend on obvious circumstances and others are altogether inexplicable. These changes, according to M. Sauffure, were sometimes so rapid in their succession, that he had not time to note them down. When rain falls without a storm, these changes are not so sudden; but with respect to the intensity of the electric force, they are very irregular; whilst the quality of it is more constant. Rain or snow almost always gives positive electricity. In cloudy weather, without rains or storms, the electricity generally follows the same laws as in serene weather. Its

intensity is generally diminished by strong winds, which blend the different strata of the atmosphere, cause them to subside towards the ground, and thus distribute the electricity uniformly between the earth and the air. M. Sauffure has observed a strong electricity, with a strong north wind. In foggy weather, the electricity is the strongest, unless the fog is about to be dissolved into rain. The various modifications of electricity in the atmosphere are observed with the greatest advantage in serene weather. M. Sauffure found, in winter and in such weather, that the electricity was generally weakest in the evening, when the dew had fallen, and so continued till sun-rise; afterwards its intensity augmented by degrees, sometimes sooner and sometimes later: but usually before noon it attained a certain maximum, from which it again declined till the fall of the dew, when it would be sometimes stronger than it had been during the whole day; after which it would again gradually decrease during the whole night; but it was never quite destroyed in weather perfectly serene. Hence it may be inferred, that atmospherical electricity, like the water of the ocean, is subject to a flux and reflux, which produce an increase and diminution twice in twenty-four hours. The moments of its greatest force are some hours after the rising and setting of the sun; and those in which it is weakest precede its rising and setting. Of this periodical flux, M. Sauffure has given a remarkable instance, deduced from his observations in an extraordinary degree of cold, and at an elevation of sixty feet above the level of the lake of Geneva. From the result of eighteen of these observations, made during three successive days, when the sky was quite serene, we learn, that the electricity was pretty strong at nine in the morning; that from this time it gradually decreased till about six in the evening, which was its first minimum; after which it increased again till eight, its second maximum; it then gradually declined till six in the morning, which was the period of its second minimum; after which, it again increased till ten in the morning, which was the first maximum of the following day: but as this day was cloudy, its periods were less regular. The electricity of serene weather is less easily observed in summer than in winter. In summer, if the ground has been dry for some days, and the air is also dry, the electricity increases from the rising of the sun, till three or four in the afternoon, when it is strongest: it then decreases till the dew begins to fall, when it again increases; but after this it declines and is almost reduced to nothing during the night. However, the serene days that succeed rainy weather in summer generally exhibit the same diurnal periods or states of electricity, with those that are observable in winter. The electricity of the air is invariably positive in serene weather, both in winter and summer, in the day and in the night, in the sun and in the dew. Hence it should seem, that the electricity of the air is essentially positive; and that whenever it appears to be negative, as in particular rains or storms, this state is produced by some clouds which have been exposed to the pressure of the electric fluid contained in the upper part of the atmosphere, or to more elevated clouds that have discharged a part of their fluid upon the earth, or upon other clouds. M. Sauffure, having collected these and similar phenomena, as the result of numerous and repeated observations, instituted a set of experiments on evaporation, in order to investigate and ascertain their cause. These our limits will not allow us to detail; but the general result was, that evaporation, which seems to be the vehicle that conveys electric matter into the atmosphere, from china and silver always produced negative electricity; and from iron and copper, generally positive electricity: and hence it may be inferred, that electricity is positive with those bodies that

are capable of decomposing water, or of being decomposed themselves by their contact with the water; and negative, with all those which are not at all decomposed or altered. As to the producing causes or sources of atmospherical electricity, we may observe in general, that they may be reduced to four, viz. friction, evaporation, heat and cold, and condensation and expansion: and with respect to the changes and modifications to which the atmospherical electricity is continually subject, they may be attributed to the operation of the various causes that produce it, and to the chemical processes that are constantly carried on by means of the various ingredients that compose the atmosphere. M. Volta (Phil. Transf. vol. lxxii. p. 32.), in reference to this subject observes, that as the vapours on their condensing lose part of their latent heat, on account of their capacity being diminished they part with some electric fluid. Hence (he says) originates the positive electricity which is always more or less predominant in the atmosphere, when the sky is clear, viz. at that height where the vapours begin to be condensed. Accordingly the atmospherical electricity is stronger in fogs, in which case the vapours are more condensed, so as to be almost reduced to drops, and is still stronger when thick fogs become clouds. In accounting for clouds, negatively electrified, he supposes that when a cloud, positively electrified, has been once formed, its sphere of action is extended a great way round, so that if another cloud comes within that sphere, its electric fluid, according to the well known laws of electric atmospheres, must retire to the parts of it which are most remote from the first cloud: and from thence the electric fluid may be communicated to other clouds, or vapours, or terrestrial prominences: thus, a cloud may be electrified negatively, which cloud may, after the same manner, occasion a positive electricity in another cloud, &c. This explains not only the negative electricity, which is often obtained from the atmosphere in cloudy weather; and the frequent changes from positive to negative electricity, and contrarywise, in stormy weather; but also the waving motion observed in the clouds, and the hanging down of them, so as nearly to touch the earth. For an account of the instruments that are used for discovering and estimating the electricity of the atmosphere, see COLLECTOR, CONDENSER, CONDUCTORS, and ELECTROMETER: and for further observations on this subject, see also ELECTRICITY, EVAPORATION, LIGHTNING, RAIN, VAPOUR, &c.

ATMOSPHERE, *Figure of the.* The atmosphere envelopes all parts of the surface of our globe; if therefore both the one and the other continued at rest, and were not endowed with a diurnal motion round their axis, then the atmosphere would be exactly spherical, according to all the laws of gravity; for all the points of the surface of a fluid in a state of rest, must be equally removed from its center. But the earth and the ambient atmosphere are invested with a diurnal motion, which carries both the one and the other round their axis: and the different parts of both having a centrifugal force, the tendency of which is more considerable, and that of the centripetal less, as the parts are more remote from the axis; the figure of the atmosphere must become an oblate spheroid, because the parts that correspond to the equator are farther removed from the axis, than the parts which correspond to the poles.

Besides, the figure of the atmosphere must represent such a spheroid, because the sun strikes more directly on the air which encompasses the equator, and is comprehended between the two tropics, than on that which pertains to the polar regions. Whence it follows, that the mass of air, or part of the atmosphere, adjoining to the poles, being less heated, cannot expand so much, nor reach so high. Nevertheless,

thefts, as the same force which contributes to elevate the air, diminishes the pressure on the surface of the earth, higher columns of it at or near the equator, all other circumstances being the same, may not be heavier than those that are lower at or near the poles.

Mr. Kirwan (Irish Transf. for 1788. p. 61.) stating the height of the mercury in the barometer on the level of the sea, indicating the natural state of the atmosphere, to be thirty inches under the equator and under the poles, observes, that in order to produce this state, the weight of the atmosphere must be every where equal at the surface of the sea; and as the weight of the atmosphere proceeds from its density and height, this equality of weight requires that the atmosphere should be lowest where its density is greatest, and highest where its density is least. These extremes of density take place in the equatorial and polar regions. Under the equator, the centrifugal force, the distance from the centre of the earth, and the heat are all at their maximum; in the vicinity of the poles, on the contrary, they are at their minimum. From this reasoning it follows, that the atmosphere must be highest under the equator, and lowest under the poles, with several intermediate gradations. Kirwan supposes the rarefaction of the atmosphere in the polar regions to proceed from the more bowditch and aulnals, which he takes to be a combination of inflammable air, excited by electricity; and as this air is lighter than any other, it consequently occupies the highest regions of the atmosphere. See *AURORA*, and *BAROMETERS*.

ATMOSPHERE, Weight and Pressure of the. The weight of the atmosphere, depending partly upon its height, and partly upon its density, and its consequent pressure, are properties that have been long determined by means of the ascent of mercury in the barometer, and of water in pumps, syphons, and other similar engines. (See *Art. Height of*) The quantity of this pressure may be easily estimated by comparing the weight of a column of atmospheric air with that of a corresponding column of quicksilver, or of water, by which it is counterbalanced. Upon this principle it has been found, that the pressure of the atmosphere sustains a column of quicksilver, in the tube of the barometer, of the height of about thirty inches; and hence it follows, that the whole pressure of the atmosphere is equal to the weight of a column of quicksilver, having an equal base, and about thirty inches in height. But as a cubical inch of quicksilver weighs about 8 oz. 1.45 drams, avoirdupois, the weight of 30 cubical inches will be 15 pounds, nearly. Such, therefore, is the weight of the atmosphere on every square inch of surface. It has been also found, by pumps and other hydraulic engines, that the pressure of the atmosphere sustains a column of water from 34 to 35 feet, or 34 feet, high; and as a cubical inch of water weighs 9.25 drams, and a cubical foot 1728 x 9.25 drams, nearly 122.2 ounces avoirdupois, or 62½ pounds, the amount of the pressure of the atmosphere on a square foot will be 74½ lbs, or 2156½ pounds; and a square foot, containing 144 square inches, $\frac{2156.25}{144}$, or nearly 15 pounds, will be its pressure on a square

inch. Hence it follows, that if a man's body contain 15 square feet, which is near the truth, he will sustain a weight equal to 2156½ x 15 = 32347½ pounds, or about 14,100 lbs, when the quicksilver in the barometer stands at 30 inches.

This pressure is so great, that it would be absolutely insupportable, and even fatal to us, if it were not equal in every part, and counterbalanced by the spring of some other elastic fluid within us, which is diffused through the whole body, and reacts with an equal force against the outward pressure. The nature of this internal elastic fluid is not

clearly understood, nor, indeed, is its existence positively ascertained. But whatever it be, it is such as to counteract the weight of the atmosphere. However, if any considerable pressure be superadded to that of the air, as e. g. by descending into deep water, it is always felt in a greater or less degree (see *DIVERSION*), more especially when the change is sudden; and, on the other hand, if the pressure of the atmosphere be taken off from any part of the human body, as from the hand placed over the exhausted receiver of an air-pump, the weight of the superincumbent atmosphere is felt, and the blood of the hand is drawn down, as it were by suction, into the veins. We must be able, that the heat of our bodies raises the particles of their surfaces, and therefore a living animal does not sustain an equal atmospheric pressure with that of inanimate and cold substance. Moreover, as the earth's surface contains, in round numbers, 200,000,000 square miles, and every square mile 27,879,400 square feet, there must be 5,575,680,000,000,000 square feet on the earth's surface; which, multiplied by 2156½ pounds, will give 12,122,570,000,000,000,000 pounds for the pressure or weight of the whole atmosphere.

Mr. Cotes (*Hydrostatical and Pneumatical Lect. p. 112.*) mentions the result of a computation which he made of the weight of all the air, which presses upon the whole surface of the earth; and he observes, that it is equal to the pressure of a globe of lead, nearly 60 miles in diameter. The computation proceeds upon these principles; that the weight of a column of air, reaching to the top of the atmosphere, is most commonly equal to a column of water, having the same base, and the altitude of 32 feet; that the semidiameter of the earth is equal to 20940/35 f. t.; and that the specific gravity of water is to that of lead as 1000 to 11,325.

The difference of the weight of the atmosphere, and of its consequent pressure, at different times, and in different situations, is a circumstance that deserves our particular notice. This difference in the same situation arises from changes in the state of the atmosphere; and it chiefly occurs in places at some distance from the equator. It is indicated, and of course easily estimated, by the different height to which the mercury is raised in the barometer. As the greatest variation of the height of the mercury occupies a range of about 3 inches, or from 28 to 31 inches, being 1/10th of the whole range, a column of air of any assignable base, equal to the weight of a cylinder of mercury of the same base, and of the altitude of 3 inches, will be taken off from the pressure upon a body of an equal base, at such times as the mercury is three inches lower in the barometer; and therefore every square inch of the surface of our bodies is pressed upon at one time more than another, by a weight of air equal to that of three cubical inches of mercury. As this is about 1/10th of the whole quantity, the difference of the pressure, which the human body sustains at one time more than another, amounts to about 1/10th. The reason why we are not sensible of this pressure is explained in the following manner by Borellus, de Mot. nat. a grav. fac. p. 10. p. 2, &c. After saying that sand, perfectly rammed in a hard vessel, is not capable, by any means, of being penetrated or parted, not even by a wedge; and likewise that water, contained in a bladder compressed equally on all sides, cannot yield or give way in any part: he proceeds; "In like manner, within the skin of an animal is contained a diversity of parts, some hard, as bones; others soft, as muscles, nerves, membranes, &c.; others fluid, as blood, fat, &c. Now it is not possible the bones should be broke or displaced in the body, unless the weight lay heavier on one part than on another, as we

sometimes see in porters. If the pressure be subdivided, so that it lie equally all around, upwards, downwards, and sideways, and no part of the skin be exempt therefrom, it is impossible any fracture or luxation should follow. The same may be observed of the muscles and nerves; which though soft, yet being composed of solid fibres, do naturally sustain each other, and resist the common weight. The same holds of blood and other humours; and a water does not admit any manifest condensation, so the animal humours contained in their vessels may suffer an attempt from an impulse made in one or more particular places, but can never be forced out of their vessels by an universal compression. It follows, that as none of the parts undergo either separation, luxation, contusion, or any other change of situation; it is impossible any sense of pain should ensue, which can only be the effect of a solution of continuity. This is confirmed by what we see in divers," &c. See DIVING.

The same is farther confirmed by Mr. Boyle, who, including a young frog in a vessel half full of water, and intruding so much air that the water might sustain eight times the weight it otherwise would; yet the animalcule, notwithstanding the great tenderness of its skin, did not seem at all affected thereby.

Besides, it ought to be considered that the pressure of the atmosphere is uniform and equal on all parts of the body; and that we have been accustomed to it by long experience. It should also be recollected, that when the ordinary weight of the atmosphere is augmented, the weather is commonly dry and serene; the circulation is promoted; the blood is driven to the internal parts; a more abundant secretion of the juices takes place; and the tonic tension of the solid parts is increased; and these circumstances combined produce an additional flow of spirits, and render us more lively and active. The same beneficial effect is observable even in brute animals. On the contrary, when the weight of the air is diminished, the weather is usually moist and foggy, and the animal frame becomes sensible of oppression, listlessness, and inactivity. These changes in the state of the atmosphere, which are felt more or less by persons of all descriptions, and of which valetudinarians frequently complain, would be more sensibly experienced, if they occurred by very sudden transitions: for to this circumstance the sensation of uneasiness and indisposition is chiefly to be attributed; and accordingly great and sudden changes in the state of the barometer and atmosphere, are generally accompanied with a corresponding alteration in the corporeal frame and animal spirits. But when a change of this kind occurs gradually, and when the same state of the atmosphere continues for some time, its effect is less sensibly perceived; as the body possesses a power of accommodating itself to such change. The spring of that elastic fluid, to which we have already referred, serves as a counterpoise to the pressure of the atmosphere, and when this is diminished it becomes more relaxed, so that the equilibrium between the one and the other is maintained. Hence it happens, that in moist foggy weather, when the pressure of the atmosphere is least considerable, our veins never swell, nor are we sensible of any internal expansion of our bodies; but, on the contrary, the vessels are more distended, the circulation becomes more languid, and we seem to be oppressed with a weight. Upon the whole, we may observe, that the pressure of the atmosphere resembles a kind of bandage, which being drawn tighter, as in the case of increased pressure, constricts the vessels of the body, and accelerates the circulation; and which being more relaxed, as in the diminished pressure, occasions a distension of the vessels, and is attended by a more slow and languid circulation. But this is a subject, in the

elucidation of which physiologists are not agreed. As variations of the atmospheric pressure in the same place produce effects that are sensibly felt, particularly by persons of delicate and tender constitution, whatever explanation may be given of these effects, and to whatever intermediate causes they may be ascribed; the changes of pressure are also perceived in different situations, as they are more elevated or depressed. Indeed if the ascent from lower to higher stations, and vice versa, be gradual, the body adapts itself to the changes that attend them, and they are scarcely, if at all, perceivable; but in the case of a more rapid ascent or descent, or when the difference of height is very considerable, the effects are more sensible and apparent. Many facts and observations to this purpose have been furnished by those who have ascended in balloons, or descended in diving-bells. (See AEROSTATION, and DIVING.) The accounts given by persons who have ascended considerable eminences above the level of the sea, have been very various; nor is it certain that the effects they have perceived have been owing wholly or merely to the variation of the atmospheric pressure. Some have complained of a total lassitude, which they have ascribed to the dilatation of the corporeal vessels, of obstructions to the functions of the respiratory organs, of violent reachings and vomitings of blood, and, in some cases, of the extrusion of blood through the fine coats of the lungs, and an ensuing hæmoptysis. M. Saussure, in his ascent to the top of mount Blanc, felt great uneasiness, as he advanced upwards. He informs us, that his respiration was much oppressed, the circulation of blood accelerated, and the pulse quickened, that he was seized with other symptoms of a fever; and that his strength was also very much exhausted. These symptoms of oppression and debility, however, did not begin to appear till he had ascended to the perpendicular height of $2\frac{1}{2}$ miles above the level of the sea; and upon an additional ascent of $\frac{1}{4}$ of a mile, he found the symptoms above recited. To some other concurring cause, besides the rarity of the atmosphere, it is natural to ascribe some of these symptoms; and, indeed, he himself says, that the atmosphere at the top of the mountain was much impregnated with carbonic acid, which is known to be pernicious to animals, and to be productive of some of the above-mentioned effects. In other cases, persons in elevated situations have experienced no effects like those which M. Saussure has related, and which the mechanical theory of diminished pressure would lead us to expect. Mr. Brydone and M. Howel mention no inconvenience of this kind to which they were subject on the top of mount *Ætna*; nor do the French mathematicians, who were for some time on the summit of a very high eminence of the Andes, make any other complaint besides that of the difficulty of respiration. (See *ANDES*.) But Dr. Heberden, who ascended to the top of *Teneriffe*, a mountain higher than *Ætna*, makes no mention even of this circumstance. It has also been alleged, that no inconvenience has been experienced by a gradual descent in the diving-bell to considerable depths in the sea, as long as the persons who have descended have remained in the air in the bell; though they have found a very material difference on exposing themselves to the pressure of the water. See DIVING.

It is not easy to assign the true cause of the variations of the atmospheric weight and pressure that occur in the same situation. In places within the tropics, where these variations are not very considerable, the chief cause seems to be the heat of the sun; and its effects are regular and uniform, as the mercury in the barometer subsides about half an inch in the day, and rises again to its former height in the night. But in the temperate zones the range is much greater, extending

tending from 28 to 31 inches, and shewing, by its various altitudes, corresponding variations in the weather. The causes that influence the variations of the one, produce also a similar effect on the other; and if the former were known, the latter might be ascertained. The immediate causes may probably be reduced to the two following; viz. an emission of latent heat from the vapours of the atmosphere, or of electric fluid from thence or from the earth. Both these causes are observed to produce the same effect with the solar heat in the tropical climates, which is that of rarefying the air by blending with it, or setting loose a lighter fluid, which did not previously act with such power in any particular place. For a more particular account of different theories on this subject, see **BAROMETER**, **HAIL**, **METEOROLOGY**, **RAIN**, **SNOW**, **WEATHER**, and **WIND**. Of the importance and utility of this property of the atmosphere, many instances occur in the animal economy, chemical processes, and mechanical operations. See **CUPPING**, **RESPIRATION**, **COLOUR**, **COMBUSTION**, **VAPOUR**, **PUMP**, and **SYPHON**.

With the gravity and pressure of the air are nearly connected its other properties of *density* and *elasticity*. The density of the atmosphere must principally depend on its gravity; and, in general, increase and decrease in the same proportion. In the lower and intermediate strata of the atmospherical air, this ratio obtains; but it is not uniform and constant in all elevations. In the higher regions of the atmosphere, where the electric fluid abounds, this fluid may diminish the gravity of the atmosphere, without affecting its density. Besides, the density of the atmosphere in the torrid zone will not decrease so fast in proportion to the height of the column, as in the temperate and frigid zones; because the column is longer, and because a greater portion of atmospherical air occupies the higher parts of this column. Consequently the density of the atmosphere at the equator, which is less at the surface of the earth, must at a certain height equal, and at a greater height exceed, the density of the atmosphere in the temperate zones and at the poles. As a current of atmospherical air is continually ascending at the equator, and part of it occupies the higher regions of the atmosphere, and as its fluidity will prevent its accumulation at the equator, it will of course descend towards the poles: and during our winter, a greater portion of the equatorial column will flow to the northern than to the southern hemisphere; but a less portion will pursue this course during the summer. The mercurial column, therefore, will be always highest with us in winter, and the corresponding range of the barometer more considerable than in summer; and vice versa. The density of the atmosphere will be materially affected by the caloric or matter of heat which it contains, and of course it will depend in great measure on the degree of cold which prevails. Where the cold is greatest, the density of the atmosphere will also be greatest, and its height will be diminished. In those countries which abound with high mountains that are generally covered with snow, the cold will be more intense than in others less elevated, though situate in the same latitude; and of course the height of the atmospherical columns will be proportionally lower. Hence the superior air in its passage to the poles will be retarded, and accumulate over them. Such accumulations will take place over the north-western parts of Asia, and over North America; and on this account the barometer usually stands higher, and its range is more uniform than in Europe. Similar accumulations are also formed in the southern parts of the old continent; for instance, over the mountainous tracts of Thibet, Tartary, Turkey in Europe, Africa, and even in some degree on the Pyrenæes and Alps.

When these accumulations have for any time prevailed, the density of the atmosphere becomes too considerable to be balanced by the surrounding medium; and of course it will descend towards the regions of the atmosphere that lie over the adjacent countries, and produce cold wind, that will raise the mercury in the barometer. Thus the north-east winds in Europe are occasionally accompanied by a rise of the barometer, because they proceed from accumulations of the atmosphere in the north-west parts of Asia, or about the pole; and hence it is, that the north-west wind from the mountains of Thibet, raises the barometer at Calcutta.

As the mean heat of our hemisphere is not permanent, the density of the atmosphere, and consequently the quantity of equatorial air, which flows towards the poles, must be subject to corresponding variations. The accumulations of atmospherical air on the mountainous parts of the south of Europe and Asia, occasionally exceed their usual limits, which is partly owing to earlier falls of snow, or to the exclusion of the solar rays by fogs of long continuance. In this case the atmosphere in the polar regions will sustain a corresponding diminution of density. In the torrid zone and equatorial regions the heat is uniform; and the density of the atmosphere, modified by it, as well as the height of the atmosphere, will not be subject to much variation. Kirwan, Irish Trans. for 1788, p. 60. See **DENSITY**. See also **BAROMETER**, under which article the cause of the variations in the weight and pressure of the atmosphere is particularly discussed. For the effects of the removal of the pressure of the atmosphere, see **AIR PUMP**, and **VACUUM**. For the elasticity of the atmosphere, see **AIR**, and **ELASTICITY of the Air**.

ATMOSPHERE, *Height of the*. The height of the atmosphere has been a subject of particular investigation; more especially since it was discovered by the Torricellian tube, that air is endued with weight and pressure. And, indeed, if the air possessed no elastic power, but were every where of the same density, from the surface of the earth to the extreme limit of the atmosphere, like water, which is equally dense at all depths, the whole height of the atmosphere might be ascertained without difficulty. It has already been observed, that the weight of a column of air, reaching to the top of the atmosphere, is equal to the weight of the mercury contained in the barometer, and counterbalancing it; and the proportion of weight likewise being known between equal bulks of air and mercury; it will be easy to find the height of such a column, and consequently that of the atmosphere itself.—For a column of air, one inch high, being to an equal column of mercury as 1 to 11364.6; it is evident that 11364.6 such columns of air, that is, a column 527 feet high, would be equal in weight to one inch of mercury; and consequently the 30 inches of mercury sustained in the barometer, require a column of air 28410 feet high; whence the height of the atmosphere would only be 28410 feet, or little more than five English miles and a quarter high.

But the air, by its elastic property, expands and contracts; and it being found by repeated experiments in England, France, and Italy, that the spaces it takes up, when compressed by different weights, are reciprocally proportional to those weights themselves; or, that the air takes up the less space, the more it is pressed; it follows, that the air in the upper regions of the atmosphere, where the weight is so much less, must be much rarer than near the surface of the earth; and, consequently, that the height of the atmosphere must be much greater than is above assigned.

Mr. Cotes, in his *Hydrostatical Lectures*, l. 3. ix. has

demonstrated, in a very familiar and intelligible manner, that if any number of distances from the surface of the earth be taken in an arithmetical progression, the densities of the air at these distances will be in a geometrical progression. Let *ax* (*Plate IX. Pneumatics, fig. 72.*) represent a vessel reaching from the surface of the earth *ax* to the top of the atmosphere *xx*; and let the side *ax* be divided into inches *ab, b, c, &c.* and let the lines *ll, cl, dm, &c.* be drawn parallel to *a*. It is evident that the air contained between these parallel lines becomes rarer as we ascend, because every ascending parallel successively is pressed by a less column of superincumbent air than the next below it. Suppose then that the air *al* is every where uniform, but denser than the air *ll*, and so upwards. Let the air *ll* be reduced into a less space *lq*, so as to become of equal density with the air *al*, by making the space *lq* less than *ll*, in the proportion that the air *ll* is less dense than the air *al*. And let a similar construction be continued, so as to reduce every inch breadth of air to the same density with the air *al*. The spaces *ak, lq, cr, &c.* will evidently be as the densities of the several inches of air, *ab, ll, cm, &c.* and the quantity or weight of the superincumbent air belonging to each of these spaces, and reaching to the top of the atmosphere, will always be as the sum of all the spaces situated above any space proposed; the quantity or weight being, by the construction of the figure, as the space which it possesses. Since then the density of the air is as the force which compresses it, and this force is the quantity of superincumbent air, the densities of the air between *ax* and *ll, ll* and *cl, cl* and *dm, &c.* are to each other as the quantities of air above *ax, ll, cl, &c.* up to the extremity of the atmosphere. But these densities, by what we have already shewn, are as the spaces *ak, lq, cr, &c.* and the quantities of superincumbent air are as the spaces *abqrstuv, xyrstuv, xdeuvw, &c.*; therefore the spaces *ak, lq, cr, &c.* are to each other respectively as the spaces *abqrstuv, xyrstuv, xdeuvw, &c.* Now the former spaces *ak, lq, cr,* being the differences of the latter, and mutually proportional, are, by a well known theorem in proportion, in a geometrical progression; as the distances *ab, ac, ad,* are in an arithmetical progression. And thus the densities of the air belonging to every one of the inches, continued to the extremity of the atmosphere, decrease in the same geometrical progression; and every the least variation of altitude will cause the same proportionable variation of density in the air. As the rarity of the air is reciprocally as its density, we may conclude that if the distances from the earth increase in an arithmetical progression, the different degrees of rarity of the air increase in a geometrical progression. Whence it is obvious, since an arithmetical series adapted to a geometrical one, is analogous to the logarithms of the said geometrical one, that the distances are every where proportional to the logarithms of the corresponding rarities. It is also plain, that, as the distances or altitudes are proportional to the logarithms of the densities or weights of the air, any height taken from the earth's surface, which is the difference of two altitudes to the top of the atmosphere, is proportional to the difference of the logarithms of the two densities there, or to the logarithm of the ratio of those densities, and their corresponding compressing forces, as measured by the two heights of the barometer there.

This law was first observed and demonstrated by Dr. Halley, from the nature of the hyperbola; and afterwards by Dr. Gregory, by means of the logarithmic line. See *Phil. Trans. N° 181.* or *Abr. ibid. vol. ii. p. 13.* and *Greg. Astron. lib. v. prop. 3.* See the further illustration and proof of it under the article *Atmospherical LOGARITHMIC.*

From this proposition, having made two or three barometrical observations of the rarity or density of the air at two or three different known heights, it is easy to deduce a general rule for determining its rarity or density at any other height, or the height corresponding to any rarity or density; and consequently the altitude of the whole atmosphere, supposing the utmost degree of rarity known, beyond which the air cannot go.

But it is to be observed, that these computations of the rarity of the atmosphere, at different heights, are founded on this principle, that the density of the air is every where proportionable to the superincumbent weight. And this rule holds true only upon the supposition that the heat is uniform at different distances from the earth; for if the air be hotter in one part than in another, the air will be more rarefied in the hotter part than it will be in the cooler, although pressed by the same weight, or at the same altitude above the earth's surface.

It must not be here omitted, that some observations made by Cassini, and his associates, seem to render this method precarious.—In continuing the meridian line of the observatory at Paris, they measured the altitudes of several mountains with great accuracy; noting the height of the barometer at the top of each; and found, that the rarefactions of the air, as you ascend from the level of the earth, are much greater than they ought to be, according to this proportion.

suspecting therefore the justness of the experiments, the Royal Academy made divers others, under great dilatations of air, far exceeding the rarities found on the tops of the mountains; the result whereof was, that they all exactly answered the proportion of the incumbent weights. Whence it should follow, that the higher air about the tops of mountains is of a different nature, and observes a different law from that near the earth.

This may be owing to the great quantity of gross vapours and exhalations here, more than above; which vapours being less elastic, and not capable of so much rarefaction as the pure air above, the rarefactions of the pure air increase in a greater ratio than the weights diminish. M. Fontenelle, however, from some experiments made by M. de la Hire, accounts for the phenomenon in a different manner; alleging, that the elastic power of air is increased by the admixture of humidity therewith; and consequently that the air near the tops of mountains, being moister than that below, becomes thereby more elastic, and rarefies in a greater ratio than naturally and in a drier state it would.—But Dr. Jurin shews, that the experiments produced to support this system are by no means conclusive. *Append. ad Varenii Geograph.*

M. Bouguer likewise, in the *Memoirs of the Royal Academy of Sciences at Paris for the year 1753,* intimates his opinion, that the condensations of the atmosphere did not observe the same law at different heights; and endeavoured to account for the variation, by supposing that particles of air at different heights are possessed of unequal degrees of elasticity. If this were the case it would be impossible to apply the barometer to the mensuration of heights with any degree of certainty. But M. de Luc has shewn, by his more accurate experiments, that this pretended inequality of spring in the particles of air does not subsist; and that its condensations and dilatations follow the same law uniformly at all heights and in all climates, excepting only the differences that are caused by heat, and other local circumstances. Admitting therefore the principle above stated, as applicable to all altitudes within our reach, or as far as the summits of the highest mountains on earth, when a correction is made merely for the difference of heat or tempera-

ture, he determined the altitudes of hills both by the barometer and also by geometrical measurement; and shewing how to allow for the difference of temperature, he has given a rule for the measurement of heights by the barometer, deduced from a greater number of experiments, and much more accurate than any before published. See his "Recherches sur les Modifications de l'Atmosphere," vol. ii. Similar rules have also been deduced from various experiments by Sir George Shuckburgh and general Roy, both concurring to shew that such a rule for the altitudes and densities held at all heights that are not liable to ice, when the density of the air is computed on a point of its density; and the rule of their experiments shew, that the difference of the logarithms of the heights of the mercury in the barometer at two different altitudes multiplied by 10000, is equal to the altitude in English fathoms of the one place above the other; that is, when the temperature of the air is about 31 or 32 degrees of Fahrenheit's thermometer; and a certain quantity more or less, according as the actual temperature is different from that degree. See the principles and application of these rules, detailed more at large, under the article BAROMETER. But it may be here observed, that the same rule may be deduced independently of a train of experiments, merely by means of the density of the air at the surface of the earth. Thus, let D denote the density of the air at one place, and d the density at the other; both measured by the column of mercury in the barometer; then the difference of altitude between the two places will be proportional to the log. of D - the log. of d ,

or to the log. of $\frac{D}{d}$. But as this formula expresses only the relation between different altitudes, with respect to their densities, recourse must be had to some experiment in order to obtain the real altitude which corresponds to any given density, or the density which corresponds to a given altitude. The first and most natural is that which results from the known specific gravity of air, with respect to the whole pressure of the atmosphere on the surface of the earth.

Now, as the altitude a is always as the log. of $\frac{D}{d}$, assume

b , so that a may be $= b \times \log. \frac{D}{d}$, where b will be of

one constant value for all altitudes: and to determine that value, suppose a case in which we know the altitude a corresponding to a known density d : as e. g. take $a = 1$ foot or 1 inch, or some such small altitude; and because the density D may be measured by the pressure of the whole atmosphere, or the uniform column of 27,600 feet, when the temperature is 55°, 27,600 feet will therefore denote the density D at the lower place, and 27,599 the less density d at one foot above it; consequently, we have this equation, viz. $1 = b \times \log. \text{of } \frac{27600}{27599}$, which by the nature of logarithms is nearly $= b \times \frac{.4242942}{27600} = \frac{b}{63551}$ nearly; and hence $b = 63551$ feet, which gives this formula for any altitude in general; viz. $a = 63551 \times \log. \frac{D}{d}$, or $a =$

$63551 \times \log. \frac{M}{m}$ feet, or dividing by 6, the number of

feet in a fathom, $10592 \times \log. \frac{M}{m}$ fathoms, where M denotes the column of mercury which is equal to the pressure of the atmosphere at the bottom, and m that at the

top of the altitude a ; and where M and m may be taken in any measure, either fathoms or feet. This formula is adapted to the nature of the barometer used, and may be applied by the method of general Roy, the barometer being divided by the height of the column of mercury in the middle between the upper and at the top of the altitude a , the result of which multiplied by the upper part, which is added to the result of the lower part, and otherwise to be added. It is likewise adapted to a column of 30 inches of mercury, which is divided into the 20th part of an inch, or 3000 parts of an inch, the 572th part of the whole column of 30 inches being considered much more convenient than by dividing the feet or 10,592 to 10,000 by dividing the column of mercury from 55° to 31° as the difference of 24° is $\frac{1}{2}$ part of the whole factor (10592) and is $\frac{1}{6}$ the 24th part of 425; therefore the distance of temperature corresponding to the change of the factor h is $\frac{1}{6}$, which reduces the 55° to 31°. Consequently, the formula becomes

$a = 10000 \times \log. \text{of } \frac{M}{m}$ fathoms, when the temperature is 31°, or nearly the freezing point; and for every degree above that, the result must be increased by so many times as 425th part, and proportionally diminished below it.

This formula may be computed under the following practical precept: 1. Observe the height of the barometer at the bottom of any height or depth proposed to be measured, together with the temperature of the mercury by means of the thermometer attached to the barometer, and also the temperature of the air in the shade by another thermometer which is detached from the barometer. 2. Let the same thing be done also at the top of the said height or depth, and as nearly as possible at the same time; reduce these altitudes of the mercury to the same temperature, if it be thought necessary, by correcting either the one or the other viz. augmenting the height of the mercury in the colder temperature, or diminishing that in the warmer, by its 920th part for every degree of difference between the two; and the altitudes of the mercury so corrected are the denoted by M and m in the above formula. 3. Take out the common logarithms of the two heights of mercury so corrected, and subtract the less from the greater, cutting off from the right hand side of the remainder three places for decimals, and then those on the left hand will be fathoms in whole numbers, the tables of logarithms being supposed to comprehend seven places of decimals. 4. Correct the number last found for the difference of the temperature of the air, in the following manner: viz. take half the sum of the two temperatures of the air, shewn by the detached thermometers, for the mean one; and for every degree by which this differs from the standard temperature of 31°, take so many times the 425th part of the fathoms above found, and add them if the mean temperature be more than 31°, but subtract them if it be below 31°, and the sum or difference will be the true altitude in fathoms, or being multiplied by 6, it will give the true altitude in English feet.

Example I. To find the altitude, when the state of the barometers and thermometers is as follows, viz.

Thermometers		Barometris
detached	attached	
57	57	25.68 lower
42	43	25.28 upper
Mean 49½	Diff. 14	

As 9600 : 14 :: 29.68 : .04
 Cor. .04
 Mean 49½
 Stand. 31
 Diff. 18½

M = 29.64 .. 4718782
 m = 25.23 .. 4027771

As 435 : 18½ :: 621.011 : 29.388
 29.388

The altitude sought is { 720.399 fathoms
 or 4322.394 feet.

Example II. To find the altitude of a hill, when the state of the barometer and thermometer, observed at the bottom and top of it, is as follows: viz.

Thermometers		Barometers
detached	attached	
35	41	29.45
31	38	26.82
Mean 33	Diff. 3	

As 9600 : 3 :: 29.45 : .01

M = 29.44 ... 4689378
 m = 26.82 ... 4284588

As 435 : 2 :: 404.790 : 1.86
 1.86

The altitude sought is { 406.65 fathoms,
 or 2439.90 feet.

M. De Luc found that the height of the atmosphere, supposing its limits where the mercury would stand only at one line, and the thermometer indicating 0 in his scale, 17° in that of Reaumur, and about 70° in Fahrenheit's, is 25105.45 toises, or 11 leagues and 3 toises; and in the same circumstances, if the mercury in the barometer sunk to 1/10 of a line, the height of that part of the atmosphere would be 35105.45 toises.

Upon the principles above stated, the following table is calculated; supposing first as a mean of the observations at the Pay de Domme in France, and those on Snowdon-hill in Wales, that at the altitude of seven miles, the air is four times rarer than at the surface of the earth.

At the altitude of	7 miles above the surface of the earth, the air is	times rarer than at the earth's surface.

It might easily be shewn by pursuing the calculation in this table, that a cubic inch of the air we breathe would be so much rarefied at the altitude of 500 miles, that it would fill a sphere equal in diameter to the orbit of Saturn.

Hence it appears that the atmosphere, however indefinitely it may be expanded, becomes at a comparatively small distance, so rare and light, as to be utterly imperceptible in its effects as a resisting medium: and if the atmospheres of the planets resemble that of the earth, they must be so attenuated at the distances of the planets from one another, as to give no sensible resistance to their motions round the sun for many ages.

M. de la Hire, after Kepler, recurred to the more ancient method of ascertaining the height of the atmosphere, viz. from the consideration of the crepuscula. It appears, from the observations of astronomers, of the duration of twilight, and of the magnitude of the terrestrial shadow in lunar eclipses, that the effect of the atmosphere to reflect and intercept the light of the sun, is sensible to the altitude of between 40 and 50 miles. So far then we may be certain that the atmosphere reaches; and at that altitude we may collect, from what has been already said, that the air is above 10,000 times rarer than at the surface of the earth. How much farther the atmosphere may extend, we are altogether ignorant. Cotes's Hydrost. Lect. p. 123. and 125.

It is allowed by astronomers, that when the centre of the sun is 18°, or allowing for the refraction 17° 27', below the horizon, the twilight begins or ends: now the ray which we see can be no other than a horizontal line, or a tangent to the earth in the place where the observer is; but this ray cannot come directly from the sun, which is under the horizon; and must therefore be a ray reflected to us by the last inner and concave surface of the atmosphere. We are to suppose that the sun when 17° 27' below the horizon, emits a ray which is a tangent to the earth, and strikes upon this last surface of the atmosphere, and is thence reflected to our eye, being still a tangent, and horizontal. If there were no atmosphere, there would be no crepusculum; and consequently, if the atmosphere were not so high as it is, the crepusculum would begin and end when the sun is at a less distance from the horizon than 17° 27', and contrarily.—Hence we infer, that the extent of the arc by which the sun is depressed when the crepusculum begins or ends, determines the height of the atmosphere. We are to note, however, that 33' must be subtracted from the arc of 18° for the refraction which raises the sun so much higher than he would be; and 16' more for the height of the upper limb of the sun, which is supposed to send the ray above his centre, so that the arc which determines the height of the atmosphere is only 17° 11'. Two rays, one direct and the other reflected, but both tangents to the earth, must necessarily meet in the atmosphere at the point of reflection, and comprehend an arc between them of 17° 11', of which they are tangents.—Hence it follows, from the nature of the circle, that a line drawn from the centre of the earth, and cutting the arc in two, will go to the point of concurrence of those two rays; and as it is easy to find the excess of this line above the semi-diameter of the earth, which is known, it is easy to find the height of the atmosphere, which is only that excess. See CREPUSCULUM.

On this principle, M. de la Hire discovered the height of the atmosphere to be 37223 fathoms, or near 17 French leagues. The same method was also made use of by Kepler, who only rejected it, because it gave the height of the atmosphere twenty times greater than he otherwise allowed

lowed it. It must be added, that in this calculation, the direct and reflected rays are supposed to be right lines; whereas in fact they are curves, formed by the perpetual refraction which the rays undergo in passing through a series of different densities of air. Computing then upon them, as two similar curves, or rather as a single curve, one extreme whereof is a tangent to the earth; its vertex, equally distant from both the extremes, determines the height of the atmosphere; which therefore will be found somewhat lower than in the former case; the point of concurrence of two right lines, which are here only tangents to the curve, the one at one end, and the other at the other, being higher than the vertex of the curve. In this way, M. de la Hire finds the atmosphere 363 $\frac{1}{2}$ fathoms, or 16 leagues. *Hist. de l'Acad. Roy. de Scien. an. 1713. p. 71.*

The nature of the curve, which is described by a ray of light in passing through the atmosphere, has been the subject of assiduous investigation. M. De la Hire took great pains to demonstrate, that, supposing the density of the atmosphere proportional to its weight, this curve is a cycloid; and he says, that if the ray be a tangent to the atmosphere, the diameter of its generating circle will be the height of the atmosphere; and that this diameter increases, till at last, when the rays are perpendicular, it becomes infinite, or the circle degenerates into a right line. This reasoning supposes that the surface of the atmosphere is a plane; but since it is a curve, he observes that these cycloids become in fact epicycloids. Hermannus, in his "Phoronomia," has detected the error of M. De la Hire, and shewn that this curve is infinitely extended, and has an asymptote; and Dr. Brook Taylor observes, "Method. Increm." p. 168. that it is one of the most intricate and perplexed that can well be proposed. This ingenious author computes the refractive power of the air, to be to the force of gravity at the surface of the earth, as 320,000,000 to 1.

The extreme rarity of the atmosphere at considerable altitudes, such as those of forty or fifty miles, bounding the production of twilight, has perplexed philosophers in accounting for meteors, which, whatever be their origin, whether electrical or otherwise, are observed at a much greater elevation than that to which the refractive power of the atmospherical air extends. A very remarkable one of this kind was observed by Dr. Halley in the month of March 1719; the altitude of which he computed to have been between 69 and 73 $\frac{1}{2}$ English miles; its diameter being 2800 yards or more than a mile and a half, and its velocity about 350 miles in a minute. Others of a similar kind, but of a greater altitude and velocity, have been observed by others; and particularly one seen in August 1783, whose height above the earth could not be less than ninety miles, and its diameter was not less than the former, whilst its velocity was certainly not less than 1000 miles in a minute. From analogy and reasoning it is very probable, that such meteors are not essentially different from those that are seen near the surface of the earth. Nevertheless in the high regions where they are observed, the atmosphere, according to our computation, ought not to have density sufficient to support flame and to propagate sound; and yet such meteors are commonly succeeded by one or more explosions, and are accompanied, as it has been reported, with a hissing noise as they pass over our heads. The meteor of 1719 was not only very bright, so that for some time it changed the night into day, but was attended with an explosion that was heard over all the island of Britain, occasioning a violent concussion of the atmosphere and seeming to shake the earth itself. And yet, in the regions in which this meteor moved, the air ought to

have been 300 thousand times rarer than the air we breathe, or 1000 times rarer than the vacuum commonly made by a good air-pump. Dr. Halley conjectures, that the immense immensity of such bodies may compensate for the rarity of the medium in which they move. Allowing them to be electrical phenomena, difficulties occur in explaining several circumstances attending them; and particularly the splendor of their appearance, which requires a circumbient fluid capable of confining and condensing the electric matter of which they are composed. From late experiments, it has been inferred, that the electric fluid cannot pervade a perfect vacuum. See METEOR.

ATMOSPHERE, Refraction and Reflection of the. That the atmosphere has a refractive power, which is the cause of many phenomena, is unquestionable. This power is ascertained by the production of twilight above noticed, and by many other facts and experiments. Alhazen the Arabian, who lived about A. D. 1100, seems to have been more inquisitive into the nature of refraction than the preceding writers. But neither Alhazen, nor his follower Vitellio, knew any thing of its just quantity, which was not known to any tolerable degree of exactness, till Tycho Brahe, with incredible diligence, settled it. But neither Tycho, nor Kepler, discovered in what manner the rays of light were refracted by the atmosphere. Tycho thought the refraction was chiefly caused by dense vapours, very near the earth's surface. Kepler placed the cause wholly in the higher regions of the atmosphere, which he took to be uniformly dense; and thence he determined its altitude to be little more than that of the highest mountains. But the true constitution of the atmosphere, deduced afterwards from the Torricellian experiment, afforded a juster idea of these refractions, especially after it appeared by a repetition of Mr. Lowthorp's experiment, that the air's refractive power is proportionable to its density. By this variation of the air's density, a ray of light, in passing through the atmosphere, is continually refracted at every point, and thereby describes a curve, and not a straight line, as it would have done were there no atmosphere, or were its density uniform. See REFRACTION.

The atmosphere, or air, has also a reflective power; and this power is the cause that enlightens objects so uniformly on all sides. The absence of this power would occasion a strange alteration in the appearance of things; their shadows would be so very dark, and their sides enlightened by the sun so very bright, that probably we could see no more of them than their bright halves; so that, for a view of the other halves, we must turn them half round, or, if immovable, must wait till the sun could come round upon them. Such a pelucid unreflective atmosphere would indeed have been very commodious for astronomical observations upon the course of the sun and planets among the fixed stars, visible by day as well as by night; but then such a sudden transition from darkness to light, and from light to darkness immediately, upon the rising and setting of the sun, without any twilight, and even upon turning from or to the sun at noon day, would have been very inconvenient and offensive to our eyes.

However, though the atmosphere is greatly assitant to the illumination of objects, yet it must also be observed that it stops a great deal of light. By M. Bouguer's experiments, it seems that the light of the moon is frequently 2000 times weaker in the horizon, than at the altitude of 66 degrees; and that the proportion of her light at the altitudes of 66 and 19 degrees, is about 3 to 2. The lights of the sun must bear the same proportion to each other at those heights, which M. Bouguer made choice of.

as being the meridian heights of the sun, at the summer and winter solstices, in the latitude of Cordé in France. Smith's Optics, Rem. 95. See LIGHT, and REFLECTION.

ATMOSPHERE, *Solubility of the*. See FUDIMETRY.

ATMOSPHERE, *The nature of the*. The variable temperature of the atmosphere, at different seasons and in different situations, has been the subject of elaborate investigation; and many speculations and theories have been proposed in order to account for the changes which it undergoes. That the pressure of the air is the principal force of heat as well as of light, and peculiar force of cold, is too obvious to have been ever doubted; and the effect produced by the greater or less obliquity of its rays has been long and universally observed and acknowledged. From this fact, however, the ancient philosophers of Greece and Rome too hastily inferred, that the torrid zone, under a vertical sun, and the frigid zone, when the rays fall very obliquely, were uninhabitable. They concluded this mistake, and predicted new phenomena which have been found difficult to explain. The hottest days are frequently felt in the coldest climates, and the greatest cold, as well as perpetual snow, are found in countries bordering on, or even immediately under the equator. In the four last centuries, very different temperatures have been observed, not only in different, but even in the same hemisphere. The temperature of the eastern coast of North America differs widely from that of the western opposite coast of Europe, but agrees nearly with that of the eastern coast of Asia lying between the same parallels. Mem. Philad. vol. i. These, and similar circumstances, have made it necessary for meteorologists to recur to other causes of varying temperature, besides the immediate agency or absence of the solar rays. Dr. Halley has, indeed, proved, that, abstracting from the intervention of fogs, mists, and mountains of ice, the hottest weather, might in summer, take place even under the poles, the duration of the sun's light more than compensating for the obliquity of its direction (see HEAT); but as many physical causes obstruct the activity of the solar rays in these and other regions, it was still necessary to recur to some other cause. At length M. De Mairan (Mem. Acad. Par. 1719 and 1767) discovered, that the rigour of the cold of winter is tempered by the heat imparted to the atmosphere by the earth itself; which heat, probably possessed from its origin, is preserved and renewed by the incessant influences of the sun, to which one half of its surface is constantly exposed. Admitting this fact, the temperature of the atmosphere must depend on the capacity of the earth for receiving and retaining heat, and for communicating it to the surrounding medium. But as the earth is composed of land and water, it should be considered that the capacities of these constituent parts for receiving both heat and cold are very different. Land, particularly when dry, receives heat from the sun's rays very readily, but transmits it through its own substance to great depths very slowly; and on the other hand, water, by reason of its transparency, receives heat very slowly, but diffuses what it receives more readily. Dr. Halley found that in the month of August 1724, when the air, and the surface of the earth, were both at 88°, a thermometer placed only two inches under the surface, stood at 85°; another 16 inches under the surface indicated 70°, and a third 24 inches deep, stood at 68°. The two last thermometers preserved the same temperature both day and night, till the end of the month, and then fell to 63° or 61°; the earth obstinately retaining its heat, at that depth, though the temperature of the air frequently varied. On the 26th of October, a thermometer, exposed to the

air, stood at 35.5°; but one sunk two inches in the earth was heated to 43.85°; another at the depth of 16 inches stood at 48.8°; and another 24 inches deep, shewed 50°; and from the 18th to the 12th of November, when the temperature of the external air was 27°, a thermometer placed at the depth of 24 inches stood at 43.8°; but from the month of March to that of September in the following year, the external air was constantly warmer than the earth at the depth of 16 inches or 2 feet: the season, however, was very rainy, and the evaporation, thus occasioned, prevented the earth from being warmed so much as it otherwise might have been. Hales Veget. Statics, vol. i. p. 61, &c. From these experiments it may be inferred, that the surface of the earth is much heated during the summer, but that the heat descends very slowly, a great part of it being communicated to the air; that during the winter, the earth gives out to the air the heat which it had received during the summer; and that wet summers must be preceded by cold winters. The experiments of Dr. Hales furnish nearly the same results with those of Mariotte (*sur le Froid and le Chaud*, p. 189.); who found, that the earth is gradually heated during the summer, and gradually cooled during the winter months; and that, at the distance of a few feet under the surface, it is constantly warmer than the external air; and the excess was found to remain till April, when the surface is again heated by the sun's rays, and slowly transmits its heat downwards. Hence it appears, that at the distance of about 80 or 90 feet below the surface, provided that there be a communication with the external air, or at a less depth if there be no such communication, the temperature of the earth admits of very slight variation, and generally approaches to the mean annual heat. Then the temperature of spring is nearly the same as the annual temperature, and varies very little. M. Van Swinden has observed, that the greatest cold, and even that which exceeds 0° of Fahrenheit's scale, if it lasts no more than a few days, penetrates no deeper than 20 inches when the earth is covered with snow, and not above 10 inches if no snow lies on the surface; and this fact evinces the important and useful purposes answered by this covering in high northern latitudes. Such facts tend to prove, that the heat of the earth does not increase as we descend into it; but at the greatest depths it is nearly the same as the mean annual temperature of the latitude. It has been observed, that lead is capable of receiving much more heat or cold than water. To this purpose, Dr. Raymond found, in the neighbourhood of Marseilles, land frequently heated to 160°; but he never found the sea hotter than 77°; and in winter he frequently observed the earth cooled down to 14° or 15°, but the sea never lower than 44° or 45°. (Mem. de la Societ. de Med. de Paris, an. 1778, p. 70.) From these facts it is an obvious inference, that the atmosphere which lies over the sea should maintain a more uniform temperature than that over the land; and this is found to be the fact; nor is it difficult to give a satisfactory explanation of it. During summer, the temperature of the sea on its surface is constantly diminished by the process of evaporation; and in the winter, when the superficial water is cooled, it descends by its augmented gravity to the bottom, and its place is occupied by water of a higher temperature. This alternate change of this heavier and lighter air proceeds, and the winter elapses before the atmosphere has diminished the temperature of the water below a certain degree. Between the mean annual temperature of the atmosphere over the ocean, and that of countries situated at a considerable distance from it, there is a very perceptible difference. As the sea is never heated to the same degree as the land,

the mean temperature of summer over the sea may be considered as lower than that over the land. In winter, when the force of the sun's rays is weakened, the sea inputs its heat to the atmosphere much more readily than the earth. The mean temperature on sea, is, therefore, at this season higher than on land, and in cold countries this difference in the evolution of heat is so very considerable, that it more than counterbalances the difference which takes place in summer; inasmuch that in high latitudes, the mean annual temperature at sea ought to exceed that on the land. Mr. Kirwan observes, that, in order to find the temperature in any place, situate between the latitudes 70° and 35° , the standard temperature for the same latitude should be lowered $\frac{1}{3}$ of a degree for every 50 miles of distance; since in winter the cold always increases in proportion to the distance from the standard. At a less distance than 50 miles the atmosphere on the ocean and land are so blended together by the agency of sea and land winds, that little difference is perceptible in the annual mean temperature. In lower latitudes than 30° , the solar rays even in winter act with no inconsiderable force, the surface of the earth also retains a pretty considerable degree of heat, and consequently the mean annual temperatures of the sea and land preserve a greater equality. In proportion as we approach to the equator, the force of the sun's rays in winter acts with additional energy, and the mean temperature of the land atmosphere at this season approximates nearer and nearer to that of the sea, till at the equator they become equal.

In latitudes distant from the equator, islands are warmer than continents, because they participate more of the temperature of the sea. Countries that lie southward of any sea, are warmer than those that have the same sea to the south of them, at least in our hemisphere, because the winds that should cool them in winter are tempered, by passing to them from that sea; and those that are northward of the sea are cooled in summer by the breezes that issue from it; but a northern or southern bearing of the sea renders a country warmer, than if it lay either to the east or west. Tracts of land which are covered with trees and luxuriant vegetables, are much colder than those which have less surface of vegetable matter: for though living vegetables alter their temperature slowly, and with difficulty, yet the evaporation from their numerous surfaces is much greater than from the same space of land uncovered with vegetables; and besides, when they are tall and close, as forests, they exclude the sun's rays, and shelter the winter snows from the wind and sun. From some experiments of Mr. Williams (Philad. Transf. vol. ii. p. 150.) it appears, that forests discharge one-third more vapour into the atmosphere, than the same space of ground would do if actually covered with water. From this reasoning it appears, that woody countries are much colder than those that are open and cultivated; and it will enable us to account for the amelioration of climate that attends agricultural cultivation. See CLIMATE.

Another principal source of heat, besides the sun's rays and earth, which may be regarded as a repository of heat, is the condensation of vapour. It is well known, that vapour contains a quantity of the matter of heat, which produces no other effect but that of making it assume an aerial expanded state, until the vapour is condensed into a liquid, but during this condensation a quantity of sensible heat is let loose, which warms the surrounding atmosphere. This condensation is frequently occasioned by the attraction of an electrical cloud; and hence proceeds the fulminations which we often experience before rain.

Vol. III.

Notwithstanding the variations of temperature that occur in every climate, and at every season, there is a mean temperature from which the atmosphere fluctuates, and a certain number of degrees. In order to determine this, Mr. Playfair, professor of mathematics in the university of Edinburgh (see Edinb. Transf. vol. v. part 2. for 1782, p. 193.) divides every month into three parts, and divides the face of the barometer and thermometer for each of these divisions. In his tables the first column contains the greatest, least, and mean height of the barometer; and the fourth column gives the temperature of the air in the room where the barometer is kept. The fifth and sixth columns shew the greatest height of the thermometer in the air, observed during the ten days to which the numbers refer; the next three give the mean height, as observed at three different times every day; viz. at eight in the morning, ten in the evening, and as nearly as possible to the west at the end of the day, or some time between mid-day and three in the afternoon. The mean of all these is taken for the mean temperature of the day, which being computed for each day, the mean of all these mean temperatures is set down for the mean temperature of the atmosphere for every one of the thirty-six divisions of the year. The mean of the three divisions of every month is given in the next column, under the title of the mean temperature of the month. It is presumed, says Mr. Playfair, that the mean temperatures, which are the points most difficult to be ascertained, are given with tolerable exactness, as they are deduced from three observations made every day, of which the first, viz. that at eight in the morning, is not far from the mean temperature of the whole day, and the other two are as near as circumstances will allow, to the two extremes of greatest heat and greatest cold. At Edinburgh, the mean temperature for the year 1797 was 48.04° ; for 1798, 49.28° ; and for 1799, 46.13° . From a mean of the observations made at the house of the Royal Society, from 1772 to 1780, the annual temperature of London appears to be 51.9° , or in round numbers 52° .

The greatest mean annual temperature prevails at the equator, or in the second degree of north latitude. As we recede from the equator, the mean temperature gradually decreases, and it is most diminished at the pole. This diminution takes place in such a manner, that the mean annual temperatures of all the latitudes are arithmetical means between the mean annual temperatures of the equator and of the pole. The ratio between the decrease of temperature, and the distance from the equator, was first ascertained by Mr. Tobias Mayer of Gottingen (Oper. Ined. vol. i.); and by means of an equation deduced from it, and rendered more clear, accurate, and general, Mr. Kirwan has calculated the mean annual temperature of every degree of latitude between the equator and the pole. He supposes the mean annual heat to be the greatest under the equator, and least under the poles; that at the equator he calls m , and that at the north pole $m-n$, and putting δ for any other latitude, the temperature of that latitude will be $m-n \sin. \delta$. Hence, as the mean annual temperature of lat. 40° , determined by the best observations, is 62° , and the temperature of lat. 50° is found to be 52.9° ; thus the value of m and n being known, the mean annual temperatures of the equator, and of the poles, may be determined; for the square of the sine of 40° is 0.41, and the square of the sine of 50° is 0.58; then,

$$m - 0.41 n = 62$$

$$\text{and } m - 0.58 n = 52.9;$$

$$\text{consequently } 62 + 0.41 n = 52.9 + 0.58 n.$$

Whence the value of n is found to be 53 nearly, and m in the first equation is 84; and therefore the mean temperature of

K k

the

the equator is 84, and that of the pole 31. Upon these principles the following table was calculated.

TABLE of the Mean Annual Temperature of the Standard Ocean in every Latitude.

Lat.	Temper.	Lat.	Temper.	Lat.	Temper.
90	31	61	43.5	32	69.1
89	31.04	60	44.3	31	69.9
88	31.10	59	45.09	30	70.7
87	31.14	58	45.8	29	71.5
86	31.2	57	46.7	28	72.3
85	31.4	56	47.5	27	72.8
84	31.5	55	48.4	26	73.8
83	31.7	54	49.2	25	74.5
82	32	53	50.2	24	75.4
81	32.2	52	51.1	23	75.9
80	32.6	51	52.4	22	76.5
79	32.9	50	52.9	21	77.2
78	33.2	49	53.8	20	77.8
77	33.7	48	54.7	19	78.3
76	34.1	47	55.6	18	78.9
75	34.5	46	56.4	17	79.4
74	35	45	57.5	16	79.9
73	35.5	44	58.4	15	80.4
72	36	43	59.4	14	80.8
71	36.6	42	60.3	13	81.3
70	37.2	41	61.2	12	81.7
69	37.8	40	62	11	82
68	38.4	39	63	10	82.3
67	39.1	38	63.9	9	82.7
66	39.7	37	64.8	8	82.9
65	40.4	36	65.7	7	83.2
64	41.2	35	66.6	6	83.4
63	41.9	34	67.4	5	83.6
62	42.7	33	68.3	0	84

In forming this table, Mr. Kirwan sought for a standard situation, with whose temperature, in every latitude, we may compare and appreciate the temperature of all other situations in the same latitudes, on water only. Accordingly, he chose that situation for a standard, which is most free from any beside the most permanent causes of alteration, viz. that part of the Atlantic that lies between the 80th degree of northern, and the 45th degree of southern latitude, and extending westward as far as the gulf stream, and to within a few leagues of the coast of America; and all that part of the Pacific ocean, reaching from N. lat. 45° to S. lat. 40° from the 20th to the 275th degree of longitude, east from London, which is by far the greater part of the surface of the globe. Within this space the mean annual temperature is expressed in the table; and the author has added the temperature of latitudes beyond 80° in the northern hemisphere, though not strictly within the standard.

Mr. Kirwan has also attempted to ascertain the mean monthly temperature of the standard ocean. With this view he states, that in every latitude, the mean temperature of the month of April seems to approach very nearly to the mean annual heat of that latitude; and as far as heat depends on the action of the solar rays, the mean heat of every month is as the mean altitude of the sun, or rather, as the sine of the sun's mean altitude during that month. Hence to find the mean heat of May, say, as the sine of the sun's mean altitude in April, to the mean heat of April, so is the sine of the sun's mean altitude in May to the mean

heat of May. By a similar process, the temperatures of June, July, and August may be found; but this rule would give the temperatures of the succeeding months too low; because it does not comprehend the quantity of heat accruing to the atmosphere by communication of the internal heat of the globe, which in every latitude is nearly the same as the mean annual heat of that latitude. Hence the real temperature of these months must be regarded as an arithmetical mean between the astronomical and terrestrial heats. E. g. In lat. 51° the astronomical heat of the month of September is 44.66, and the mean annual heat is 52.4°; consequently the real heat of this month is $\frac{44.66 + 52.4}{2} = 48.4$,

which is more conformable to observation. Mr. Kirwan has with great labour formed a table, showing the monthly mean temperature of the standard ocean from lat. 80° to lat. 10°. Hence he shews, that the coldest weather in all climates prevails in the month of January; and that July is the warmest month in all latitudes above 48°; but in lower latitudes, August is generally the warmest; that December and January, and also June and July, differ but little; that the differences between the hottest and coldest months, within 20° of the equator, are inconsiderable, and that they increase as we recede from the equator; that in the highest latitudes we often meet with a heat of 75 or 80 degrees; that every habitable latitude enjoys for two months a heat of 60 degrees at least, which seems to be necessary for the growth and maturity of corn; and that the quickness of vegetation in the higher latitudes proceeds from the duration of the sun above the horizon; that as the cold of the higher latitudes, and the heat of the lower, are moderated by the vicinity of seas and mountains, these, instead of being irregular and fortuitous, may be regarded as a wise and beneficial provision of nature, in this respect as well as in many others. Mr. Kirwan has also shewn, that the greatest cold within the twenty-four hours generally happens half an hour before sun-rise, in all latitudes; the greatest heat in all latitudes between 60° and 45° is found about half past two o'clock in the afternoon; between lat. 45° and 35°, at two o'clock; between lat. 35° and 25°, at half past one; and between lat 25° and the equator, at one o'clock. On sea, the difference between the heat of day and night is not so great as on land, particularly in low latitudes.

TABLE exhibiting a Comparison of the Temperature of London, with that of other noted Places.

	Annual	Jan,	July,
London	1000	1000	1000
Paris	1028	1040	1037
Edinburgh	923	1040	914
Berlin	942		
Stockholm	811	1583	964
Peterburgh	746	3590	1000
Vienna	987	1305	1037
Pekin	1067	1730	1213
Bordeaux	1070	925	1139
Montpellier	1170	850	1195
Lisbon	1319	559	1128
Spanish Town in Jamaica	1557		
Madras	1565	491	1349

The first column of this table exhibits the differences of the annual temperature; the second, that of January; and the third that of July; that of London, as the standard, being

being estimated at zero. The degree of cold is estimated in the second column, and the degree of heat in the third and fourth.

A View of the Annual Temperature of Different Places, according to the Order of their Latitude.

As the earth is the chief source of heat in the ambient atmosphere, distance from the earth is a source of cold; and the greater cold must prevail in the highest regions of the atmosphere, more especially as clear unclouded air seems to receive no heat from the rays of the sun, whether direct or reflected. Thus, if the focus of the most powerful burning glass be directed on mere air, it does not produce the smallest degree of heat, because the air being transparent, a free passage is afforded to the sun's rays. At the level of the sea, the temperature corresponds to that of the standard ocean; but as we ascend above that level, the tem-

perature is gradually decreased; but as a general rule, we arrive at the region of perpetual congelation, as Mr. Bouguer & others were the first to observe, the height of this varies according to the latitude of the place, and at that height it constantly falls to aught near the equator, but the equator it is at its highest, being 19,000 fathoms high; the south as we advance toward the pole. On the summit of Incheuca, one of the Cordilleras of Peru, under the line, M. Bouguer found the cold to be 7 to 9 degrees below the freezing point of water, and the thermometer. He fixed the height of this region of perpetual congelation between the tropics at a distance of 19,577 feet; but in latitude 25, he thinks that it is 111,000 fathoms high, or at a height of 13,000 feet from the level of the sea. He did not go any higher, as he never saw snow, but he is of opinion that the height is 60,000 ft. M. Bouguer's thermometer of congelation, and he does not under the height of 111,000 feet at which he fixed the height of perpetual congelation. To the purpose, he observes, that the temperature of both is nearly constant; but in order of gradualness, it is variable both in summer and winter, and the point of congelation which prevails on the surface of the earth varies there is a mean annual temperature peculiar to each latitude, so there is a mean height for each of these terms peculiar to each latitude. And if we take the differences between the mean temperatures of every latitude and the point of congelation, it is evident that whatever proportion the difference under the equator bears to the height of either of the above terms, the same proportion will the difference peculiar to every other latitude bear to the height of those terms. Thus, the mean heat of the equator being 84, the difference of this and 32 is 52; and the mean heat of latitude 25 being 72 2/3, the difference between this and 32 is 40 2/3. Then as 52 : 155,77 :: 40 2/3 : 12072. In this manner Mr. Kirwan calculated the following table.

Lat.	Mean height of the Lower Term of Congelation.		Mean height of the Lower Term of Congelation.		Mean height of the Upper Term of Congelation.
	Feet.	Fathoms.	Feet.	Fathoms.	
0	15577	2660	45	7658	13750
5	15557	2654	50	6250	11253
10	15467	2644	55	4912	8835
15	14493	2451	60	394	6546
20	13719	24661	65	2515	4676
25	13050	2323	70	1557	2809
30	11792	2038	75	748	1249
35	11094	1919	80	120	207
40	9716	1677			

In this manner, the height of both terms of congelation may be calculated in every latitude for every degree of heat observed at the surface of the earth, on which it evidently depends; for when that is at 32, the lower limit of congelation may be also on the surface. Hence if the height of the lower term of congelation in any latitude be known, and also the general temperature at the surface of the earth, the decrement of heat at any lower height may be found. The heat is observed to decrease in ascending into the atmosphere nearly in an arithmetic progression, and thus, having the first and last terms, it is made to many terms in the progression as there are hundreds of feet in the distance of the line of congelation, we shall be able to determine the decre-

ment at each term. Let L = the entire decrement or difference between the heat at the surface and 32° ; D = the distance of the lower line of congelation, in feet; n = the number of terms = $\frac{D}{100}$; d = the first decrement = $\frac{L}{n}$; and R = the rank of any given term, whose decrement is required. Then the decrement at any given term is = Rd ; and, subtracting this from the heat at the surface, we have the heat at that given height. The temperature at the upper term of congelation may be investigated in the same manner, or that of any other height in the atmosphere, except over mountains; for the air over mountains is generally warmer than air of the same height over the sea or over plains.

Sometimes the temperature of the upper air is higher than that of the lower, particularly when a large mass of vapour is condensed by electrical agency; for no part of the heat given out by that cause being lost by communication with air much colder, that which surrounds the condensed vapour must be heated to a considerable degree. Air, rendered opaque by clouds, transmits less, and absorbs more light, and is therefore more heated than clear air. Sometimes winds, in opposite directions and different temperatures, flow at different heights, the uppermost being often the warmest; all which circumstances, especially in cloudy weather, render all calculations of the height of the terms of congelation on any particular day precarious, though when they regard a particular month or season, they may be sufficiently exact.

With regard to the effect of elevation on the temperature of the atmosphere, we may observe, that as heat is propagated through the atmosphere, chiefly by contact and communication with the earth, lofty mountains of limited surface cannot warm it to any considerable degree, as they receive the sun's rays more obliquely, and communicating less with the common mass of the earth, are less heated than plains. Hence it happens that the steepest mountains are always the coldest. Indeed, the coldness of the atmosphere on the tops of mountains has been ascribed, by M. Lambert and M. De Luc, to the greater rarity of the igneous fluid, or elementary fire, in such elevated situations, than on the plains. M. Lambert is of opinion, that it is rarified above by the action of the air, and that it is condensed below by its own weight. Without absolutely deciding the question, he seems inclined to admit the identity of fire and light. M. De Luc compares elementary fire to a continuous fluid, whose parts are condensed by being mutually compressed; and though he denies that fire and light are the same, yet he supposes that light puts into motion the igneous fluid contained in bodies, and that it acts with greater force near the earth than at a distance from its surface, by means of this fluid, which he calls an heavy and elastic one, by being more condensed there than at a greater height. M. Bouguer has demonstrated, by simple and obvious principles and facts, that in order to account for the diminution of heat on mountains, it is unnecessary to recur to dubious hypothesis. In his account of what was experienced on the mountains of Peru, he says, "it was proper, in order to explain this subject, to insist on the short deviation of the sun's rays, which cannot strike the different sides of mountains but for a few hours, and even this not always. A horizontal plain, when the sun is clear, is exposed at mid-day to the perpendicular and undiminished action of these rays, while they fall but obliquely on a plain not much inclined, or on the sides of a high pile of steep rocks. But let us conceive for a moment an insulated point, half the height of the atmosphere, at a distance from all mountains as well as from the clouds which float in the

air. The more a medium is transparent, the less heat it ought to receive by the immediate action of the sun. The free passage which a very transparent body allows to the rays of light, shews that its small particles are hardly touched by them. Indeed what impression could they make on it, when they pass through almost without obstruction? Light, when it consists of parallel rays, does not, by passing through a foot of free atmospheric air, near the earth, lose an hundred thousandth part of its force. From this we may judge how few rays are weakened, or can act on this fluid, in their passage through a stratum of the diameter, not of an inch or line, but of a particle. Yet the subtilty and transparency are still greater at great heights, as was obvious on the Cordilleras, when we looked at distant objects. Lastly, the grosser air is heated below by the contact or neighbourhood of bodies of greater density than itself, which it surrounds, and on which it rests; and the heat may be communicated by little and little to a certain distance. The inferior parts of the atmosphere by this means contract daily a very considerable degree of heat, and may receive it in proportion to its density or bulk. But it is evident that the same thing cannot happen at the distance of a league and an half or two leagues above the surface of the earth, although the light there may be something more active. The air and the wind therefore must at this height be extremely cold, and colder in proportion to the elevation."

This theory is adopted by Saussure, who has superadded the following fact to prove, that the force of the sun's rays, considered abstractedly and independently of any extrinsic source of cold, is no less powerful on mountains than on plains; viz. that the power of burning lenses and mirrors is the same at all heights. For ascertaining this fact, he procured a burning glass, so weak in its effect, that at Geneva it would just set fire to tinder. This glass was carried to the summit of mount Saleve, 3000 feet high, and it there produced the same effect, and even with greater ease. Hence he concluded, that the principal source of cold on the tops of mountains is their being perpetually surrounded by an atmosphere, which cannot be much heated by the rays of the sun, on account of its transparency, or by their reflection from the earth, by reason of its distance; but he wished also to know, whether the direct solar rays had the same power on the top of a high mountain as on the plain below, whilst the body on which they acted was placed in such a manner as to be unaffected by the surrounding air. With this view he instituted a set of experiments, from which he deduced the following conclusions; viz. that a difference of 777 toises in height diminishes the heat which the rays of the sun are able to communicate to a body exposed to the external air, 14° of the thermometer; that it diminishes the heat of a body partially exposed, only 6° ; and that it augments by 1° the heat of a third body completely defended from the air. Hence it appears, that the atmosphere counteracts the operation of the solar rays in producing heat, by a power which is exerted at all distances, from the surface to the higher regions. From the experiments of M. Pictet, to this purpose, it is inferred, that even in places exposed to the rays of the sun, the heat at five feet from the ground is greater only by 1° or $2'$ than at fifty feet above the surface, although the ground was at that time 15° or 20° warmer than the air immediately in contact with it. This difference, however, small as it is, does not obtain in higher regions; for if it did, the cold on the top of the mountain of Saleve, 3000 feet above the lake of Geneva, would be 60° greater than at the foot of it; whereas it really is only 10° . In the night the case is reversed; for the stratum of air, at

five feet from the ground, was found by M. Pictet to be colder than that at 50°. Besides, different strata are found to possess very different and variable degrees of cold, without any regard to the altitude or depression of their situation. In 1750, Dr. Wilson of Glasgow (*Phil. Trans.* for 1752, p. 467.; and for 1781, p. 368.) found a remarkable cold both to the surface of the ground; so that the thermometer, when laid on the surface of the snow and hoar-frost, sunk many degrees lower than one suspended twenty-four feet above it. Hence it has been concluded, that snow, falling from the higher regions of the atmosphere, is generally colder than the lower air.

With respect to the precise effect of elevation, Mr. Kirwan found it to be nearly as follows: when the elevation is moderate and gradual, such as that of the interior parts of most countries very distant from the sea, its effects are to be blended with those of distance from the standard ocean, that the same allowance in the diminution of temperature is to be made for both. By a gradual elevation, the mean such as rises at a less rate than six feet per mile, counting from the nearest considerable sea. If the elevation proceeds at a greater rate, then for every 200 feet of elevation, the annual temperature of the standard must be diminished in that latitude, as follows:

If the elevation be at the rate of		
6 feet per mile	- - -	$\frac{1}{4}$ of a degree.
7 feet	- - -	$\frac{1}{2}$
13 feet	- - -	$\frac{3}{4}$
15 feet, or upwards	- - -	1

For every 50 miles distance from the standard ocean, the mean annual temperature in different latitudes must be depressed or raised, nearly at the following rate:

From lat. 70° to lat 35° cooled,	$\frac{1}{2}$ of a degree.
35° - - - - -	0
30° - - - - -	0
25° warmed	0
20° - - - - -	0
10° - - - - -	1°

See on this subject Kirwan's Estimate of the Temperature of different Latitudes, 1787, passim.

It has been observed, that in clear weather, though the surface of the earth be then most liable to be heated by the sun, yet after sun-set, and during the night, the air is coldest near the ground, and particularly in the vallies. The experiments made on this subject for a whole year, by Mr. James Six, may be seen in these venty-eight volume of the Philosophical Transactions, but our limits will not allow our reciting them. The conclusions deduced from them are these: that a greater diminution of heat frequently takes place near the earth in the night time, than at any altitude in the atmosphere within the limits of the writer's inquiry; that is, 220 feet from the ground; and that at such times the greatest degrees of cold are always met with near the surface of the earth. This is a constant operation of nature, under certain circumstances of the atmosphere, and occurs at all seasons of the year; and this difference never happens in any considerable degree, except when the air is still, and the sky perfectly unclouded. The refrigeration was not at all impeded, but rather promoted, by the moistest vapours, as dews and fogs. In very severe frosts, when the air frequently deposits a quantity of frozen vapour, it is commonly found greatest; but the excess of heat, which in the day was found in the lowest stratum in summer, was diminished in winter almost to nothing. The fact of the mercury's sinking in a thermometer, included in a receiver, when the air begins to be rarefied, has been usually attributed, not to any degree of cold thus produced, but to the sudden expansion of

the bulb of the thermometer, in consequence of the removal of the atmospheric pressure; but from some experiments of Dr. Down (*see Phil. Trans.* vol. 78, p. 45. &c.) it appears, that the atmosphere at 70° becomes warm by compression, and cold by dilatation from a compressed state. This ingenious author mentions a curious phenomenon observed in the fountain of Hiero, manufactured on a very high peak in the Chemnitz mountains in Hungary. In this machine the air, in a large vessel, is compressed by a column of water 260 feet high; the stop-cock is then opened; and as the air issues out with great violence, and in consequence of its previous condensation becomes immediately much expanded, the moisture contained in it is not only precipitated, as in the exhausted receiver, but falls down in a shower of snow, which is adhering to the side of the cone. (*see Phil. Trans.* for 1761, vol. 52.) From this phenomenon, as well as from his experiments, Dr. Down infers, that there is good reason for concluding, that in all circumstances where air is continually expanded, it becomes capable of attracting the fluid matter of heat from other bodies in contact with it. (*see CALORIC.*) Now (says he), as the vast regions of air which the winds our globe in perpetual motion along its surface, climbing up the sides of mountains, and descending into the vallies; as it passes along, it must be perpetually varying its degree of heat, according to the elevation of the country it traverses; for in rising to the summits of mountains, it becomes expanded, having so much of the pressure of the superincumbent air taken away; and when thus expanded, it attracts or abstracts heat from the mountains contiguous with it; and when it descends into the vallies, and is again compressed into its former state, it again gives out the heat it has acquired to the bodies it becomes in contact with. The same thing must happen in respect to the higher regions of the atmosphere, which are regions of perpetual frost, as has lately been discovered by the aërial navigators. When large districts of air, from the lower parts of the atmosphere, are raised two or three miles high, they become so much expanded by the great diminution of the pressure over them, and thence become so cold, that hail or snow is produced by the precipitation of the vapour; and as there is, in these high regions of the atmosphere, nothing else for the expanded air to acquire heat from after it has parted with its vapour, the same degree of cold continues, till the air, on descending to the earth, acquires its former state of condensation and of warmth.

The Andes, almost under the line, rears its base on burning sands; about its middle height is a most pleasant temperate climate covering an extensive plain, on which is built the city of Quito: while its forehead is encircled with eternal snow, perhaps coeval with the mountain. Yet, according to the accounts of Don Ulloa, these three discordant climates seldom encroach much on each other's territories. The hot winds below, if they ascend, become cooled by their expansion; and hence they cannot affect the snow upon the summit; and the cold winds, that sweep the summit, become condensed as they descend, and of temperate warmth before they reach the fertile plains of Quito.

The temperature of the atmosphere, and the vicissitudes of its heat and cold, are subject to a variety of irregularities, which no theory that has yet been proposed is altogether sufficient to explain. For other observations on this subject, see the articles CLOUDS, COLD, CONDENSATION, EVAPORATION, HAIL, HEAT, HYGROMETER, METEOROLOGICAL, RAIN, SNOW, WEATHER, WIND, &c.

ATMOSPHERA, 21, (*Use of it*). There are so numerous and various, that it would require a very minute and extended

detail to recite even the principal of them. Of its indispensable necessity, to the existence of animal and vegetable life, instances frequently occur in the course of this work. Animals and vegetables in their immense variety, and from their state of eggs and seeds to their full maturity, owe the commencement and continuance of their being to the atmosphere that surrounds them. How much it conduces to the fertility of the earth, by means of the parts that compose it, and to the convenience and comfort of mankind, by furnishing a fit repository for the vapours that descend in refreshing showers, and for the winds that form an intercourse of society and commerce with distant nations, and by affording those refractions and refractions of light which lead to the ever-fascinating Aurora, and which form pleasing transitions from darkness to day, and from day to night, by means of twilight, it is altogether needless to specify. The subject would afford scope for much declamation; and we might derive from it arguments that would impress a thoughtful mind with just and laudable sentiments of the creator. How necessary it is to the various operations of arts and science, as well as to the common purposes of life, will amply appear under the several articles which it would be almost superfluous to mention. See AIR, and the several articles to which we have already referred.

ATMOSPHERE, *Method of purifying in the*. See AEROSTATION.

ATMOSPHERE *of the Sun, Moon, Planets, and Comets*. See the several articles.

ATMOSPHERE *of solid or consistent Bodies*, is a kind of sphere formed by the effluvia, or minute corpuscles emitted from them. Mr. Boyle endeavours to shew that all bodies, even the hardest and most coherent, as gems, &c. have their atmospheres. See GEN.

ATMOSPHERE, in *Electricity*, denotes that medium which was conceived to be diffused over the surface of electrified bodies, and to consist of effluvia issuing from them: whereby other bodies immersed in it become endued with an electricity contrary to that of the body to which the atmosphere belongs. This was first taken notice of at a very early period in the history of this science, by Otto Guericke, and afterwards by the academicians *de Cimento*, who contrived to render the electric atmosphere visible, by means of smoke attracted by, and uniting itself to a piece of amber, and gently rising from it, and vanishing as the amber cooled. But Dr. Franklin exhibited this electric atmosphere with great advantage, by dropping rosin on hot iron plates held under bodies electrified, from which the smoke rose and encompassed the bodies, giving them a very beautiful appearance. He made other observations on these atmospheres; he took notice that they and the air did not seem to exclude one another; that they were immovably retained by the bodies from which they issued; and that the same body, in different circumstances of dilatation and contraction, is capable of receiving or retaining more or less of the electric fluid on its surface. However, the theory of electrical atmospheres was not sufficiently explained and understood for a considerable time; and the investigation led to many very curious experiments and observations. Mr. Canton took the lead, and was followed by Dr. Franklin; Messrs. Willeke and Epinus prosecuted the inquiry, and completed the discovery. The experiments of the two former gentlemen prepared the way for the conclusion that was afterwards drawn from them by the latter, though they retained the common opinion of electric atmospheres, and endeavoured to explain the phenomena by it. The conclusion was, that the electric fluid, when there is a re-

dundancy of it in any body, repels the electric fluid in any other body, when they are both within the sphere of each other's influence, and drives it into the remote parts of the body, or quite out of it, if there be any outlet for that purpose.

By atmosphere, M. Epinus says, no more is to be understood than the sphere of a body belonging to any body, or the neighbouring air electrified by it. Sig. Beccaria concurs in the same opinion, that electrified bodies have no other atmosphere than the electricity communicated to the neighbouring air, and which goes with the air, and not with the electrified bodies. And Mr. Canton likewise, having relinquished the opinion that electrical atmospheres were composed of effluvia from excited or electrified bodies, maintained that they only result from an attraction in the state of the electric fluid contained in, or belonging to the air surrounding these bodies to a certain distance: for instance, that excited glass repels the electric fluid from it, and consequently beyond that distance makes it more dense; whereas excited wax attracts the electric fluid existing in the air nearer to it, making it rarer than it was before. In the course of experiments that were performed on this occasion, Messrs. Willeke and Epinus succeeded in charging a plate of air, by suspending large boards of wood covered with tin, with the flat sides parallel to one another, and at some inches asunder; for they found, that, upon electrifying one of the boards positively, the other was always negative; and a shock was produced by forming a communication between the upper and lower plates. Beccaria has largely considered the subject of electric atmospheres, in his *Artificial Electricity*, p. 179, &c. Eng. edit. Dr. Priestley's *Hist. of Electricity*, vol. ii. sect. 5. Cavallo's *Electricity*, vol. i. p. 241. vol. iii. p. 282. See CONDENSER, and CONDUCTOR, *Luminous*; and *Experiments in ELECTRICITY*.

ATMOSPHERE, *Magnetic*, denotes the sphere within which the virtue of the magnet, &c. acts.

ATMOSPHERICAL *Logarithmic*. See LOGARITHMIC.

ATNAH, or *Carrier Indians*, in *Geography*, a tribe of Indians in the north-west continent of America, inhabiting the banks of the Columbia river, south of the Nagaiser Indians, about N. lat. 52°, and W. long. 122°. The Atnah language, of which Mr. Mackenzie obtained some specimens, has no affinity to any with which he was acquainted. Mackenzie's *Journal of a Voyage through the N. W. Continent of America*, p. 258.

ATOM, formed of the privative α , and $\tau\omicron\mu\omega$, *I divide*, in *Philosophy*, a part or particle of matter, so minute as to be indivisible.

Atoms are properly the *minima nature*, the last or ultimate particles into which bodies are divisible; and are conceived as the first rudiments, or component parts of all physical magnitude; or the pre-existent and incorruptible matter whereof bodies were formed.

The notion of atoms arises hence, that matter is not divisible *in infinitum*. And hence the Peripatetics are led to deny the reality of atoms, together with that of mathematical point: an atom, say they, either has parts, or it has none; if it hath none, it is a mere mathematical point; if it hath, then do these parts also consist of others, and so on to infinity.

But this is to recede from the genuine character of atoms, which are not esteemed indivisible, because of their want of bigness, or parts (for all physical magnitude must have three dimensions, length, breadth, and thickness, and all extension is divisible); but they are indivisible on account of their solidity, hardness, and impenetrability, which preclude all division.

tion, and leave no vacancy for the admission of any foreign force to separate or diffuse them.

As atoms are the first matter, it is necessary that they be indissoluble, in order to their being incapable of being dissolved. Isaac Newton adds, that it is also required they be impenetrable, in order to the world's continuing in the firmness, and bodies being of the same nature now as formerly. For this purpose he observes, at the close of his inquiry into the nature, laws, and constitution of matter, that God in the beginning created matter in solid, massy, hard, impenetrable, moveable particles, so possibly harder than any of the porous bodies composed of them; nay, so hard as never to wear or break in pieces; no human power being able to divide what God has joined at the creation, while these particles continue united, they may compose bodies of one and the same texture in all ages; but if they should wear away, or break in pieces, the nature of bodies depending upon them would be changed. See *Downy Matter*, and *SOUBTILITY*.

Hence the ancients were obliged to maintain atoms eternal: because what is made is not to be eternal. They also added gravity, as a cause of descent, and motion to their atoms, and farther observed, that atoms thus falling perpendicularly could not find one another; they superadded a rotation of these atoms, and furnished them with certain hooked parts, in order to enable them to catch and hang the better together.—And from a casual and fortuitous jumble of these atoms, they supposed the whole universe to be formed.

ATOMARIA, in *Conchology*, a species of *CYPRINA*, about half an inch in length. This shell is oblong, fleshy-white, dotted with brown, and at each end two dusky maras. Martini, Gmel. &c.

ATOMARIA, in *Entomology*, a species of *CANORIS* (*M. p. 10*, Fabr.), found in Europe. It is greyish, with an ovate abdomen; wings brown, crowded with white dots. Gmelin.

ATOMARIA, a species of *PHRYGANEA* found in Germany. The wings are pale-grey with numerous black dots.

ATOMARIA, a species of *PHALENA* (*Geometra*) that inhabits Europe. The wings are entirely yellowish, streaked and speckled with brown. Guich. &c. This is *Phalena pennata* of Scopoli, and *Phalena antennaria*. *Phalena glaucaria* of Wien, Schmettenl. is supposed to be a variety of this species by Gmelin. The larva from which this moth is produced is smooth and greyish, with numerous ferruginous interrupted lines, and two tubercles on the posterior part; feeds on *centaurea scabioria*.

ATOMARIA, a species of *NOCTUIDEA*, about the size of a louse, and inhabits the river Volchova in Russia. It is white; above and wing-veins pale-greyish; wings milk-white. Pallas, It.

ATOMARIA, a species of *SILPHA*. (*S. l. 10*, Fabr.) This insect is smooth and black; wing-veins marked with crenate striæ; legs pale. Fabr. Guich. &c. A native of Europe.

ATOMARIUS, a species of *SCARABÆUS* (*M. l. 10*, Fabr.) that inhabits the eyes of Oxen, Horses, and other animals. This insect resembles the *Blow-fly*. It is powdered with white; thorax oval, red and black; wing-veins brown; abdomen white, with lateral black dots.

ATOMARIUS, a species of *CICUTIFERA* found in Europe. This insect is brown; wing-veins distinct, with the hind-veins smooth, freely pinnate, and a few blackish spots; feet greyish brown hairs; ill. in *Entomol.* Mus. Linn. p. 18, n. 380. Lin. Another descends at *mus. Linn. in Id. n. Mus. Linn. p. 19, 399*, and which does not seem to differ

specifically from the foregoing: *C. atomarius* f. *leuc.* d'ye; *leuc.* d'ye; *leuc.* d'ye; *leuc.* d'ye.

ATREMATON, a species of *CANORIS* that inhabits Europe. It is apterous, black, and glossy, with wings of a reddish-brown, with minute, scattered, confluent dots of a purple colour; margin purple. Mus. Linn.

ATREMATON, a species of *CICUTIFERA*. *Atre. l. 10*, f. *leuc.* d'ye; *leuc.* d'ye; *leuc.* d'ye; *leuc.* d'ye; wings white, dotted with brown.

ATREMATON, a species of *PHRYGANEA*. *Atre. l. 10*, f. *leuc.* d'ye; *leuc.* d'ye; *leuc.* d'ye; *leuc.* d'ye; wings white, dotted with brown.

ATREMATON, a species of *PHRYGANEA*. *Atre. l. 10*, f. *leuc.* d'ye; *leuc.* d'ye; *leuc.* d'ye; *leuc.* d'ye; wings white, dotted with brown.

ATREMATON, a species of *PHRYGANEA*. *Atre. l. 10*, f. *leuc.* d'ye; *leuc.* d'ye; *leuc.* d'ye; *leuc.* d'ye; wings white, dotted with brown.

ATREMATON, a species of *PHRYGANEA*. *Atre. l. 10*, f. *leuc.* d'ye; *leuc.* d'ye; *leuc.* d'ye; *leuc.* d'ye; wings white, dotted with brown.

ATREMATON, a species of *PHRYGANEA*. *Atre. l. 10*, f. *leuc.* d'ye; *leuc.* d'ye; *leuc.* d'ye; *leuc.* d'ye; wings white, dotted with brown.

ATREMATON, a species of *PHRYGANEA*. *Atre. l. 10*, f. *leuc.* d'ye; *leuc.* d'ye; *leuc.* d'ye; *leuc.* d'ye; wings white, dotted with brown.

ATREMATON, a species of *PHRYGANEA*. *Atre. l. 10*, f. *leuc.* d'ye; *leuc.* d'ye; *leuc.* d'ye; *leuc.* d'ye; wings white, dotted with brown.

ATREMATON, a species of *PHRYGANEA*. *Atre. l. 10*, f. *leuc.* d'ye; *leuc.* d'ye; *leuc.* d'ye; *leuc.* d'ye; wings white, dotted with brown.

ATREMATON, a species of *PHRYGANEA*. *Atre. l. 10*, f. *leuc.* d'ye; *leuc.* d'ye; *leuc.* d'ye; *leuc.* d'ye; wings white, dotted with brown.

ATREMATON, a species of *PHRYGANEA*. *Atre. l. 10*, f. *leuc.* d'ye; *leuc.* d'ye; *leuc.* d'ye; *leuc.* d'ye; wings white, dotted with brown.

ATREMATON, a species of *PHRYGANEA*. *Atre. l. 10*, f. *leuc.* d'ye; *leuc.* d'ye; *leuc.* d'ye; *leuc.* d'ye; wings white, dotted with brown.

ATREMATON, a species of *PHRYGANEA*. *Atre. l. 10*, f. *leuc.* d'ye; *leuc.* d'ye; *leuc.* d'ye; *leuc.* d'ye; wings white, dotted with brown.

ATREMATON, a species of *PHRYGANEA*. *Atre. l. 10*, f. *leuc.* d'ye; *leuc.* d'ye; *leuc.* d'ye; *leuc.* d'ye; wings white, dotted with brown.

ATREMATON, a species of *PHRYGANEA*. *Atre. l. 10*, f. *leuc.* d'ye; *leuc.* d'ye; *leuc.* d'ye; *leuc.* d'ye; wings white, dotted with brown.

ATREMATON, a species of *PHRYGANEA*. *Atre. l. 10*, f. *leuc.* d'ye; *leuc.* d'ye; *leuc.* d'ye; *leuc.* d'ye; wings white, dotted with brown.

Dr. Cudworth observes, that though adopted by Epicurus, it has been commonly ascribed to Democritus, who was prior both to Aristotle and Plato; but Laertius represents Leucippus, who was somewhat senior to Democritus, as the first inventor of it. Aristotle, who often mentions this philosophy, commonly ascribes it to Leucippus and Democritus jointly. Plato refers its original to Protagoras, who was an auditor of Democritus. "However", says the learned Cudworth (*ubi supra* p. 12.), "we are of opinion, that neither Democritus, nor Protagoras, nor Leucippus, was the first inventor of this philosophy; and our reason is, because they were all three of them atheists (though Protagoras alone was banished for that crime by the Athenians); and we cannot think that any atheists could be the inventors of it; much less that it was the genuine spawn and brood of atheism itself, as some conceit, because however these atheists adopted it for themselves, endeavouring to serve their turns of it, yet if rightly understood, it is the most effectual engine against atheism that can be." This learned writer alleges also historical probability for the opinion that this philosophy was much more ancient than either Democritus or Leucippus. To this purpose he observes, that Posidonius, as we learn from Empiricus and Strabo, avowed it for an old tradition, that the first inventor of this atomical philosophy was one Moschus, a Phœnician, who according to Strabo, lived before the Trojan war, and who has been supposed by some persons to be the same with Moses the Jewish lawgiver. See MOSCHUS.

Dr. Cudworth further maintains, that Pythagoras, who is thought to have conversed at Sidon with the Jewish philosophers, priests, and poets, that were the successors of Moses, to have borrowed many things from the Jews, and to have translated them into his philosophy, was not unacquainted with the atomical philosophy; and he therefore concludes, that the philosophy of Democritus was Pythagorean; and the philosophy of Pythagoras, Democritical or atomical. Accordingly, he alleges the authority of Ephantus, a famous Pythagorean, and other testimonies, to prove that the Monads of Pythagoras were nothing else but corporeal atoms. In order to reconcile Aristotle with himself, and to preserve the credit of Laertius, both of whom ascribe this philosophy to Democritus and Leucippus, as its first authors, Cudworth suggests, that although the atomical philosophy was in use long before Democritus and Leucippus, yet these two with their confederate atheists, of whom Protagoras seems to have been one, were undoubtedly the first "that ever made this philosophy to be a complete and entire philosophy by itself, so as to derive the original of all things in the whole universe from senseless atoms, that had nothing but figure and motion, together with vacuum, and made up such a system of it, as from whence it would follow there could not be any God, not so much as a corporeal one." The atomical philosophy, according to this learned writer, existed before and without atheism; and Democritus and Leucippus are to be regarded as the first inventors or founders of the atomical philosophy "atheized and adulterated." Consequently, there have been two sorts of atomists in the world; the one atheistical, the other religious. The first and most ancient atomists, holding incorporeal substance, used that philosophy in a way of subordination to theology and metaphysics. The others, allowing no other substance but body, made senseless atoms and figures, without any mind and understanding, (*i. e.* without any God) to be the original of all things; which latter is that, that was vulgarly known by the name of atomical philosophy, of which Democritus and Leucippus were the source. Dr. Cudworth has shewn, by a variety of citations from ancient writers, that the atomists before

Democritus did generally join theology and incorporealism with their atomical philosophy; and he has also proved by the most conclusive reasoning, that atheism, so far from being a natural and necessary appendage to atomism, is totally distinct from it; that there is, neither in reason nor in fact, any inconsistency betwixt the atomical philosophy and theology; and that there is, on the contrary, a most natural cognition or alliance between them. *Ubi supra*, p. 27, &c. The atomical philosophy of Democritus and Leucippus was cultivated and improved by Epicurus, though he would not acknowledge that he had borrowed his hypothesis from any; and from him it obtained the denomination of the Epicurean philosophy. See the articles DEMOCRITUS, LEUCIPPUS, EPICURUS, and EPICUREAN *Philosophy*. See also COSMOGONY.

The opinion of Dr. Cudworth with respect to the antiquity of the atomical philosophy has been contested by some later writers. The learned bishop Warburton, in his "Divine Legation of Moses," admits it as a settled point, that Democritus and Leucippus were the authors of this philosophy; and Brucker (*Hist. Philos. by Enfield*, vol. i. p. 60.) thinks, that the single evidence of Posidonius, the Stoic, who lived so many ages after the time of Moschus, to whom Cicero allows little credit, and of whose authority Strabo and Sextus Empiricus, who refer to him, intimate some suspicion, is too feeble to support the whole weight of this opinion. But the circumstance, says this writer, which most of all invalidates it, is, that the method of philosophizing by hypothesis or system, which was followed by the Greek philosophers, was inconsistent with the genius and character of the barbaric philosophy, which consisted in simple assertion, and relied entirely upon traditional authority. He adds, that the part of the history of Pythagoras which relates to this subject, has been involved in obscurity by the later Platonists; and that neither the doctrine of monads, nor any of those systems which are said to have been derived from Moschus, are the same with the atomical doctrine of Epicurus. He therefore concludes, that, whatever credit the corpuscular system may derive from other sources, it has no claim to be considered as the ancient doctrine of the Phœnicians. We incline however to admit the testimonies and arguments of Dr. Cudworth; and with the distinction which he has adopted between the atomical philosophy derived from tradition before the time of Democritus and Leucippus, and that system of materialism and atheism connected with it by their speculations, and with this reproach annexed to it transmitted to Epicurus and his followers, by whom it was again modified, it seems most probable, that the atomical philosophy was not first invented by these speculative philosophers, but derived by tradition from Phœnicia or Egypt. The atomical philosophy has been revived by some moderns, and particularly by Gassendi and others, who, rejecting the eternity of atoms and their fortuitous motion, have made it a very intelligible and rational system. It is now espoused and adhered to by a great part of the philosophical world, under the denomination of the CORPUSCULAR *philosophy*; which see. It is the philosophy of Newton, Locke, and all their followers; and it claims regard, among other considerations, from its being the genuine philosophy of the first and most ancient atomists. The scholastic divines among the Mahometans, who are very orthodox as to the creation of the world by God, do also admit both atoms and a vacuum; but their atoms are different from those of Leucippus, for they have no magnitude and are all like one another; and they suppose, as that philosopher ought to have done, that every atom of a living body is alive, that every atom of a sensitive body is en-
dued

duced with sense, and that the understanding resides in an atom; though they differ as to the soul and knowledge, whether they consist in a single atom, or a collection of several. Maimon. in More Nevochim. c. 73.

The atomic system, adopted by modern philosophers, and extended by Le Sage and De Luc to great subtleties, supposes that matter fills its space merely by its existence; that it is absolutely impenetrable; that its division can be carried to a certain length only, ending in atoms, which, though extended, are not further divisible; that there are empty interstices between the atoms; that the particles of elastic fluids, as air, vapours, caloric, &c. do not touch each other, and consequently they form discrete fluids, as they are called; and that the rarity or density of a body depends solely on the quantity of empty interstices, in a certain volume of space occupied by the matter constituting that body. In these respects, this system is opposed to that denominated the dynamic system, illustrated by Kant in his "Metaphysical Elements of Natural Philosophy." See *DYNAMIC SYSTEM*.

A late writer has distinguished between *common*, and *philosophic atomists*. Under the former appellation he comprehends those who think with the vulgar, not only that matter exists externally, but that it really possesses all those properties which strike the senses; such as cold, heat, colour, sound, &c. Under the general name of philosophic atomists, he comprises all those philosophers, who admit the essential properties of matter, such as extension, impenetrability, cohesion and mobility, and who reject the real or external existence of those properties that are called sensible qualities. These latter atomists he further distributes into two classes: viz. *simple*, and *mixed*: simple or pure atomists acknowledge extension and impenetrability alone, and the attributes necessarily arising from these, viz. inertia and cohesion. According to them, matter is merely passive, endued with no internal powers; and cohesion, though not necessarily contained in the idea of matter, is essential to the idea of extension; so that all changes are effected by powers foreign to matter: in *nature*, the power of God; in *creatures*, the powers of the soul. Mixed atomists, or Dynamists, place powers in matter itself, which in their opinion belong to it, and inhere in it in such a manner that they are independent of spiritual substance, and are either formed in bodies, or superadded as attributes of material existence. Of this kind are gravity, elasticity, irritability, attraction, repulsion, &c. These powers operate according to the organization of bodies. To atomists of each class this writer opposes the *Idealists*, who entertain the same opinions concerning the primary qualities of bodies, which are held by atomists concerning the secondary. As the latter maintain that no light can exist without being seen, or sound without being heard, so the former assert that neither impenetrability nor extension can have place independently of our conceptions. This opinion, which seems to have been countenanced by Plato, is fully developed in the system of Berkeley. Malebranche is placed by this writer among the Idealists, as his mathematical points, consisting of extension, vanish into nothing when we attempt to analyse them. Locke, by supposing that matter may be made capable of thought, approaches to the Dynamists. Leibnitz and Wolf may be deemed Idealists, since, in reality, they allow of no material existence out of the mind; for although the monads are the occasion of our ideas, yet these ideas have nothing in common with the object. Kant, who derives no sensations from the attention of the soul to real existences, though he acknowledges that our ideas are in some other manner excited, by something existing out

of the mind, is placed also under the class of Idealists; and, according to him, all our observations and determinations are founded on appearances. Of Dr. Priestley this anonymous writer remarks, that, although he makes the soul material, he makes matter spiritual; and therefore he is ranked with the mixed atomists. See account of Prize Dissertations, by Teyler, Theological Society, vol. x. in Monthly Review Enlarged, vol. iii. p. 487. &c.

ATOMOS, in *Entomology*, a species of Cane-cricket found in running water in Europe. It is bicar; has 4 legs, with a single lang; leg, fourteen, with two oval vesicles on each side between the fourth and fifth pair.

ATOMUS, a species of *Lustration*, varied with pale and brown. This insect, Gnath. Atomus n., inhabits Upsal; is smaller than a musc, and feared; to be dangerous, except when it is a noton.

ATONEMENT, in *Theology*, is a term that has been variously explained and applied by writers of different opinions. However, there are three principal senses, in which, with subordinate modifications, the term has been usually understood. The first is, that which has been adopted by those who are commonly called Calvinists; and it supposes, that the death and sufferings of Jesus Christ, partaking of the divine and human nature in one person, being, with respect to the former equal to the Father, were such, considered in their degree and value, as to be a proper equivalent for the penalty annexed by the divine law to the transgression of those of the elect who are penitent and believing. Divine justice, it is said, required its victim, either in the sinner or his substitute; Jesus became the surety; he paid the debt, and satisfied the demand. Others, who have not espoused the doctrine of the proper deity of Christ in the sense of the Trinitarians, or who have not contended for an absolute and strict equivalent to the merit and consequent punishment of transgression, have expressed their notion of this doctrine in a manner somewhat different. Accordingly, Dr. Watts, in his "Redeemer and Sanctifier" (see his works, vol. iii. p. 742.), explains his sentiments in the following manner. "By atonement for sin, I do not mean any such thing as shall in a proper and literal sense appease the wrath of God, the offended governor, which is supposed to be kindled against his sinful creatures, and shall incline his heart to mercy, which was before determined upon vengeance; for though this doctrine may be so represented sometimes after the manner of men, yet this is an idea or supposition in many respects inconsistent with the attributes and actions of the blessed God, and with the doctrine of the New Testament. In that book God represents himself as rich in mercy, and for this reason he pitied sinful creatures who had broken his law, and had deserved to die, before he had received any atonement; and therefore God himself provided and sent his own son to become a sacrifice of atonement, and a ransom for them; he appointed him to be a surety for us, the just for the unjust, and to suffer death in the room and stead of sinners. By the words "atonement," or "propitiation," I mean therefore some tolling or painful thing done or suffered, or both, by Jesus Christ the son of God, in the room and stead of sinful men, as a penance or punishment on account of their sins; and this by the wise and righteous appointment of God, the universal governor, shall excuse the penitent offender from the punishment that was due, and obtain his pardon, because it shall give a recompence to the authority of the divine law, given for the affront which was put upon him by the sins of men, and shall make some reparation of honour to his holy law which was broken. And this is not only intended to mend the evil nature and the desert of sin, together with God's

hatred of it; but it shall also answer the demand and design of the threatening by such actual pain or punishment, though it is laid on the surety instead of the offender; and thus it may secure the law from being broken, in time to come, as if the offenders themselves had been punished. Such a pain, penance, or punishment, are the humiliation and sufferings of Jesus Christ, his labours and sorrow; and it is in this sense that the language of expiation or atonement, of propitiation and ransom, is so often used. See 1 Pet. ii. 23. 2 Cor. v. 21. Gal. iii. 10. "Now by these appointed sufferings of the Son of God, in the room and stead of sinful men, there is an honorable atonement made to the Governor of the world for the violation of his law, and a glorious way made for the exercise of mercy in the pardoning of the sinner, and that without any imputation or reflection upon the holiness of God's nature and conduct, or any suspicion of the justice of his government, as if he would connive at sin; since he discovers and declares, that by passing by the sins of his people in former ages, and in pardoning and justifying sinners who now believe in Christ, he will manifest his justice and righteousness by requiring such a sacrifice whereby sin shall be punished, though the sinner be spared." See Rom. iii. 24—26. To this purpose, Whitty (in Heb. v. 3.) observes, that Christ, after he became our surety, was not, nor could be delivered from those sorrows which were the punishment of our sins; he being as our expiatory sacrifice, not only on the occasion of our sins, but in our stead, to bear the punishment of our iniquity. (See SATISFACTION.) In the sense above explained, the death and sufferings of Christ were properly VICARIOUS. The advocates for this opinion have sometimes asserted, without reserve or qualification, that the necessity of an atonement arose from the immutable nature, and the indispensable demands of divine justice; and that God *could not*, in consistency with his moral attributes, have pardoned sin without receiving a plenary satisfaction; that this satisfaction or atonement *could not* have been given by any other being but his own everlasting and equal Son; and that even he *could not* have effected this great and ultimate object of his mediatorial office, unless our sins had been imputed to him in the same degree as his merits are imputed to us. (See IMPUTATION.) On the other hand, those who have carried Calvinism to the extreme in other points, have nevertheless maintained, that punitive justice was not essential to the divine nature, and that God might have pardoned sin by virtue of his own absolute authority, independently of an atonement. Dr. Owen, however, has opposed this tenet in a Latin tract, intitled, "Distributa de justitia divina."

"Christ's death," says the learned biblical writer, Dr. Clarke (Sermons vol. viii. p. 366.), "was truly and properly, in the strictest meaning of the word, an expiatory sacrifice. For if sinners, by having diminished the honour, and despised the authority of God's laws, were become liable to the justice and vengeance of God; if the Son of God in our nature, by vindicating the honour of God's laws, hath discharged this obligation, and obtained remission for us; and if the obtaining this remission was by the shedding of his blood, which is called "the price of our redemption" (1 Cor. vi. 20); it follows, that the wrath of God was appeased by the death of Christ, and that God was graciously pleased to accept this vicarious suffering of his Son, in the stead of the punishment that was due to the sinner in his own person; which is the express and most proper notion of an expiatory sacrifice." To the same purpose this excellent writer observes in another place (vol. v. p. 203.), that "Christ hath vindicated the honour of God's laws, by taking upon himself the punishment of their sins

who repent, and embrace the terms of the gospel. He condescended to be made sin for us, i.e. to be made a sacrifice for our sins, that we through that expiation might become subjects capable of the mercy of God. He took upon him our nature, and was clothed in flesh, *purisly* indeed that he might preach the will of God to mankind in a nearer and more condescending conversation with them; but, *principally*, that he who in the form of God could not suffer, might become capable of suffering by being made in the likeness to man. He led a most innocent and spotless life, that he might indeed set us an example, that we should follow his steps; but *chiefly*, because, as it was required that the typical sacrifices under the law should be whole and without blemish, so it was necessary, that he who was to be the real expiatory sacrifice for the sins of others, should have none that needed expiation of his own.—He suffered a shameful and ignominious death upon the cross, that he might indeed give us an example of patience and readiness to suffer; but the *principal* design of it was, that he might put away sin by the sacrifice of himself, and obtain eternal redemption for us through faith in his blood. His resurrection was the demonstration of this sacrifice's being accepted by God; and his ascension into heaven was in order to plead the merits of his sufferings before God, and intercede for those who, according to the terms of the gospel-covenant, should be capable of receiving the gracious benefits purchased by his death." Similar sentiments of the doctrine of atonement are largely illustrated in a treatise, by Mr. M. Tomkins, who was an avowed Arian with regard to the Trinity, intitled, "Jesus Christ, the Mediator between God and Man;" of which a second edition was printed in London: in 1761. This writer, having produced several passages of scripture, that speak of Christ's death as a sacrifice, and which declare him to be constituted an high-priest, and having established, as he conceives, beyond all reasonable doubt, the literal sense of those scriptures, proceeds to consider what was the notion of expiatory sacrifices, and of the priestly office under the law of Moses. (See SACRIFICER.) These sacrifices, he shews, were intended to make atonement for the person who offered them; i.e. according to his statement they were, by divine appointment, of avail to free him from the guilt he had contracted, and to prevent the punishment to which he was liable. See Numb. viii. 19. xvi. 46. These sacrifices he considers as a proper expiation, or a real propitiation; not that they were the cause of a merciful disposition in God, and in that sense rendered him propitious who was before implacable; but they were appointments for procuring pardon, and the priests by offering them obtained from the mercy of God those blessings of which they otherwise must have been deprived. Hence he infers, that the effects attributed to the blood of Christ correspond with such effects of these legal sacrifices, and that his acting as our high-priest answers to the office of the high-priest under the law. See Heb. viii. ix. 8. 23. x. 1. He proceeds to shew, that our pardon and acceptance with God, and our freedom of access, are represented, in the New Testament, as the fruit of the suffering of Christ not merely as an act of obedience, but as a sacrifice for sin, as a demonstration of God's displeasure against it, and of his regard to the righteous sanction of the original law, which denounced death to the transgressors of it. With this view, when God resolves to shew mercy to sinners, he also determines that his only begotten son, not indeed without his consent, shall suffer death, the penalty which the original law had denounced against transgressors. Thus Christ, by suffering death, prevented or warded off those effects or consequences of sin, which would otherwise have come upon mankind; and accordingly his death and

his mediation are very justly represented as the means of procuring for us the blessings of which we are made partakers. See Heb. ix. 12. 1 Cor. vi. 20. viii. 23. Rev. v. 9. This representation of the matter gave rise to the term satisfaction, which has been generally used by writers in treating of this subject. (See SATISFACTION.) This author having stated his notion of the death of Christ as an atonement for sin, obviates the objections that have been urged against the opinion he has adopted. But we must refer for further particulars to the author's treatise, p. 105, &c. See also Chapman's Eusebius, vol. ii. ch. iv. v. vi.

The *first* explanation of the term atonement, which has sometimes been called the Arminian scheme, supposes that the sufferings of Jesus Christ were inconceivably severe; and that the object of them was to exhibit the evil and demerit of sin, and the displeasure of God against it, who would not even forgive a sincere penitent, without thus manifesting his hatred of wickedness. This coincides, in a great measure, with the illustration of this doctrine already given; it has been denominated the moderate doctrine, and has been adopted, with certain modifications, by many divines and others.

A *third* hypothesis relating to this subject is that of the learned Dr. John Taylor (see his "Scripture Doctrine of Atonement examined, &c. and also his "Key to the Apostolic Writings," prefixed to his "Paraphrase, &c. on the Epistle to the Romans," ch. viii.), who supposes, "that the scriptures represent the death of Christ as an act of obedience so acceptable to God, that, as the reward of it, he thought fit to grant unto mankind, corrupt and wicked, the forgiveness of sin (*absolutely*, in relation to antecedent blessings; and *upon condition of repentance*, in relation to eternal life), and to erect a new dispensation furnished with all proper means to draw us from sin unto God, and to bring us to the possession of immortality. The blood of Christ, says this writer, or that by which he has bought or redeemed us, is his love and goodness to men, and his obedience to God, exercised indeed through the whole of his state of humiliation in this world, but most eminently exhibited in his death. It is his complete and spotless righteousness, his humility, goodness, and obedience unto death, which makes his blood precious in the best and highest sense, and gives his cross all its worth and efficacy. Obedience was the sacrifice which he offered unto God for us." "It was his righteousness, or righteous, kind, and benevolent action, his obedient death, or the sacrifice of his love and obedience, which made *atonement* for the sin of the world; so far, and in this sense, that God, on account of his goodness and perfect obedience, so highly pleasing unto him, thought fit to grant unto mankind, whom he might in strict justice have destroyed for their general corruption and wickedness (John, iii. 17.), the forgiveness of sins, not imputing unto them their trespasses (2 Cor. v. 19.) or those sins which were past, or which they had already committed (Rom. iii. 25.), and for which they deserved to fall under the dreadful effects of God's wrath. And not only did he forgive former trespasses to all the *living* and to all the penitent and obedient *dead*, but further he erected a glorious and perfect dispensation of grace, exceeding any which had gone before; it in means, promises, and prospects; at the head of which he set his Son, our Lord Jesus Christ, invested with universal power in heaven and on earth, constituting him king and governor over the new body, which he designed to form, captain of our salvation, the high-priest of our sacrifices, the mediator and surety of the new covenant, to negotiate and manage all affairs relating to our present instruction and sanctification, to raise all the dead out of their graves, and

to put the obedient and faithful into possession of eternal life."—"As in various instances, the *virtues*, piety, and prayers of good men were the reason of God's bestowing pardon and sundry blessings upon other, how much more, according to the author, must the perfect righteousness, obedience and goodness of the Son of God, have been sufficient for remitting the sins of mankind, so far as, in the nature of things, they are capable of remission, or of being forgiven? For the sins of the impotent, who finally neglect and reject all means of reformation, cannot be atoned or forgiven. Grace or favour, through the atonement of Christ, may be so far shown to reach us to all within space and time to repent; but none besides the penitent who truly receive the divine goodness and patience, can receive the benefit of eternal salvation through the atonement of Christ. This wisdom, as well as the grace of this dispensation are illustrated, when we consider, that pardon in the gospel is limited to a very high degree; and repentance is there to be attainable, not only to exempt from punishment, but also to gain a new and glorious state of being in eternal life, which is a grant of favour extended far beyond the natural line of repentance. Besides, the grant of remission of sin, and of other blessings of the gospel, through the blood of Christ, has a strong and direct tendency to promote our sanctification, and to render us penitent and obedient; and therefore this constitution must be required in as perfectly wise and beneficent." Dr. Taylor in examining the notion of atonement above stated and considered as the satisfying divine justice, by another's suffering the punishment due to the criminal's sin in his stead, adduces a variety of passages pertaining to this subject, and those more especially in which the Hebrew word כִּפֶּרֶת , by which, or its derivatives, atonement is expressed in the Old Testament; and though he discards the notions of the imputation of our sins to Christ, his suffering in our stead the punishment due to us, or his paying an equivalent to divine justice, yet he concludes his examination with inferring from it, that the sacrifice of Christ was, truly and properly, in the highest degree, and far beyond any other, peculiar and expiatory, to make atonement for, or to take away sin; not only to give us an example; not only to assure us of remission; or to procure our Lord a commission to publish the forgiveness of sin; but moreover to obtain that forgiveness by doing what God in his wisdom and goodness judged fit and expedient to be done in order to the forgiveness of sin; and without which he did not think it fit or expedient to grant the forgiveness of sin." The truly excellent bishop Butler, in delivering his sentiments on this subject (see his works, vol. ii. c. 5), observes, "that some have endeavoured to explain the efficacy of what Christ has done and suffered for us beyond what the scripture has authorized; others, probably, because they could not explain it, have been for taking it away, and confining his office as redeemer of the world to his instruction, example, and government of the church. Whereas the doctrine of the gospel appears to be, not only that he taught the efficacy of repentance, but rendered it of the efficacy which it is by what he did and suffered for us; that he obtained for us the benefit of having our repentance accepted to eternal life, &c. How and in what way it had this particular efficacy, there are not wanting persons who have endeavoured to explain; but we do not find that the scriptures have explained it. It is our wisdom thankfully to accept the benefit, without disputing how it was procured." To the same purpose, Dr. Price, who formed his sentiments very much on the general plan of Butler's *Analogy*, says in his "Sermons on the Christian Doctrine," p. 10. "Our Christ descended to this earth from a state of

Pre-excellent dignity; and that, after having passed through human life, enduring all its sorrows, he delivered himself up to death, and thus acquired the power of delivering us from death. By offering himself a sacrifice on the cross, he vindicated the honour of those laws which sinners had broken, and rendered the exercise of favour to them consistent with the holiness and wisdom of God's government; and by his resurrection from the dead, he proved the efficacy and acceptableness of his sacrifice. In a word, Christ not only *died*, but *obtained* the available *acts* of repentance to pardon; and became by his interposition, not only the *conveyer*, but the *author* and the *means* of our future immortality:—"in such a sense that we owe them to him, as well as primarily to God." This author has declined the use of the terms *felicitation* and *satisfaction*, because they do not occur in scripture; but others have alleged, that though the literal expressions do not occur, the phraseology of the sacred writers warrants the use of them.

Among other writers who have totally rejected the doctrine of atonement according to either of the explanations above given of it, we may mention Dr. Priestley, who reckons it in the class of the corruptions of Christianity. See *Hillory of the Corruptions of Christianity*, vol. ii. p. 152, &c. In all the books of scripture, says this writer, we nowhere find the principle on which the doctrine of atonement is founded, which is a display, on the part of God, of justice and of his abhorrence of sin, so that God could not pardon it without an adequate satisfaction being made to his justice, and the honour of his laws and government. Admitting the popular doctrine of atonement, the whole of the Old Testament, as he conceives, is a most unaccountable book, and the religion it exhibits is defective in the most essential article. The Jews in our Saviour's time, it is said, had certainly no idea of this doctrine; for if they had, they would have expected a suffering, and not a triumphant Messiah. And it is alleged, that our Lord and his apostles are silent with regard to it. This author undertakes to explain the sense in which Christ is represented as a sacrifice, and other figurative interpretations of it, independently of this doctrine. He proceeds to examine the sentiments of the Apostolical fathers, and though he allows that single expressions occur in their writings which seem to favour the doctrine of atonement, yet the general strain shews, as he apprehends, that they had no proper idea of it. It is also argued, that this doctrine is not enumerated as an article of Christian faith in any ancient summary of Christian doctrine. To the too literal interpretation of the figurative language of scripture, Dr. Priestley ascribes that advance towards the doctrine of atonement, which was observed in the third and fourth centuries. Grotius shews (*Opera*, vol. iv. p. 347.) that this doctrine is maintained by Theodorus Abucara, a Greek writer of the ninth century; but in the Latin church it does not seem to have been fixed in the eleventh century, although there are obvious and indisputable references to it in the writings of Anselm, and also in Theophilus, a Greek writer cited by Grotius. Wickliffe evidently believed the absolute necessity of the death of Christ in order to the forgiveness of sin, and after the reformation by Luther, the doctrine of satisfaction, or atonement for sin was reduced to a regular system grounded on certain principles, and pursued to its proper extent. It was unequivocally avowed in the confession of faith presented to Charles V. at Augsberg, in 1530; in the Helvetic confession of the year 1536; and at the synod of Dort, in 1618. It is now the doctrine of the established churches of England and Scotland; and it is very generally retained, at least in some qualified sense, by

divines and others, both Trinitarian and Arian. Socinus discarded it, and his followers have almost universally exploded it. We observe, that though the word atonement frequently occurs in the Old Testament, we meet with it but once in the New Testament; and in other places the same original word, *καταλλαγή*, is rendered reconciliation. As for those who reject the generally received doctrine of the atonement, they maintain, that the great object of our Lord's mission was to teach the doctrine of a resurrection to a future immortal life, and that hence arose the peculiar necessity and utility of his own death and resurrection as a proof of his doctrine. See EXPIATION, ILLUSTRATION, PROPITIATION, SACRIFICE, and SATISFACTION.

ATONEMENT, *Day of*. See *Pass of EXPIATION*.

ATONIA, *ἀτονία*, in *Medicine*, a term which signifies a want of tone, firmness, or strength, in the muscular fibre; in other words, a relaxation thereof; from *α* privative and *τονος*, *tonos*, *I stretch*, or *extend*. This condition takes place either partially or generally in most forms of chronic diseases, and in the convalescent period of acute diseases. The remedies are the Peruvian bark, bitters, chalybeates, the sulphuric acid, cold bathing, country air, and exercise, with a mild and nourishing diet.

ATONICS, in *Grammar*, denote words unaccented. See ACCENT.

ATOOI, or ATTOWAI, in *Geography*, the most northern and the largest of the west group of the Sandwich islands, being about 300 miles in circumference; containing, according to the statement in the third volume of Captain Cook's voyage, about 54,000 inhabitants. It has a good road and anchoring place on the south west side of the island, called Wymon. It is observed, in the account of Porlock's and Dixon's Voyage to the north-west coast of America, that the east side of the island rises gradually from the sea, till it terminates in high land, near the centre of the island. The height of the most elevated land or mountain, according to Marchand (*ubi infra*. p. 16.), is 1216 toises. The hills are clothed to the summit with lofty trees, exhibiting a beautiful verdure. The land next the shore on the east side is uncultivated and destitute of inhabitants; but to the westward it is generally cultivated, and houses are scattered along the shore. The domestic animals on this island are hogs, dogs, and fowls. Its principal vegetable productions are yams, sweet potatoes, the sugar cane, and a sweet root called by the natives, *tee*. Some trees were found about fifteen feet high, with spreading branches, a smooth bark, and a nut resembling a walnut; others about nine feet high, with blossoms of a beautiful pink colour: and a variety with nuts, like our horse chestnuts, which are used by the natives as substitutes for candles, and give an excellent light. The island affords a supply of fresh water. In Marchand's Voyage (vol. ii. p. 80.), we have an account of two English sailors, who had been carried off from an English brig by the natives of this island, and who confirmed the report of captain Cook concerning the natives of the Sandwich islands, that these islanders are cannibals, and eat their prisoners. The relation, however, is disputed; and it is suggested, that the natives of these islands cut in pieces the bodies of their dead enemies, burn their flesh, and preserve their bones as trophies for perpetuating the memory of their exploits. Thus, it is said, they dealt with the body of the unfortunate captain Cook. In the voyage of Vancouver, who visited this island in 1792, we are informed, that the prostitution of the women is here carried to the most wanton excess. Vol. i. p. 171. N. lat. 22°. E. long. 200° 30'. See SANDWICH Islands.

ATOTOTL, in *Ornithology*, a name under which Seba describes

describes the purple creeper, or *Certhia purpurea* of Gmel. avis virginiana phoenicea de Ato uti dicitur. Seb. Mus. i. t. 72. See PURPUREA CERTHIA.

ATOUGIA, in *Geography*, a small town of Portugal, in the province of Estremadura, seated on a eminence near the sea, opposite to the rocks called Purlins, defended by a castle, and containing about 1300 inhabitants; two miles and an half east of Peniche.

ATOUNI, a large tribe of Arabs that possess the isthmus of Suez, and from thence go up betwixt the Red sea and the mountains that bound the east part of the valley of Egypt. See HOWADAT.

ATOYAQUE, a deep and large river of America, in Mexico.

ATRA, in *Conchology*, a species of *PARTELLA*, described by Schroet. The shell is black and striated; vertex pale; bottom with a spatulate brownish spot, and surrounded with a horse-shoe shaped band of white. About an inch and a quarter in length. The country is unknown.

ATRA, a species of *HELIUM*, about two inches in length, and consisting of seven whorls. The shell is tapering, black, and minutely striated; whorls rather convex; aperture oblong-oval. Gmel. Test.

ATRA, in *Entomology*, a species of *COCCUS* (*Musca* Fabr.) that inhabits Denmark and Germany. The abdomen is cylindrical and incurvated; body black. Gmel. The mouth of this insect is white; antennae black, with a yellowish band; legs black; posterior legs without.

ATRA, a species of *PHALANX* (*Bombix*), entirely of a footy-black colour, and without spots. This is *Bombix hians* of Fabricius, and *Tinea granaea* of Wien Schmetterl. The larva is black and hairy, with a sanguineous dorsal line; it secretes itself within a follicle composed of dried leaves and straws. The pupa is ferruginous-brown.

ATRA, a species of *CICADA* (*Cicada* Fabr.) of a large size, that is found in South America. It is black, with a marginal sanguineous stripe on both sides of the wing-cafes. Fabricius, &c.

ATRA, a species of *PODURA*, very common in Europe. It is globose, brown, and shining; antennae long, and of many joints. Faun. Suec. Linn. Act. stockh. 1743.

ATRA, a species of *PIMELIA* (*Holops* Fabr.) of a black colour, with striated wing-cafes. Gmel. Fabr. &c. This is *Pyrochroa (nigra) nitida*, corpore ovato, thorace convexo, antennis pedibusque fuscis, of Degeer. Inhabits Europe.

ATRA, a species of *BUPRESTIS*, that inhabits Germany, and in some respects resembles *Buprestis viridis*. The wing-cafes are entire, somewhat linear and punctated; thorax deflexed; body black and elongated. Fabricius.

ATRA, a species of *LAMPYRIS* (*Lampyris* Fabr.) of a deep black colour; thorax orbicular, and with the wing-cafes red; an impressed black spot on the back. This is a native of Europe. Mus. Lach. Linn.

ATRA, a species of *CANTHARIS*, the body of which is entirely of a deep black. Fabricius. A native of the north of Europe.

ATRA, a species of *N. CYDALIS*, of a black colour, with all the thighs clubbed. Inhabits the south of Europe. Fabricius. The thigh in one sex simple.

ATRA, a species of *LEPTURA*, the body of which is totally black. Fabricius. The legs of this kind are sometimes ferruginous. Poda calls it *Leptura aethiops*, and Geoffroy, *Stenocorus totus niger*. Inhabits the south of Europe.

ATRA, a species of *CURCULIO*, of an oblong form, and black colour, with rufous antennae. A native of Europe, and supposed to be a variety of *C. chloropus*. Gmel. Fabr. &c.

ATRA, a species of *HIERA*, the body of which is entirely deep black. Schr. der. Berl. &c. Gmel. Fabricius describes it as having but one antenna; thorax and wing-cafes fuscous; and body black. Geoffroy calls it *Canceris atra (plum. nortida)*. It inhabits the south of Europe and the north of Asia, and feeds on the roots of grass.

ATRA, a species of *CHRYSONOTA* (*Chrysonota* Fabr.) found in Germany. It is wholly or shining black, with the base of the antennae, and sides of the feet patchy-black. Gmel. Geoffroy, &c.

ATRA, a species of *C. COSTATA*, of a black colour, with two white spots; margin of the thorax and tail yellow. Thunberg. The body of this insect is very globose and glabrous.

ATRA, in *Ornithology*, a species of *MUSCIVORA*, called in the Swedish *Zoology* the *Dugg-Fly-atche*, and is of an olive-ash colour; breast cinerous; body pale yellow; legs black; head, tail, and quill feathers black; margin of the feet indented; and outer web of the exterior tail feathers white. Gmelin, &c. This is a native of New York, where it appears in March, and departs in August; feeds on bees, and lays five small white eggs; legs black.

ATRA, a species of *TANAGRA* that inhabits Guiana. This bird is cinerous; face, chin, and throat black in the male, and brown in the female. Buffon calls it *Canard ou Cravatte*, and Tangara a *cravatte noire de Cayenne*. The length of this bird is seven inches; the bill and legs black; base of the upper mandible white.

ATRA, a species of *TANAGRA* that inhabits the banks of the Rhine. The head and neck are black; back and wings brownish intermixed with black; breast and belly cinerous, rump cinerous, undulated with black and white. Sander.

ATRA, a species of *ARDEA*, entirely of a black colour, with a smooth head and face, bare of feathers. Gmel. The wings are glossed with blue. Brill. calls it *ardea nigra*; Buff. heron noir; and Latham the black heron. It inhabits Sardinia.

ATRA, in *Ancient Geography*, the capital of the Arabians of Singaura; who formed a tribe, which possessed an independent territory of Mesopotamia. Trajan besieged this place in the year 117, but by the resilience of the inhabitants, and the heat of the season, he was obliged to abandon the enterprise. The town was seated on the top of a high mountain in a dry and desert country, and encompassed by a strong wall. It retained its reputation under Severus, but was raised under the reign of the emperor Julian.

ATRABILARIE CAPSULE, in *Anatomy*. See CAPSULE.

ATRABILIS, *Black Bil*, in *Medicine*. The ancients (says Dr. Percival) as appears from Galen, supposed the atrabilis to be derived either from the drops of the blood, or from yellow bile torrefied and highly concocted. A celebrated modern anatomist is of opinion that it is blood, which having lodged some time in the intestinal canal, has acquired a blackness and putridity. But is it not (this elegant and ingenious writer asks) more probable, that in general it is no other than gall become acid by stagnation in the vesica fellea, and rendered viscid by the absorption of its fluid parts? When discharged into the duodenum in this state, it occasions universal distension and disorder till evacuated either by vomiting or purging. A young gentleman who laboured under a marasmus produced by intemperance, and which at last proved fatal, voided several times both by stool and vomiting a considerable quantity of black, tenacious, and most offensive bile. The symptoms which preceded the discharge, and which ceased soon afterwards,

were

were a quick pulse, head-ach, delirium, hiccup, intense thirst, inward heat, and an uncommon factor in his breath. A lady aged thirty, unhappily addicted to habits which have a peculiarly pernicious effect upon the liver, after a constipation of the belly during six days, was seized with a violent and incessant vomiting of black and viscid bile. The infusion fœmæ limoniatum, warmed with the tincture of Colombo, soon checked her retching, and operating by stool, prevented the return of her vomiting. The matter discharged in both these cases bore not the least resemblance to grumous blood. Dr. Percival adds, that he has several times observed the febrile symptoms in children, which are ascribed to dentition, relieved by these pitchy stools; and that he recollects three cases of the disease called acute asthma by Dr. Miller, in which the paroxysms seemed to be critically terminated by a similar evacuation. Whether, in these instances, the black bile was the cause or the effect of the disease, cannot (he observes) with certainty be determined; but the former appears to him to be the more probable opinion. Percival's Essays, Medical, Philosophical, and Experimental, vol. i. p. 342. 4th edit. This view of the subject is very satisfactory; but as an evacuant, peculiarly adapted to this disorder, we would suggest the employment of calomel. Black bile was supposed by the ancients to constitute a peculiar temperament, which they termed the atrabiliary or melancholic temperament. See TEMPERAMENTS.

The disease termed Melæna, or morbus niger, in which there is a dark-coloured bloody discharge, unaccompanied by gripping pains and acute fever, seems to be a species of diarrhœa. (See MELÆNA.) Before we close this article, we would observe, that black or pitchy stools may be occasioned either by discoloured bile, or by the effusion of venous blood into the intestinal canal. An experienced practitioner will seldom be at a loss to distinguish the difference; but if any doubt arise, recourse must be had to chemical analysis.

ATRACÈS, in *Ancient Geography*, a people of Europe, in that part of Greece called Ætolia. Their country was watered by the river Atrax, whence their name.

ATRACTYLIS, in *Botany* (from ἀτράκτος, infus, a spindle), distaff-thistle, Lin. Gen. 930. Reich. 1009. Schreb. 1259. Class, *syngenesia polygamia aqualis*. Nat. Ord. *compositæ*. Gen. Char. *Cal. ovata* many-leaved, linear, large, rounded, permanent, confining the common one; common ovate, imbricate; the scales oblong, very many, lanceolate, converging, unarmed. *Cor. compound* radiate; corollules hermaphrodite, numerous, tubular on the disk; herm. ligulate in the ray; *perianth* of the disk funnel-form, five cleft; of the ray, ligulate, flat, five-toothed. *Stam.* filaments five, capillary, very short; anther cylindrical, tubular. *Pist.* of the disk; germ very short; style filiform, the length of the filaments. *Stigma* bifid; of the ray very like that of the disk, but obscure and withered. *Per.* none; calyx converging. *Seeds* turbinate, compressed; down plumose. *Rec.* villose, flat.

Ess. Gen. Char. *Cor.* radiated; *corollules* of the ray five-toothed.

Species, 1. *A. gummifera*, gummy rooted atractylis. "Flowers senseless." From the root which is perennial, issue many narrow deeply sinuated leaves, armed with spines on their edges. These lie close to the ground, and between them the flower is situated; it is white at the border, but yellow at the disk. A native of Italy. The root abounds with a gummy matter, which has occasioned it to be chewed for the same purposes as mallich. 2. *A. humilis*, dwarf atractylis, Cavan. Hist. 40. t. 54. *β.* Barr. rar. 1127.

t. 592. "Leaves tooth-sinuated; flower radiated, fenced with an expanding involucre; stem herbaceous." Stems nearly a foot high; leaves indented, spinous at the edges; flowers purple, in heads on the branches; root biennial. A native of France and Spain, flowering in June. Cavanille's description of this plant differs from the above. 3. *A. cancellata*, netted atractylis. "Involucres latticed, lullyng, linear, toothed; calyxes ovate; flowers flocculous." Annual, eight or nine inches high, producing two or three slender branches, each terminated by a head of flowers like those of the thistle, with an involucre composed of several narrow leaves, armed with spines on their sides, and curiously netted over, which keeps off the flies; florets purple. A native of the south of Europe. It was cultivated here in the time of Parkinson. 4. *A. lancea*; lance-leaved atractylis. "Involucres pinnate, leaves lanceolate, ciliate, smooth." Stem a foot high, flexuose, branching; leaves alternate, acute, sessile, erect; flowers on the branches terminal, solitary, subsessile. It differs from the third in having smooth leaves, and a leafy stem. 5. *A. ovata*; ovate-leaved atractylis. "Involucres pinnate, leaves ovate, ciliate smooth." Stem simple, streaked, scarcely a foot high; leaves alternate, petioled, acute, nerved, pale underneath; petioles with ciliate edges; flowers terminating, solitary. Both these last are natives of Japan. 6. *A. oppositifolia*; opposite-leaved atractylis. "Leaves opposite." Leaves and calyxes tomentose underneath. Receptacle with hair-like chaff. In the ligulate florets the anthers are effete, and there is neither style nor stigma. A native of the cape of Good Hope. 7. *A. purpurata*; purple-flowered atractylis, Smith. Ic. ined. 3. 65. "Leaves hastate, runcinate." Stem round, woolly; leaves crowded, a span in length, acute, irregularly toothed, veined, tomentose underneath; peduncles longer than the leaves, branched, angular, rugged, woolly, covered at top with linear acute scales; flowers large, erect, specious, purple; receptacle naked. Found by Mutis in New Grenada. 8. *A. Mexicana*; Mexican atractylis. Smith. Icon. ined. 66. "Leaves oblong, quite entire." Stem shrubby; branches simple, leafy, without spines, covered with a downy substance; leaves alternate, lanceolate, acuminate, with netted veins; beneath very white, tomentose; petioles keeled, tomentose; flower terminating, nodding, purple, supported by two or three bracte-shaped leaflets; receptacle with very short chaff. Found by Mutis in Mexico.

Propagation and Culture. "1, 2, 3. are propagated by seeds, which must be obtained from the countries in which they grow naturally: these should be sown on a border of light earth, in a warm situation, early in April, and when the plants come up, and are fit to transplant, they should be thinned, and those which are drawn out may be transplanted, leaving the others two feet asunder; after which, the only culture they require is, to keep them clear from weeds in summer, and in winter to cover the roots with some old tanner's bark to prevent the frost from penetrating the ground. The other species are yet strangers to European gardens; and whenever they are introduced, will require the protection of a green-house or stove." See Martyn's Miller's Dict.

ATRACTYLIS. See CARTHAMUS.

ATRA Dies, in *Antiquity*, denotes a fatal day, whereon the Romans received some memorable defeat. The word literally imports a *black day*; a denomination taken from the colour, which is the emblem of death, and mourning. Whence the Thracians had a custom of marking all their happy days with white stones, or calculi, and their unhappy days with black ones, which they cast, at the close of each day,

day, into an urn. At the person's death, the flowers were taken out, and from a comparison of the numbers of each complexion, a judgment was made of the felicity or infelicity of his course of life.

The *dies atræ*, or *atri*, were afterwards denominated *7. 3.* and *posteri*. Such, in particular, was the day when the tribunes were defeated by the Gauls, at the river Allia; and lost the city; also that on which the battle of Cannæ was fought; and several others marked in the Roman calendar, as *atra*, or *unfortunate*.

ATRAGENE, in *Botany*, a family of plants resembling Clematis, but without a nectary, Lin. g. 695. Schreb. 949. Gaertn. 71. Juss. 232. Class, *polyumbria polygynia*. Nat. Ord. *radicifloræ*. *Ranunculac. s.* Juss. Gen. Char. *Cal.* perianth four-leaved; leaflets oval, spreading, obtuse, deciduous. *Cor.* petals twelve (in *A. capensis* about twenty), linear, very narrow at the base, obtuse, spreading. *Stam.* filaments very many, very short (outer petal-like, two anthered); anthers oblong, acuminate, shorter than the calyx. *Pist.* germs numerous, oblong; styles villose, permanent; stigma simple, the length of the anthers. *Per.* none. *Seeds* numerous, ending in a hairy tail (capsules feather-tailed).

Et. Gen. Char. *Cal.* four-leaved. *Pet.* twelve. *Seeds*, tailed. Species, 1. *A. japonica*, japonese atragene. "Erect, leaves opposite, triternate; leaflets ovate, gashed." Stem angular, streaked, subdichotomous, villose, two feet high; leaflets acute, toothed, very thinly villose; petiole stem-clasping; flowers from the divisions of the stem, few, on elongated one-flowered filiform peduncles; petals more than twenty, purple within, white-tomentose without. Were it not for the number of its petals it would belong to the anemone. A native of Japan. 2. *A. alpina*, Alpine atragene, Jacq. Auft. 3. t. 24. 1. Clematis Sibirica, Mill. fig. t. 284. "Leaves doubly ternate, ferrate, outer petals four-fold." Stems slender, weak, covered with brown thin bark; leaflets two inches long, of a deep green colour; peduncles naked, three or four inches long, one-flowered; calyx yellowish, white within. This plant is differently described by several Botanists, and Jacquin asserts that the Austrian plant is specifically different from the Alpine. A native of the High Alps of Switzerland, &c. 3. *A. capensis*, Cape atragene. "Leaves ternate; leaflets gashed, toothed, outer petals five-fold." Scape simple, six or seven inches long; involucre in the middle of the scape, composed of swelling, ovate, villose, foliaceous stipules; leaves wedge-shaped, trifid, acute, naked; petals about twenty, white, the six lower ones broader, villose underneath, purplish. A native of the cape of Good Hope. 4. *A. tenuifolia*, fine-leaved atragene. "Leaves doubly pinnate; pinnules linear, entire." Found at the Cape by Thunberg. 5. *A. ceylonica*, Ceylonese atragene. "Tendrils two-leaved." Cauliscent, scandent; leaves opposite, compound, conjugate; leaflets ovate, entire, or sometimes with a single tooth, three nerved, on very short footstalks; panicle terminal, composed of a twice trifid peduncle, bearing commonly nine flowers; petals twice the length of the calyx, purplish. A native of Ceylon.

Propagation and Culture. The second species may be increased by cuttings or layers in the same manner as Clematis. In a strong soil, and trained against a wall, it will rise to the height of six or eight feet. The flowers appear early, and if the season prove favourable, they make a handsome appearance; but as this plant is apt to put out leaves very early in the spring, it is frequently nipped by the frosts. The other species have not yet been cultivated in England. See Martyn's Miller's Dict.

ATRALIS, in *Entomology*, a species of *Phaenax* (*C. atralis*), of a black colour, with the wings marked on each log. Fabr. Do. ov. Brit. Inf. Ker. T. 1. p. 10. f. 7. Europ.; it is called *Phaenax fumaria* by M. de Linn. Duct. *Phaenax fumalis* Act. nidros. and *phænia atralis*, Wagn. Schmetz. l. c.

ATRAMENTA. See *lyre*.

ATRAMENTATA, in *Entomology*, a species of *Phaenax* (*G. atramentata*) that inhabits Europe. The wings are white, sprinkled with black dots.

ATRAMITTE, in *Antient Geography*, a name given to the inhabitant of Hadramaut, or Hadramuth, a rich and flourishing country of Arabia Felix. See *HADRAMAUT*.

ATRANI, in *Geography*, a town of Naples, in the Principato Citra, situate between two cliffs, joined together by buildings. Along the vall y a norl winds up to Revello and Scialo, two episcopal cities, or rather draggling villages, on the mountain top. It is not far from the city of Anagni.

ATRAPAXIDIS, in *Entomology*, a species of *Ceryptocentrus*, about the size of *C. quadrangula*. It is black, with three red spots; wings casted black, with three black spots; thighs rufous. Fabr. *Trichocorymbia atrapaxidis* of Palla., and inhabits S. Britain.

ATRAPHAXIS, in *Botany*, an exotic plant, resembling polygonum. Lin. g. 449. Schreb. 612. Gaertn. t. 119. Juss. 82. Class, *alexandria dignia*. Nat. Order, *lythraceæ*. *Polygonac.* Juss. Gen. Char. *Cal.* perianth two-leaved; leaflets opposite, lanceolate, coloured, permanent. *Cor.* petals two, roundish, sinuate, larger than the calyx, permanent. *Stam.* filaments six, capillary, the length of the calyx; anthers roundish. *Pist.* germ compressed; style none; stigmas two, capitate. *Per.* none; calyx closed, including the seed. *Seal* one, roundish, compressed. *Cl.* *A. undulata* has a four-parted calyx, and no corolla.

Et. Gen. Char. *Cal.* two-leaved. *Pet.* two, sinuate; stigmas capitate. *Seed*, one.

Species, 1. *A. spinosa*, prickly-branched atraphaxis, L'Herit. Stimp. Nov. t. 14. "Branches spiny." It rises four or five feet high, sending out many weak lateral branches, armed with spines, and furnished with small spear-shaped smooth leaves, of an ash-colour. Flowers at the ends of the shoots in chusters, each consisting of two white petals tinged with purple, included in a two-leaved calyx, of a white herbaceous colour. L'Heritier has described this plant very particularly, vide l. c. It is a native of Armenia, Siberia, and Persia, flowering in August. Cultivated by Miller in 1759. 2. *A. undulata*, waved-leaved atraphaxis, Will. Elth. 36. t. 32. f. 36. (called *arbuscula africana*, &c.) "Without spines." Stems about a foot long; leaves ovate, obtuse, waved at the edges, alternate, longer than the internodes. Flowers in oblong spikes, at the ends of the stem and branches, furnished with short bracts. Calyx yellow, involving the fruit. The flowers are commonly quadrifid, but sometimes they are six-parted, with eight filaments. Several authors make this to be a species of polygonum, while others would unite the two genera.

Propagation and Culture. "The seeds of these plants not ripening in England, they are propagated by cuttings during any of the summer months. In winter they must be forced from hard frost, which commonly destroys them, as are planted in the open air." See Martyn's Miller's Dict.

ATRARCA, in *Ichthyology*, a species of *Pereca* that inhabits Carolina, and is called by Garden, the black fish. The body is black, and the fins spotted with whitish. Gmelin. The anterior gill-cover is denticulated, posterior

rior ciliated; lateral line straight; dorsal fin lined with white.

ATRATA, in *Conchology*, a species of **PATELLA**. This shell is rather convex, narrow, white, lacated with red; outside spotted with black, with elevated, convex, unequal striae; aperture at the vertex oblong, bordered with chesnut. Schroët. This shell is about three quarters of an inch in length, with a crenated margin, and the vertical aperture surrounded with a red lish ring within.

ATRATA, a species of **NERITA**, found in the Atlantic, American, and South seas. Shell deep, black, glabrous, very thinly striated above; both lips white; exterior one very finely falcated, and somewhat toothed within; inner one concave, rugose, and tuberculated. Chemnitz.

ATRATA, in *Entomology*, a species of **MEGILLA** that inhabits America. It is hairy and black; wings ferruginous, and black at the tip. Fabricius.

ATRATA, a species of **TIPULA**. The wings are glaucous; marginal dot and body black; first segment of the abdomen and legs rufous. Fab. Succ. Linn. This is *tipula schreumonea* of Degeer. Inhabits Europe. The abdomen of the female is recurved, subulate, and very pointed.

ATRATA, a species of **MUSCA** (*Rhagio* Fabr.) that inhabits Italy. It is black, and without spots; wings hyaline, with a black marginal spot. Fabr. Gmel.

ATRATA, a species of **MUTILLA** that is found in Africa. It is black; thorax rufous above; abdomen blue, with two white bands. Fabricius. This is *mutilla atra*, *abdomine fascia alba*, *thorace immaculato* of Linn. Syst. Nat. It is hairy, and has brownish wings.

ATRATA a species of **FORMICA**, with four spines on the thorax; head depressed and marginated, with two spines on each side. This is *formica quadridens* of Degeer, and *tapiini* of Maregrave Bras. 252. It inhabits South America; is black, with an obtuse head; jaws very short; petiole of the abdomen bituberculated.

ATRATA, a species of **TENTHREDO**, of a black colour; back with a yellow-green band, and three curves of the same colour. Inhabits England. Forster's Nov. Inf.

ATRATA, a species of **PHRYGANEA** that inhabits Siberia. It is black; wings whitish, with many spots, and two bands of black. Lepechin.

ATRATA, a species of **PHALENA** (*Geometra*). The first wings whitish, and black at the base, with a broad black stripe; second pair brownish, with two white undulated streaks. Linn. &c.

ATRATA, a species of **CICADA** found in China, and described in Donovan's Insects of China, under the name of *cicada atrata*, great black Chinese frog-hopper. The colour is black, with white wings, black at the base, and veined with yellowish brown. This is supposed from its being extremely common in China, to be the species of *Cicada* observed by sir George Stanton, in the route of the British embassy to the court of Peking, and noticed in his work under the trivial name of the noisy cicada. "The music emitted by a species of cicada," says that writer, "was not of the vocal kind, but produced by the motion of two flaps or lamelle, which cover the abdomen, or belly of the insect. It is the signal of invitation from the male of that species to allure the female, which latter is quite unprovided with these organs of courtship."—On this subject it is remarked, in the History of Chinese Insects referred to above, that these organs of sound are by no means peculiar to the individual species sir George describes; all the males in that section of Linnæan cicadæ which Fabricius calls *tettigonia*, are furnished with such lamelle, and emit a sound in like manner; and the males of those species included in

the other sections of that genus are certainly furnished with them also, although in some kinds they are very small, and in a few instances not visible to the naked eye. These organs will be noticed more particularly in speaking of the genus cicada.

ATRATA, a species of **MELOE**. (*Mylabris* Fabr.) It is of a deep glossy black, with a yellow-waved band near the apex. Is found near the Caspian sea. Pallas.

ATRATA, a species of **LYTTA**, the body of which is entirely brown and unmaculate. Fabricius. Inhabits Barbary.

ATRATA, a species of **SILPHA**. It is black; wing-cases punctated, with three elevated lines; thorax entire. A native of Europe.

ATRATA, a species of **CICINDELA** (*Elaphrus* Fabricius), described by Pallas as being entirely deep black and opaque. Pall. It. 1 App. n. 42. A native of Siberia; in form and size resembles *Cicindela germanica*, and it is conjectured by Gmelin may not properly belong to the *Elaphrus* genus.

ATRATA, a species of **CHRYSOMELA**, described by Geoffroy as a native of France. This kind is black, with wings of a blood-red colour. Gmel.

ATRATA, a species of **CASSIDA**, about the size of *cassida nebulosa*, or rather smaller. It is black, with the shield of the head sanguineous in front. Found in Austria.

ATRATA, in *Ornithology*, a species of **TANAGRA** that is entirely black and shining. This is *enterica atra* of Linn. Syst. Nat., and *black tanager* of Latham. Is a native of India, and has the back glossed with shining blue. About the size of a thrush.

ATRATA, a species of **MOTACILLA**, called by Latham the *black red-tail*. This bird is six inches in length; colour black; crown lead-colour; quill feathers black; exterior margins of the secondaries rufous; the two middle ones black. Gmelin. Its country is unknown.

ATRATO, in *Geography*, a considerable river of America, which runs into the gulf of Mexico, near Carthagena.

ATRATORIUS, in *Entomology*, a species of **ICHNEUMON**, with the feet white; thorax without spots; three last segments of the abdomen edged with white; legs rufous. A native of Germany.

ATRATUS, HUGH, in *Biography*, born at Evesham, in Worcesterhire, made such proficiency in philosophy, mathematics, and medicine, that he was esteemed the phoenix of his age. He was invited to Rome by pope Nicholas III. and addicting himself to the church, in 1281, he was advanced to the cardinalate. He died of the plague in 1287. The works attributed to him are, "Canones medicinales, super Opus Februm Isaaci Opusculum." "De Genealogiis Humanis." Eloy.

ATRATUS, in *Conchology*, a species of **TURBO**, of a blackish colour, with double alternate black and cinereous moniform belts of granulations; and a single tooth on the pillar lip. About the size of a nut, and inhabits the Nicobar islands. Gmelin.

ATRATUS, a species of **MUREX** of a deep black; whorls transversely striated with tubercles; pillar with a single plait; tail straight, Born.; whorls of the spire ten in number; lip crenulated.

ATRATUS, in *Entomology*, a species of **TENTERIO**. (*Stanus* Fabr.) It is a native of Egypt, and is entirely black and glossy. Gmel. Fabr. &c. The wing-cases are united, and the anterior legs bidentated.

ATRATUS, a species of **CURCULIO** found at the cape of Good Hope. It is glabrous, shining-black; wing-cases striated

striated, with impressed dots on the interstices. Sparrm. nov. act. Stockh. 1785.

ATRATUS, a species of **CRYPTOCEPHALUS**. (*Criniceris* Fabr.) It inhabits Tranquebar; is pale with the wing-cases entirely margined with deep black. Gmel. &c.

ATRATUS, a species of **CERAMBYX** (*Prionus* Fabr.) that inhabits Ceylon. The thorax is bidentated on each side; body black; antennæ moderate, with ferrated spines in front. Gmelin, &c.

ATRATUS, an European species of **CARABUS**, of a black colour, with orbicular thorax, pale wing-cases, varied with black; antennæ and legs ferruginous-brown. Muf. Lefk. Linn.

ATRATUS, a species of **TENEBRIO** found in Egypt; it is entirely black and glabrous. Gmel. The wing-cases are united, and the anterior legs bidentated.

ATRATUS, a species of **CIMEX**, of an oblong form (*Oblongus* Sect.) and entirely of a deep black. Geoffroy. Inhabitans France.

ATRATUS, a species of **HEMOROBIVS** found in Africa. The wings are whitish; first pair spotted with black; body black. This is a large insect, and inhabits Africa; the thorax is hairy, and the abdomen cylindrical. Fabricius.

ATRATUS, a species of **ICHNEUMON** that inhabits Europe. It is black; abdomen ferruginous, with the four extreme segments black; legs rufous; antennæ ferruginous, annulated with brown, and tipped with black. A native of Europe. Muf. Lefk. Linn. *Obs.* In Gmelin's subdivision of the ichneumon genus, this insect belongs to that family which has the scutel and thorax of the same colour, and the antennæ annulated or banded. Another species occurs under the same specific name, which belongs to that family in which the scutel and thorax are of one colour, and the antennæ black. This is a large insect, and inhabits America. It is black; head, legs, and streak on the tail, yellow; sting very long. Fabricius. The mandibles and streak between the eyes are black; wings dusky; sting thrice the length of the body.

ATRATUS, in *Natural History*, a species of **ECHINUS** that inhabits India. It is hemispherical-oval, and rather depressed, with very short, obtuse, truncated spines; the marginal ones clubbed and depressed. Gmelin. This is *cidaris violacea* of Klein, and *violette egel-mæder* of Phell. *Zee-eg.* p. 30. The form of this kind is rather orbicular, cinereous inclining to violet; spaces ten, very finely granulated, with a row of larger tubercles, in the larger ones disposed in a quincunx order, and a double row in the smaller ones; avenues brown, excavated, granulated, with four rows of pores; spines violet, some of them clubbed, some angulated at the tip, and some cylindrical.

ATREBATIO, or **ATREBATIO**, in *Ancient Geography*, a people of Britain, situated next to the Bibroci, in part of Berkshire and part of Oxfordshire. According to Camden they inhabited Berkshire; but Baxter says that their country was Oxfordshire. They occupied, as it is said, nearly the whole of the western parts of Berkshire, from the river Loddon on the south-east, the banks of the Thames on the north-west and west, and the hills of East Hitley, Lamborn, and Ashbury on the south. The Atrebatii were one of those Belgic colonies which had come out of Gaul into Britain, and there retained their ancient name; for they were a tribe of the Belgæ, who inhabited the country which is now called Artois. They are mentioned by Cæsar among the nations which composed the Belgic confederacy against him; and the quota of troops which they engaged to furnish on that occasion was 15,000. Comius of Arras was a king or chieftain among the Atrebatii in Gaul in Cæsar's time;

VOL. III.

and he seems to have possessed some authority, or at least some influence, over our Atrebatii in Britain; for he was deputed by Cæsar to persuade them to submission. Hence it is probable that this colony of the Atrebatii had not been settled in Britain very long before that time. These were among those British tribes which submitted to Cæsar; nor do we hear of any remarkable resistance which they made against the Romans at their next invasion under Claudius. It is probable, that before this second invasion they had been subdued by some of the neighbouring states, perhaps by the powerful nation of the Cattivellauni, which will account for their being so little mentioned in history. Calliva Atrebatum, mentioned in Antonine's Itinerary, and called by Ptolemy, Calcuva, seems to have been the capital of the Atrebatii; though our antiquaries differ in their sentiments concerning the situation of this ancient city; some, with Horsley, placing it at Silchester in Hampshire, near the confines of Berkshire; Stukeley, at Farnham; and most others, with Camden and Baxter, placing it at Wallingford in Berkshire. It has been doubted, whether the country of the Bibroci and Atrebatii was within the Roman province called Britannia Prima, or in that called Flavia Cæsariensis; but it seems most probable that it was in the last of these provinces. Henry's Hist. vol. i. p. 248. vol. ii. p. 413. See **ANCALITES**.

ATRELLA, in *Entomology*, a species of **PHALANA** (*Tinea*) that inhabits Italy. The wings and body are black and bronzed; apex of the posterior ones, and the tail testaceous.

ATRESIA, from α , and $\tau\rho\epsilon\sigma\omega$; whence $\tau\rho\epsilon\sigma\omega$, *to perforate*; in *Surgery*, imperforation, or the state of those persons who want some natural aperture.

ATRETI, those persons of either sex, in whom the anus, or genitals, are imperforate, or close, whether naturally, or occasioned by some accident or disease, as the growth of some fleshy excrescence, or a membrane which stops the orifice.

ATRI, in *Geography*, a town of Italy, in the kingdom of Naples, and province of Abruzzo Ultra; nine miles east of Teramo. See **ADRIA**.

ATRI, a village of Egypt, on the right bank of the Damietta branch of the Nile. A little below it runs a large canal, which empties itself into the lake Menzale, towards the eastern part of it. The cottages that compose this village, cover the ruins of the ancient *Atritis*, which, according to Ammianus Marcellinus, was one of the most considerable towns in Egypt. But no remains of its former extent and grandeur now exist.

ATRI, a river that runs through the western part of the island of St. Domingo, and empties itself into the sea.

ATRICAPILLA, in *Ornithology*, a species of **EMBERIZA**, of a reddish brown above, beneath cinereous; chin white; crown yellow; forehead, and flaps through the eyes black. This is *emberiza atricapilla* of Gmelin, and *black crowned bunting* of Latham. It inhabits the Sandwich isles. There is a variety of this bird in which the breast is waved with black; and also another bird corresponding with the first in some respects, but in which the crown is not yellow; this is supposed to be the female.

The black-crowned bunting is seven inches in length; upper part of the plumage reddish brown, and each feather marked longitudinally with a dusky colour; coverts and quills edged with a paler colour; the throat, breast, and belly are ash-colour; the last marked along the middle with yellowish buff; tail brown; legs brown; claws dusky. Lath.

ATRICAPILLA, a species of **MUSCICAPA**, called by English naturalists the *cold-finch* and *pie'd fly-catcher*. The colour is black; beneath, spot on the front, and another on the wings, white; outer web of the exterior tail feather white. Kramer, Gmelin, &c. This is *motacilla remigibus extimo dimidiato extrorsum albo* of Linn. Fn. Suec. *rubetra anglicana* of Brisson, *ficedula atricapilla se mutans* Aldr. Orn. 2. p. 758. le tarquet d'Angleterre of Buffon, cold-finch of Willughby, and pied fly-catcher of Pennant and Latham.

The length of this bird is four inches and three quarters; bill black; irides hazel; general colours black and white; the upper part of the body, wings, and tail black; upper tail coverts intermixed with black and white, and sometimes entirely black; legs of the same colour. Female brown in those parts where the male is black, and destitute of the white spot on the forehead. This bird inhabits Europe. In England it is rare, and chiefly found in Yorkshire, Lancashire, and Derbyshire. Vide Lath. Gen. Syn.—Donov. Brit. Birds, &c.

Of this species there are two or three varieties; the first, *muscicapa nigra*, and *le gobe-mouche noir* of Brisson Orn. a bird about five inches and a half in length, and differing from the last in having a mixture of grey on the upper parts, the thighs mixed brown and white, and the three outermost tail feathers white on the margin. The other is *motacilla nigra terquata* of Cramer, and *le gobe-mouche noir à collier* of Buffon: this is like the first kind, but has the white on the neck passing entirely round, and forming a collar. It is met with in Lorraine and Brie, where it arrives in the middle of April. The principal food of this bird is flies. A third kind, called by Linnæus *muscicapæ variegata*, inhabits India; this is about the size of the white wagtail; general colour brown; forehead, sides of the head, and underparts white; and a line of white extending also from the shoulders to the middle of the back; outer feathers white at the tip.

ATRICAPILLA, a species of **MOTACILLA**, well known in England by the name of *black-cap*, and in France by that of *la fauvette à tête noir*. It is specifically described as being testaceous, cinereous beneath; cap dusky or black. Linn. &c. The length is five inches and a quarter; bill brown; top of the head black; upper parts of the body greenish, ash-colour; sides of the head and under parts grey, becoming almost white near the vent; quills and tail cinereous brown; the two middle tail feathers rather shorter than the rest; legs lead colour; claws black. The female differs in having the head of a ferruginous chestnut colour instead of black.

This bird inhabits Italy, and other parts of Europe to the northward of that country, and is not unfrequent in England during the summer months; it arrives here in the spring, and retires in September. In Italy it builds twice a year, according to Olina, with us only once; the nest is generally placed in some low bush, and is composed of dried stalks, mixed with a little wool, and green moss; the inside is lined with the fibres of plants, and thinly covered with horse-hair: the eggs are five in number, of a pale reddish-brown colour, mottled, and sprinkled with a few larger dark spots. It feeds on insects, but not exclusively on them, as it will eat the fruits of spurge, laurel, and ivy. The song of this bird is amazingly fine, and in some particulars resembles that of the nightingale; emulating in delightful sweetness and melody the note of that charming songstress, and being only deficient in that wild variety and extent of modulation, for which the nightingale is so much admired. The black-cap is from this circumstance called by some the mock-nightingale.

Dr. Latham describes three varieties of this species of warbler; one in which the body is entirely variegated with

black and white only; *curruca albo et nigro varia* of Brisson, *ficedula varia* of Aldrovandus, and first variety of Gmelin.—Another, a bird somewhat larger, having the upper parts almost black, with a white throat, and sides almost grey; this is *curruca supra fere nigricans, gula alba* of Gmelin, the second variety of that author, and *petite columbaude* of Buffon.—And the third variety is *fauvette verdâtre de la Louisiane* of Buffon, and *curruca subtus grisea, gula superciliosque albis* of Gmelin; the under parts of this is greyish; the throat, and streak above the eye white; the hind part of the neck deep ash-colour; sides and back pale brown, tinged with green; wings and tail blackish.

ATRICAPILLUS, in *Entomology*, a species of **TURDUS**, of a brown colour, with a black head; belly and rump rufous; and a black spot on the wing. Gmelin. This is *merle à tête noire du cap de Bon Espérance* of Buffon. It inhabits the cape of Good Hope; and is about nine inches in length; the belly is striated with brown; tail cuneated, the feathers pale at the tips.

ATRICAPILLUS, a species of **CARABUS**, of the winged kind. The thorax is rufous; wing-cases testaceous and obtuse; head black. Fabricius. *Olf.* Gmelin describes it as being yellow, with a black head and very obtuse wing-cases.

ATRICAPILLUS, a species of **STAPHYLINUS** that is found in England. The thorax is rufous; wing-cases fuscous, with a dot at the base and posterior margin white. Fabricius.

ATRICAPILLUS, in *Ornithology*, a species of **LANIUS** that inhabits Surinam, and is called by some the Surinam strike. The tail is wedge-formed, and with the crown, neck, shoulders, and wings, black; body above mouse-colour; beneath of a bluish ash-colour. Merrem Beytr. &c. The length of this bird is five inches; wings short; margins of the wing-coverts and secondary quill-feathers white; all the tail-feathers, except the two middle ones, tipped with white.

ATRICAPILLUS, a species of **PSITTACUS** called by Brisson *ara Moluccensis varia*. It is a native of the Molucca isles, and about fourteen inches in length; colour above blue; chin, throat, and breast red; belly and vent green; crown black; neck green and red. Gmelin. The wings and upper tail-coverts are blue, lower green, varied with red; tail green above, beneath red, edged with black. Klein calls this *psittacus capite nigro, collaris viridi*, and Buffon *grande perruche à bandeau noir*.

ATRICAPILLUS, a species of **CHARAEBRIUS**, called by Latham the *black-crowned plover*. Above it is cinereous brown, beneath white; bill and legs red; crown black, encircled with white; neck and breast cinereous, and terminating in a transverse dusky streak. Inhabits New York. Gmelin. The front is black; bill black at the apex; base of the tail white, blackish near the extremity, tips white.

ATRICAPILLUS, a species of **PARUS**, found in North America, and called the *Canada titmouse* by Pennant and Latham. The cap and throat are black; body cinereous, and white beneath. Brisson calls this *parus atricapillus canadensis*, and Buffon *mifange à tête noire de Canada*. The length of this bird is four inches and a half; it feeds on worms and insects, and bears cold with remarkable perseverance. The upper tail-coverts are whitish; greater wing-coverts brown, edged with grey; quill feathers brown, with the exterior edges grey, and the inner ones whitish; middle tail-feathers cinereous; lateral ones brown, with grey margins; legs and claws blackish. Gmelin, &c.

ATRICES, or **ATTRICES**, in *Surgery*, small tubercles about

about the anus, which sometimes disappear, and then return again, at least while in their early state.

The atrices are ranked in the number of *oxylyonata* or *fei*. Some authors also give the denomination *atrices* to a kind of latent wounds in the extremity of the rectum, which however do not perforate the same.

ATRICILLA, in *Ornithology*, a species of *LARUS* or gull, called by Willughby Baitner's great ash-coloured femew; and in the Arctic Zoology of Pennant and Gen. Syn. of Latham, the laughing-gull. Buff. names it *gavia ridlundia*, and Buff. mouette rieufe. This bird is very common about the shores of America, and places contiguous. Its food is fish and marine worms; and it is specifically distinguished from the rest of the gull tribe by being of a hoary grey colour, with a black head, red bill, and black legs. Oed. Nov. Act. Stockh. &c.

ATRICILLE, in *Entomology*, a species of *CHRYSOMELA*, of a black colour, with the thorax, wing-cases, and hanks of the legs testaceous. Linn. Faun. Suec. Fabricius describes it as *chrysomela saltatoria nigra*, thorace-clytrisque cinereis. Spec. Inf. *Chrysomela melanocephala* of Degeer is supposed to be a variety of this species, by Gmelin. Inhabits Europe, and is found on various plants.

ATRICILLOIDES, in *Ornithology*, a species of *LARUS*, that inhabits Siberia, about the salt lakes. The colour is reddish white, with the head, orbits, and neck black; back and wings cinereous; legs scarlet. Falck. It. 3. p. 355.

ATRIENSES, in *Antiquity*, a kind of servants or officers, in the great families at Rome, who had the care and inspection of the atria, and the things lodged therein.

These are otherwise called *atriarii*, though some make a distinction between *atrienses* and *atriarii*; suggesting that the latter were an inferior order of servants, perhaps assistants of the *atrienses*, and employed in the more servile offices of the atrium, as to attend at the door, sweep the area, &c.

The *atrienses* are represented as servants of authority and command over the rest; they acted as procurators, or agents of their master, in selling his goods, &c. To their care was committed the statues and images of the master's ancestors, &c. which were placed round the atrium; and which they carried in procession at funerals, &c.

In the villas, or country-houses, the *atrienses* had the care of the other furniture and utensils, particularly those of metal, which they were to keep bright from rust. Other things they were to hang from time to time in the sun, to keep them dry, &c. They were clothed in a short white linen habit, to distinguish them, and prevent their loitering from home.

ATRIP, in *Nautical Language*, is applied either to the anchor or sails. The anchor is atrip, when it is drawn out of the ground in a perpendicular direction, either by the cable or buoy-rope. The top-sails are atrip, when they are hoisted up to the mast-head, or their utmost extent.

ATRIPALDA, in *Geography*, a small town of Naples, in the Principato Ultra, built upon the ruins of the ancient Abellinum Marticum, and standing upon an eminence composed of strata of soft coloured tufa. The inhabitants are supposed to have retired from it in the middle ages, and to have founded the present city of Avellino, as more convenient for traffic. Atripalda carries on some trade in paper, cloth, and hard-ware. This town was first held in fee by the Montforts; it was afterwards granted by Ferdinand I. to George Castriot, or Scanderberg, prince of Epirus, as a reward for his timely assistance in 1460; and it now gives the title of duke to the prince of Avellino's eldest son.

ATRIPELEX, in *Botany*, the plant called Orache or Arache. Lin. g. 1153. Schreb. 1577. Gertn. 75. Juss. 85. Class. *polytrichia monaria*. Nat. Order. *heliantha*. *trigonica* Juss. Gen. Char. Terniaphrodite flower. Cal. perianth five-leaved, concave, permanent; divisions ovate, 5-nave, membranaceous at the edge. Cor. none. Stam. filaments five, tubulate opposite to the leaves of the calyx, and longer than them; anthers roundish, twin. Pyl. germ orbiculate, style two-parted, short; stigmas reflex. Per. none. Calyx, closed, pentagonal, with the angles compressed, deciduous. Seed, one, orbicular, depressed. Female flower on the same plant. Cal. perianth two-leaved; leaflets flat, erect, ovate, acute, large, compressed. Cor. none. Pyl. germ compressed; style two-parted; stigmas reflex, acute. Per. none; valves of the calyx very large, cordate, imbricate; the seed between them. Seed, one, orbicular, compressed.

Ess. Gen. Char. Herm. Cal. five-leaved. Cor. none. Stam. five. Style, two-parted. Seed, one, depressed. Female. Cal. two-leaved. Cor. none. Stam. none. Style, two-parted. Seed, one, compressed.

Species, 1. *A. helima*, tall, shrubby orache, or Spanish sea-purslane. "Stem shrubby; leaves deltoid, entire." Root perennial, woody, branched. The whole shrub is white; stems from four to six inches high or more, dividing into woody brittle branches; leaves scattered on long foot-stalks; flowers small, purplish, at the ends of the branches. It grows in hedges near the sea about Nice, also in Spain, Portugal, Sicily, &c. According to Parkinson it was cultivated here in 1640. 2. *A. portulacoides*, dwarf shrubby orache, or common sea-purslane. Hudf. With. Lightf. Eng. Bot. 4. t. 261. "Stem shrubby; leaves obovate." A low underthrub; leaves narrow, whitish; branches angular, reclining, glaucous; flowers in clustered spikes terminal, yellow. It grows near the sea in salt marshes, flowering in July and August. 3. *A. glauca*. "Stem undershrubby procumbent; leaves ovate, sessile, quite entire; the lower ones subdentate." Stem three or four feet long, with declining branches; leaves thickish, of a silvery glaucous colour; flowers yellow at the axils of the upper branches. A native of France and Spain. 4. *A. rufea*. Villars Dauph. 2. 565. "Stem herbaceous; leaves hoary, serrated; fruit quadrangular, toothed." Stem erect, somewhat angular, white, smooth, branched, a foot and a half high; leaves alternate, subsessile, rhomb-heart-shaped, sinuate-toothed, covered with a farinaceous white powder; flowers in close clusters, axillary; valves of the fruit hoary and finely notched. A native of the south of Europe. Annual. 5. *A. floricola*, Siberian orache. "Stem herbaceous; leaves deltoid angular, calyxes of the fruit mucronate on the outside." This is of the same size as the *A. hortensis*. The fruit is tomentose at the base, and mucronate on the outside; the leaves are silvery beneath, and the flowers white. A native of Siberia. Annual. 6. *A. tartarica*, Tartarian orache. Hudf. 443. n. 2. 2. "Stem herbaceous; leaves deltoid, sinuate-toothed, waved, alternate." According to Linnæus, this rises five or six feet high. Mr. Hudson considers it as a variety of the laciniata produced by cultivation. 7. *A. hortensis*, garden orache. Gmel. Sib. 3. 71. Gertn. Fruct. 1. 362. "Stem erect, herbaceous; leaves triangular." Root annual; stem above three feet high; leaves thick, pale, and variable in their shape; valves of the calyx ovate-cordate, streaked, entire. A native of Tartary, and cultivated by Gerard in 1596. It was formerly cultivated as a culinary herb, being used as spinach, and it is still eaten by the French. There are some varieties of it which depend wholly upon colour. 8. *A. laciniata*, jagged sea orache. Hudf. With. Lightf. Eng. Bot. 3. 165. "Stem herba-
